Plants Of Yrth

Ten Green Reasons for Adventure in *GURPS Banestorm*

by Thomas Devine

Setting details are a great source for adventures. They also give the game world flavor and style. This article will add to the ***Banestorm*** setting by describing 10 plants native to the continent of Yttarria. Each of these plants can be dropped into most fantasy settings fairly easily, and can also be used to spice up Planetary Romances, Space Operas, Lost Cities and/or Civilizations, as found in ***Steampunk*** or ***Cliffhangers.*** With small modifications, several of these fictional plants would make good transgenetic plants for a ***Transhuman Space*** setting. However, each of these plants is set on Yrth and has adventure ideas attached to it for that setting.

Bread Oaks

A close relative of the White Oak, it grows both as a tree or a bush. The acorns of the Bread Oak, unlike those of common oaks, are edible and tasty. These acorns are also more nutritious than any other known plant seed and are wonderfully easy to preserve. As the name suggests, Bread Oak acorns are ground into a flour which is as versatile as wheat flour and much easier to preserve.

Bread Oaks grow in all areas of Yttarria except the highest mountains and the Great Desert. They do best in temperate climates. They are hardy and provide stable amounts of edible acorns year after year. The Elves of Yrth created a truly secure food supply in the Bread Oak.

Game Uses: Bread Oaks have important military and political implications. Bread Oak acorns are excellent military rations: easy to store, easily made into bread, tasty when eaten raw, and excellent for keeping active people going. Any military leader on Yrth wants large supplies of these acorns for his troops and to destroy any supplies his rivals have. Heroes could be hired either to secure supplies of Bread Oak acorns or to sabotage another military's supply.

Bread Oaks are also a constant source of friction in feudal society. Peasants and central governments love Bread Oaks, just as local nobles dislike them. The Elves developed Bread Oaks to provide a *stable* food supply. In a good year or a bad one, Bread Oaks produce about the same number of acorns. Peasants love this. Nobles, who finance their ambitions on crop surpluses, strongly prefer wheat and rye. Central governments, especially Megalos, require that nobles produce a certain quota of Bread Oak acorns for the government's military needs, and the nobles need the acorns for the same reason. This creates constant friction and intrigue as local nobles try to keep the Bread Oaks to the minimum. Murders, riots, revolts, and other violence, come out of this conflict regularly. Adventurers can be spies for the local lord, a rival lord seeking to disgrace a neighbor, or the central government. Peasant PCs could seek revenge on tyrannical lords or play one set of lords off against the others to preserve their Bread Oaks.

Fayflax

Fayflax grows throughout northern Yttarria as a large bush, much like a mustard bush. Far easier to process than normal flax, and far more productive per acre, Fayflax is a major source of fiber for most of Yttarria. Human craftsmen can make excellent thread, like high quality linen from Fayflax, and also good paper as well. The Elves can also spin Fayflax fibers into silklike threads and produce the best paper on Yrth from Fayflax. This Elven paper is amazingly durable and tough as well as beautiful. Given its excellence, and lower price, Fayflax has displaced flax from every use except sailcloth. Flax seed is also valuable in its own right. But Fayflax is the main source of plant fiber throughout most of Yrth.

Game Uses: Elf Silk -- or gossamer, as high quality Fayflax thread and cloth are often called -- is highly sought after.

Alchemists and enchanters both seek it out as does anyone else who likes fine cloth. Intrigues and diplomacy are often needed to get Elves to part with the highest qualities of gossamer. The Elvish communities often use the gossamer trade to get needed concessions.

Several Sahud clans have gotten their hands on samples of gossamer. At least one has sent assassins to eliminate the supply, and two have sent ninjas to steal the secret.

The fine paper made by the elves are sought out by both the Church and Islamic religious authorities for the manufacture of Bibles and Korans. Since most Elves are worshipers of the Eternal, this requires diplomacy. Sadly, religious zealots of both faiths have been known to steal shipments of fine paper meant for the production another faith's holy book. Other zealots have been known to murder paper dealers who buy pagan paper for holy books.

Honeyroot

This plant common to northern and central Yttarria has large tuberous roots. The sap of these tubers is very sweet and tastes something like honey. This sap is often boiled down into syrups and candies; it is the major sweetener in Cathness, and commonly used throughout Yttarria. The rich use sugar and honey, the poor use honeyroot.

Honeyroot is also used to brew flowermede, a cheap alcoholic beverage. Peasants drink flowermede in the spring and summer and beer in the fall and winter. Poorer townsfolk also drink what they call root ale or bud water. As flowermede often smells like the local wildflowers, different brews are quite distinctive. The best flowermede is prized even by the aristocracy, while the cheap stuff smells like cheap perfume. All of it can get you drunk.

Game Uses: There are often strong local rivalries centered around the local brews. People have been known to sabotage and destroy rival breweries. Heroes could be to guard or harass a local brewery.

Pepperberries

The pepperberry is a close relative of the raspberry that grows mainly in Cathness, but is cultivated in much of al-Wazif, Cardiel, and Megalos. Ripe berries are a dark garnet red and have a strong spicy-peppery flavor. Pepperberries can be used fresh or dry to season food. A sauce is commonly made from these berries, as a means of preserving them. This sauce is as ubiquitous in the cuisine of Yttarria as ketchup was in the United States in the 1930-1990 period.

Game Uses: The highest quality pepperberries are prized by all of Yttarria's gourmets. High prices are paid for the wild pepperberries of northwestern and north central Cathness. King Conall has the right to a share of the proceeds of all pepperberry sales to foreign merchants. Even though he doesn't get profits from the rebels, he and his allies control all of the best pepperberries. These pepperberry sales represent a nice supply of cash to the crown of Cathness. While not a large part of the total wealth of the crown, the pepperberry revenues are a large part of the crown's liquid assets. Anyone hostile to Conall, or desirous of prolonging the Cathness civil war, or perhaps breaking up Cathness, would want to cut off this source of revenue. PCs could be involved in intrigues, river piracy, military action against river pirates, and any other means of blocking or preventing the blockage of the wild pepperberry trade.

On a less grand level, local cultivars of the pepperberry bush are highly prized and jealously guarded. Adventurers could be hired to steal cuttings or destroy plants grown from cuttings.

Luciole

The flowers of the firefly (French luciole) bush of Araterre glow gently at night. The Aralaise grow large , sweet-smelling, luciole bushes to light their gardens. The Balinese Aralaise make luminous paints and cosmetics, as well as paste jewels that glow when worn next to the skin. Alchemists find many valuable uses for the flowers, leaves, and roots, of the luciole plant. Products made from luciole are sold across Yttarria.

Game Uses: The time needed to make any alchemetic product involving light is reduced by up to half if extracts of luciole are used in the mixture. Enchanters can use luciole to greatly reduce the cost of light enchantments. Luciole jewel lockets (a paste jewel inside the locket that has a Continuous Light spell enchanted into it) are more convenient than lanterns and becoming popular among those who can afford them.

Luciole extracts and similar products are valuable trade goods and a magnet to the pirates that haunt the seas around Araterre. The heroes could be involved either way.

Fue Sucre

Sugared fire is the name given a large gourd native to Araterre. Ripe Fue Sucre gourds are ground and boiled, and the broth is stained. This yields a syrup that can be made into candies or cakes of gourd sugar, much like maple syrup. The main novelty with Fue Sucre, as the name suggests, is that this sugar is as hot as a good chili pepper. Fue Sucre candies are popular in Araterre and these red hots are a prized treat in most of Yttarria's ports. But the quality that makes Fue Sucre more than a novelty is that it repels insects.

By adding Fue Sucre sugar or syrup to any processed food, the cook guarantees that insects will ignore it. In a tropical land lacking refrigeration, a good tasting insect repellant is a godsend. This same property means Fue Sucre is in demand all over Yttarria.

Game Uses: Anyone who needs to preserve food in a TL 3 or 4 society would love to get their hands on Fue Sucre sugar or syrup. Even sprinkled as a power, Fue Sucre repels insects. Alchemists can make insects repellents from Fue Sucre (effectively TL4+5 insecticides). Fue Sucre is a classic high value/low volume trade good with serious military uses (armies have to eat). Fue Sucre can motivate robberies both for its monetary and military value. The PCs can be involved in trying to steal or guard, acquire or sell, Fue Sucre.

Saint Valentine's Daisy

These delicate blue and white daisy-like flowers with the pink tips on each petal are common in Cardiel, al-Wazif, and southern Megalos. The flower is named for Saint Valentine because that Saint's intercession is called for in cases of fever and infection, and this little flower is one of the most powerful medicinal herbs native to Yrth.

A simple wine (much like dandelion wine) is made from these flowers. Used either topically or ingested, this wine acts like a powerful antibiotic. The effects are stronger and faster the higher the mana level. This wine strongly enhances both alchemetic healing elixirs and healing spells. In both mundane and magical medical uses, both skill rolls and HT rolls gain a bonus if saint Valentine's Daisy wine is used. In low mana areas, the bonus is +2, in normal mana areas the bonus is +5, and in high mana areas the bonus is +7. Any aspected mana bonus to healing is doubled, while penalties to healing from aspected mana are halved. Saint Valentine's Daisy wine has no special properties in no-mana areas.

Game Uses: Quite apart from its value and the trade in flower wine, the fact that the benefits of Saint Valentine's Daisies increase with the mana level can set up any number of race for life plots. For example: A young squire -- dear to the heart of one of King Conal's more important allies -- is ill, and not responding to treatment. About two days ride away in the local woods is a hospital built by a healing spring and maintained and staffed by a lodge of healer mages. The area where the hospital stands is a little island of normal mana and the springhouse itself is high mana and healing aspected. The Saint Valentine's Daisies grown here can surely heal the lad. The heroes simply have to take a helpless young man, who would make a valuable hostage, through disputed territory without killing him. With variations, this scenario can be set up nearly anywhere on Yttarria.

Dyer's Rose

This plant, found mainly in Cardiel, grows as a tree about 20 to 25 feet high. It produces large rose-like blossoms and a small bitter fruit that look like crabapples. What makes this tree look odd is that its flowers always range across the

full spectrum of colors. Reds and oranges showing up on the southwestern quadrant of the tree and blues and violets to the northeast. These colors also show up in the flesh of tree's fruit. The juice of these roseapples is an excellent dyestuff.

If two or more Dyer's Rose trees are planted close together, the color pattern is played out over to group of trees. With two trees of roughly equal size, the more southwesterly tree would display the red, orange, yellow, and yellow-green flowers, and the northeasterly tree would display the blue-green, blue, indigo, and violet, flowers, If a large orchard of Dyer's Rose trees is planted, the rainbow pattern would be played out over the whole orchard.

Game Uses: Dyer's Rose is a major industrial crop in Cardiel especially in the southeast. Roseapples are sorted, dried, packed, and shipped out to all of Yttarria's dyemakers. It's an important part of any Lord's income. In Cardiel's highly competitive politics, losing a source of ready cash is always to be avoided . . . and everybody knows it. Mercenaries could be hired to damage crops, protect crops, steal, guard, or spy on the stealing or guarding, of the roseapples crops.

As the subtlest shades of color can be magically important, enchanters often hire agents to acquire the flower or roseapples of the perfect shade and hue. As other agents will probably want the same hue, there will be competition.

Saint Dominic's Bane

This large annual plant has dark blue flowers with a vaguely unpleasant sour smell. It's common throughout Yttarria and well liked by farmers because insects hate it. When Saint Dominic's Bane is grown with any crop, damages and loss from insects is greatly reduced. The juice of the blossoms, when rubbed on the skin make a fine insect repellant that last for about a week or until the user's next good bath.

The oily sap of the stalk is sometimes made into soap. Saint Dominic's Bane soap is a powerful insect repellent, but it smells bad. Most soapmakers mix the sap with other fats to make soap. This weakens the insect repellent effects, but vastly improves the smell.

Alchemists make a dark gray-green dye from Saint Dominic's Bane. Clothing colored with this dye repels insects for several years after it's dyed. The travelers, hunters, and soldiers of Yttarria prefer flea-, louse-, and tick-free clothing. In Araterre, some part of the bedclothes with always be dyed with Saint Dominic's Bane green to drive off mosquitos.

Game Uses: In a real TL3 society, a cloak that repels insects would be a treasure. Given that disease kills far more soldiers in low-tech warfare than fighting ever does, any Yrth military wants this dye. Some intriguers have been known to replace the Saint Dominic's Bane dye with common green dye. This leads to outbreaks of disease in enemy troops. The PCs could be sent to switch dyes, prevent a switch, or secure quality dye. Alternately, they could be con artists selling fake Saint Dominic's Bane dye. The heroes could also be falsely accused of passing fake dye, a charge that combines murder and treason; this would require them to clear their names or flee.

Scribe's Rush

A large reedlike plant found in every wetland on Yttarria. The stalks have fibers that are made into rope, coarse cloth, and paper. The seeds are used as the basis for most of Yttarria's ink. Rushpaper is generally good paper, but never of the highest quality. Rushpaper is cheap, common, and widely sold. The drapfond (rush wool) cloth is used like burlap or jute. Drapfond rope is prefered for ships rigging and all naval uses. However, encrefond -- the ink made from Scribe's Rush -- is the best ink on Yrth, especially for printing.

Game Uses: Most common pamphlets are printed on rushpaper to keep costs down. However, printing pretty much requires encrefond. Anyone tracking down illegal printers needs to know who has been buying rushpaper and encrefond. Anyone trying to hide an illegal printing press has to hide their purchases of rushpaper and encrefond. This has the makings of a classic cat and mouse game either way.

Galaxy Prix

by [Chad Underkoffler](#)

Art by [Greg Holkan](#)

Genre: Science Fiction Spaceship Racing.
Style: Cinematic.
Fidelity: Low (Space Opera or Anime).
Theme(s): Chases & Races; Winning at Any Cost?; Side Adventures.

The most popular sport in the Galactic Alliance of Systems is the *Galaxy Prix* -- the umbrella term for a host of different types of spaceship racing events. Players take on the roles of a space-racing team, out to win and look great doing it. On your mark, get set, and blast towards adventure!

What Everybody Knows

Galaxy Prix

Every fan of Galaxy Prix knows about the general structure of the sport as well as the various types of events, spaceships, teams, and individual crew members, as detailed below.

NOTE: This setting can easily be fleshed out further with more science fiction details -- alien races, cyborg pilots who link into their speedsters, FTL engines, non-vehicular robots, ray guns, transformable mecha, and enemy space empires, to name just a few elements -- as desired by players and GMs.

*Spaceflight in this Campaign in a Box is highly cinematic -- think **Flash Gordon** and **Star Wars** at one end of the spectrum, and **Firefly/Serenity** and **Babylon 5** at the other. That is, ships and objects come way closer to each other than they would in any sort of realistic depiction of spaceflight.*

The Galaxy Prix Commission

The *Galaxy Prix Commission* is the unifying body that develops the rules regarding vehicle construction, team composition, and each type of race; trains and assigns Commissioners to establish rules, administrate events, and referee the races; controls membership in the Gold and Silver Leagues (see below); and tracks the scoring of Pilots and Teams over the season.

As far as Galaxy Prix is concerned, the word of a racing Commissioner is law, and can only be countermanded by a higher-level Commissioner. Each event has several ranked Commissioners involved in and responsible for everything from course safety to public relations for the event up to the Race Commissioner, who is where the buck normally stops. (However, appeals can be made to the Sector Commissioner or even the Galactic Commissioner, if necessary.)

The Racing Leagues

There are two racing Leagues: the *Gold* and the *Silver*; both have a six Alliance Standard Month-long season. The Gold League is the "major" league, with Alliance-wide coverage and interest; the Silver League is the "minor" league, with sector-wide coverage and interest. Technically, there are several of these subleagues, one for each sector, that all run local events. Depending upon how well or poorly a racing organization does during a season, they can be promoted up, remain in their current League, or demoted down.

Types of Races

Galaxy Prix is really a collective, general name for a wildly varying set of racing competitions, listed below in a rough order of increasing complexity.

"Practice Laps"

For any type of competition below, teams are often permitted to do one (or more, depending upon the event) "practice laps" around the circuit or flightpath of the race. This gives different Team Members (see below) a chance to develop their individual and collective strategies for the official race. Pilots and Navigators figure out how to best fly the path and take "pace notes." Spotters identify hazards along the circuit. Engineers modify ship systems to better handle the type of competition (adding extra maneuverability for Obstacle Courses, increasing jet output for Speed Trials, adjusting the power of the inertial dampers for Fragile Courier races, etc.).

"Qualifying Laps"

Some races select starting position or launch times of the competitors randomly, but more often a racer's *grid position* -- where or when the pilot starts the race -- is determined by a "qualifying lap" around a circuit (which may or may not be the actual race flightpath). The fastest pilot gets the best position or launch time (called "pole position"); the slowest pilot gets the worst (called "tail-end charlie").

Speed Trial

Speed Trials are flat-out "how fast can you go?" type races. These can be on a closed circuit -- usually a large circular or looping empty flightpath. Sometimes there are space-landmarks or buoy-satellites to maneuver around.

Obstacle Course

Take a Speed Trial and throw a whole bunch of junk in the middle of the flightpath, and you get an *Obstacle Course.* While usually plotted through a naturally occurring asteroid field, some competitions involve artificial obstacles. These sorts of races are "how fast can you go without smashing and crashing?" events.

Team Parallel Races

A *Team Parallel Race* is any sort of race where multiple pilots from a team are participating in the event at the same time. These are most commonly Speed Trials, Flag Quests, and Dogfight Derbies.

Team Serial Races

Also known as *Team Relay, Team Serial Races* are competitions where a single pilot at a time participates in a set number or laps or legs and is then replaced by a new pilot and ship for the next set of laps or legs. Team Serial Races are often Speed Trials, Obstacle Courses, or Fragile Couriers -- and sometimes combine multiple types in one event.

Flag Quest

These races require the pilot or pilots to collect "flags" (any small item or element of information) on a course of circuit; to win, the team members must have the required number of flags as well as the best time. Flag Quests can get hideously complex, and are often combined with other sorts of races (especially Rally Races).

Fragile Courier

Also called *Egg Carry* races, *Fragile Courier* events involve the transportation of a delicate instrument or package that must be intact when the pilot crosses the finish line. A broken Egg can penalize points or time, or even disqualify a racer.

Rally Races

Rally Races are not run on a single circuit or flightpath; instead, they are run in separate timed *legs* (point A to point B; point C to D; and E to F), with untimed *stages* between the legs (point B to C and point D to E). Rally Races usually provide a wide variety of conditions -- different types of Obstacle Courses, Obstacle Courses mixed with Speed Trials, unique space hazards (flying through heavy radiation belts, skimming a gas giant's atmosphere, or slaloming through a star's solar prominences), and so forth. A good Rally pilot is regarded inside the Galaxy Prix world as a cut above the average racer.

Dogfight Derbies

Essentially space combat with simulated weapons, *Dogfight Derbies* are an up-and-coming Galaxy Prix event. Purist fans generally dislike them, since they're not really races -- but they are wildly popular.

Winner's Circle

Galaxy Prix

What can space-racers win in these supreme contests of speed and skill?

Individual & Team Points

Individual racers are awarded points for their performance in an event; the Team adds up all the points earned by their individual members. At the end of the season, points are totaled for both, to give the *Season Champion Racer* and the *Season Champion Team.* It is definitely possible for a Pilot or Team to not take the first place prize in any individual race of a season, and still walk away as the champion.

The Galaxy Prix Commission gives point awards to the top five pilots (and thus their Teams) per event according to the chart below:

First Place: 6 points
Second Place: 4 points
Third Place: 3 points
Fourth Place: 2 points
Fifth Place: 1 point

Prizes & Purses

Individual race events usually have the following rewards for the top placewinners (consider 10 Prize Credits as equal to enough money to build a totally new ship; 5 Prize Credits to repair and refit a heavily-damaged ship or several less-damaged ships; and 1 Prize Credit as enough to perform routine repairs and maintenance on all racing and support craft *and* pay all of the crew's living expenses and salaries for one month):

First Place: 8 Prize Credits

Second Place:	4 Prize Credits
Third Place:	2 Prize Credits
Fourth through *Eighth Place:*	1 Prize Credit

Individual events, especially those sponsored or underwritten by a Sector Government or MegaCorp, may have additional -- and often idiosyncratic -- awards. For example:

- The team that garners the most points in the Fomalhaut VII Team Quest gets a Team Purse of 3 Prize Credits.
- The winner of the Buuqada System Rally (2 legs along the rings of the gas giant in the outer system, 2 legs through the asteroid belt, and a speed trial from the belt to the system capital) receives a temporary Knighthood within the system, which lasts until the checkered flag goes down on the next Rally.
- The racer that comes in *last* in the Alpha Regula 15K has his or her ship painted yellow and is roundly mocked for a week after the event.
- The winner of the BioShield Industries Cup takes home an additional purse of 2 Prize Credits for his or her Team, 1 Prize Credit for himself or herself, and a Sector-wide endorsement deal (see below).

Endorsement Deals

People love winners. People especially like to purchase products endorsed by winners. SectorCorps and MegaCorps often hire race winners and season champions to hawk their wares. Depending upon the skill, style, and record of the character (and the depth of the PR pockets of the Corp), this can be extremely lucrative: average endorsement contracts run between 4 and 6 Prize Credits.

Of course, signing a contract like this means that the new Corp Spokesman has certain required duties to perform on behalf of the Corp: opening supermarkets, doing AllianceNet commercials, or cozying up to Corp Directors at the "executive retreat" on the Pleasure Moon of Zuxual.

Types of Spaceships

Each of the types of races mentioned above can be further qualified by the type of spaceship used to compete in it -- for example, an Obstacle Course run with a Speedster and an Obstacle Course run with a Stock Ship should be two different events. Racing teams normally have a few of each of these types of craft on hand (except for the Team Support Ship), representing a substantial capital investment for the owner(s) of the team.

Most racing spaceships are *subluminal*; since they have to be fast in normal space, why carry the mass of a hyperwarpdrive? Other spaceships are *superluminal* and can break the light-barrier and enter hyperswarpspace -- handy for getting from system to system for racing competitions; they are, alas, usually fairly slow in normal space. Teams will need access to one or more superluminal ships to get themselves and their ships to Galaxy Prix events.

Stock Ship

Stock Ships are off-the-shelf (aka "stock") subluminal vehicles used for racing purposes. Early on, this class of ships was driven unmodified, but over the years of Galaxy Prix, the Commission has permitted Teams to modify and alter them for racing purposes. By the current rules, no specially engineered or uniquely constructed parts can be included in a Stock Ship -- all must be commercially available. Stock Ship racing is thus of great interest to Mechanics.

One-Design

One-Design are custom-built and common subluminal vehicles. The point of a One-Design ship is that it is exactly the same as any other One-Design ship; they are built with simple or black-box components that don't permit much -- if any -- tweaking or alteration. The idea here is that the skill of the Pilot, rather than the technology of the spaceship, determines the winner of a One-Design race. Thus, these sorts of races are beloved by Pilots.

The current supplier of One-Design to Galaxy Prix race teams is Tatsunoko Technologies; they provide three different models of One-Design ship: the G-1 Eagle (fast and streamlined), the G-2 Condor (sturdy and powerful), and the G-3 Swan (nimble and efficient).

Speedsters

Speedsters are subluminal vehicles that are custom-built and unique to their Team. This is where the Team tries to show the superiority of their spaceship technology as well as the skill of their Pilot. Teams must construct their Speedsters to achieve specific operational minimums set by the Galaxy Prix Commission. Speedster racing is of especial interest to Engineers, but some Pilots are fascinated by the potential to perfectly match skill and spaceship.

Team Control Ships

A *Team Control Ship* is a floating headquarters for a racing team. It is a superluminal craft, containing -- at the very least -- ship cradles for racing and support ships, repair bays, crew dorms, cargo space, a sickbay, a race control module, a galley, and a rec room.

Support Ships

Support Ships are general purpose subluminal spaceships used for spotting, tug-towing, onsite repair, refueling, ambulance, and spotting purposes by a Team. They are very rarely used in races, though there are one or two special competitions set up for them (often called "space rodeos").

Types of Teams

There are three main types of racing team participating in Galaxy Prix: Constructors and two types of Factory Team.

Constructors

Constructors are Teams without Corp sponsorship; if an organization or company of their own (sometimes called a *SoloCorp*), they are dedicated to racing over vehicle production. Constructors are usually small, tightly-knit, and have much less funding than a Factory Team. However, they are specialists and enthusiasts, living to race and racing to live. Some lucky constructors are underwritten by wealthy sponsors as a hobby.

SectorCorp Factory Teams

SectorCorp Factory Teams are underwritten by a smaller Corp; they are essentially technology testbeds and PR arms of the company. They are often formed to help drum up investor interest in their commercial designs and technologies. They are usually medium-sized, organized, and decently -- if not extravagantly -- funded. The difference between a Constructor Team and a SectorCorp Factory Team is one of intent: Constructors are solely about racing, while SectorCorp Factory Teams have to balance business concerns with competition concerns.

MegaCorp Factory Teams

MegaCorp Factory Teams are formal divisions of a galaxy-wide Corp. They are primarily used for PR and advertising purposes, but this doesn't mean that they aren't serious about racing! They are put-together to boost the reputation of the MegaCorp over all things. MegaCorp Factory Teams are usually large, formally organized, and well-funded, but they impose plenty of contractual requirements upon Team members. The differences between a SectorCorp Factory Team and MegaCorp Factory Teams are related to funding of the Team, the limitations on Team freedom, and the "good of the Corp" over the "good of the Team" issues.

What Everybody Doesn't Know

Well, not much that anyone doesn't already suspect.

Racing Teams are often involved in illegal gambling and race fixing scams, are in the front lines of corporate skullduggery between Corps, provide plenty of opportunities for graft and bribery to influence government contracts for shipbuilding, and are sometimes believed to be spies for other system or Sector governments.

There are always rumors of terrorist groups covering their operations through the use of Teams (who travel everywhere), and it's whispered that government researchers sometimes test out advanced or secret technologies under the guise of being a Constructor Team or SectorCorp Factory Team.

PC Opportunities

Players should all take the roles of members on a racing team; together with the GM, they should decide with what type of team (see above) they are. (It's suggested that the PC group should be a Constructor or SectorCorp Factory team, starting in a Silver League, but this is not mandatory).

Also, in small Teams, members often cross-train in *at least* one other team role, for the sake of safety, back-up, and efficiency. An Owner may also be the Public Relations person, an Engineer might also perform the duties of a Manager, and a Pilot may also be a back-up Navigator and emergency Medic.

Possible Team Members

Pilot: Pilots are skilled in flying spaceships. While they might specialize in a particular type of race or ship, this is not mandatory (and is mildly recommended against for PC Pilots, unless the gaming group wishes their Team to be rather structured and optimized, because it can influence general adventuring capability).

Navigator: Navigators ride along with Pilots (when permitted to) in order to enhance the ship's ability to avoid obstacles and dangers; Navigators can also serve as gunners.

Spotter: Spotters follow the race along -- but off -- the flightpath or circuit, to advise the Pilot of upcoming dangers, their current position, and other race strategy observations.

Engineer: Engineers design new technologies and parts for spaceships.

Mechanic: Mechanics repair, rebuild, fuel, and modify spaceships.

Owner: The Owner underwrites the company, and often has the supreme veto power over Team decisions.

Manager: The Manager keeps the Team running, and makes the decision regarding all the nuts-and-bolts issues involving the Team. A Manager is the strategic leader of a Team.

Public Relations: The Public Relations member of a Team deals with the public, setting up advertising venues and other photo-ops for the Team. They also are the ones who usually deal with Galaxy Prix Commission issues and interact with the Commissioners of an event.

CorpRep: A CorpRep interfaces with any Corp sponsors, channeling communications and directives between the Corp and the Team.

Doctor: The Team Doctor keeps the Team healthy and heals them if they are injured and cares for them if sick.

Medic: A Team Medic is trained in emergency response and first aid with the goal of stabilizing an injured Team member for transport back to the Team Control Vehicle's sickbay and the tender mercies of the Team Doctor.

Vehicle Itself: Some Teams are dabbling in sapient AI, and treat these "smart ships" as full Team members rather than just equipment. Currently, Galaxy Prix does not recognize robots as qualified solo racers, but individual events (read: individual Commissioners) have permitted them as Co-Pilots or Navigators. *NOTE: Depending upon the Galaxy Prix campaign, the legal status of robots and droids might be an issue of interest.*

NPC Backgrounds

Each character below has their most important *strengths* (generally positive qualities, abilities, skills, or effects) and *weaknesses* (generally negative qualities, abilities, skills, or effects) detailed. In descending order, the ranks are Master, Expert, Good, Average, and Poor. Depending upon the concept of what a character is like, any quality can be a strength or a weakness.

For example, suppose a character has "Spoiled Brat" as a quality. If it's ranked Average or above, it's a strength: the character always gets his own way, can wield undue influence by threatening to sic their Mommy or Daddy on others, might possess lots of cash or gadgets, and people may fawn over them, making life easy. But if the character has "Spoiled Brat (Poor)," this is a weakness: the character has led a pampered and sheltered life, rubs people the wrong way, and expects everyone to bend over backward to fulfill his most minor needs.

Since many game mechanics provide prose "benchmarks" to understand stat or skill levels, the ranked qualities below should be easily adaptable into any desired system. (Also see ***the PDQ System*** from Atomic Sock Monkey Games.)

GOTCHA Vehicles SoloCorp Team

GOTCHA Vehicles is a small spaceship start-up company, hoping to field test its designs in Galaxy Prix events, build up capital from race winnings, and interest outside investors in the small SoloCorp. All of the members of the race Team are joint Owners in this company, except for Swallow -- which irritates it immensely. (While it's rumored that Team GOTCHA performs "extracurricular activities" when not racing, it's not exactly clear *what* it is they're doing.)

Pilot **Ken Hunter:** Ken is an Expert Pilot, Good Brawler, Good Charismatic, Good Manager, Average Courier, and Poor Obsessive Duty to the Team. He is the leader and CEO of GOTCHA Vehicles. He is involved in a romantic triangle with June and Joe -- while he has strong feelings for June, his friendly rivalry with Joe and his Obsessive Duty gets in the way.

His ship is a Speedster called the *Warp Go,* which is notable for its Expert Speed, Good Maneuverability, and Good Extras (Laser Cannon).

Pilot **Joe Fokker:** Joe is a Good Pilot, Good Brawler, Good Crack-shot, Good Mechanic, Good Navigator, and Impulsive as Hell (Poor). He loves to stir up trouble, usually with other race Teams, especially in spaceport bars. He is involved in a romantic triangle with June and Ken -- he has strong feelings for June and a friendly rivalry with Ken. He also likes to pick on Rhys.

His craft is a Stock Ship called the *Comet 9,* which is notable for its Expert Toughness, Good Speed, and Good Extras (Gatling Railgun).

Doctor **June Hayes:** June is an Expert Doctor, Good Pilot, Good Spotter, Good Public Relations, and Stubborn (Poor). While Ken may be the Team leader, she's not afraid to stand up to him if she thinks he's making a mistake. She is involved in a romantic triangle with Ken and Joe -- she is interested in the former for his genuine concern and sense of duty to others, and to the latter for his wild nature.

Her craft is a One-Design G-3 called the *Michi,* which -- like all G-3s -- is notable for its Good Nimbleness and Good Endurance. Rhys has whipped up an Extra for June, though: a combat-grade Expert Force-field Booster that plugs into one of the G-3's standard outside equipment ports.

Vehicle **X-0P** *aka* **Swallow:** Swallow is a sapient AI in a highly modified Support Ship shell, and supports the team's racing activities. It is a Good Pilot (of itself), a Good Mechanic and Good Medic (and contains various modules of tools to aid in these roles), and possesses Good Endurance as well as a potent Extra -- a Good Tractor/Pressor Beam (which it can use as a weapon). Unfortunately, its unique programming has fouled up its vocoder modules, which cannot be replaced without damaging its personality, causing Swallow to have an Irritating Bleep/Bloop Speech Impediment (Poor). It is especially friendly with Rhys and (to a lesser extent) June.

Engineer **Rhys Mifune:** The scion of a long line of racing enthusiasts, Rhys is an Expert Engineer, Good Mechanic, Good Medic, Good Strong as an Ox, Average Navigator, and Average Pilot; he is often looked down on for his Bluntness of Speech (Poor). He often is drawn into Joe's barroom dust-ups quite against his will. He views Swallow as his closest friend, follows Ken without reservation, and is often at odds with Joe.

Rhys flies the GOTCHA Vehicles Team Control Ship, the *Djinni,* which is notable for its Expert Toughness, Expert Repair Bays, and Good Sickbay.

Events & Possible Story Arcs

Random Race Generator

The charts below provide a method of randomly generating a race event. GMs can use either a single 2d6 roll or a series of 2d6 rolls to generate the type of race, the type of ship involved, elements of the race's name, and a possible Side Adventure (see below).

2d6 Roll	2	3-4	5-7	8	9	10	11	12
Type of Race	Fragile Courier	Speed Trial	Obstacle Course	Team Parallel Race	Flag Quest	Team Serial Race	Dogfight Derby	Rally Race Leg (roll again)
Type of Ship	Stock Ship	One-Design (Planet Name)	Speedsters	Stock Ship	One-Design (System Name)	Speedsters	Stock Ship	Speedsters
Race Name Element 1	Streaking		Warp	Argent		Golden	Blazing	Leaping
Race Name Element 2	Comet	Prix	13	Hyperspace	Dash	Chase	Nova	Pulsar
Side Adventure	Celebrity Event	Mystery	Entertainment	Courier Work	Caravan Escort	Bounty Hunting	Smuggling	Espionage

Advice, Opportunities, & Pitfalls

Chases & Races

A simple but interesting game system for chases and races is the heart of a Galaxy Prix campaign. The rules below were inspired by the chase rules in *Unknown Armies,* 2nd ed. (Atlas Games) and modified for the Vehicles rules of *Truth & Justice* (Atomic Sock Monkey Press). They should be easily adaptable to any other game system.

Spaceship Rules

Just like NPCs (see above), spaceships have strengths and weaknesses that can be ranked. These strengths and weaknesses can combine with those of the piloting character (when appropriate) to great benefit. For example, if a Good Pilot in a ship with Good Speed was trying to go fast, he could add those two Goods together. However, if he was trying to pull off a tricky maneuver, the Good Speed of the ship probably wouldn't help him out.

The common qualities that spaceships have include: Endurance (going steadily or for a long period), Maneuverability (being nimble), Speed (going fast), and Toughness (resisting damage). A ship can also have Extras (cool toys or capabilities: weapons, hidden storage, onboard repair systems, remote drones, cloaking device, etc.) that might be

useful in competition or in Side Adventures.

NOTE: If a player is portraying a ship as his or her character, the Vehicle PC can add (or subtract!) his or her own Piloting ability to that of any character serving as the Pilot! This means that a Vehicle PC that has Good Piloting and is being driven by a Good Pilot can add their Goods together. This combines with any qualities like Speed or Toughness or Nimbleness possessed by the Vehicle PC and relevant to the situation at hand.

Racing Rules

- Races are 2d6+6 lengths in duration. (At the GM's option, players may not know the exact total length of the race.)
- The first grid position ("pole position") is +2 lengths for the pilot in that position on their first turn. A "good" grid position is worth +1 length on first turn. The last grid position ("tail-end charlie") is worth -1 length.
- Every turn, each pilot gains a base of 2 length, modified by the interaction of the Course Difficulty and their piloting roll (2d6 plus Pilot Modifier).
- Course Difficulties: Master [13], Expert [11], Good [9], Average [7], Poor [5].
- Pilot Modifiers: Master [+6], Expert [+4], Good [+2], Average [0], Poor [-2].
- Basic piloting roll result:
    - Match or beat Course Difficulty = +1 length
    - Fail to match or beat Course Difficulty = +0 length
    - Highest result of all basic piloting rolls = +1 length
    - Lowest result of all basic piloting rolls = -1 length
- Hazards on the course are positioned at certain lengths; these have Hazard Difficulties using the same scale as Course Difficulties. Obstacle Courses have many Hazards; maybe even one per segment! When a racer enters or passes the length containing the hazard, he or she must make an additional Piloting roll to bypass it. (Alternately, if the individual race permits ride-along Navigators, the Navigator can roll to bypass any Hazards.) If a Pilot has the advice of a Spotter, he or she may get a +1 or +2 bonus to Piloting at the GM's option.
    - Match or beat Hazard Difficulty = +0 length
    - Fail to match or beat Hazard Difficulty = -1 length
    - If racer fails to match or beat Hazard a second time during a race, he or she has cracked up on the hazard and is out of the race (the racer, the vehicle, or both may even be damaged).
- Taking a Risk -- shortcuts, redirecting half of the shield power to the engines, cutting tight corners -- can gain extra lengths. The player determines the risk taken, but cannot use the same risk twice in one race. The GM decides the Risk Difficulty (usually Average [7] or Good [9]), and the racer makes a piloting roll. (Navigators and Spotters may be permitted to suggest a Risk; some GMs may also want them to help determine the Risk Difficulty through rolling against their relevant ability: success could mean the lower level of Difficulty, and failure the higher.)
    - Match or beat Risk Difficulty = +2 lengths
    - Fail to match or beat Course Difficulty = -2 lengths
- Daredevil Maneuver -- reversing the polarity of the reactionless drive, gravitic slingshot speed boosts, pulling a "Crazy Ivan" -- are insane risks taken for potentially great advancement in lengths, but with the strong chance of cracking up. The player determines Daredevil Maneuver attempted, but cannot use the same Maneuver twice in one race. The GM decides the Maneuver Difficulty (usually Expert [11] or Master [13]), and the racer makes a piloting roll at a -1 penalty. (Navigators and Spotters may be permitted to suggest a Daredevil Maneuver; some GMs may also want them to help determine the Maneuver Difficulty through rolling against their relevant ability: success could mean the lower level of Difficulty, and failure the higher.)
    - Match or beat Maneuver Difficulty = +5 lengths
    - Fail to match or beat Maneuver Difficulty = the racer has cracked up on the hazard and is out of the event (the racer, the vehicle, or both may even be damaged).
- After their basic Piloting (and, if necessary, Hazard) rolls are made, Pilots can choose to take either a Risk or perform a Daredevil Maneuver at any time before the current Turn ends.
- Highest length at the end of the Turn when a racer crosses the "finish line" determines the winner.
- GMs may find it handy to sketch a quick series of boxes equal in number to the overall length of the race, with

each box suitable numbered, to help keep the locations of Hazards and characters' current lengths straight.

Example of a Race

Galaxy Prix

1. GM rolls 2d6+6, generating a 12 length race.
2. The GM determines that the course has a Good [9] Difficulty, and places a Hazard at length 8 -- an Average [7] "subspace cross-rip."
3. Alpha (Average [0] Pilot), Beta (Good [+2] Pilot), and Gamma (Expert [+4] Pilot) are all flying One-Design Ships (Average in all respects, providing no bonuses to their rolls) provided by BlandCorp. Alpha has pole position and Gamma is tail-end charlie.
4. On Turn One, all characters get the base length, plus position bonus, plus Piloting roll vs. Course Difficulty result.
   - Alpha rolls a 7; this is a failure, placing him in length 4 (2 base + 2 pole position bonus + 0 failed roll).
   - Beta rolls a 10, plus 2 for her Pilot Rank, for 12; this beats the Course Difficulty, placing her in length 3 (2 base + 1 successful roll).
   - Gamma rolls a 6, plus 4 for his Pilot Rank, for 10; this beats the Course Difficulty, placing him in length 3 (2 base - 1 tail-end charlie penalty + 1 successful roll).
   - Beta rolled highest with 12, and gets a +1 length, bringing her to 4.
   - Alpha rolled lowest with a 7, and gets -1 length, bringing him to 3.
   - Summary: Beta (length 4), Alpha (length 3), Gamma (length 3).
5. On Turn Two, all characters get the base length, plus Piloting roll vs. Course Difficulty result.
   - Alpha rolls a 7; this is a failure, placing him in length 5 (3 + 2 base + 0 failed roll).
   - Beta rolls a 7, plus 2 for her Pilot Rank, for 9; this is a success, placing her in length 7 (4 + 2 base + 1 successful roll).
   - Gamma rolls a 7, plus 4 for his Pilot Rank, for 11; this is a success, placing him in length 6 (3 + 2 base + 1 successful roll).
   - Gamma rolled highest with 11, and gets a +1 length, bringing him to 7.
   - Alpha rolled lowest with a 7, and gets -1 length, bringing him to 4.
   - Summary: Beta (length 7), Gamma (length 6), Alpha (length 4).
6. On Turn Three, all characters get the base length, plus Piloting roll vs. Course Difficulty result.
   - Alpha rolls a 9; this is a success, placing him in length 7 (4 + 2 base + 1 successful roll).
   - Beta rolls a 5, plus 2 for her Pilot Rank, for 7; this is a failure, leaving her in length 8 (7 + 2 base - 1 failed roll).
   - Gamma rolls a 9, plus 4 for his Pilot Rank, for 13; this is a success, placing him in length 9 (6 + 2 base + 1 successful roll).
   - Gamma rolled highest with 13, and gets a +1 length, bringing him to 10.
   - Beta rolled lowest with a 7, and gets -1 length, bringing her to 7 -- she hasn't advanced at all!
   - Gamma has crossed length 8 and hits the Average [7] subspace cross-rip Hazard. He rolls vs. Hazard Difficulty and gets a 4, plus 4 for his Pilot Rank, for a result of 8, and surfs the cross-rip easily (+0 length).
   - Summary: Gamma (length 10), Beta (length 7), Alpha (length 7).
7. On Turn Four, all characters get the base length, plus Piloting roll vs. Course Difficulty result.
   - Alpha rolls a 10; this is a success, placing him in length 10 (7 + 2 base + 1 successful roll).

- Beta rolls a 9, plus 2 for her Pilot Rank, for 11; this is a success, placing her in length 10 (7 + 2 base + 1 successful roll).
- Gamma rolls a 7, plus 4 for his Pilot Rank, for 11; this is a success, placing him in length 13 (10 + 2 base + 1 successful roll) -- which will end the race at the close of this Turn.
- Gamma and Beta tied rolls, so no one rolled highest -- no bonus.
- Alpha rolled lowest with a 7, and gets -1 length, bringing him to 9.
- Alpha and Beta have crossed length 8 and hit the Average [7] subspace cross-rip Hazard. Alpha rolls vs. Hazard Difficulty and gets a 5; failing to navigate the cross-rip, the subspace currents rip the engines off of his speedster -- he's out of the race. Beta rolls and gets an 11, and bypasses the Hazard.
- Beta has already lost, unless she tries to make a Daredevil Maneuver. She goes for it, telling the GM she wants to repolarize her ventral shields to bounce off of the subspace cross-rip at high velocity. The GM estimates that to be an Expert [11] Risk. Beta rolls 11, plus 2 for her Pilot Rank, minus 1 for the Daredevil Maneuver penalty, for a result of 12 -- she makes it! She is now at length 15 (10 + 5 daredevil maneuver).
- Gamma could take a Risk or try to pull off a Daredevil Move of his own to boost his length total before the end of the turn, in order to beat Beta. However, a simple Risk will only cause him to tie with her, and a Daredevil Maneuver could get him hurt -- and he's got a hot date with Delta later. So, Gamma decides to be a good sport and take the second place Prize.
- Summary: Beta (length 15), Gamma (length 13), Alpha (length 10).

Winning at Any Cost?

Racing-based campaigns have a lot of potential for the hard question of "What will you do to win?" Separately and together, PCs can be presented with several challenges, either in the form of a "golden opportunity to initiate" or "become the target of" any of the issues below:

Cheating: Illegal modifications to ships; taking unapproved short-cuts; attacking opponents during a race; having one's Team attack or interfere during a race; taking performance-enhancing drugs; and so on.

Sabotage: Physical sabotage of opponents' ships; physical or psychological sabotage of opponents (drugging, frame-jobs, and blackmail are all popular); or booby-trapping the race flight-path or circuit.

Betrayal: Will a character abandon a Teammate to injury or death during a race if it means assured victory? What about an opponent? What happens if a Pilot or Team is offered a substantial amount of Prize Credits under the table to throw a race? Plus, corrupt Galaxy Prix Commissioners or CorpReps (on the Team-side or the Corp-side).

Side Adventures

What do the characters do when they aren't racing? Here's a short list of possible Side Adventures for Teams to get involved with:

Bounty Hunting: A little skip-tracing and head-busting on the weekends never did no one no harm. Plus, collected bounties can be handy in keeping payments up on that G-1 Eagle.

Celebrity Life: Maybe the Team parties-hearty, swans around with other famous people, busts up space-hotels, goes to gala AllianceNet premieres, and so on.

Courier Work: Fast ships. Skilled pilots in need of Credits. Messages or objects that cannot be trusted to usual carriers. Any questions?

Entertainment: Perhaps they perform "space shows" with precision piloting and stunts. Or maybe they play in a band (see ["Campaign in a Box: Behind the Musick"](#) for more ideas here).

Escort Tradeships: Slap a few weapons on the Team's racers, and they can defend supply ships and traders from the point the caravan exits hyperwarpspace until they land at the local Spaceport (or from when they take off and go superluminal, or both).

Mystery Solvers/Crimefighters: They fly high-speed spaceships -- and fight crime! The Team might stumble into some weird mystery that needs to be solved. Maybe the spirit haunting the Ghost Planet is really Old Man Ghostal dressed up in a yellow sheet...

Smuggling: Team Control Ships gain go superluminal, have a lot of room to hide contraband, and all their extra equipment and ships makes it that much harder to properly search. Plus, they have plenty of reasons to be bouncing around from sector to sector following the Galaxy Prix events. A little surreptitious smuggling can earn enough credits to get a Team flying until the next race.

Spies: Whether political or corporate, espionage is a great opportunity for professional athletes who travel from system to system. Just don't get caught, or it won't be your jets that flame out, Speedy.

Sponsorship Deals: Serving as pitchmen for athletic shoes, designer space-jeans, and new spaceships can earn both Credits and a modicum of celebrity... and pull the Team into business hi-jinks.

Pyramid Review

Dungeonville

Published by [Z-Man Games, Inc.](#)

Designed by James Ernest & Mike Selinker

Developed by Falko Goettsch

Art by John Kovalic

Five pawns and 105 blood tokens in five colors, 64 adventurer cards, five 32-card dungeon decks, five entrance cards, five deed cards, six town cards (including deed house), & one seeing stone card; full-color, boxed, two to five players; $24.99

It's a dirty job, but someone's got to do it. The town of *Dungeonville* is, for want of a better term, "blessed" with many local dungeons. You and your fellow mad geniuses have inherited these, and are trying to outdo one another by killing the most brave, adventuresome souls.

The object of the game is to be the first wizard to kill seven adventurers with your dungeon.

There are five dungeons, including poorly lit pits like the Ice Cavern and the Rat Haus. Up to five fiends can play. Since it's their primary export, Dungeonville offers several places to meet and greet potential adventurers, with richer heroes hanging out in pricier places. Each has a class (barbarian, sorcerer, peasant, etc.), rank, color, and set of dungeon combat stats. The heroes who can carry the most hang out at the tavern and demand the most money, and go in descending order until you can hire the toughest fighters on the street for free. The "starting player" (a position that rotates each turn) chooses first, replacing his hero selection from the deck. The newcomer falls into the numerical pecking order, shifting others up or down to accommodate him.

Your team picks a dungeon entrance. Multiple parties at the same place must duke it out for the privilege of dying there. Participants arrange their heroes in order secretly, then flip them over one at a time. The "higher" rank (the lowest number) wins; if the colors differ the loser dies, but if they're the same (blue on blue, say) the winner recruits the loser to his team. You may therefore find yourself with extra troops, or be forced to work shorthanded. When the dust settles, whoever has the most survivors gets to go inside (the loser just sits this turn out).

Each hero has the five dungeon symbols on his card, rated A (the best) to E (the worst). To explore a dungeon, you flip its cards up one at a time. You can keep any items that show up, though only the right classes can use them (otherwise turn them in for gold). Other dungeon cards have letters (A to E, but you knew that) matching their victims. B cards kill someone in the party rated B for this dungeon, for example -- leave your blood counter to show the dungeon has claimed a victim. If no one dies and it's not an item card, you can escape the dungeon -- or take your chances and flip the next card. Your party can only carry as much gold as the team's total ranks (those "lower" ranks with higher numbers are good here), so losing members means a smaller possible haul.

The funds you drag out purchase new team members, or (with fewer than five players) buy a spare deed from the Deed House in exchange for the one you have. That's useful if the new dungeon has claimed more lives than the property you owned, and since dying in your own dungeon subtracts from your score, you may wish to unload it. Once you've amassed seven kills -- those who have died in your dungeon plus anyone you wiped out at various entrances -- you reveal your deed and announce victory.

The components for the game are, in a word, lousy. James Ernest may have had a hand in the design, but apparently the pieces are too cheap to be called cheap-ass. The box is the best part; it's sturdy as all get-out. The dungeon cards are hard to separate let alone shuffle. They give you several rubber bands, but they're more like thin latex straps and may not last. The hero deck is better quality. These are somewhat mushy and perfect for shuffling, but a flick of the wrist will bend them the wrong way. The town cards are improperly cut, leaving chunks of paper hanging off the edges. And the deed cards (that are supposed to be secret, mind, lest your whole strategy comes undone) are printed poorly enough that some may be recognizable. At least the misprinted component list underestimates the pieces you actually get.

Setting aside the material issue, you've got a pretty decent game here. It's another one that's better off with a bigger complement of friends, and the rules have one of those piles of half-answered questions that usually merit their own web page of addenda, but clearly Mssrs. Ernst and Selinker have labored hard to make all the mechanics work out right. Knowing whether to attack a fellow player is tough -- there's a whole lot of second-guessing and bluffing to be done. Just about anywhere you go you're stepping on someone's toes. In a two-player game, it's too easy to fall into a non-competitive pattern. If the two of you are all decked out for taking on separate caverns and daren't try to outmaneuver each other at an entrance, only judicious, anticlimactic, possibly random (read: tedious) deed-switching scores you more blood counters.

Dungeonville's strategies are still rich and explorable, even if the game feels a little dry. John Kovalic's pictures are perfect, and the names of the heroes are the game's second-best feature (that swell, swell box . . .), but after that . . . the cards have fancy names like the "Glacier of Shards," leaving the mechanics to add any more "color." Your job is to try to keep track of what letter cards have been played in the dungeon you're confronting, not to work past traps and monsters. It's not a tilt-o-whirl of excitement, but it's an engrossing, cutthroat pastime that takes well-spent time to master.

Pyramid Review

Ghostfighter (for a|state)

Published by [Contested Ground Studios](#)

Written by Gregor Hutton with Malcolm Craig & Mark Whalley

Cover by Paul Bourne

Illustrated by Paul Bourne & Gregor Hutton

40-page US Letter-size black & white 6.4 MEG PDF; $6.95

One of the most interesting games to have come out of Scotland since SLA Industries is Contested Ground Studios' *a|state,* best described as a dark and gritty RPG of Dickensian Science Fiction. Bar the supplement, *The Lostfinder's Guide to Mire's End* and several downloads available from the publisher's website, there is not a huge amount of support for the game. This is a shame as the game certainly deserves it. To counter this lack, Contested Ground Studios is producing a number of supplements in PDF format. The first of these is *Ghostfighter.*

The ghostfighter is one of the game's signature character types, the ultimate in melee combat specialists. He is a knife fighter *par excellence,* eschewing the use of the impersonal firearm and preferring to wield the ghostfighter's signature weapon, the Llife. Made of bonded layers artificial diamond and ceramics, the Llife is an extraordinarily sharp slashing weapon capable of slicing through dense materials and inflicting nasty cuts to a victim. Considering how sharp and painful a paper cut is, just multiply with a Llife . . . If you cannot get to a doctor or hospital for such a wound, then one solution is the use of Ghostfighter Glue, a flesh-bonding adhesive that binds the cut closed to leave a nasty scar. Another trademark of the ghostfighter is the Ghostfighter Coast, tailored to the individual with not just armored inserts, but also with a freedom of movement that will not impede a ghostfighter's fighting style.

Essentially *Ghostfighter* is a player's guide as much as it is a GM's resource. The layout is neat and tidy, sprinkled with pieces of color fiction and more of the computer generated artwork that made the *a|state* rule book stand out. Unfortunately, the rest of the artwork does not equal this high standard, and to be fair, while Gregor Hutton's cartography is excellent, his illustrations are less so.

Ghostfighter does several things, the first of which is discussing the role of this character type in the party, whether as the Killer or Professional, or having a common cause or being partners in crime. Slang common among the ghostfighter fraternity, known as the Patter, is listed, as is a summary of the character creation rules from the core rulebook. It also explains why certain skills and advantages are useful to the ghostfighter, with new rules detailing thrown weapons; new skills covering the use of the garrote, the quickdraw of weapons, and even base jumping; and new advantages that can be purchased during play. Of the latter, the Combat Advantage is particularly important to the ghostfighter. They include Two Weapons fighting, Unarmed Parry (and counterstrike), and Weapon Parry with one weapon; it is suggested that a player character be allowed just the one. A ghostfighter can also study a Fighting Style, of which two are known and taught in The City, both involving the use of the knife or Llife and its variants. "Markain" is predicated on overwhelming offence, while "Demeloque" concentrates on defense. Finding a master to teach either could easily become an in-game objective for a player character ghostfighter.

New gear includes a variety of weapons: two variations in size and reach of the standard Llife (the Half Llive and the Long Llife), as well as the boatman's hook, the garrote, and several throwing weapons. Combat drugs can temporarily enhance a ghostfighter's senses, agility and dexterity, or strength and speed, as well as dulling pain sensors, though all

three pills have dehabilitating effects or horrendous side effects if abused.

In keeping with the style of the game, no statistics are given for The City's famous ghostfighters, but they can be matched with the supplement's templates. There are five of these character templates, each with a description and a ready-to-use character sheet. They are, in turn, the Bodyguard; the Fallen Angel, who has given up her religious upbringing to become an itinerant knife-for-hire; and the Perfectionist, a highly skilled practitioner of the perfect kill. The Pit Fighter fights for money, fame, and the adulation of the crowds, while the Radge is young, lawless, an on the edge punk, whose destiny is either dead in an alley, or learning to overcome his excesses. The supplement is rounded out with a new character sheet and an equipment list.

Ghostfighter is welcome support for *a/state,* throwing light upon a character type that can be otherwise be difficult for the GM or player to both define and portray. In doing so, it adds more to this one aspect of the game rather than adding to the game as a whole, but of course it was never designed to do more than this. It also sets a decent standard for the future supplements that will expand upon other character types, such as the lostfinder and the flowghost. Overall, there are no downsides to this supplement, making *Ghostfighter* the start of a useful little series.

Murphy's Rules

Four Games I'd Buy Again

I'm still hacking away at a deadline that's wearing a gray cloak and carrying a scythe, so I don't have much time this week to devote to my column. (Or, to paraphrase Mark Twain, "I wrote you a long colum because I didn't have the time to write a short one . . .")

Anyway, on a plethora of newsgroups for the various genres I'm interested in, one of the things I've seen in recent weeks has been lists of "Stuff They Should Bring Back" -- computer games they should make sequels to, comics they should revive, and so on. This seems like a really easy column idea to crank out, so I'm presenting a list of four RPGs I'd like to see come back in some form. Three of them are licenses, but such is the nature of the beast. Note that I make no claim as to these being my most-wanted nonexistant RPGs, mostly because I'm sure someone will come up with an e-mail or message board post saying, "What about long-out-of-print Game X?" to which I'll reply, "Heck, yeah! I loved that game!"

I've tried to limit myself to games that (to the best of my knowledge) aren't being actively supported, nor are there any plans to support them. (So, for example, while I might love to see a full scale-up re-envisioning of *In Nomine,* the fact that the game is still being supported in its old incarnation means I won't be mentioning that one. Err . . . except for here. But it's a parenthetical aside, so it doesn't count.) I'm also leaving off-limits games whose status is, best I can tell, in limbo -- sorry, *Star Wars, Star Trek,* and *Lord of the Rings.* I'm also keeping off-limits games that *have* been revised, but whose revisions I just don't care for. For example, while I'd love to see a return to the 1980's FASERIP *Marvel Super-Heroes* RPG or the Mayfair *DC Heroes* game, both of those licenses have spawned at least one RPG after their demise, and (to the best of my knowledge) there have been almost no examples of games going back to previous systems after trying to convert over. (This also means that I need to shunt to a parenthetical aside my opining for the TSR version of the *Indiana Jones RPG,* which was an awful game but had those wonderful cardboard props.)

We have the ground rules? Is the column half-written already? Have I bought myself a few minutes to poke the Grim Reaper of Deadlines with a pen? Good; let's begin!

1) *Doctor Who* -- Yes, I know there was the pretty-darn-neat *Time Lords* RPG a while ago written by Ian Marsh (no relation), but the paper version of that one came out in 1991 and the freeware electronic version came out in 1996 (available somewhere via http://myweb.tiscali.co.uk/ianmcdonald/who-rpg/, if you're curious).

The interesting thing about the *Doctor Who* license is that it's one of the few "time travel" games that actually has a decent shot at working as an RPG . . . mostly because all instances of "time travel" are usually kept in quotes to indicate a ("Okay; we're going to the Dawn of Time tomorrow! Next week, futzing around in King Arthur's court. The week after, lizard men!") Really, if you think about it, both *Doctor Who* and the original *Star Trek* dipped into the time-travel well for actual story fodder about the same amount of time, and the rest of the time they tended to fight latex monsters and robots.

Anyway, given the recent rekindling of *Doctor Who* as a well-received television show, now would be a perfectly snazzy time for a new RPG to see the light of day.

2) *The Prisoner* -- Sadly, whatever company would do this one would need to contend itself with the idea that it's never gonna be a giga-jillion seller. However, other niche properties have done pretty well, including *Red Dwarf* and others I'm too lazy to look up right now. Heck, the trading card market (non-CCGs, that is) has quite a number of companies who do well keeping coming out with product for relatively small licenses. Of course, it's probably easier to slap some stock photos onto cardstock than it is to come up with a 256-page hardcover, but that's beside the point.

Where was I? Ah, yes. *The Prisoner.* This classic cult show has been out of print in an RPG form for 15 years (or, as I like to think of it, "almost half my life"), when *GURPS Prisoner* saw print. Of course, with modern survailance techniques, issues of privacy, and the omnipresence of computers epochs beyond what the original series envisioned, the underlying issues are as relevant as ever.

Ideally such a book would contain advice and settings for various levels of play: "pure" 1960s-style espionage gaming, a modern-era *Prisoner* campaign, and perhaps advice for amalgamating the two (as has been done in recent novels).

3) An Immortal Set for *Dungeons & Dragons* -- I originally wrote about *Spelljammer* here, but *Spelljammer* has a really vibrant fan community and the *Immortal Rules* don't. Curiously, both *Spelljammer* and the original gold-box *Immortal Rules* for the No-Prefix *Dungeons & Dragons* game were responsible for my most mind-blowing gaming moments as a child ("How can you throw an apple into an orbit around a ship?! What does it mean that nightmares exist in the third, fourth, and fifth dimensions?!?"). I loved *Spelljammer* more primarily because I could understand it, but the *Immortal Rules* haven't seen an update since the admittedly superlative Aaron-Allston-scribed *Wrath of the Immortals* boxed set from the early 1990s.

4) *Ghostbusters* -- Finally, wrapping up my trip down nostalgia lane, I'd love to see another version of the *Ghostbusters* RPG. This game seems to beg for a Twilight Creations Inc.-style *When Darkness Comes . . .* boardgame/RPG combination treatment. This is one of the most timeless humorous licenses to come out in the past couple of decades, and I suspect many good games could come from its respawning. (Hey, they came out with new *Army of Darkness* stuff . . . how long can it be before this one comes back?)

As an aside, one of the earliest non-*Dungeons & Dragons* adventures I remember reading as a kid was *Ghost Toasties,* the adventure that came with the *Ghostbusters* screen. Know who co-wrote that one? None other than SJGames' own Scott Haring (who was, of course, the pulsing brain behind *Pyramid* for many, many years). Small world.

Anyway, there's my off-the-cuff list of four. Hopefully I haven't named any that are in development but for which I missed the press release. And hopefully one or more of these will be under my tree next Christmas.

--Steven Marsh

Oppidian Horsepower

by Eric Funk

The Energy Crisis

On this mildly alternate world, as humanity approached the end of the first decade of the 21st century, gasoline prices began to double every year. Hybrid cars were manufactured at an alarming rate to meet this gap, but could not match it. As more and more people turned to mass transit and bicycles, companies began to invest in hydrogen fuel cells for their trucks and busses. These conversions proved so successful (and inexpensive in the long view of rising gas prices) that most heavy vehicles were converted within the decade. Due to the bulk and startup cost, these motors are unsuitable for cars and small trucks. Seeing this trouble dawning, the governments reserved the alcohol fuel and "biodiesel" for military use and for emergency vehicles (ambulance, fire, and high-performance police pursuit operations). Another technology springing back is the use of plant oil as diesel fuel. This was first experimented in World War II, and is being used as a fuel supplement (about 10%) in some agricultural cities circa 2005.

Some more exotic fuels were tried in small towns. A few include methane, potatoes, processed waste, and re-burning wood smoke. Few of these met with much success, but some of the pilot vehicles and plants are still around. Electric cars are not found due to the "public knowledge" of their low speeds and unstable small tanks. They were forbidden due to deeply implanted laws sponsored by gas consortiums to prevent home generation of hydrogen (e.g. requirements that cars be mainly powered by a combustion engine). Thus the large car companies were caught unprepared for the crisis, and many folded. The survivors concentrated on their government and military contracts. Airline companies re-invented the [zeppelin](), and cheap flights are possible at modest speeds. Some use combination helium-hydrogen lift bags so the hydrogen bag can be burned as fuel.

Local production of power including solar, wind, and water generators have kept consumer electricity prices from skyrocketing. Water and electricity prices are higher than in 2010, but still barely affordable. Many licensed companies sell power back to the grid with their own resevoirs, collecting rain water for drinking (or plumbing) and making hydrogen. Money can be saved by cracking the hydrogen during the night when power is cheaper and running their hydrogen fuel cells during the day. Others buy hydrogen wholesale and burn it during the day. The rain water also helps cut down on water bill. This investment can be profitable; larger companies usually have larger roofs. Companies in polluted areas can even use the acid rain to their advantage by chemically extracting the hydrogen from the acid. Some warehouses also make a good profit selling the hydrogen for vehicles. Others give over large rooms over to allowing water exhaust to condense and be recycled. This allows many large companies to add saunas to their recreational facilities, and providing steam for hot water heaters and winter heating.

Urbania

Mass-transit vehicles in most cities use middle and large fuel cell-powered busses or electric trains. Poorer areas (and many routers replacing small busses) use horse-drawn trailers (with manual brakes). Most towns sport "public cycle" programs, with generic 10-speed bicycles available for public use. The downtown core of most cities have changed little. They usually have a rail system and a large number of buses. Most outdoor parking lots become fields, covered parking garages, and stables. (The byproducts are sold as fertilizer as part of the "contract" of using the facility.) Most of society is at late TL8, with early TL9 energy production (but no superscience power cells or fusion power yet). Most cities by now have a Farrier's Guild, which still teaches by apprenticeship; they hold a virtual monopoly on shoeing horses.

Not everyone will own or use a horse. One limit is the food required for horses (about 15 acres of farmland, or 1.2 acres of grazing each). The second is the space requirements for keeping horses in general. Finally, mass transit and telecommuting mean that personal mid-range transport isn't as neccessary as it once was. Some companies offer "horse clubs" that let one borrow a horse at any branch in the city and return it at any location. Most horses are trained to

return to a bonded pen if left unattended for a while, although some companies embed GPS transponders in their tackle to enable them to find the mount after a time of being left alone. One can even have a horse delivered for rent in the morning (if one has a pole and feed ready). It can be taken to the office, and dropped off in a "pool" for the company to take care of; then one can pick another from the pool, return home, and the horse will be picked up. Most people ride the horses, while other have carriages (with heating and air conditioning powered by generators on the axles) or boxes for children. A great many simply call a hansom cab or ride a bus.

Animal cruelty laws still prevent abuse of horses, making it forbidden to tie them up without water or food for extended periods of time. A controversial topic is the use of blinders on horses; while they help keep the animal focused in traffic, they also may get into collisions they might have instinctively avoided.

Culture

Popular culture has embraced this new mode of transport. The "cool" crowd has polished horseshoes, tackle, and brand-name riding gear. The picture of a successful businessman is a man in a business suit riding a horse with cell phone in hand. Throwing horseshoes is a common sport, with competing lines (and styles) of plastic horseshoes for children to throw. The purchase price of a standard riding horse is about $5,000 (saddle and tack not included). Rental for 24h: ~$60 (less on weekends). Rental just during business hours: ~$40.

A few ads include:

- "Ride low and it will keep you warm in the winter."
- "In Summer, plan ahead and ride into the breeze."
- "Specially bred horses can eat different qualities of feed, so none of the grain is wasted. Know what your horse needs so they get enough nutrients and not too many!"

Adventure Seeds and Ideas

Lobbying for the Horseless Carriage: A riot breaks out around the PCs, demanding that they help protest the legislation of completely electric cars.

Horse Doctors: The huge demand for equestrian transport is still ahead of veterinary capabilities at all stages of life. Thus some breeders are pumping out horses in large-scale "puppy mills" in unsanitary conditions. The heroes are asked to investigate by concerned citizens. (It may well turn out that the mill has an inside informant in the local government so they clean up minimally at the last moment; if so, are the heroes prepared to fight the government for justice?)

Horse Hockey: This sport involving horses wearing horseshoes with cleats came into being during years of consecutive lockouts and strikes of the professional hockey leagues. Competition is no less fierce, even between the fans.

Horse Thieves: The adventurers catch some youths breaking into a stable. If caught, they claim to be paid by someone who matches the description of the party's current contact in this city. The youth should escape before police can arrive, requiring further investigation.

Horse Whisperer: A woman is making rounds, claiming to be able to talk to horses (or a primal horse spirit, if talking to horses is mundane), and can diagnose what is wrong with the animals. This is gaining her great influence and prestige. Is she for real, or is she adept at veterinary science and body language (horse and human)?

Horse Sense: In a high-biotech, secret-magic, or mad-science-friendly campaign setting (such as Supers), adventurers may face a foe that is using some sort of mind-control to abduct riders while on their horses or prevent mounted pursuit.

Shoe-In: A small town the team is passing through has an opening for a farrier. There are people desperate for

someone to shoe their horses; if any of the party is qualified and has mercy, making shoes for a few desperate souls, then they and the rest will make it hard to leave. If so, they may well have to deal with the Farrier's Guild demanding union dues, yet not showing any interest in sending a replacement. (Alternatively, the town might have a farrier, but the Guild refuses to replace him, or examine his skills. Woe be to anyone dependant on that guilder's craft in a tight situation . . .)

Variants

Autoduel: In a one-horse town, the man with the car is king. Even criminals on humble motorcycles would have the speed advantage when trying to escape. Of course, refueling will cost a lot more, requiring more daring deeds to acquire money . . .

Infinite Worlds: Approximately two seconds behind Homeline, this parallel is technologically behind by one step from "normal" in almost every way. This world, designated "Hippodrome," is Open for travel. Under White Star's careful investment, local researchers are getting closer to solving the energy crisis. Tourism brings a lot of people interested in horses, and too many that are trying to "invent" new power sources.

Space/Infinite Worlds: One world among many, it is proceeding nicely toward the next TL. Many citizens will be content to wait until a clean power source is available (considering the energy cost of importing petroleum).

Today: As a not-too-weird exotic locale for any modern setting, a modern government (such as a county or small country) can get tired of rising gas prices. This setting can be used as presented, but without the fuel cells.

Gunpowder Empires

Military Parallels among the Infinite Worlds

by Michael Daumen

An *Infinite Worlds* campaign based on the exploits of Alternate Outcomes allows for the derring-do of military action. Such a game is clearly designed to include adventures revolving around historical battles of our past that many players will recognize. It is often difficult to appease history buffs who may object to particular characterizations of the leaders and tactics of such engagements. On the other end of the spectrum, not all players may derive the same enjoyment from dealing with the minutiae of a little-known conflict.

For times then a GM may not want to foist (or risk) a history lesson on PCs in the Battalion, here are three parallels with a decidedly martial bent. They include the possibility of large-scale warfare involving many nations and forces. In each one, comparatively very little time has passed since the divergence points, so they retain familiarity while either prolonging old wars or generating new ones. The conflicts are designed to be near-global in scope, so realistically only "modern" tech levels from 5 to 7 are involved. Confrontations among combatants with lower TLs tend to be regional affairs.

Outworld Operations

On these worlds, the Infinity Council's official position is that they don't know where to start. It is difficult for any expert to predict with reliability how to untangle conflicts that sprawl across continents. A GM is more than free to combine an interesting locale with an interesting objective and let the party loose, without worrying too much about the results of the operation. And since these parallels are all lie within Quanta 6 or 7, infiltration by Centrum agents is always a useful possibility.

Because of the dangers of collateral damage in worlds like these, tourists generally avoid them, although travel to them is not restricted outright. Most spectators prefer earlier times, content to watch the clash of steel from a picnic blanket and safe vantage point in the time-honored Medieval fashion.

Finally, two of the parallels have alternate names, depending on whether the GM wants to emphasize the relevant facets of these worlds, or surprise the players instead.

Guayaquil/Napoleon-8, A.D. 1837

The change point of Guayaquil occurs on the island of St. Helena in 1820, where a plot to poison Napoleon is thwarted, rather than leading to his death the following May. He is presumed to be too far from Europe to cause alarm; but two men much closer to the exiled Corsican regard his continued existence as a unique opportunity. Their names are Thomas Cochrane, a disgraced Scot now commanding of the Chilean Navy, and Jose de San Martín, veteran of the Peninsular war and leader of a joint Chilean-Argentine army.

They often fail to see eye to eye -- Lord Cochrane in particular decried San Martín's cautious campaign to liberate Chile and coastal Peru, responding with a series of dazzling maneuvers to cripple Spain's Pacific fleet. However, the duo shares the fervent desire to see South America freed from European control, and is willing to sacrifice everything -- even old animosities - towards that end. In early 1822 they approach Bernardo O'Higgins, the director of Chile and a lifelong friend of San Martín, to consider their daring plan, and he reluctantly agrees.

In April, the schooner Mendoza sails from Buenos Aires with a handpicked force of grenadiers, landing unannounced at St. Helena. Before news of the raid reaches London, Bonaparte has left Argentina with 50 veterans of the Army of the Andes. By the time San Martín meets Simon Bolivar in the free port of Guayaquil in late July, to determine the fate

of the last Spanish army in Upper Peru, the one-time emperor of France is a secret addition to the former's staff.

On Homeline, San Martín abdicated his command to Bolivar without a shot fired -- the third refusal of near-absolute power in a remarkable career. But here, instead of placating the Colombian, San Martín has a clear alternative, and he seizes it. A grumbling Bolivar acquiesces, after securing platitudes to democracy and a share of command with the others. By the time Europe can address this crisis, it is 1823 and the Spanish have been routed by the superior tactics of El Corso and his lieutenants.

The Archduchess Marie Louise of Austria, who had declined to follow her husband to St. Helena, is equally scornful of an invitation to South America. Napoleon divorces her in 1824 and marries the sister of Pedro, regent and heir-apparent to a fictional Brazilian crown. With his brother-in-law's assistance, Portuguese troops opposed to turning fiction into reality are driven from Brazil. All the newly independent nations ratify the 1826 Recife accords, uniting the continent into a loose federation and proclaiming South America forever free from European influence.

The federation -- ruled by a weak executive triumvirate of Napoleon, Bolivar, and Pedro -- allows its members to govern itself, largely because it has its hands full. England and Spain desire to renew the offensive, while France is cautiously neutral. The belligerent European posture long flummoxes the United States, whose president never pronounces the doctrine which bears his name.

It is 1837, and the cold war which had endured for a decade has sublimated in the flash of gunpowder. A score of running battles extends the length of the Western Hemisphere, from Indians and Canadians opposing American expansion west and north, to suramericanos checking the advances of the Atlantic Alliance of England, Spain, and Portugal. Independence movements in the provinces of the Yucatan and Coahuilla y Tejas plague the Republic of Mexico. Napoleon has died, and even before his tomb is sealed the Gran Colombians chafe at the suggestion that his son Juan "Napoleonito" ascend to the triumvirate, which already favors the southern cone (Bolivar died in 1830 from tuberculosis, and Pedro in 1834, replaced by Antonio Jose de Sucre and O'Higgins, respectively). If this wedge doesn't drives a continent apart, perhaps the one brewing in the United States will.

Characters visiting Guayaquil can witness the resumption of epic Napoleonic warfare first-hand throughout the Americas. The Age of the Soldier has bloomed anew for a generation in Europe that had known peace. Soldiers can expect anything from battling counterinsurgency in occupied Canada to running guns in French Guiana, as well as traditional set-piece engagements in Mexico and Argentina. And even if the American Civil War doesn't arrive early, plenty of new inventions are on the horizon, promising to transform the waging of war in an instant.

Divergence Point: 1820; Napoleon survives a poisoning plot to play a role at the conference of Guayaquil during the wars for South American independence.
Major Civilizations: Orthodox (empire), Western (multipolar), Chinese (empire)
Great Powers: Confederacion de Suraméica (oligarchy, CR3), United States (representative democracy, CR3), British Empire (representative democracy, CR3), Russian Empire (dictatorship, CR4), Manchu Empire (dictatorship, CR5)

La-Perouse/Lenin-7, A.D. 1920

After the outbreak of the Russo-Japanese War in 1904, Japan's navy outclassed that of the Russian Empire, and constantly lured the hostile ships into a series of one-sided engagements, culminating in a spectacular victory in the straits of Tsushima. In this parallel, the tsar reins in his enthusiastic admirals until the arrival of the Baltic fleet from its epic journey across three oceans. Most fortunately for them, the commander had decided instead to sail for Vladivostok via the straits of La-Perouse, sacrificing time for safety. Faced with the newly-enlarged enemy, Japanese admiral Togo no longer seeks a decisive engagement, and the stalemate ends with the Treaty of Portsmouth a year later than in our timeline. Russia allows Japan a greater presence in China and emerges essentially without any losses.

Without the devastating defeat that occurs on Homeline, Russia avoids the naval mutinies and disastrous Revolution of 1905. Under the able leadership of prime ministers Witte and Stolypin, the Russian people finally taste the first fruits of democracy. An aborted Bolshevik revolution fails in 1913; Lenin is imprisoned and executed in Ekaterinburg. Still, the Great War breaks out in 1915, despite a diplomatic resolution to the July Crisis of the preceding year.

Russia is in much better shape to fight this time around, and her advances throw Austria-Hungary into disarray, shock the Ottoman Empire into inaction, and convince Germany that the real danger lies eastward. As a result, the Kaiser shelves the Schlieffen plan for a later date, and Britain only enters the war in summer 1916, after France appeals for aid in breaking the stalemate. Leon Trotsky is present in Paris when the French finally give out in 1917, leading British, French, and German troops on a wild chase to quell the unrest he causes.

Three years later, the war continues, largely along the same lines as before. Austria-Hungary and Italy fight a punchless Alpine campaign, while the Turks retreat slowly westward from Russian positions in the Caucasus and British advances in Mesopotamia. They will be the next to quit. As long as Germany can check both Britain and Russia, however, there is no peace in sight. The United States, which remains neutral, ironically dooms itself to the status of a minor power, as the ravages of the Grippe remain confined to American cities once the quarantine goes into effect.

The major powers are still in decent condition to prolong the fight, and barring a major change or domestic upheaval, will do so. The remnants of France with some semblance of autonomy have declared belated neutrality, and as they lie away from the bulk of the fighting Germany and Britain largely ignore them absent rumors that Trotsky may be nearby. The northern chunk of the country, slashed by trenches from the Low Countries to the Massif Central, is administered under German or British martial law, or has reverted to no man's land. Japan is largely a wild-card, having declared war on Germany only and more than content to pick at the pieces of her Pacific colonies. They are steadily expanding in China, and may still be casting greedy eyes at Manchuria and the Russian Far East.

Welcome to World War One, made slightly less grim without the specters of the Russian Revolution, the Spanish flu pandemic, and possibly even Nazi Germany. Characters can engage in trench warfare in Poland or Belgium, guerilla raids with Pancho Villa, T.E. Lawrence or Trotsky, or police actions with the Japanese in warlord-torn China. Naval action between dreadnoughts in the North Sea and aerial combat between Zeppelins and ever-improving biplanes are possibilities as well.

Divergence Point: 1904, Russian ships in the Pacific avoid major engagements with the Japanese until the arrival of the Baltic fleet, lessening the effects of that conflict and transforming the First World War.
Major Civilizations: Orthodox (empire), Japanese (empire), Western (multipolar), Islamic (empire with rivals).
Great Powers: Russian Empire (dictatorship, CR4), British Empire (representative democracy, CR4), United States (representative democracy, CR3), Ottoman Empire (theocracy, CR5), German Empire (dictatorship, CR4), Empire of Japan (feudal, CR4)

Ketsu-Go, A.D. 1962

In our timeline, the USS Indianapolis was sunk on July 30, 1945, having set a speed record across the Pacific in deviation of the standard anti-submarine zig-zag tactics. Although Captain Charles McVay paid the price for his decision, he was able to deliver his cargo to the island of Tinian -- the first atomic bomb. Unfortunately for the inhabitants of Ketsu-Go, the cruiser is still hit by Japanese torpedos even when McVay plays by the book and follows procedure; this time, however, the precious cargo is still aboard. Despite standing orders to save the bomb even at the expense of the crew, Little Boy sinks with a majority of the seamen and marines aboard, and Fat Man does not ravage Hiroshima until August 17. The next bomb is slated for delivery by the end of the year, but not before the invasion of

Japan starts.

Although US casualties in the invasion of Kyushu are horrendous, they are nearly matched by Soviet troops in the invasion of Hokkaido. Soon thereafter, with the bulk of American forces leaving Europe for the Pacific front, Stalin's armies menace Istanbul and northern Iran, securing both rights to the Mediterranean and oil concessions from the shah. The allies hold most of each small island before the second bomb drops, on December 13 over Niigata. This is far enough north to avoid the irradiation of most American forces -- though many have already gotten sick after exposure to the ruins of Hiroshima -- and close enough to the Soviet lines for Stalin to take notice. He acts accordingly, speeding up the USSR's atomic program. Still, Japan surrenders a week later.

The jointly occupied Axis nations are divided, with the new border between North and South Japan running across Honshu. The Soviet Union holds Korea and Manchuria, and eyes the burgeoning civil war in China warily. After the Marshall mission defuses the tension, China is split into a over dozen states, from the rabidly pro-American Sinkiang in the west, to Communist Manchuria and Inner Mongolia and the bursting polities of Kuomintang Taiwan and Guangdong. The detonation of Stalin's first weapon in 1947 seals the deal.

In 1962, a fragile peace is now maintained across a much larger front, although both the United States and the USSR are just as content to wage war through their proxies. Europe suffers, but not under the yoke of the Warsaw Pact; Malenkov must keep his eyes on the East as well as the West. Rather, American aid is much slower in coming, and arrives in smaller parcels. Most of the independent European states are still fierce colonialists, holding on to what resources they can, even as they lack the means to crush the myriad insurrections that have arisen across Africa and southern Asia. The only colony with a degree of independence is the Union of South Africa, whose troops manage the Suez canal under a British mandate; India remains unpacified, and a steady stream of Jews argue for a greater say in Palestine as they jostle with their Arab neighbors.

As long as a weakened Europe seems acceptable to the Soviets, America is content to exercise free rein in its own hemisphere. Just two years ago the CIA toppled the Batista government, replacing him with the Cuban ultranationalist Raul Castro. Every so often, however, Soviet aid gets to the rebels in South America, led by a shadowy Argentine doctor. Perhaps if the Kennedy government sends more than advisors to Brazil they can make some headway in the jungles.

Ketsu-Go is a Cold Warrior's dream, with dozens of localized brushfire wars inflaming the globe. Spies practice the ancient art of espionage in the tottering capitals of Europe and the hastily industrializing cities of the Far East. Independence forces gain momentum as the colonial masters falter in Africa, the Middle East and Indian subcontinent, Indochina and the East Indies. The only real advantage this alternate might have over Homeline is the smaller number of nuclear powers. Both American and Russian troops have witnessed the horrors of nuclear bombardment firsthand in Japan, and a true reluctance to use more offers a certain degree of stability. The secrets of fission are jealously guarded by the US and the Soviets, and anyone with proven access to uranium commands a great deal of attention.

Military characters have their choice of combat zones, from the Sahara across the roof of the world to the sweltering Malay jungles. Idealistic soldiers can help throw off the colonial yoke in India, and mercenaries are always welcome in South Africa's campaigns of conquest. To most citizens of Ketsu-Go, the specter of a mass conventional conflict in Europe and the Far East both a constant threat; to a few others, however, it might be considered an intriguing opportunity.

Divergence Point: 1945; use of the first atomic bomb is delayed, causing World War Two to last for four additional months.
Major Civilizations: Western (empire with rivals), Orthodox (empire with satellite states), Chinese (diffuse).
Great Powers: United States (representative democracy, CR 4), Soviet Union (dictatorship, CR5), Union of South Africa (oligarchy, CR3 for whites, 6 for non-whites)

Pyramid Pick

Shadows Over Camelot

Published by [Days of Wonder](#)

Designed by Bruno Cathala & Serge Laget

Illustrated by Julien Delval

Four game boards (three double-sided), 16 swords, 168 cards, seven "coats of arms" (character sheets), eight dice, two booklets (rules and quests), & 30 miniatures; three to seven players, full-color, boxed; $49.95

Camelot has fallen several times over the years, in many ways and in many guises, but one thing seems certain…it always falls. This time it's not a forgone conclusion -- you and your friends have the opportunity to achieve a happy ending for the mythical kingdom in *Shadows Over Camelot* -- but that doesn't mean it's going to be easy.

The object of the game is to finish the game with more white swords than black laid across the legendary Round Table.

Three to seven players take the role of King Arthur or one of his famed knights; each has a card that lists important game information and a unique special ability. Everyone starts at the round table where they can gather white cards for their hand. These help you fight, go on quests, and call upon the services of Merlin and others. Each turn you have to give evil a chance to progress: draw a black card, allow a siege engine to muster in the fields beyond the castle, or lose a life point.

Once the bad guys have made inroads, you may take a heroic action; you can draw or play cards, attempt to destroy a siege engine, or go on a quest. Quests include battling the Black Knight, seeking the Grail or Excalibur, or fighting Picts and Saxons, among others. Too many siege engines, and Camelot succumbs. Forge your way through a quest and you stand to gain white swords, life points, and white cards. Fail, and the black swords will do the siege engines' job for them.

Most quests involve the play of cards. Gaining the Grail, for example, means drawing enough Grail cards to stretch across a track printed on one of the maps. If you draw an opposing card from the black deck, though, you'll have to play additional Grails to get rid of those before you can finish the quest. Challenging the Black Knight requires you to play two pairs of matched cards before he becomes too powerful, and fighting off invading armies require a "straight." Mechanics aside, there's plenty of flavor -- all the important notables, historical and otherwise, make an appearance, from Lancelot to Morgan to dragons.

Some journeys must be undertaken alone (the Black Knight), while others benefit from multiple participants. Using cards can be like Bridge: You want others to benefit mutually from your plays, but you can't just tell people what you have that might solve the current quest. The cooperation factor is key here, making it one of the few games where you won't even notice you haven't hit your friends with anything all session long. Work together with your cards and abilities and survive; argue, and it seriously impairs your chances for glory. Then once you think you've got a grip on those rules, introduce the possibility of a traitor in the ranks and it becomes a whole other game.

There's a king's ransom of components with this game, and Days of Wonder makes sure they count. Some sections, like the main board, get a little crowded (there are spaces for the black and white decks, oddly, but not their discards), but you wouldn't want to cover up any of that gorgeous artwork. The cards are good stock, the dice are wooden, and all

the boards are firm, mounted masterworks of both material and illustration. And the figurines? Yes, you'd gladly pay serious money for those, and they only paint the heroes' bases. (The company offers a fully painted set of heroes separately.)

In this busy game there's always something to do, and the beautiful thing is it's not too hard to keep all the ongoing plots straight. You're never bored, and never sure of victory. Sacrifice is a meaningful part of the game's inner workings. Threats hem you in on all sides, keeping tension at a steady level no matter how many quests you complete. Sure, it all seems overwhelming, but in a fun way, and from your first game it's possible to see how all the threads interconnect. Somewhere out there is a playtesting group that is sick of the sight of this box, and their wounds are a boon for you and your group…you're going to end up playing this as much as they did.

Be prepared to sit down to a dining table full of Sieges Perilous. Perhaps the richest simulation of Camelot ever, the wondrous, intricate, challenging tapestry presented here is so well-balanced it bears playing again and again. Better still, in spite of its breadth and depth, it's not an imposingly long game you could play twice in a single evening. With **Shadows Over Camelot,** the fabled storybook tale is in good hands: the designers', and yours.

--Andy Vetromile

Pyramid Review

The Imp Game

Published by [Neo Productions Unlimited](#)

Written by Nate Petersen

Cover by Calvin W.Camp

31-Page 677 KB PDF File; $5

Think *[My Life With Master](#)* by way of **Toon, *[Rune](#)*** and **Kobolds Ate My Baby,** and you pretty much sum up ***The Imp Game.*** Reminiscent of the *Dungeon Keeper* PC Game, this is a beer 'n' pretzels game in which the players assume the roles of Imps, the incompetent, bumbling-but-usually-willing minions of the "Master." Happy (mostly), to undertake the tasks he assigns them, or wheedle and whine their way though an excuse or two if not. Being sidekicks of course, the Imps are prone to failure, and fail they do loudly and often. Yet once in a while an Imp might succeed and thus earn the much-desired praise of their master.

The Imp Game is much like ***Rune,*** in that it is collaborative in nature, with the roles of both player and GM changing places over the course of an adventure. The GM is there to set the scene, keep the story moving, and to prevent any abuse of the GM's mechanics. Yet he also has his own Imp character that he plays like the other players. Further any player is free to add elements to the game -- NPCs, Locations, and so on, as long as they fit the game and add to the enjoyment of the play.

In keeping with the simplicity of the game, defining each Imp is a very easy task. Every Imp has a class, which represents what it is good at. Each class is categorized along typical roleplaying attributes -- strength, intelligence, charisma, and so on. Thus a Big Dumb Imp is strong, and better at picking things up or pushing them around, while a Devious Imp is relatively charming (for an Imp!) and is quite capable of getting what it wants. There is also the Crazy Imp, whose key attribute varies from one task to the next. One moment it might be the equivalent of a Big Dumb Imp or a Smart Imp or even suffer a bout of Common Sense, an attribute that only a Crazy Imp has access to! Every time a Crazy Imp attempts an action it has to roll to see which attribute it can use.

In addition an Imp has three traits, such as Clumsy, Curiosity, Kleptomaniac, or Pacifist. A player selects two, while the group chooses the third. A trait is a roleplaying tag, one that a player has to roleplay, and everyone else will find a way to take advantage of. Likewise, an Imp has one Fear selected by his player, and another assigned by the group. A Fear can also be taken advantage of by the other players, and can be anything uncommon, such as a fear of anything purple, or bunnies or sheets or sausages.

Particular to each Imp is a special ability such as being able to animate his badly drawn artwork, Fire Breathing, Hypnotism or even Imp Magick. The latter is a simple affair, spontaneous and invariably unwieldy and unpredictable. It can be used to temporarily replicate any of the listed abilities. All abilities need to make a successful challenge check to work, but can be raised from rank 0 to rank 2. Each additional rank provides a small modifier to a challenge check roll. Finally, an Imp's player begins with 10 poker chips.

The mechanics in ***The Imp Game*** support its need for frequent failure results. It uses two six-sided dice, rolled any time an Imp needs to make a challenge check. The target number for this roll varies, but is always the same for all of the players, the aim being to roll equal to or under the target number. At game start, the target number is two. If the roll fails, the target number rises by one, making the target number for the next challenge check for any of the players a three. It can be raised temporarily by an Imp expending one or two Guts Points, represented by the poker chips. Any

Guts Points so invested are lost if the challenge check fails, but if it succeeds, an Imp recovers Guts Points equal to the roll. The target number also resets itself back down to two. In event of a failed roll, the player is expected to narrate the effects of his Imp's failure, as he would a success.

Besides being spent on raising target numbers, Guts Points can be used to activate another Imp's traits. For example one Imp might force another Imp with the Eager Trait to volunteer to undertake an unpleasant task, or a Know-It-All Imp to land himself in trouble by revealing too much. In addition, any Gut Points over ten at the end of the turn, become Praise Points, which represent the approval, doled out by the Imp's master after a successfully completed task. The group can also award Praise Points to a player for enjoyable play. Saved over the course of several adventures, Praise Points can be spent to purchase new abilities, raise the rank of an existing one, buy a new trait or get rid of an existing one, or even buy more Guts Points.

Playing *The Imp Game* is designed to be undemanding working as it does in a quasi-medieval world chock full of every cliché going. Imps are generally short, fat, and none too bright, but are eager to please; villagers are equally stupid, are fearful of the Imps, and are easy to deceive, bamboozle, or beat up. And of course, Adventurers are the stars of the show. Popular, intelligent (in comparison), better armed and equipped, they are an Imp's foil, and a bunch of Imps will have to use their abilities to beat any Adventurers. And while all that seems too tough for the Imps, they at least cannot be killed. Suffer pain, and lots of it, but not killed.

Physically, *The Imp Game* is presented as simply as the game is played. The only illustration is the cover, but this does not detract from the game, which is clearly written and easy to grasp. It comes with 13 scenario suggestions, which range from kidnapping a princess and stopping a gallant knight from rescuing her, to hiring more monsters to populate the master's dungeon and breaking up a strike by the monsters in the dungeon.

Mechanically simple, it is these mechanics that drives the failure/success dichotomy in *The Imp Game.* The players are encouraged to fail -- and fail often because only that will increase the chance of a success. To enforce the fact that failure is not seen as such, it is also up to the player to narrate its outcome. The point is that an Imp's failure should be as enjoyable as its successes. Such simple mechanics are of course open to abuse, but this is where the GM is needed, and anyway, the game is hardly intended for deep, serious play. What *The Imp Game* is, is a light, undemanding affair, suited to occasional play, especially when the GM wants a night off.

--Matthew Pook

Absinthe and Sensibility

"After the first glass, you see things as you wish they were. After the second, you see things as they are not. Finally, you see things as they really are, and that is the most horrible thing in the world."
-- Oscar Wilde

It is the fondest dream of this column to see things as we wish they were. So one glass it is. Of course, we wouldn't be able to get very far with that project if we didn't see things as they are not. So a second glass for us, then. But the third glass -- do we drink it? Have we already drunk it? And who is the lady in emerald and opal to whose honor we drink, and would that really be the most horrible thing in the world? Raise your glass and look into the green.

"Green changed to white, emerald to an opal: nothing was changed.
The man let the water trickle gently into his glass, and as the green clouded, a mist fell from his mind.
Then he drank opaline.
Memories and terrors beset him. The past tore after him like a panther and through the blackness of the present he saw the luminous tiger eyes of the things to be."
-- Ernest Dowson, "Absinthia Taetra"

Under the Second Empire of Napoleon III, the time between work and dinner was *l'heure verte,* "the green hour." Fashionable Paris drank a glass of opalescent green absinthe to "switch off" after a hard day of millinery or novel-writing, almost as a ritual to begin the evening and its pleasures. And drinking absinthe was a ritual, to be sure, involving some iteration of special glassware, sugar cubes, an ornately slotted spoon, and iced water -- all of which tended to keep it a safely upper-middle-class beverage. This despite its social origins as the unofficial tipple of the French colonial army, which issued absinthe as a febrifuge in Algeria in the wars of the 1840s. (The line between specialty liquor and health tonic was fuzzier in those pre-NyQuil days.) But apparently, enough of the officer class enjoyed a dalliance with *La Fée Verte,* the "Green Fairy," to let absinthe jump up to the fashionable boulangeries and cafés of Paris and Marseilles. But it didn't jump all the way up. It kept a certain notoriety as a vice all its own, and it gained a special allure as a drink of more than usual qualities. And its notoriety and allure fed each other, and drew the artistic and the pseudo-artistic alike into the green.

"Do you know what it is like to be haunted by colors? To me, in the color [green](), there is something like the temptation of the devil."
-- Henri de Toulouse-Lautrec

Edgar Allan [Poe]() drank absinthe, though not much. Poe's worshipper Baudelaire drank more, but renounced it by age twenty. Baudelaire's disciple Verlaine nearly died of it, and Verlaine's acolyte Rimbaud only escaped it by fleeing France altogether. Oscar Wilde turned to it in French exile. Alfred Jarry attempted to live on it, using it to fuse hallucination and perception, to abolish days and nights. Manet and Degas roiled the painterly world with their portraits of absinthe drinkers, and became only the first flares of absinthism in French art galleries. Gaugin and Picasso both drank it, and Toulouse-Lautrec and Van Gogh consumed it in vast quantities. (Barnaby Conrad III's *Absinthe: History in a Bottle* provides a superb "who's who" of absintheurs, and a colorful gallery of absinthiated art as well.) To all of these artists absinthe was more than a beverage, it was a symbol of -- or perhaps an initiation into -- [Bohemia](), the shadow world of art, magic, and rebellion. Absinthe was the communion to a new religion; the poet Ernest Dowson went so far as to dangle a crucifix in his absinthe before drinking it. The Green Fairy was less and less metaphorical, and more and more a constant presence. She became the subject of poems and portraits alike, the spirit of the age sidling toward Montmartre to be born.

"I am only sipping the second glass of that 'fascinating, but subtle poison, whose ravages eat men's heart and brain' that I have ever tasted in my life; and as I am not an American anxious for quick action, I am not surprised and disappointed that I do not drop dead upon the spot."
-- Aleister Crowley, "The Green Goddess"

But tying absinthe so fervently to revolution and sin had a cost. As the Third Republic continued to come apart at the

seams, all corners of society from monarchists to communists were looking for a scapegoat, and absinthe was it. Absinthe became the whipping girl for everything from the falling birthrate to military unpreparedness to street crime to that crazy Erik Satie music those kids liked these days. And even if it could have withstood an absinthe-besotted Paul Verlaine attacking his mother, or the sensational "Absinthe Murder" of 1905, it couldn't withstand its fall from bourgeois grace. After the Commune and the fall of the Emperor shook Paris society apart in 1870 -- and more especially after the phylloxera blights of the 1870s and 1880s raised the price of decent wine -- absinthe returned to the working man. Bottlers made more, and cheaper versions of the stuff, replacing the grape alcohol with industrial alcohol. Like gin in the 1730s or marijuana in the 1930s, absinthe was the drug of choice for the lower classes, and therefore found itself increasingly blamed for poverty and moral decay. Which meant only one thing -- it had to be banned. And so it was, in its birthplace Switzerland in 1906, in the United States in 1912, and in France in 1915.

Both anti-absinthe doctors and pro-absinthe poetasters claim that absinthe is special, different, somehow "worse" or "better" or both than other drinks. And indeed, what makes absinthe absinthe is the presence of wormwood, Artemisia absinthium, the second-bitterest plant known to nature, in the mix along with fennel, melissa, hyssop, and the anise that gives absinthe much of its taste. The active ingredient in wormwood is thujone, a terpene similar to menthol or camphor. (Hippies used to say that thujone and THC affected the brain similarly. Not so.) In sufficient quantities, thujone is a convulsant poison that some doctors have found produces hallucinogenic effects. It's those "sufficient quantities" that get you, though -- those convulsing, hallucinating guinea pigs get pure, injected thujone at 100 ml per kilogram of body weight. By contrast, the dose of thujone in a glass of Toulouse-Lautrec's Pernod Fils probably topped out at around a millionth of that, since even Toulouse-Lautrec was bigger than a guinea pig. The majority of research indicates that there is no chemical way for the minuscule amount of thujone in absinthe (averaging around 60 parts-per-million in the Belle Epoque) to cause hallucinations, to say nothing of madness. And certainly my own research bears that out; absinthe gives you a strange "awake" feeling, and gives me, at least, a hyper-sensibility of touch, but no "trails" or lizards or urge to shoot Paul Verlaine. (The stuff I was testing was King of Spirits Gold, an extremely potent Czech brand with a technically illegal 100 ppm thujone content. I give heart and soul for this column.) What far more likely did for Verlaine and van Gogh and Toulouse-Lautrec was the punishing alcohol content of absinthe, which ranges from the mild stuff at 120 proof up to 164 proof for the "Suisse" variety. In a nation of wine-drinkers, absinthe is just too much alcohol in too small a glass. The "speedball" effect -- think vodka and Red Bull -- in which the thujone keeps you weirdly sober while the alcohol goes to work on your central nervous system, doesn't help.

"For the lips of a strange woman drop as an honeycomb, and her mouth is smoother than oil: But her end is bitter as wormwood, sharp as a two-edged sword. Her feet go down to death; her steps take hold on hell."
-- Proverbs 5:3-5

Although the invention of absinthe per se had to wait for the discovery of distillation, wormwood elixir goes back to ancient Egypt as medicine (prescribed for, of course, worms in a papyrus of 1600 B.C.) and ancient Greece as occasional recreational (or religious) beverage. (Artemisia was, of course, offered to Artemis, from whence it came.) The Greeks gave us their name for wormwood, *apsinthion,* which sadly apparently does not mean "undrinkable." The Greek word interestingly resembles the Old Persian word for wormwood, *asfand,* which might be cognate with the Indo-European root *-spend* meaning "offering" or "ritual." Hmmm. Our word "wormwood" comes from the Anglo-Saxon *wermod,* which comes from nowhere that linguists agree on. (I suggest *weir-* "twisted" and *mod* "mind, spirit.") The connection with worms -- with wyrms -- is well established in myth and folklore, though not in linguistics.

Going back to the Egyptians, wormwood and worms have been linked, and herbals ever since have done likewise. An early Christian legend holds that wormwood grew in the tracks of the serpent as it left the Garden of Eden -- whether evil post-Adamic demon seed or valiant plant guardian is left murky. Wormwood shows up in the Bible a number of places, most notably in Greek in the Book of Revelation, in which the "star called wormwood" falls and turns a third of the earth's waters bitter. (Although *chernobyl* is apparently Russian for mugwort, a close relative of wormwood, and not the true herb, the parallel is still kind of creepy.) In Hebrew, wormwood is *la'anah,* which kabbalistically adds to 155, the value of Elemiah, the angel of Inward Journeys, and is just one less than "viper," which is the wyrm turning back around.

"Salon, Mausole, Tarascon of the arch of Sextus
Where the Pyramid still stands

They come to deliver the Prince of Denmark
Offering and shame at the temple Artemisia."
-- Nostradamus, Century IV:27

Similarly snakily, the Pernod absinthe plant moved to Tarragona, Spain (where absinthe was never banned) in 1918. The herb tarragon, of course, is Artemisia dracunculus, the "little dragon," and a close cousin of wormwood. Similarly draconic names dot the shores of the Gulf of Lyon, including Tarascon in France, home to the monstrous Tarrasque. This dragon (or wolf) rose out of the river Rhône and devastated the landscape until tamed by St. Martha with a chalice of water, although there's no mention of sugar cubes or slotted spoons in her legend. But there is the other French river dragon, the Vouivre, which flies in streaks across the sky (like the "star wormwood") and dwells in the Alpine rivers, especially the Loue. (That, at least, is where Marcel Aymé put her in his novel.) The Vouivre is female, half woman, half snake -- a winged Lamia, a spirit of poisoned drink.

And when we see a reference to both Tarascon and Artemisia in Nostradamus' quatrain above, we begin to look askance at the other bits. (Nostradamus, steeping unknown herbs in water for visions.) The "Prince of Denmark" bit is strange, although Hamlet's willingness to "drink eysel" -- wormwood wine -- for Ophelia, drowned in a river with rue, becomes newly alarming. And when we read that the "Mausole" refers not to the Mausoleum of Halicarnassus (built by a grieving Queen Artemisia, I'll note) but to the town of St.-Paul-de-Mausole in the Rhône valley, we prick up our ears. And then we further discover that Vincent van Gogh was confined in the mental asylum at Mausole in 1890, in the grip of absinthism, and that he died in late July, just before the wormwood came into flower. (He was buried under a thujone tree, to boot.) We begin to see the hints of the "offering and shame," and of the trail of the wyrm-wode, the Green Fairy, the vampire Lamia who preys on artists. Perhaps Dowson had other reasons to dip a crucifix in his absinthe.

"Ice thawed by currents from the south
Swell the swift streams beneath,
So when the water out of your mouth
Rises against your teeth,

I seem to drink Bohemian wine
Victorious, bitter, and tart,
A liquid sky strews sublime
Stars across my heart."
-- Charles Baudelaire, "The Dancing Serpent"

The Vouivre is also known, in the Franche-Comte, snug up against the Val de Travers in Switzerland where absinthe was invented, as "Tante Arie," and she lives in an underground stream beneath the mountain, where she spins the fate of the world. Her stream, the Loue River, was born from the blood spilled between a female wolf (*la louve*) and the Vouivre -- shades of our wolf-dragon in the Rhône. The goddess under the mountain, the Aradia or Venus or Berchta or Hecate, we've met before. I'll note, in this connection, that not only the wolf but mugwort (that oh-so-closest relative of wormwood) is sacred to Hecate, and that there was a fane of Hecate in the Temple of Artemis at Ephesus. And Hecate, in early myths, was a mortal priestess who drowned herself and was resurrected by Artemis as a goddess. Drowned and resurrected women, dragons in rivers, streaks of light in the sky, a serpentine Green Fairy (or werewolf woman) who seduces and destroys poets and artists, an "offering" and a "ritual" from the Magi to Montmartre, all connected in the louche mythos of the Artemisia.

Am I reaching? A little too much inspirational research having its effect? Then perhaps it's only a coincidence that on August 11, 1901, during the flowering of Artemisia, during the quinance of Leo assigned to Elemiah, Angel of Inward Turnings, the Pernod plant at Pontarlier was struck by "lightning" and exploded in flames. Workers managed to divert the flaming absinthe into the Doubs River, where it flowed under the mountain -- and out into the Loue, where it turned the water green a resurrected three days later, on August 13. A date known to the Romans as Nemoralia, the torchlit feast of Diana -- which is to say the birthday of Artemis. Artemis, reborn in water after a flash of light across the sky; the Vouivre, Lamia, and the Star Wormwood in one. Salut!

Usenet and Other Dinosaurs

This is one of those columns I'm reluctant to write since I always feel like an old fogey whenever I begin something along the lines of "Back in *my* day . . ."

Anyway, back in *my* day we had a source of information that was a constantly updating information source and a discussion medium. It was called "Usenet." Oh, sure, something purporting to be Usenet continues to exist, but it's mostly for the purpose of providing another forum for the infinite spambots to spew their unending garbage.

Now, for those of you unfamiliar, Usenet -- also known as "newsgroups" (and, no, I'm not going to get into the semantics about other things that are called newsgroups . . . for many a year, when most folks were concerned about signing up with newsgroups, they meant Usenet) -- was a worldwide communication protocol that allowed ongoing conversations via . . . well, newsgroups. Newsgroup programs could collect related posts, or sort them by date order, author, size, or the like.

As I'm typing this, I'm realizing I'm not doing a great job of explaining why Usenet was special. I've included a screenshot of the *Pyramid* newsgroups, which uses the same NNTP protocol that Usenet does.

Usenet

Pyramid's newsgroups, using an NNTP client

Some advantages off the top of my head (many of which don't matter as much, but some of which still do):

- **Speed of reading/replying:** Since all messages were stored locally, the news reader could (and would, if you told it to) download all new messages in a group, or all messages in a thread, or all messages from a specific author, and so on. Nowadays this doesn't matter much, but in the dial-up days you could tell it to download all new messages from a group, get a snack, and by the time you're back, you have many uniterrupted minutes of information assimilation ahead of you. (And since NNTP messages don't have formatting or flashy avatars and graphics, the messages were tiny.)
- **Customizable reading experience:** Most good NNTP clients would give the user a fair bit of control over how messages would be displayed.
- **Easy archiving:** Again, since messages are stored locally, they're much easier to archive, save, and search.

So Usenet's been on its deathbed for a number of years; why do I mention it now?

Because I'm realizing how ineffective I find most modern methods of getting semi-common information.

I don't know about you all, but I do a *lot* of searching every day. Whether I'm doing research for a writing project, trying to troubleshoot a computer problem, or looking for trivia about a beloved television program or movie, I go to Google within the first minutes. And in the past couple of years, I've been noticing a real lack of answers of a certain catagory -- namely, the kind of questions that a community can answer (and, more often than not, does so, multiple times). So, let's say I'm trying to search for . . . oh, what the rarest *GURPS* books are. A standard Google search for "rarest GURPS" (no quotes) doesn't pop up anything useful. A search for "rarest GURPS" (with quotes) pops up two links, both of which are dead. Unfortunately, a search for "Rare GURPS" (with or without quotes) isn't much more helpful, since there's a website devoted to rare *GURPS* articles from . . . ummm . . . Usenet.

Now, as someone with an inside track, I have a reasonably good idea what the rare *GURPS* books are. (Hint: My *GURPS Prisoner* and *Bili the Axe: Up Harzburk!* get buried with me when I die.) But not everyone who would be looking for this information would be able to tap Steve Jackson on the shoulder (virtually) and ask him.

Now, the big thing that's replaced Usenet are private message boards, especially those for fan communities of games that are currently extant, and "big box"-type communities. SJGames has their own example of the former, and the gaming world's biggest example of the latter is RPGnet. I have absolutely no doubt that this move has been a godsend for the companies who run them; it's much easier to keep up with a community when you own the sandbox, not to mention the advantages of being able to kick out the kids who don't play nice. Of course, as someone who doesn't frequent a lot of boards, I also note that it's easy to develop a "tunnel vision" in this regard. For example, in the Usenet days, I used to read about other games because everyone was lumped into one generic "roleplaying" group; if someone was a fan of, say, *Feng Shui,* he might talk about it in a thread about another game. (As an aside, it's also one of the reasons I like lurking in the shadows of *Pyramid's* sjgames.roleplaying board; there are a lot of different voices lurking there, and I learn a fair bit about the game scene that I wouldn't find elsewhere.)

But if everyone is on West End Games' board to talk about West End Games' stuff, then it's harder to get exposed to new stuff. Sure, I could brave RPG.net for a similar experience, but it generally takes about 10 times as long as my old Usenet days. And some boards are hampered by being private or requiring registration; if I'm trying to find out information about a James Bond movie, why would I want to register with a message board just to be able to search it? (Assuming it's able to be searched, of course; RPG.net disabled their site's forum searchability many moons ago.)

Of course, I'm sure a lot of people's experience with Usenet was less than stellar; the system wasn't very user-friendly, the folks in the groups were often none too friendly (especially for newbies), and a fair bit of the enjoyability of the experience fell on the shoulders of the Usenet client one used. This latter one is especially problematic; unlike Outlook Express or other common e-mail clients, there was never a stellar universal standard Usenet client. (Rereading that, note that I don't necessarily believe Outlook Express is a stellar e-mail client. But I digress.) And that's too bad; while a modern forum site experience will be roughly the same from person to person, the customizability and power-user-ness of Usenet made the experience vary a lot among users. I guess the best analogy I can offer is e-mail. As best I can tell, most people who deal with more than a handful of e-mail use a local client (Outlook Express, Thunderbird, Eudora), which gives a lot of advantages. Now, what if the only way you could check your e-mail was via a web-based client, a la Hotmail? I don't know about most of you, but my e-mail would languish even longer than it does currently in that case.

Now, a few years ago this would have been just another old man's grumblings about how things were so much better. But, actually, there's been a development that's really gained traction in the past year or two that has really taken the edge off of this: the wiki. A well-designed and populated wiki -- the most famous of which is Wikipedia -- is like a constantly updating newsgroup. While in the newsgroup days I might search for the monthly FAQ update to see if a question is answered, in a Wiki I can keep probing various hyperlinked articles until I stand a fair shot at learning what I wanted. I think I realized the big change in my life when I noticed that, for about a third of my search queries (especially trivia- or history-type stuff), I started with Wikipedia instead of Google. Now, I don't think I'd ever trust my life on the information I'd find on a Wiki, it's still a great place to start, and most of the time -- like the Usenet days -- it's Good Enough.

(As an aside, I just did a Wikipedia search for Usenet -- basically, the first three-quarters of this article was done better by someone else in that piece . . . proving two points at once, I think.)

To tie this in loosely to gaming, I note that science fiction settings would do well to remember that new technology can replace the old in unexpected ways; Wikis aren't anything like Usenet, but for much of the function I used it for, it's the same. Fax machines became near-obsolete with the advent of e-mail, and to many in the next generation, instant messaging has utterly supplanted e-mail . . . despite the fact that all three techs are very different. What if, in the *Star Trek* universe, they never quite perfected replication, but they were able to get massive transdimensional site-to-site transport technology on non-living matter? Giant government warehouses of food would enable ships to continue doing many of the same functions as replicators, while introducing new opportunities and problems. ("Captain's Log: Since we have Intertran Beaming but no sub-space radio, I'm preparing another quarterly typed and printed report to

send back to Starfleet Command . . .")

Anyway, I know the clock can't be turned back, and I do have a reasonable enough time on some of the boards I frequent. But I notice that "frequent" feels a lot more infrequent than my Usenet days, and -- as I stumble across one more failed search result pointing to a stub of a dead BBS -- I find myself wondering what might have been.

--Steven Marsh

Department Of Transport

for *GURPS*

by Stephen Dedman

Sometimes even the best-prepared team of heroes will find themselves without a vehicle that will get them where they need to go -- be it the other side of a river too deep to ford, or a planet in a distant galaxy. The following characters are designed for those times when the GM needs a non-generic ship's captain, taxi driver, or barnstorming pilot to get the PCs out of (or into) trouble. All were created using *GURPS* Fourth Edition rules with a particular worldbook in mind, but require only minor changes to adapt to almost any setting.

Ragnar Lodestone, drakkar captain   *225 points*

Ht 5'10", Wt 180 lbs, Size Modifier 0, Age 34.

Appearance: Ruddy complexion, blue eyes, unruly sandy hair and short beard.

Languages: Old Norse (Native); Anglo-Saxon (Accented) [2*]; Old German (Accented) [2*]; Frankish (Broken) [1*]; Gaelic (Broken) [1*], Latin (Broken) [1*]. [7] TL: 3. Cultural Familiarity: Homeline. [7 points]

* Illiterate in languages other than Norse.

Attributes: **ST** 13 [30]; **DX** 11 [20]; **IQ** 12 [40]; *HT* 13 [30]. [120 points]

Secondary Characteristics: Dmg 1d/2d-1; BL 34; HP 13 [0]; Will 12 [0]; Per 12 [0]; FP 13 [0]; Basic Speed 6.00 [0]; Basic Move 6 [0].

Advantages and Perks: Absolute Direction [5], Ally Group (Ship's Crew, Constantly Present, group of 6-10, 50% point total) [48], Charisma/1 [5], Combat Reflexes [15], Status +2 [10], Temperature Tolerance/1 [1], Wealth (Comfortable) [10] [94 points]

Disadvantages and Quirks: Always carries at least two knives [-1], Attentive [-1], Bloodlust [-10], Code of Honor (Viking) [-10], Collects art objects from distant lands [-1], Congenial [-1], Duty (to Crew, 12 or less) [-10], Duty (to Jarl, 12 or less) [-10], Incompetence (Musical Instrument) [-1], Overconfidence (6)[-10]. [-55 points]

Gear: Fine Broadsword; Light Shield; 1 large knife, 1 small knife, 1 dagger; Pot Helm; Fur Tunic (DR 1), sleeveless, with gold filigree belt buckle; leather breeches (DR 1); boots; silver arm-rings.

Ragnar Olafsson was born in Denmark in 805 A.D., the son of a fisherman and former sea-rover. Even as a boy,

Ragnar became almost legendary for his sense of direction, earning the nickname Ragnar Lodestone. He was later trained as a navigator, serving on merchant knarrs (cargo ships) and later becoming captain of a 20-oar drakkar (dragon ship). After his wife died giving birth to his stillborn first son, Ragnar spent less and less time in Denmark and more at sea.

Ragnar always shared his loot fairly with his crew, but he always made sure he had first pick of any jewelry or art objects. His time as a merchant had given him a good eye for beautifully made items, and his sea-chest contains several artistic treasures -- including many that would be of great interest to modern historians.

Ragnar and his crew died in the English channel in 839 when the drakkar was swamped by a sudden fierce storm . . . but some 150 years later, the magician Gerbert discovered that the ghost ship, with its captain and crew, could easily be summoned and compelled to carry passengers and/or small amounts of cargo to anywhere Ragnar had ever sailed. This covers the east coast of Britain, the north-west of Ireland, the Faeroes, and the European shoreline from Brest to the Urals, as well as the major rivers in that area. Over the years since, many other magicians have learned how to call forth Ragnar and his crew, using their ship either as a means of escape from the Inquisition or other foes, or to carry fighters into a sneak attack on a coastal community. All it takes is for a magician to stand in water at least 3' deep, in a place that the drakkar can sail into, and cast a Summon Spirit spell (at the appropriate penalties; see p. 252 of the *Basic Set*). If it's successful, the ghost ship will manifest before him in solid form; if the magician can then speak to Ragnar in a language both know at either native or accented level, and Ragnar has a Neutral or better reaction to him, then he (and his party, if any) will be welcomed onto the boat, which will then revert to spirit form. If he has a Very Bad or worse reaction, of course, the Vikings will attack.

Campaign Uses

In a Viking campaign, or fantasy campaign which has a culture similar to that of the Vikings, the PCs may be crew or warriors on (the living) Ragnar's ship. Alternatively, they may be his enemies or rivals. Otherwise, Ragnar's drakkar is intended mainly as a means of getting around Europe stealthily at any time after about 990 AD: in its usual spirit form, the longship is undetectable by non-magical means until it actually beaches.

Ragnar and his Vikings are unaware that they are ghosts, and it is impolite for PCs to suggest otherwise. They exist from day to day with no sense of longer stretches of time passing; the food and drink in their sea-chests is restored every sunrise, and will never run out. PCs who eat this food, or drink their beer, will be unable to leave the ship unless a magician finds a way to remove the curse. The same is true of anyone whose blood is shed on board, or who tries to steal anything from the ship, be it one of Ragnar's genuine treasures (which include a prayer-book illuminated with gold leaf, a silver filigree reliquary, and a small jade figurine of Buddha) or an oarsman's cheap dagger. The ship is therefore dangerous for anyone with any of the following disadvantages: Kleptomania, Gluttony, Alcoholism, Greed, or Obsession (collecting archeological artifacts or art treasures).

Other Settings

Though designed for a Viking campaign (while alive) or Middle Ages campaign with fantasy elements (in spirit form), Ragnar's drakkar may be used in any Horror campaign, or any other campaign where magic works, or adapted for any fantasy setting.

Ragnar's Drakkar

TL 3; **ST/HP** 109; Hnd/SR -3/3; **HT** 12c; Move 1/6; LWt 60; Load 54; SM +7; Occ 81+40; DR 3; Range -; Cost $20k; Loc MO; Draft 2.5.

Ragnar's drakkar has a crew of 80 oarsmen as well as the captain/navigator. Ten of these crewmen are old friends of Ragnar's who are absolutely loyal (and each has at least one ally of his own), but these statistics may be used for any crewman on the boat.

Ragnar's allies   100 points

* +2 for Talent (Animal Friend)
† Improved from Default

‡ -2 for Skinny

Gear: Colt Lightning double-action revolver (treat as Revolver, .38, p.B278); Lever-Action Carbine; .41 Derringer; large knife; 5-yard Bullwhip. Wears heavy leather leggings [p. B283], old Levis, faded red shirt, yellow bandana, sombrero and army boots.

Christy Lynch has lived an eventful life and seen much of the U.S. west of Chicago -- as a Pony Express rider, riverboat gambler, soldier, trail boss, buffalo hunter, and a variety of other jobs before becoming a stagecoach driver. Not all of the stories Christy tells are true, of course, and most of them leave out one important detail: Christy is actually a woman, something she's determined to keep a secret from all but a few close friends -- most of them "soiled doves" in different towns, who prefer her company to that of cowboys and miners.

The coming of the railroads has meant that the stagecoaches only run between those towns too small or unimportant or remote to be reached by train, and it's in these rarely visited areas that the PCs are most likely to meet Christy. Her coach will rarely be more than half full (1d+1 random travelers), with room on board for a typical posse, even if some have to ride on the roof. If she's carrying anything that might attract robbers, she will also be accompanied by a heavily armed expressman riding shotgun -- or need to hire one.

Campaign Uses

In a *Deadlands* campaign, the lonely trails that Christy rides are also likely to be haunted by abominations such as dust devils, tumblebleeds, wall crawlers and other varmints -- and Christy will know just where such creatures might be found, and can lead the PCs to them. In a more conventional Old West setting, she can serve as a source of information as well as a means of transport -- or come riding to the PCs' rescue in places (the "roads" she follows can only be detected with roll on Tracking at +3; the PCs might be on one and not know it). In an Outlaw campaign, the PCs might try to rob Christy's coach, and find that the scrawny old teamster is more than he seems.

Other Settings

Someone like Christy might be encountered in a post-holocaust setting or on a low-tech planet, where fuel is harder to come by than oats or hay. Change a few skills, and she might be found driving a Greyhound or a truck in an *Autoduel* campaign, or in a bandit-infested region in a *Cliffhangers* or modern-day adventure.

Christy's Coach: a Concord coach, seats six comfortably, with room for three more inside and another six on the roof. See "Coach," p. 464 of the *Basic Set.*

Typical Expressman   *100 points*

Attributes: **ST** 12 [20]; **DX** 12 [40]; **IQ** 10 [0]; **HT** 10 [0]. [60 points]

Secondary Characteristics: Dmg 1d-1/1d+2; BL 29; HP 12 [0]; Will 10 [0]; Per 12 [10]; FP 10 [0]; Basic Speed 5.5 [0]; Basic Move 5 [0]. [10 points]

Advantages and Perks: Combat Reflexes [15], Fearlessness/2 [4]. [19 points]

Disadvantages and Quirks: Bloodlust [-10], Careful [-1], Uncongenial [-1]. -12 points]

Skills: Area Knowledge (Western USA) (E) IQ [1]-10; Brawling (E) DX [1]-12; Fast-Draw (Pistol) (E) DX+1 [2]-14*, Fast-Draw (Knife) (E) DX+1 [1]-13*, Fast-Draw (Shotgun) (E) DX+2 [2]-14; Guns/TL6 (Pistol) (E) DX+1 [4]-14, (Shotgun) DX+2 [3]-14 †; Holdout (A) IQ [2]-10; Melee Weapon (Knife) (E) DX [1]-12; Riding (Horse) (A) DX [4]-13; Savoir-Faire (E) IQ [1]-10; Streetwise (A) IQ [2]-10. [23 points].

* +1 from Combat Reflexes.

† Improved from Default.

Gear: Two Colt Lightning double-action revolvers (treat as Revolver, .38, p.B278); 10G double shotgun; large knife; cartridge belt with six rounds 10G and 20 rounds .38.

Eric "Eaglebeak" Ekberg, barnstormer (Cliffhangers)   135 points

Ht 6'2", Wt 155 lbs, Size Modifier 0, Age 37.

Appearance: Homely and ungainly-looking. Freckled complexion, green eyes, unruly dark brown hair, prominent nose, bad posture, walks with a limp.

Languages: English (Native); French (Accented) [4]; Russian (Broken) [2]; Mandarin Chinese (Broken) [2]. TL: 6. Cultural Familiarities: Homeline. [8 points]

Attributes: **ST** 10 [0]; **DX** 13 [60]; **IQ** 12 [40]; **HT** 11 [0]. [100 points]

Secondary Characteristics: Dmg 1d-2/1d; BL 20; HP 10 [0]; Will 12 [0]; Per 14 [10]; FP 11 [0]; Basic Speed 6 [0]; Basic Move 3 [-15]. [-5 points]

Advantages: 3D Spatial Sense [10]; Acute Vision/2 [4]; Charisma/2 [10]; Daredevil [15]; Fearlessness/2 [4]; Less Sleep/1 [2]. [30 points]

Disadvantages and Quirks: Agnostic, but keeps kosher when possible [-1]; Appearance (Unattractive) [-5]; Broad-Minded [1]; Charitable (12) [-15]; Debt/5 [-5]; Easy to Read [-10]; Incompetence (Accounting) [-1]; Lame (Crippled leg) [-10]; Overconfidence (9) [-7]; Pacifism (Self-Defense Only) [-15]. [-70 points].

[39 points]

* includes bonus for 3D Spatial Sense.

Gear: Leather Jacket; Leather Pants; Leather flying helmet; leather gloves; shoes; pocket knife; cigarette lighter. Gear in plane includes Auto Pistol, 9mm, with lanyard and 100 rounds ammo; Flak Jacket; Crash Kit; mechanic portable tool kit; heavy flashlights; telescope; flares; and sleeping bag.

Eric Ekberg was an impressionable seven year old when he first heard that the Wright brothers had flown, and from that day, he became obsessed with becoming a pilot. Even being shot down over France during the Great War didn't extinguish his love of flying, though it diminished his enthusiasm for dogfights. While recuperating from a shattered leg, he thought back on the two enemy pilots he'd shot down and decided that if he were to fly again, he wanted to save lives rather than take them.

In 1920, Eric bought a cheap war-surplus biplane and became a barnstormer, making some money on the side during Prohibition flying good booze from Canada into the U.S. His dream of saving lives with his plane came true in 1929, when he was able to find the missing son of a millionaire lost at sea, and drop him an inflatable boat and some emergency supplies. The grateful magnate bought Eric a larger plane -- a Stinson Detroiter -- and Eric set up his own charter business. He's a much better pilot and mechanic than he is a businessman, however, and often turns down safe and steady work in favor of mercy missions or risky propositions that will enable him to fly to new places.

Campaign Uses

Eric makes a useful Ally or hireling, as he can take the PCs to all but the most inaccessible spots on the globe (his plane can be fitted with skis or floats as well as wheels). He can also come to their rescue when they need it -- and discuss the bill later.

Other Settings

Eric is designed for a Cliffhangers campaign, but could still be flying in any later era -- even in a small starship or a parachronic conveyor.

Stinson Detroiter: TL6; **ST/HP** 45; Hnd/SR 0/3; **HT** 10f; Move 2/55; LWt 2.25; Load .66; SM +5; Occ 1+5P; DR 4; Range 750; $12.5K; Loc G2WWi; Stall 30.

Virgil "Gus" Pastore, Taxi driver (modern day)   45 points

Ht 5'8", Wt 190 lbs, Size Modifier 0, Age 43.

Appearance: Average complexion, dark brown eyes, receding dark brown hair, stocky and somewhat pear-shaped.

Languages: English (Native); Italian (Native) [6]. TL: 8. Cultural Familiarities: Homeline. [6 points]

Attributes: **ST** 10 [0]; DX 10 [0]; **IQ** 10 [0]; HT 9 [-10]. [-10 points]

Secondary Characteristics: Dmg 1d-2/1d; BL 20; HP 10 [0]; Will 10 [0]; Per 11 [5]; FP 9 [0]; Basic Speed 4.75 [0]; Basic Move 4 [0]. [5 points]

Advantages: Contacts (Military, usually reliable, skill 15, 6-) [2], (Police, usually reliable, skill 12, 9-) [2], (Street, somewhat reliable, skill 15, 9-), [2]; Eidetic Memory [5]; Night Vision/5 [5]; Sensitive [5]. [31 points]

Disadvantages and Quirks: Addiction (Amphetamines, see p.B440) [-5]; Appearance (Unattractive) [-5]; Combat Paralysis [-15]; Curious (15) [-2]; Dreamer [-1]; Lecherous when drunk [-1]; Overweight [-1]; Sports fan, especially football and boxing [-1]; Unfit [-5]. [-36 points].

Skills: Area Knowledge/TL6 (City) (E) IQ+4 [12]-14; Boxing (A) DX [2]-10; Current Affairs/TL8 (Regional) (E) IQ+3 [8]-13; Driving/TL6 (Automobile) (A) DX+2 [8]-12; First Aid/TL6 (E) IQ [1]-10; Gambling (A) IQ [4]-11; Guns/TL8 (Pistol) (E) DX [1]-10; Mechanic (Gas engines) (A) IQ+1 [4]-11; Merchant (A) IQ [2]-10; Navigation/TL8 (Land) (A) IQ [2]-10; Savoir-Faire (E) IQ [1]-10; Scrounging (E) Per [1]-11; Shadowing (A) IQ [2]-10; Streetwise (A) IQ+2 [8]-12; Writing (A) IQ-1 [1]-9. [56 points]

Gear: Snub revolver, .38; cell phone with camera; Ballistic Vest; leather jacket; leather cap; shoes.

The youngest of five brothers, Virgil Pastore spent most of his childhood wearing hand-me-down clothes, playing with hand-me-down toys, and riding hand-me-down bicycles. Even his jobs as a taxi driver and pizza delivery boy had previously belonged to his elder brothers while they waited to start their new careers -- in the Air Force, police, and fire departments respectively (the eldest, the only one the family could afford to send to college, became a priest). After failing to make it through basic training or win a scholarship and being rejected by the police force, NASA and the C.I.A., Virgil decided to become a writer, driving the taxi while he waited for his big break. Twenty years later, he's still unpublished and still driving the taxi. He does, however, know his city and its people extremely well -- from the scum to the dregs and everything in between, as he likes to say. Some of his knowledge comes from his brothers, but most of it is first-hand. To him, it's research for the thrillers he writes when he's off-duty. For the heroes, it may be exactly what they need to know.

Gus has convinced himself that most of the city's criminal enterprises are merely meeting demand, and that most crooks only kill each other. If he has a good or better reaction to the PCs (a large tip helps -- and if there's any chance of glory, that's even better), he'll give them any help he can, but he won't knowingly be an accomplice to a crime against innocent people. He's no vigilante, however, and is much more likely to reach for a cell phone and call the cops than he is to draw his gun.

Campaign Uses

Gus is most useful as a guide to an unfamiliar and dangerous city. He knows the best places to shop for almost anything, legal or illegal, including weapons and hirelings. He knows which cops and judges can be bought, and the going price, and which are incorruptible. He knows where the politicians and organized crime figures can usually be found, and the places where the police only go in force. He knows short-cuts that will get the PCs somewhere ahead of the villains -- and he's almost always delighted to be asked to follow another car.

Other Settings

Variants of Gus may be found pulling rickshaws, pedaling trishaws, poling gondolas, or driving cabs (albeit hansom cabs) in a wide range of historic as well as modern or near-future game-worlds. In a *Supers* campaign, his admiration for sporting heroes will be replaced by a fascination with super-heroes. In an *Autoduel* world, he would be mostly unchanged, though his car is likely to be much more interesting.

Professor Melissa de Jong, Starship captain (Space)   *200 points*

Ht 5'6", Wt 115 lbs, Size Modifier 0, Age 96.

Humanoid female, attractive, pitch-black skin, dark green eyes, bald.

Languages: English (Native). TL: 10. Cultural Familiarity: Homeline (Sector).

Attributes: **ST** 9 [-10]; **DX** 11 [20]; **IQ** 13 [60]; **HT** 11 [10]. [80 points]

Secondary Characteristics: Dmg 1d-2/1d-1; BL 16; HP 9 [0]; Will 13 [0]; Per 13 [0]; FP 11 [0]; Basic Speed 5.25 [0]; Basic Move 5 [0].

Advantages: Acute Vision/2 [4]; Deep Sleeper [1]; Doesn't Breathe (Limitation: Oxygen Storage, can hold breath for 50 times as long as usual) [12]; Eidetic Memory [5]; G-Experience (all) [10]; High Manual Dexterity/3 [15]; Protected Senses (Vision) [5]; Sensitive Touch [10]; Serendipity/1 [15]; Temperature Tolerance/3 [3]; Tenure [5]; Vacuum Support [5]. [90 points]

Disadvantages and Quirks: Absent-minded about eating [-1]; Attentive [-1]; Curious (9) [-7]; Imaginative [-1]; Impulsiveness (15) [-5]; Pacifism (Self-Defense Only) [-15]; Stubborn [-5]; Uncongenial [-1]; Xenophilia (12) [-10]. [-36 points].

Skills: Administration (A) IQ-1 [1]-12; Archaeology (H) IQ+1 [8]-14; Area Knowledge (Galaxy) (E) IQ [2]-14; Astronomy/TL10 (H) IQ-1 [2]-12; Beam Weapons/TL10 (Pistol) (E) DX [1]-11; Breath Control (H) HT-1 [2]-10; Climbing (A) DX [1]-10; Computer Operation/TL10 (E) IQ [1]-13; Current Affairs/TL10 (Science & Technology) (E) IQ [1]-13; Engineer/TL10 (Starship) (H) IQ-2 [1]-11; Environment Suit/TL10 (A) DX [2]-11; Expert Skill (Xenology) (H) IQ+1 [8]-14; Free Fall (A) DX [4]-12; Freight Handling (A) IQ-1 [1]-10; Geography/TL10 (Earthlike planets/Physical) (H) IQ-1 [2]-12; Navigation/TL10 (Space) (A) IQ [2]-13; Photography/TL10 (A) IQ [2]-13; Physician/TL10 (H) IQ [2]-13; Piloting/TL10 (High-Performance Spacecraft) (A) DX+2 [8]-13; Research/TL10 (A) IQ+1 [4]-14; Savoir-Faire (E) IQ [1]-13; Scrounging (E) Per+1 [2]-14; Search (A) Per+1 [4]-14; Survival (Earthlike

Desert) (A) Per+1 [2]-13; Writing (A) IQ [2]-13. [66 points]

Gear: Laser Pistol (see p.B280); TL10 Vacc Suit (see p.B285).

Melissa de Jong retired from teaching xeno-archaeology at Oxford more than twenty years ago, but remained at the university as a tenured research fellow longer than anyone expected. Eventually the college bursar decided that it would be cheaper to buy her a used Survey Service scout-ship than to keep paying her travel expenses. Melissa was delighted, and had her brain transplanted into an android body capable of surviving brief periods in vacuum and other hostile environments before stocking the starship with ration packs and bottles of good wine, downloading her library into the computer, and taking off. She re-appeared a year later, transmitted a report to the university and re-stocked the ship, then set off again in search of new sites.

Melissa isn't a particularly good pilot, navigator or engineer, and tends to leave these details up to the ship's long-suffering AI (which also has to remind her when to eat) or to the rare graduate student brave enough to fly with her. Because her greatest discoveries have come out of following her hunches, she never files a flight plan and could turn up anywhere at any time -- possibly exactly when the PCs need transportation off-world. She will rescue people in need, but will not accept money from them -- though she may allow them to work their passage. The problem with relying on Melissa for a lift is that she will not be swayed from her own apparently random course, and the PCs may have to make several lengthy unexpected stops before reaching another starport.

Campaign Uses

Melissa de Jong is intended primarily as a means of rescuing stranded space travelers and taking them to other planets of the GM's choosing, though it is also conceivable that the PCs will be hired to locate and possibly rescue her.

Other Settings

Someone like Professor de Jong would be even more dangerous in charge of a parachronic conveyor or time machine than a starship. In lower-tech settings, she could be converted into a marine archaeologist with her own research vessel, or a paleontologist roaming the wild west in a prairie schooner.

Adventure Seeds

One-Horse Town *(Deadlands/Old West):* The PCs spend the night in a small town, and wake up to find their horses have been stolen. The only other transport available is Christy Lee's coach -- and Christy is more than willing to help them, as she detests horse thieves, is heading towards the town where the thief is likely to try to sell the horses, and needs a replacement for her Expressman (who has contracted food poisoning and is too sick to finish the journey). She'll pay the best shot in the posse $2/day to ride shotgun with her, which should more than cover the 15 cents per mile she charges the rest of the heroes and any other passengers.

Unfortunately, Christy and the PCs are riding into an ambush. In a Deadlands campaign, her strongbox contains a relic, an unholy symbol which attracts abominations. In an Old West campaign, it contains a 600-lb solid lump of silver and a diamondback rattlesnake.

Emergency Exit *(Cliffhangers):* The heroes have just succeeded in raiding the stronghold of Aryan Shah, a Tajik mercenary who has installed himself as a warlord in northern Afghanistan, while Shah's lieutenant was away leading a raiding party. Erik Ekberg arrives to pick them up -- but there's a small complication. Shah's collection of art treasures and antique weapons is heavy and bulky, and the PCs have also liberated his harem of five women kidnapped from different countries. Ekberg will give first priority to the wounded, then to the rescued women, then to healthy adventurers, and finally to the loot. His Detroiter seats six, but by removing all the seats but his own, he can squeeze 1320lbs worth of people and/or cargo in at a time. The return trip to Kabul, the nearest airfield and relative safety, takes six or seven hours; the raiding party may return at any time.

The women's weights range from 80 to 200 lbs (3d+2 × 10 lbs), their ages from 13 to 38 (5d+8); none speaks English (their native languages are Korean, Swedish, Kiswahili, Hindi, and Portuguese), but all have learned Broken Farsi (Persian). If communication breaks down (or on a bad or worse reaction roll), the women may not trust or co-operate with the rescue -- and the PCs may understandably feel nervous about leaving them alone with the more portable items of loot.

Connoisseur (Visual Arts), Archaeology, or Merchant skills will help the PCs pick the most valuable items out of Shah's collection.

Those in Peril on the Sea *(Weird WWII):* 1943: the PCs, escaped POWs or downed aircrew, have reached Denmark in the hope of making their way to Sweden and then back to England. They are offered shelter by an old gypsy who says she can provide them with a boat, as long as they help escort her family and a group of Jews past the SS patrols to the coast.

The gypsy's boat, when it arrives, is Ragnar's drakkar. Some of the refugees fail their fright checks, and have to be manhandled on board. And a few miles from the Swedish shore, the drakkar encounters another ghost ship -- a medieval cog (p. 464 of the *Basic Set*). The ship has no weapons, but ten of its crew are soldiers armed with crossbows (skill-13); one fires at what he thinks is a ghost ship. The shot misses, but at least one PC should realize that the crossbows have a much better range than the vikings' weapons, and that an attack on the cog is likely to cause unnecessary casualties. It's up to the PCs to persuade Ragnar to stay out of range and keep heading for shore, rather than attacking the cog.

Reflected Glory *(Supers):* The metavillain Luxor, with his power to cast laser beams or blinding flashes from his glowing eyes, has escaped from a SWAT team after being badly wounded. The next day, the PCs receive a call to say that a local cabbie claims that Luxor, in plain clothes, fled the scene by catching his cab. The cabbie, Pastore, can confirm that he made a pick-up in the appropriate general area shortly after Luxor's escape, and offers as proof the bloodstains in the back of his cab -- which glow pink in the dark. Pastore doesn't want money for revealing the location of Luxor's possible hideout: he wants to take the supers there himself, so that he's part of the story if Luxor is captured. Pastore has the right location -- but the hideout, underneath a scientific supply warehouse, is defended by Luxor's laser and bio-chemical weapons, and Luxor's super-powered allies will come to his aid if need be.

Ars Longa, Vita Brevis *(Space):* The PCs are stranded parsecs from any inhabited world when their stardrive fails catastrophically, and Melissa de Jong's scout-ship is the first to answer their distress call. Unfortunately for the heroes, de Jong insists on going to the uninhabited world of Shakak before the summer thaw ends and the ruins there are once again buried beneath the icecaps.

Shortly after de Jong and the adventurers land, another ship comes down nearby -- thieves, intent on looting the site of valuables. They're only lightly armed, but they outnumber the PCs two to one. The good news is that their ship is the same model as the heroes, and if they steal the parts they need to repair their own ship, the thieves will be stranded on Shakak's icecap until the police arrive.

Murphy's Rules

Avoid Endless Romps in Hallways

Having finally completed my latest big writing project a couple of day ago (or, at least, the contractually required first draft of it), I find myself breathing a sigh of relief at having successfully pushed another freelance demon down the stairs, causing him to twist his ankle slightly before springing up -- fully healed -- in a dramatic fashion to continue the pursuit anew. And, while I live in fear that the sumitted document contains 64-word sentences such as the one proceeding this one, I figure any catastrophic oversights are what second drafts are for. So, as a result, I've taken a couple of days off, assessing what went right and what went wrong with my latest writing venture.

Now, I won't bore you with those details, but I will note that a fair bit of consternation was caused by the fact that I've spent, roughly, 75% of my time in the past two weeks in my office. Now, I think I've described it in the past, but my is actually a converted walk-in closet. This has some definite advantages; for one thing, heating's a cheap snap, even in the chilly winter . . . closing the door is usually enough to maintain the temperature level, thanks to the constant hum of the computer, monitor, and printer, and turning on a space heater for a few minutes is enough to get the entire room toasty. Another advantage is that this organizational legerdemain resulted in another "room" for meager our two-bedroom apartment (since I exhibited the wisdom that God gave earthworms by insisting the new Mrs. got the second bedroom for her secret Fortress of Solitude).

But there are also some really big disadvantages, such as needing to remember to leave the room every so often so the air can replenish. And even more significant than the fear of suffocative death is the fact that it's pretty boring spending multiple hours at a stretch in a 10"×5" windowless room. Attempting to alleviate the boredom I dug up my old *Mystery Science Theater 3000* tapes from Cardboard Box #4815162342, and I blared in the next room's VCR.

Please note that, in accordance with the Columnist Information Act of 2003, I am required to assure you at this time that this article *will* tie into gaming. One of the episodes I had on a near-continuous loop was one called ["Soultaker."](#) Like so many MST3K episodes, the underlying movie was pretty bad. Without giving away too much about said movie, approximately 1,624% of the movie takes place in a hospital, with people running around the hospital, having exposatory scenes in the hospital, getting into chases in the hospital, and -- in a climactic moment of the film -- jumping off the roof of the hospital, landing outside of the hopsital, and then running back *inside* the hospital. This is a pacing coup de grace of plentiful pain.

Anyway, my mind escaping inside my skull as it's often wont to do, at some point around word 26,000 I realized that the movie *Soultaker* and I had something in common -- we couldn't escape our respective "prisons" (be they hospitals or closets). And it's a problem I've noticed with some RPG adventures, including some I've run: Namely, the reticence to change the scene. Many badly paced movies have a problem with pacing a scene, including knowing when to make a change of scenery. So do many gaming adventures; some tales have the PCs running around the same sets of rooms over and over, or hanging out at the same spot too long.

My late, great former writing professor [Jerome Stern](#) told us about an interesting way to watch a movie (at least from an audience/writer's standpoint). For each scene, determine at what point the purpose of the scene has been established, then start doing a mental second-count to see how much longer the scene lasts beyond that. For example, if the purpose of the scene is to establish, "These two characters are falling in love" or "this mastermind is evil"; while it's often impossible going into a new movie to determine what a scene is doing, it's surprising how often it's *not*. (As an aside, this was one of my big criticisms about the movie *Good Will Hunting,* a film universally beloved by my friends and peers, depsite having scenes that generally lasted about a minute or so too long. "Yes; you're brilliant and rage-filled and no one understands you. Got it.")

Now, it's entirely possible to be at a set location for an extended period of time (and, indeed, I've [given](#) such [advice](#) in the [past](#)), it's important to make sure that your locations have variations, sublocations, and interesting permeutations. And, in the gaming world, it's also important to know when to do a screen-wipe and go on to the next scene.

For the rest of this week's column, I'll be looking at the first half of that equation: variations, sublocations, and permeutations.

Soultaker's crime was not setting the entire movie in a hospital; entire television series have taken place within hospitals. (I'm sure movies have, but I can't think of any right now.) No; what *Soultaker* got wrong was in having so much of the movie take place in chase scenes in the hallways of a hospital. Sadly, I can't think of any easy way to fix such a deficiency, since no matter how much you spruce up a hallway you still end up with a spruced-up hallway. But hospitals, in and of themselves, aren't boring. And even the most seemingly boring places can have interesting twists and possibilities spun on them.

Let's see if we can't approach the gamability of one of the most boring examples I can think of: The courtroom drama. While these can play out pretty well on television (I'm a big fan of the 87 *Law & Order* franchises), the basic idea of "judge, jury, prosecutor, defense, witnesses" etc. sounds like a pretty boring gaming session. Now, I've even run a courtroom drama as an RPG adventure -- once. And it was pretty fun and well-received . . . once. But the idea of doing that week after week -- or even for a three-part adventure series -- doesn't fill me with warm fuzzies.

But then I just start brainstorming all the places I could use in a courtroom drama series. Staying within the courthouse itself:

- Courtroom
- Judges' chambers
- Hallway
- Jury room
- Courtroom corridor (probably the best spot for those dramatic hallway screaming matches)
- Security entrance area
- Clerks' offices
- Restrooms (lots of deals can get brokered with words and a handshake . . . minus the handshake)

Now, I note that that's seven spots right there . . . and some of them have multiple possibilities. (For example, each judge has his own chamber, so each of those chambers could be made as distinctive and unusual as the judges themselves should be.) And this doesn't even count the possibilities that come in if you can go outside the courthouse, since that's part of next week's column.

What does this list mean? Well, for many players (including myself and most of the ones I've been with) having possible changes of scenery means that you get a chance to refocus, to think of the adventures as having scenes, rather than being a long, boring sequence of events like real life. For example, let's say the judge needs to make a decision from the bench. Well, while it's probably possible for him to make his decision and go on with the game, it's often equally possible for the judge to retire to his chambers. And if the GM looks at his watch and realizes that it's been an hour since the last scene change, why not have that judge go to chambers? Heck, there are two easy possibilities right there: the judge summons the laywers (at least one of whom is bound to be a PC) for a private discussion, or a recess is declared and all the lawyers and other characters (again, probably including a handful of PCs) will have to stand around and possibly interact elsewhere.

And, depending on how "cinematic" you want to be (for sufficiently Ally McBeal-y values of "cinematic"), it's also possible to introduce various permutations within the locations themselves. We've already talked about having different judges' chambers; now, what if each courtroom had something interesting going on in there? For example, maybe the acoustics are oddly off in one courtroom, so that lawyers need to speak unusually quietly or loudly to be understood. Or maybe only one courtroom is set up for video recording, so all the "high-profile" ones need to go there. Maybe one courtroom has been recently renovated, and it has all the "new" material, is the most compelling/comfortable. And so on.

Even the most seemingly standardized locations all have personality and quirks; insinuate to any diehard baseball fan that all stadiums are the same, and you'd better prepare for an earful. As such, even an office with a hundred different cubicles has the possibility to be not one boring location, but a 100+ interesting ones. Think about the possibilities, and go outside the box. After all, it's like they say: Scenery is belivery.

--Steven Marsh

The Best of Both Worlds

Bringing Psionic Power Levels and Skills into *GURPS Fourth Edition*

by Reverend P. Kitty

With the change from "Power Groups" to the new "Talent, Abilities and Power Modifier" approach, psi has become incredibly versatile. Players and GMs can create anything they might envision, secure in the knowledge that it can be made into an ESP ability with the simple addition of a power modifier. However, a blank canvas can be rather intimidating, especially to an inexperienced player (or GM). And even many of the seasoned *GURPS* gamers still look to the old Third Edition Power Groups, longing for a return to the psionic dichotomy of Power and Skill.

It makes sense. The concept -- that your Power determines what you can do and your Skill determines how well you can do it -- is both logical and easy to understand. It can also be simpler for new players and GMs in a hurry. While there are many players who love sitting down and figuring out which advantages are needed and adding in all of the enhancements and limitations to create the perfect psionic ability, there are at least as many who would rather just look at a shopping list of what's available, write "Telesend, Power 4, Skill 13" on their character sheet and be done with it. Fortunately, this is still possible to do in Fourth Edition.

All it takes is a little bit of advance planning.

Forged from Raw Power . . .

While Power Groups are gone for good, it's still simple to turn each specific psionic ability into a leveled advantage. The first step is to determine how many levels to offer. While you can have any number from two (a "low-powered" and "high-powered" version of each ability) to two dozen, I've found that five levels works well. It offers enough variety to keep things fun, while ensuring that there's a significant difference between what the different power levels can do.

After determining your power range, you want to figure out what those power levels mean to you -- as well as approximately how much each level should cost. You'll probably need to adjust these a few times as you work out each ability, but it's good to start off with guidelines. For five levels, the following seems logical:

1. *Weak.* For a psi who only wants the ability as a backup power. Should cost around 10-15 points.
2. *Underpowered.* A good level for secondary abilities for any starting psi. Should cost around 15-25 points.
3. *Average.* Good enough to be a psi's primary ability if he has other talents. Should cost around 25-35 points.
4. *Powerful.* Good enough to be a psi's primary ability even if he can't do much else. Should cost around 40-50 points.
5. *Dominating.* The level of ability that psionic characters will be hoping to reach. Should cost around 60-70 points.

This progression is somewhat slanted towards 100 to 200 point psis. In a four-color supers game, it would make sense to add another five levels and keep going -- all the way into levels costing hundreds of points each!

Once you've established your guidelines, it's time to decide what abilities are available. Think about the classic tropes of each psionic power and what you want psis of each flavor to be able to accomplish . . . or just steal brazenly from the old *GURPS Psionics.* Bear in mind that, in some cases, it will make sense to combine abilities (see Mental Blow, below, for an example) or even to split one into two or more. For example, the old Telekinesis ability, with all of its special tricks from *GURPS Psionics,* could be split into "External TK" (Telekinesis, to pick someone up), "Internal TK" (Crushing Attack with Malediction, to squeeze someone's organs), and "Projectile TK" (Piercing Attack with Accessibility: Requires Small Rocks, to fling pebbles at the speed of bullets).

Finally, all that remains is putting it together. For each ability, decide what the power levels mean to you and build them. It can be intimidating at first, but is easier than it seems. Some advice:

It will usually be easy to choose the base advantage, but certain cases may be tricky. Don't hesitate to combine advantages, or even to replace one advantage with another as you rise in power level, as long as it makes sense for *that psionic ability.* Think of it as "upgrading" from one advantage to the other as the character advances. (See Illusion, below, for an example.)

For the lower levels (Power 1 and 2), most advantages will need to be limited to reduce their effectiveness and fit the point budget. Judicious use of Contact Agent, Costs Fatigue, Racial (or an equivalent Accessibility or Specialized), Sense-Based, Short-Range, Takes Extra Time, Takes Recharge, and Temporary Disadvantage can help keep costs down, and are all appropriate for the psionic genre.

By Power 3, you want the ability to be fairly unrestricted for normal use, though it's okay if it lacks certain frills. In higher levels (Power 4 and 5), try to work in whatever neat specialized enhancements the base advantage offers or, perhaps, add another related advantage. If the second advantage compliments the use of the primary one, join them together via Link or Follow-Up. If the second advantage is more of a "powered-up" version of the primary, you can save points by making it an Alternative Ability (*Powers,* p. 11). In such a case, you can only use one of the advantages at a time (and must take a second to switch between them unless they're both attacks), but you get the less expensive one for 1/5 cost!

If you can't seem to build an ability on the point scale you've allotted, perhaps because the base advantage is too expensive, you have some options. If it's close, you may wish to change your guidelines to accommodate it. If not, it may be simpler to just establish a second set of "power level guidelines" for it; see Telecontrol, below, for an example of this.

A fully worked example of this process, Telepathy Power, appears below.

. . . and Tempered by Skill

Using psionic skills gives the game a very different feel than rolling against attributes does. Players have far more control over how well their character handles his psi, from near-incompetence to mastery. And it's a simple thing to add.

The optional *Skills for Everyone* sidebox on p. 162 of *Powers* has rules for "power skills" -- skills which represent the training required to properly use one's superhuman abilities. If the psi would normally roll against IQ to use his abilities, he instead rolls against an IQ/H skill. Talent adds to the skill, of course, and the point cost of the ability is unaffected. The drawback of having to buy an additional skill is more than balanced out by the potential to raise one's skill level far beyond the limits of "attribute plus Talent".

Note that only one skill should be required per psionic ability, regardless of how many advantages comprise that one ability. For example, telepathic eavesdroppers buy a single Telereceive skill as opposed to buying separate Mind Reading and Mind Probe skills. This is both simpler and truer to the genre, in which reading other people's thoughts *and* memories is really one ability, not two. Because of this, if an ability consists of more than one advantage, it's important to make sure that they all roll against the same attribute. If they don't, use Based on (Different Attribute) to correct that.

Putting It Together: Telepathy

What follows is a worked example for Telepathy Power. It revisits most of the telepathic abilities from *GURPS Psionics,* though with a few changes. Mindswitch seemed to work out better as a lower level of Telecontrol, for example, and Mental Blow has subsumed Mental Stab and Sleep. Note that the type of Social Regard used for Aspect will depend on the telepath's avatar.

Telecontrol is a good example of adjusting point limits. Because Possession is such an expensive advantage, there was no way to do Telecontrol justice on the same point budget as the others. Rather than crippling it or artificially inflating the power (and point cost) of every other telepathic ability, the point guidelines for Telecontrol were set at twice that of the other abilities. This way, a player building a psi can easily tell that taking Telecontrol is the equivalent of taking any other *two* telepathic powers.

The Telereceive, Telesend, Aspect, Suggestion and Telecontrol skills are all IQ/H (default IQ-6); the Illusion, Mind Shield and Mental Blow skills are Will/H (default Will-6); and the Telescan skill is Per/H (default Per-6). Telepathy Talent adds to all of these.

Telepathic Abilities

Telereceive: 12, 21, 35, 50 or 65 points

1. You can read another human's surface thoughts for as long as you remain in contact with them. You must touch their bare skin to do so and win a contest of your Telereceive skill versus Will. If you do not speak their language, you will only pick up on non-verbal cues such as emotions and urges. *Mind Reading (Contact Agent, -30%; Racial, -20%; Telepathic, -10%) [12]*
2. You can read thoughts at a distance, subtracting normal range penalties from your skill roll. *Mind Reading (Racial, -20%; Telepathic, -10%) [21]*
3. You can also go beyond surface thoughts, probing the subconscious mind for answers to questions. Roll a new contest for each question; repeated questions are at a cumulative -2 penalty. *Mind Probe (Racial, -20%; Telepathic, -10%) [14]; Mind Reading (Racial, -20%; Telepathic, -10%) [21]*
4. You can stay in contact with multiple people simultaneously. Your skill roll to contact a new person is at a cumulative -1 penalty for each person you're already linked to. You can only read one mind at a time, but you can switch between them with no roll and will notice if one of them is intentionally trying to get your attention. *Mind Probe (Racial, -20%; Telepathic, -10%) [14]; Mind Reading (Multiple Contacts, +50%; Racial, -20%; Telepathic, -10%) [36]*
5. You can read minds at incredible range. Subtract Long Distance Modifiers (p. B241) from your skill instead of normal range penalties. *Mind Probe (Racial, -20%; Telepathic, -10%) [14]; Mind Reading (Long Range 1, +50%; Multiple Contacts, +50%; Racial, -20%; Telepathic, -10%) [51]*

Telesend: 15, 18, 33, 45 or 60 points

1. You can transmit your thoughts to any nearby person. Roll your Telesend skill, at -1 per yard between you and the recipient; if you cannot see him, additional penalties apply (see p. B91). *Telesend (Racial, -20%; Short Range 2, -20%; Telepathic, -10%) [15]*
2. Your Telesend roll uses normal range penalties instead of being at -1 per yard. *Telesend (Racial, -20%; Short Range 1, -10%; Telepathic, -10%) [18]*
3. You can broadcast to everyone within a given range, at an extra -4 to your skill roll. *Telesend (Broadcast, +50%; Racial, -20%; Short-Range 1, -10%; Telepathic, -10%) [33]*
4. You can share your sense of sight with a willing subject as well as your thoughts, transmitting everything you can see. *Telesend (Broadcast, +50%; Racial, -20%; Short-Range 1, -10%; Telepathic, -10%; Video, +40%) [45]*
5. You can share all of your senses, not just sight! If the recipient(s) are willing, they can experience everything that you do, in real time. Your range is also increased greatly; apply Long Distance Modifiers (p. B241) to your skill roll instead of normal range penalties. *Telesend (Broadcast, +50%; Racial, -20%; Sensie, +80%; Telepathic, -10%) [60]*

Mind Shield: 13, 22, 36, 44 or 62 points

1. A mental barrier protects you from other psis intruding upon your mind. You get +4 to your quick contest against any mental intrusion (see p. B70 for details). In addition, when anyone attempts to locate your mind, you may roll against your Mind Shield skill (with the same +4 bonus) to resist it. You may voluntarily raise or lower your shield on your turn; it does not interfere with your own psi use. *Mind Shield 4 (Cannot Power Block, -10%; Telepathic, -10%) [13]*

2. Your bonus to resist mental invasion becomes +6. In addition, you can attempt to "power block" such attacks with your shield (once per turn). Make a separate roll against (Mind Shield skill)/2 + 3. Success means that your bonus is doubled (to +12) for the roll to resist the intrusion! However, failure means that your Mind Shield adds *nothing* to this one resistance roll. *Mind Shield 6 (Telepathic, -10%) [22]*

3. You now have +8 (doubled as usual for a "power block") to resist. In addition, you no longer have to lower your shield if you want to let a friend into your mind; you can create an opening for him without giving anyone else access. *Mind Shield 8 (Selective Effect, +20%; Telepathic, -10%) [36]*

4. Only the most skilled telepaths can penetrate your defenses. Your shield gives you +10 to resist attacks (+20 with a "power block")! *Mind Shield 10 (Selective Effect, +20%; Telepathic, -10%) [44]*

5. With effort, you can extend part of your mental defenses to protect those around you as well. This costs two fatigue points and lasts for one minute, during which time any of your friends in skin-to-skin contact with you have +5 to resist any intrusion. If you choose to "power block" (they cannot), their bonus is doubled as well (to +10) on a success and reduced to +0 on a failure. *Mind Shield 5 (Selective Effect, +20%; Telepathic, -10%) [22]; Mind Shield +5 (Affects Others, Area Effect 1, and Force Field, limited by Costs Fatigue, 2 FP, and Contact Agent, +88%; Selective Effect, +20%; Telepathic, -10%) [40]*

Aspect: 12, 20, 34, 44 or 68 points

1. You can exude a force of will that makes others notice you. Roll against your Aspect skill to use this ability; everyone in your immediate vicinity resists with their Will. (You may exclude anyone that you wish.) Everyone who fails reacts to you at +3 for as long as you remain near them and do nothing to upset them. Subjects can build up a resistance to your Aspect if you use it too much; victims are at +1 to their Will for every time you've affected them within 24 hours. *Social Regard +3 (Nuisance Effect, Subjects build resistance, -5%; Requires IQ roll, -10%; Resistible, Will, Quick Contest -15%; Selective Area, +20%; Telepathic, -10%) [12]*

2. Those affected react to you at +5. In addition, you project an "avatar", a subliminal image or emotion related to your personality. Unless you choose to hide it, everyone affected by your Aspect will sense this avatar and associate it with you. (A critical failure when hiding one's image causes it to be projected into everyone's mind in the most negative way possible.) *Perk (Mental avatar) [1]; Social Regard +5 (Nuisance Effect, Subjects build resistance, -5%; Requires IQ roll, -10%; Resistible, Will, Quick Contest, -15%; Selective Area, +20%; Telepathic, -10%) [20]*

3. Your reaction bonus is doubled (to +10) among those who find your gender attractive! *Perk (Mental avatar) [1]; Social Regard +5 (Doubled for opposite sex, +50%; Nuisance Effect, Subjects build resistance, -5%; Requires IQ roll, -10%; Resistible, Will, Quick Contest, -15%; Selective Area, +20%; Telepathic, -10%) [33]*

4. Instead of affecting those around you, you can focus your full Aspect onto a single person, overwhelming him with awe. He must be within 100 yards and able to either see or hear you. Roll against Aspect skill; your subject makes a Fright Check at a penalty equal to the amount you succeeded by. If he fails, roll 3d, add the result he failed by, and look up the result (as Awe) on the *Awe and Confusion Check Table* (**Powers,** p. 85). *Perk (Mental avatar) [1]; Awe (Alternative Ability, x1; Active, +0%; Increased Range x10, +30%; Telepathic, -10%) [36]; Social Regard +5 (Alternative Ability, x1/5; Doubled for opposite sex, +50%; Nuisance Effect, Subjects build resistance, -5%; Requires IQ roll, -10%; Resistible, Will, Quick Contest, -15%; Selective Area, +20%; Telepathic, -10%) [7]*

5. Your victims no longer develop a resistance, no matter how often you use this ability on them. In addition, you can awe everyone around you! This requires no skill roll and affects everyone who can see you. They must immediately make an unmodified Fright Check or suffer the appropriate result from the Awe table. As always, you may exclude whoever you wish. *Perk (Mental avatar) [1]; Awe (Alternative Ability, x1; Active, +0%; Cosmic, No bonus for repeated Fright Checks, +50%; Increased Range x10, +30%; Selective Area, +20%; Selectivity, +10%; Telepathic, -10%) [60]; Social Regard +5 (Alternative Ability, x1/5; Doubled for opposite sex, +50%; Requires IQ roll, -10%; Resistible, Will, Quick Contest, -15%; Selective Area, +20%; Telepathic, -*

10%) [7]

Note: If you don't have **GURPS Powers,** look up any failed Awe rolls on the Fright Check table (p. B360); it's close enough.

Illusion: 12, 25, 33, 48 or 66 points

1. You can disrupt a person's senses, flooding them with random images and sounds. This requires no skill roll, just one second of skin-to-skin contact. The victim can make a Will roll to resist. If he fails, his senses are overwhelmed (treat as hallucinating, p. B428) for one minute per point of failure, after which he recovers completely. *Affliction 1 (Will; Based on Will, +20%; Contact Agent, -30%; Hallucinating, +50%; No Stunning, -10%; Telepathic, -10%) [12]*
2. You can affect your target at a distance. Roll a quick contest of Illusion skill versus the victim's Will; you are at a -1 penalty for each yard to the subject. *Affliction 1 (Will; Based on Will, +20%; Hallucinating, +50%; Malediction 1, +100%; No Stunning, -10%; Telepathic, -10%) [25]*
3. Subtract normal range penalties (instead of -1 per yard) when affecting someone. Also, if you win the contest by more than 5, you have the option of removing any of your subject's senses instead of (or in addition to) making him hallucinate! *Affliction 1 (Will; Based on Will, +20%; Hallucinating, +50%; Malediction 2, +150%; No Stunning, -10%; Secondary Disadvantages, Blindness, Deafness, No Sense of Smell/Taste, Numb, +19%; Selectivity, +10%; Telepathic, -10%) [33]*
4. You can take complete control of your victim's perceptions. You can make him sense anything you wish (this cannot cause damage, knockdown, etc.), including nothing at all! Changing the illusion requires concentration. Duration is unlimited, but you are at a cumulative -1 penalty for every subject already under your control. *Illusion (Based on Will to use, +20%; Mental, +100%; Short-Range 2, -20%; Telepathic, -10%) [48]*
5. You can overload your subject's sensory input so strongly that they take damage. This requires intense concentration; you can only attempt it once every five seconds and have no active defenses on any turn in which you do so. Roll another quick contest of Illusion skill versus Will; on a success, the subject takes damage equal to your margin of victory. *Illusion (Based on Will to use, +20%; Mental, +100%; Short-Range 2, -20%; Stigmata limited by All-Out and Takes Recharge, +72%; Telepathic, -10%) [66]*

Mental Blow: 15, 21, 31, 48 or 66 points

1. You can attack another person's neurological system with your mind. You must have line-of-sight to them with your naked eye (the GM may require a vision roll if unsure) and win a quick contest of your Mental Blow skill (at -1 per yard of distance between you) versus their HT. If you win, they are physically stunned and must roll HT every second to recover. *Affliction 1 (HT; Accessibility, Only Humans, -20%; Malediction 1, +100%; Sense-Based, Vision, Reversed, -20%; Telepathic, -10%) [15]*
2. Your attack uses normal range penalties instead of being at -1 per yard. In addition, any victim who loses the quick contest by 5 or more is dazed (p. B428) for minutes equal to the margin, and then stunned (as above) afterward! *Affliction 1 (HT; Accessibility, Only Humans, -20%; Malediction 2, +150%; Secondary Dazed, +10%; Sense-Based, Vision, Reversed, -20%; Telepathic, -10%) [21]*
3. Those affected are automatically dazed for minutes equal to your margin of victory. If they lose by 5 or more, they fall unconscious (for the same duration) instead. Either way, they're stunned once they recover. You can also target opponents via indirect methods (e.g., seeing them via a live video feed) or if you know *exactly* where they are. *Affliction 1 (HT; Accessibility, Only Humans, -20%; Dazed, +50%; Malediction 2, +150%; Secondary Unconsciousness, +40%; Telepathic, -10%) [31]*
4. In addition to being dazed or knocked out, your victims immediately lose 1d-1 fatigue points if they fail to resist. *Affliction 1 (HT; Accessibility, Only Humans, -20%; Dazed, +50%; Malediction 2, +150%; Secondary Unconsciousness, +40%; Telepathic, -10%) [31]; Fatigue Attack 1d-1 (Follow-Up, Affliction, +150%; Telepathic, -10%) [17]*
5. Your victims now take 1d+1 damage when affected -- and you decide (before attacking) whether it comes off of their fatigue points or their hit points! *Affliction 1 (HT; Accessibility, Only Humans, -20%; Dazed, +50%; Malediction 2, +150%; Secondary Unconsciousness, +40%; Telepathic, -10%) [31]; Fatigue Attack 1d+1*

(Alternative Attack, x1; Follow-Up, Affliction, +150%; Telepathic, -10%) [32]; Toxic Attack 1d+1 (Alternative Attack, x1/5; Follow-Up, Affliction, +150%; Telepathic, -10%) [3]

Suggestion: 10, 20, 35, 45 or 60 points

1. You can verbally give one person a *simple* suggestion (see the Suggest skill on p. B191 for guidelines), which they will do their best to follow. Roll a quick contest of your Suggestion skill (minus normal range penalties) versus their Will. If you win, your control lasts for as long as you concentrate, then for minutes equal to your margin of victory. The GM may give the person extra resistance rolls for dangerous or repugnant suggestions. If you use this ability on a different person or fall unconscious, your victim regains his senses immediately. *Mind Control (Accessibility, Only Humans, -20%; Cannot Affect Multiple Subjects, -10%; Sense-Based, Hearing, -20%; Suggestion, -40%; Telepathic, -10%) [10]*

2. You can give your target complex and specific commands, not just vague suggestions. *Mind Control (Accessibility, Only Humans, -20%; Cannot Affect Multiple Subjects, -10%; Sense-Based, Hearing, -20%; Telepathic, -10%) [20]*

3. You can control more than one person, though you can only assume control of one person at a time. You are at -1 to skill for every subject already under your control, and any critical failure frees them all instantly. You can also choose to send your commands telepathically and thus silently. *Mind Control (Accessibility, Only Humans, -20%; Telepathic, -10%) [35]*

4. Once you have the subject controlled, you can rewrite their mental programming as well. Roll a second quick contest; your Suggestion skill is at -1 for every -5 points in disadvantages being added (and -1 for every *other* person currently under your control.) Each attempt takes one minute of constant concentration. The disadvantages last for days equal to your margin of victory; see p. B69 for details. *Mind Control (Accessibility, Only Humans, -20%; Conditioning, limited with Takes Extra Time x6, +20%; Telepathic, -10%) [45]*

5. As above, but fast! Each attempt takes only one second. *Mind Control (Accessibility, Only Humans, -20%; Conditioning, +50%; Telepathic, -10%) [60]*

Telescan: 12, 17, 31, 43 or 63 points

1. By remaining perfectly still and concentrating deeply, you can mentally search the surrounding area for a specific person's mind. Specify who you are looking for; it must be someone you have used your Telepathy on or have had frequent interactions with. The GM will roll your Telescan skill, at normal range penalties to the subject. On a success, you know the exact location of the subject and can target them with any telepathic abilities that do not require line-of-sight. This ability requires you to be completely immobile; it will not work in a moving vehicle, for example, and you get no active defense if attacked while using it. *Detect (Known Human Minds; Only finds the single mind specified, -20%; Precise, +100%; Telepathic, -10%; Temporary Disadvantage, Sessile, -50%) [12]*

2. Instead of specifying one person, you can scan the area for everyone that you know. The GM will look up the amount your Telescan roll succeeded by on the Speed/Range table (p. B550) and tell you the location of any and all people that you know within that range. Each turn, you can make a second, "follow-up scan" skill roll on any one person to identify them. You can now move while using this skill, but due to intense concentration, you are still defenseless if attacked in mid-scan. *Detect (Known Human Minds; All-Out, -25%; Precise, +100%; Telepathic, -10%) [17]*

3. Your scan can detect all human minds within range, known or otherwise. You can still make a follow-up skill roll to identify a known mind, but unknown minds are merely faceless positions. This does not prevent you from targeting them with appropriate psionic abilities, of course. *Detect (Human Minds; All-Out, -25%; Cannot analyze unknown minds, -10%; Precise, +100%; Telepathic, -10%) [31]*

4. You can search far and wide; your searches and scans use the Long-Distance Modifiers (p. B241) instead of the normal range penalties. In addition, you can make a second, follow-up roll on unknown minds. If successful, you learn basic information (e.g., "white male in his 30s"). *Detect (Human Minds; All-Out, -25%; Long-Range 1, +50%; Precise, +100%; Telepathic, -10%) [43]*

5. With one scan, you receive both the location and details of everyone within range, as if you had done a "follow-up scan" on all of them. You can then make a additional Telescan rolls to get even more information: the status

of a known person (e.g., "he's wounded and under attack") or the details of an unknown one (e.g., "she's an accountant named Tina Dobbs"), though only a critical success will reveal a secret identity. *Detect (Human Minds; All-Out, -25%; Analyzing, +100%; Long-Range 1, +50%; Precise, +100%; Telepathic, -10%) [63]*

Telecontrol: 20, 37, 67, 97 and 130

1. You can switch bodies with another person by concentrating for a turn and touching him. If you win a quick contest of Telecontrol skill versus Will (Will+5 if he's suspicious of your actions), you control his body, but he also controls yours. You each gain the other's physical abilities and retain your own mental ones -- see p. B75 for details. However, all of *your* attribute and skill rolls (except passive rolls for resistance, survival, etc.) are made at -1 due to the unfamiliar body and neurons. *Possession (Mind Swap, +10%; No Memory Access, -10%; Specialized, Humans Only, -40%; Telepathic, -10%; Temporary Disadvantage, -1 to all attribute/skill rolls, -33%*) [20]*

2. You can body-snatch at a distance; you may target any human being within 20 yards, at normal range penalties. *Possession (Mind Swap, +10%; No Memory Access, -10%; Ranged, +40%; Reduced Range 1/5, -20%; Specialized, Humans Only, -40%; Telepathic, -10%; Temporary Disadvantage, -1 to all attribute/skill rolls, -33%*) [37]*

3. Your Telepathy is strong enough to displace your subject's mind without giving them control over your body. While you control their body, yours remains in a trance; when your control ends, you come to, physically stunned (roll HT every second to recover). *Possession (Backlash, Stunning, -10%; No Memory Access, -10%; Ranged, +40%; Reduced Range 1/5, -20%; Specialized, Humans Only, -40%; Telecontrol, +50%; Telepathic, -10%; Temporary Disadvantage, -1 to all attribute/skill rolls, -33%*) [67]*

4. You can take a person over from up to 100 yards away. In addition, when you are finished, you awaken in your body immediately, alert and unstunned. *Possession (No Memory Access, -10%; Ranged, +40%; Specialized, Humans Only, -40%; Telecontrol, +50%; Telepathic, -10%; Temporary Disadvantage, -1 to all attribute/skill rolls, -33%*) [97]*

5. You adapt fully enough to suffer no penalties to attribute or skill rolls when borrowing someone's body. *Possession (No Memory Access, -10%; Ranged, +40%; Specialized, Humans Only, -40%; Telecontrol, +50%; Telepathic, -10%) [130]*

* This is treated as a -42 point meta-trait: ST -1 (Success rolls only, -50%) [-5]; DX -1 [-20]; IQ -1 [-20]; HT -1 (Active success rolls only, -80%) [-2], Basic Speed +0.25 [5]. Its value as a limitation has been adjusted to meet the "80% rule" on p. B115.

Keeping It Simple

With the complex, open-ended psionic system reduced to a clear, concise list, even first-time players will find it easy to pick and choose their psionic abilities. The simplest way to present this to them is to delete all of the game mechanics (in italics) and present the list to your players. Let them buy each psi ability as a self-contained advantage (e.g., "Suggestion 3 [35]") and take the appropriate skill for each.

If you believe your group would prefer a system even more straightforward and symmetrical, you can try this (strictly optional) approach: Average the costs for each level and come up with a simple, unified table for buying psionics. Don't worry about rounding errors; a point or two either way won't break anything.

Here's an example based on the Telepathy skills above:

Psionic Abilities

Power	*Cost**
1	12
2	20
3	33

4	45
5	65

* Double cost for Telecontrol

This has the effect of making psionics feel like more of a system, rather than a collection of abilities. It may not be right for every group, though, especially with players who want to know *exactly* where every one of their points is going.

The Results, Please . . .

A streamlined psionic system, based around universal concepts like power and skill, will make it easy for anyone to get into the game. New players will find the "shopping list" approach simple and nonthreatening, while experienced players will appreciate the options. Even expert rules tinkerers will find the worked examples useful as something to tweak to their heart's content. The net effect is that it lets everyone focus less on how to build their psi and more on roleplaying, which is always a good thing.

The Great Dice Source

He wafted in on a breeze of Doritos and Mountain Dew, wearing a weasel's mustache and possessing a voice two octaves too high for his ample bulk. That was my first meeting with the infamous Les Cheddarblok, dice king of the Rocky Mountain region. There were few who could surpass his desire for dice. Or his willingness to increase his collection no matter the means. I had heard rumors and I wanted them to stay just that -- rumors.

"I'm looking for Ms. Barnhorst. The Dice Detective," he said as I looked up from my stool behind the counter.

"You're looking at her, bud," I growled. "Whaddya want?"

"Lucky told me I might find you here. Said that you might be able to help me with a little dice mystery."

"Lucky? What does he know about dice? He ain't rolled a natural 20 since he caused that total party wipeout in '02."

Cheddarblok stared at me. "If I understand Lucky correctly, he wasn't the only one responsible for that debacle." I winced. I could never live down the shame. The past is like deadbeat ex-boyfriends. Just when you think you've paid the piper with them, they come back with another debt that you owe. He continued, "I'm willing to pay well."

"And if you've been gabbing with Lucky then you know I'm out of the business. I ain't taking any new cases."

"I bet that you will after you see what I have."

A regular wandered into the store.

"I got customers to help and you ain't one of them, Mister."

C.W., a blond Pillsbury Dough Boy with a perpetually dissatisfied attitude, was one of those customers that made me want to take a hammer and smash my own skull with it. We had had our disagreements and I would have been happy if his oily shadow had never darkened our doorway again.

I addressed C.W., "You can't take a hint?"

"Did you know that the store domain name has been bought?"

"Yeah. . . we bought it ourselves. Kind of useful for us so that we can use it with our website. Why do you ask?"

"I checked. I figured that if someone hadn't already bought it, I could buy it and then make you buy it from me. Oh, by the way, you guys hiring? You have an application I can fill out?"

I turned my back on him, fruitlessly hoping that he would get the hint and skedaddle but he wandered into the miniatures aisle instead. There was enough clutter back there that he might get lost for several days. I wasn't even sure what forgotten treasures he might find and I was fervently hoping that Black Pudding might find him instead. But then I heard a sound that I could not ignore, the sound of dice rolling. I shuddered and turned to face Cheddarblok. He had emptied a velvet-lined dice bag onto the counter. His fingertips, stained orange from years of Cheetos consumption, lightly stroked the pearls of gaming that he had thrown onto my front counter. I had vowed never to touch a polyhedral again but I moved forward when I saw what he had brought to me. Red and blue cubes of plastic sparkled as if lit with an inner vitality. My senses dimmed as I stared at them. Dice. My doom. My downfall. I could never forget the disaster I had caused when I had given into my greed for these babies.

"What are these to me, Cheddarblok?" My casual air didn't fool Les. He smiled out of the side of his mouth.

"Beautiful, aren't they? I acquired them some years back. But I am missing the eight-sider and the 10-sider. I've searched for years. I've sent agents investigating worldwide but I've exhausted all my resources. You are my last

option."

Some option, I thought to myself and I could tell that the Rocky Mountain Dice King agreed with me. Cheddarblok knew that he had me -- I needed to stall for time so I welcomed the interruption when another customer, the one we simply knew as Red Shirt Boy, approached us with awe in his face.

"Dice . . . these dice, they're the real thing, aren't they? I bet you if I had these kind of dice, I would never lose another character." Reluctantly he pulled his gaze from the shining cubes and addressed me. Ms. Barnhorst, ma'am, I have a *D&D* question for you."

"Don't you have a bus to catch?"

"I missed it. I can catch the next one."

"Haven't you heard? I don't do rules. Everyone knows that and I don't know how to play *D&D.* I'm the wrong person to ask." I don't have to tell this pipsqueak about that fateful day in '02. In those days, I was someone big in the gaming world around here. Gamers from all around knew that I was the One, the One who knew everything there was to know about rules, and I would sit in judgment of many a rules dispute.

"But it isn't actually a question so much as advice."

"You don't know who you are talking to. My advice don't come cheap, boy."

Red Shirt Boy plowed on. "I've always played *D&D* with miniatures but now I am playing with a *GURPS* group and they've never played with miniatures. They just keep everything in their head but when I am GMing I just can't keep it straight."

"Make them play with miniatures." I could feel Cheddarblok hovering, the dice calling me, and suddenly they seemed like welcome old friends.

"There's this other group that I play with and they didn't think that I could run an eight-foot Chinese ninja wearing a black cloak in the desert. Of course, when I fell out of the tree onto the fire and burned my cloak . . . " I refrained from asking about the tree in the middle of the desert and addressed the Dice King instead.

"If I take a look, tell you what I know, you'll leave me alone, right?"

He looked around at the dusty, nearly deserted store. This place had been big once, I mean really big, but it had declined as I had. The two of us, companions in decrepit destitution.

"To all this?" He asked with a sardonic twist to his lips.

"Yeah, to all this. Wanna make something of it?" I challenged him. He didn't answer me. "I help you and you leave me alone from now on, pal. We got us a deal?"

He nodded. I turned my attention to the dice and concentrated for a time. It could have been two minutes or two years. Red Shirt Boy had spied C.W. in the miniatures aisle and sidled up to him, never stopping his story about the misadventures of the Chinese Ninja. I welcomed the silence as it dropped over me as my hands moved of their own volition. I needed to touch the dice. I noticed a small child clutching a deck of *Yu Gi Oh* cards standing at my elbow.

"Where did you come from? There isn't a tournament today."

"Don't do it, ma'am. You'll regret it for the rest of your days. Don't do it."

"This ain't no place for a tadpole like you. Get out of here." My voice had thickened. I stared into the child's eyes and then I turned back to the dice, knowing even then that I was doing wrong.

"Don't do it." The child's voice had grown faint but I put that down to an addiction to the ink on the *Yu Gi Oh* cards he held. It was the only theory I had ever been able to come up that could explain these children's irrational devotion to such a non-game.

I forced myself to pick the dice up. They were cool in my hands yet burned with an inner fire. The polyhedral sets were identical in type except one was deep red and the other royal blue. My expert eye winced to see their perfection marred by their missing fellows. These little gems were valuable but their price would rise astronomically if the sets could be completed.

"Hmmm, the swirl pattern reminds me of Crystal Caste's Ice Cream series but they never did anything in these deep colors . . . and look at the numbers. Small, much smaller than what is being done now. With black ink for the numbers too. Black hasn't been used for dice like this since the early days of dice production in the 80s. No, these babies are old, really old."

"I know all this," the Cheddarblok agreed. "What else?"

"Nothing like this is coming out of the major manufacturers these days. Not Koplow, and not Chessex. The ink color is completely wrong for Crystal Caste -- they've been going with that teal color that everyone hates. Not Zocchi. The edges are too rounded." I looked up. "An independent? You got some rogue dicemaker working for you, Mr. Cheddarblok?"

"These aren't forgeries." He became agitated, pacing up and down the store aisles. I had given him what he wanted and now it was time for him to honor his part of the deal and exit this aging establishment. It, and I, had some decaying to get on with. I leaned back on my stool and pretended to go to sleep. I didn't think I was being too subtle.

He stopped and turned to me. "What if I told you that I think that these dice are special. That they are the motherlode themselves. That they come from the Great Dice Source, itself."

The Great Dice Source? That was a myth. There was no Great Dice Source. But then I thought about Red Shirt Boy's nearly primeval response to the dice when he had seen them. His character story had fountained from him. What if all the fables were true? What kind of effect would something like these dice have on real gamers?

Suddenly Red Shirt Boy piped up from somewhere in the stacks. "I was wondering if you had any job openings?"

"Nope, not right now."

"You always say that."

"Shuddup, will ya?"

I turned back to Les, "The Great Dice Source? You've been reading too many bedtime stories, Mr. Cheddarblok. You need to get some reality into your head."

"But I have evidence to the contrary . . . and a map. Just think. All the dice your heart could desire and they only roll the numbers you want them to. The gamer who possesses access to the Great Dice Source would be a wealthy beyond his wildest dreams."

"Or something like that." I was already caught in Cheddarblok's web and thus I had begun my downfall. My years at the store were waning and I would diminish and go into the West. Or the East depending on where the map sent me. I would listen to the Dice King's blandishments and set off on a journey beyond my craziest imaginings, a journey that would eventually lead to the downfall of gaming, itself.

But that is another story.

Graphics by Michael Menzel

96 tiles in four colors, 120 tokens in four colors, rules; full-color, boxed, 2-4 players; $19.95

You know how it is when you're sitting on top of the medieval food chain and your class has got it all: You want to add what others of your class have to your own pile. ***Raub Ritter*** (Robber Knights) is a game for two to four players of stealing away everyone else's property while protecting your own lands.

The object of the game is to score the most points for the towns you possess at the end of the game.

The countryside is composed of the landscape tiles everyone plays. Each player has his own stack, identified on the back by colored coats-of-arms, but once placed they're fair game for anyone to spread out on. Tiles are also labeled A through E, indicating the order in which they're drawn from your deck, though you can only play one of the three tiles that form your hand. This gives you a little leeway for choosing what to place first. Over the course of a turn, you'll play one to three tiles, drawing a new one as you go. Each new placement has to abut a tile someone already played side-by-side, but the playing field only expands until it forms a square. This is 10 tiles on a side for a four-player game, but no one knows the extent of the lands until the rows and columns are actually played. You may want to expand on this side of the mountains, but someone else may stretch things out on his end of the board, and once you get to 10 tiles in any direction, expansion stops . . . time to expand the other direction.

The countryside has three kinds of settlement: towns, villages, and castles, worth three, two, and one points respectively. There are also three kinds of terrain that affect the movement of knights: plains, forests, and mountains. When you set down one of your castles, you may put zero to five knight tokens on it (your supply is limited to 30 counters). These men move in a straight line from the castle, so you should make sure they have someplace adjacent to go before you drop them in. Once placed and moved, they stay put for the rest of the game.

When knights set out, they must leave tokens behind. A plains space requires one knight remain there; forests take two; and mountains eat up three of your stack. Since you only get points for the buildings, it's better if you place tiles containing those features for your knights to occupy -- empty landscape spaces just eat up your limited supply of knight tokens. Only the faction whose token is topmost on a stack at the end of the game gets points for that structure, so being first isn't always the best -- going in a later round lets you stack your tokens atop the old ones.

There's a four-token maximum, though, and everyone must obey the terrain requirement for leaving men behind. If you play two tokens on a forest space, the next player can and must leave two as well to make his mark there. If you put three knights on a forest space, though, the next person can't place the requisite two-token minimum without exceeding the five-token maximum. Mountains make good obstacles for these reasons, and everyone gets a lake tile that can be used to block. Play continues until the grid is filled out -- whether you have knights left to play or not -- at which point the top token on each building is determined and points assigned to their owners.

The components are simple and straightforward -- tiles and tokens -- but for all that they're still good work. You get wooden counters for the knights, and thick, colorful little tiles for the landscape. The towns and castles can start to look alike if you're not careful, especially if you allow yourself to be distracted by the terrain that surrounds them, and

you have to look at the illustration rather than the colors.

The rules are presented well, though getting all the math involved with token placement is your first big challenge. There are a lot of strategic options, but some players will find there are just too many to consider -- play can extend in several directions, and not just from tile placement. Hemming in another player is almost impossible, and sometimes your best bet is to play conservatively and try not to make as many mistakes as your opponents.

On the other hand, anyone who enjoys an expansive game will love curling up with ***Raub Ritter*** (and curling their head around the many possibilities), and perhaps the long view that accommodates a long learning curve is what will keep such a game fresh.

Practical Divination

Tricks for GMs

by Chris Wong Sick Hong

Most GMs are familiar with the following scene: after completing a great and arduous task, the players are permitted to ask one question of the oracle. Or they cast a spell which gives an answer of "yes" or "no" to a single query. And with a cleverly worded question and a gleam in their eyes, the players learn the one piece of information that turns the next few sessions from a Herculean labor worthy of their efforts into a cakewalk.

Most people enjoy a challenge, and turning a main encounter of the campaign into a walkthrough is unlikely to satisfy anyone's gaming urges. Players come to the table to do great things, not have fame and fortune handed to them on a silver platter. Unless, of course, getting the information itself was a triumph into which they put their blood, sweat, and tears. In that case, the challenge was not defeating the bad guy per se, but acquiring all the information necessary to do so. (This theme is especially common against near-omnipotent foes.)

But if the fight is meant to be challenging, there are still many options. To be consistent, however, which one you choose depends on the conceptual framework behind divination in your campaign. Where does the information come from? How specific and complete is the information gleaned? Is divination fallible? Together, the answers to these questions can not only provide solutions, but adventure hooks as well.

Technology offers insights into the nature of divination. Spy-planes, satellite photos, and even cell phones offer ways for people to learn about things far distant from their current location. To a medieval peasant, calling someone in Tucson to ask about the weather is powerful magic. The possibilities increase the higher on the tech scale you go. Thanks to quantum mechanics, you get things like being in two places at once and that old favorite, time travel.

A good way to handle divination in low-tech worlds is to compare it to its higher tech analogues. Asking the gods is equivalent to asking some superior race for help. Remote viewing becomes satellite recon. Telling the future stays the same, but the input of quantum mechanics can raise some interesting questions, such as whether or not the players are actually causing the future by viewing it prematurely. And time travelers are always interesting sources of information.

Anything that can go wrong with higher tech versions of information gathering can also happen in low-tech worlds. The gods are unhelpful or don't actually know everything. Remote viewing is blocked by a malicious presence. Time travelers with their own agendas try to influence the players by giving faulty information. Any adventure hook that focuses on intelligence gathering can be altered to work with divination in fantasy campaigns.

But by far the most important question about divination, game-wise, is whether it is accurate. If it isn't completely so, that always leaves outs. Perhaps the party learns the lunar wizard loses his power on the new moon. But since the wizard knows that too, he's stored some of his power in an artifact just for that purpose.

Types of Divination

Divination, even when telling the future, comes in one of two types.

Present-based divination relies on information that can be obtained in the present. This applies to all types of clairvoyance, clairaudience, and other forms of remote sensing, as well as some predictions of the future. A modern analogy would be weather forecasting. They use information available now to make educated guesses. Though if the PCs are placing their lives on the line, hopefully their guru is a little more accurate than the Channel Five news at five.

Future-based divination exclusively tells the future, but unlike extrapolations, the diviner actually yanks information from the future, when the event in question has already happened. This type, while potentially more accurate, raises questions about free will and the nature of time. (If the diviner sees a PC screwing up, is the PC doomed to do so?

Divination that is completely accurate raises a few more problems. With present-based divination (see sidebar), that usually means the GM can't change monster weaknesses on the fly, but with future-based divinations the issue of free will is raised. If it concerns NPCs, there's not much problem because the GM can make happen whatever needs to happen. But if the PCs watch a fortune-telling scene unfold with them in it, is it acceptable to take control of them away when that time comes? Some story-oriented players will accept that, but most will want to defy their "fate."

The easiest way to handle this is to make the information incomplete enough that the party has no idea what ultimately happens. For example, cyberpunk heroes, facing an upcoming battle with a sentient computer virus and its cyborg allies, find a surveillance tape from the complex the battle is going to be held in. But, due to fluxes in space-time caused by the virus's experiments, the tape is of the battle itself. One way to handle the tape is to make it fallible, merely showing one of many possible futures. Another way is to limit the information that can be usefully gleaned. Perhaps the tape only shows the party carefully taking their positions just as the cyborg armies bust through doors number four, six, and seven. And as the battle begins, the surveillance tape shows a curious blip that on further magnification proves to be a small robot heading away from the battle. Then the tape cuts out.

Notice the vagueness present. The PCs "carefully take their positions," without any reference to any particular formation. Some players will ask for specifics, at which point you can admonish them to use their imaginations, or create some other factor, like damage to the tape which makes it too grainy to tell who is who. This vagueness straitjackets no one, leaving them free to choose their destinies. (If pressed, the GM may resort to scientific sounding principles like, "The more specific the information gained, the shorter amount of time it applies to.") And having a misfiring weapon take out the camera once the battle begins can build a nice sense of continuity into the scene. (Having the party need to find some way to get this tape to their earlier counterparts can also be the basis for a miniquest.) But also notice that the tape does provide useful information. Of the doors, the initial assault only comes from four, six, and seven, and there will be a smaller robot the party will need to watch out for. Without such salient information, future-based infallible divination devolves into common-sense assumptions the players could have come up with themselves.

Similarly, prophecies that could mean anything and everything are frustrating to players. Try to avoid these, or at least give them riddles with one or two clear interpretations.

Even if characters perform divinations themselves, they typically incorporate a large amount of bells-and-whistles that can add ambience to any story. Instead of merely casting the stones to make a prediction, "the old seer shuffles around the room, lighting cedar incense. When these preparations are complete, she lowers the lights and settles herself firmly in the middle of the room. From the folds of her robe, she produces a small squirrel-skin and lies it fur down in front of the party. Shaking the oddly-shaped stones in her hand, she blows across them before tossing them violently onto the skin.

Huddling over the stones as if afraid the party might steal them, she squints carefully down, then up, then back down repeatedly, muttering to herself all the while. Eventually she speaks in a voice evoking spiritual possession . . ."

Or is the future mutable, and the diviner only sees the most likely outcome?) The movie *Minority Report* is also about future-based divination, specifically, is it morally right to arrest people for crimes they haven't yet committed?

Modes of Divination

A typical mode of divination is to ask the gods, or other more powerful beings, for information, past, present, or future. This resulting goodies are typically regarded as infallible, often on par with GM-given knowledge. A good way to pique interest is for usually infallible divination suddenly become wildly inaccurate. Is this a sign the gods are displeased with humanity? Are the long-lost enemies of the Keepers of the Time-Space Continuum revealing themselves by altering transmissions?

Another common source of divination, is the casting of stones, bones, tarot cards, and other materials. They work on the principles of synchronicity, that, seemingly by coincidence, the patterns of the universe will be revealed in the arrangement of the items. Most often these practices only divulge the vaguest of information, but can be good for flavor, especially if the setting and procedure are exquisitely invoked. These fortunes are almost exclusively present-based, but if one oracle suddenly becomes exceedingly accurate . . .

Intuition-based divination covers practices such as scrying into crystal

Even if magical divination is a complete fraud, the smoke and mirrors fortune tellers use to convince people are great for color. And a believable fortune might persuade one of the players regardless. Who knows, the prophecy might be plausible enough to be self-fulfilling.

Remember, divination is just another source of information, and most hassles can be avoided by remembering players have access to it. As for telling the future, having a consistent explanation for why divination does/doesn't work goes a long way to avoiding future arguments about world coherency. Plus, the questions raised about the nature of time can provide endless material for campaigns.

Related Links

www.facade.com -- fortune-telling website good for exploring the basics of many divination systems. Lets you choose patterns, explains the results, and offers links to many other sites.

balls. Reading tarot cards can also fall into this category because the cards have so many meanings that the intuition of the reader comes heavily into play. The fallibility and accuracy of these predictions depend on the skill of the reader. Many intuition-based divination schemes also assume that these practices are natural; the reader is simply tapping into a source of information that most people simply choose not to use. Are these so-called prophecies accurate or just plain bull?

And, finally, technological-based divination includes many areas people no longer consider magic, such as wire-taps, the internet, and spy-satellites. Still, finding a machine that shows the future can be awe-inspiring and fun.

Pyramid Review

Mysterious Places (for the World of Darkness)

Published by [White Wolf Games Studio](#)

Written by Kraig Blackwelder, Rick Chillot, Geoff Grabowski, James Kiley, Brett Rebischke-Smith, & Chuck Wendig

Illustrated by Sam Araya, Greg Boychuk, Vince Locke, Chris Martinez, Mark Nelson, Jim Pavelek, Durwin Talon, Jamie Tolagson, Andrew Trabbold, & Cathy Wilkins

138-page B&W hardcover; $24.99

One of the pleasing aspects of the Origins Award-winning *World of Darkness RPG* is the development of the setting even before a storyteller gets to its more outré elements with the addition of *Vampire: the Requiem, Werewolf: the Forsaken,* or *Mage: the Awakening.* The aim here is to have the player characters explore the setting as mere mortals, enabling the game to be played as a traditional horror RPG rather than one in which you play the monster or rather the "superhero by night." Of course, the events of such play can serve as a character's prelude to one of the other aforementioned campaign settings. The supplement *[Ghost Stories](#)* falls exactly into this category, as does the latest release.

Mysterious Places presents nine different locations, ready to work into a campaign or be used to kick off a campaign. They are in turn eldritch, bizarre, or just simply tainted by the horror that lurks just beyond the reality of normal, everyday life. And while they can be used in conjunction with the inhabitants of that beyond place -- vampires, werewolves, and so on, they are nevertheless best used with mere mortals. There is something faintly familiar about the nine places, many feeling as if they have appeared in stories found in books, or on the radio or television. Indeed the feeling with several is as if you have seen them appear in episodes of *The X-Files.* Which is not necessarily a bad thing, though the nine described are flexible enough to be employed outside of that series' format.

Each location is presented in a similar format. It starts with a summary of the place before going on to discuss its history, as well as the myth, the legend, and the reality. NPCs and their motives are discussed before going into the preliminary events that can occur before the stories then can be told there and then suggesting ways in which a story teller might want to bring the story to a close. Included are systems details particular to each place and although particular to the Storytelling System, such details are kept to a minimum thus making any one of the nine easily adapted to other games and mechanics.

[SPOILER ALERT!]

The first of the nine is "The Swimming Pool," a dark secret on the edge of any town. Reputedly the pool is bottomless, or home to gigantic catfish, or the site of a teenage suicide pact, or of a secret kept by the pool's owner. In reality, the pool is a water filled quarry that grants a wish to those who make a sacrifice of fresh blood. Much like the tale of The Monkey's Paw, a wish in the World of Darkness is double edged. Again this is a secret kept by those in the know. "The Swimming Pool" can be played with the characters as outsiders or as locals, even children. Whereas the secret in this place is well defined, that of "The University" is less so but more pervasive; its secret is literally able to influence those on the campus, whether on the faculty, other staff, or students. How much is known about this "influence" and by whom is another matter. It is also very much up to the Storyteller to define this influence and how it can be combated.

There is something of the ghoulish and the American Gothic in "Swamp Indian Hollow." This has the ability to animate the dead, not as whole corpses but as puppets made from the flesh and bones of the recently departed. Clinton Weiss runs a nearby crematorium and thus has access to a ready supply of the dead. Always a lonely man, Weiss uses the constructed puppets to create a fantasy world that he and his mother can inhabit. Clothed in the proper accoutrements, the puppets take on suitable roles such as police patrolmen and mother's nieces. Clinton has also crafted puppets that can be worn and also impart roles such as the Mayor. This is a quiet affair and possibly difficult to use, but faintly reminiscent of *A Nightmare Before Christmas.*

"The Village Secret" plays on notions of rural isolation and another community with something to hide. This is nothing less than the source of eternal life, something that the villagers will go to extreme measures to protect. Equally adapted to other places, including an inner city ghetto this falls back heavily on rural stereotypes. More interesting and potentially more personal is "The Statue Of Weeping Alice" which portrays the sudden turnaround in fortunes of a declining town after a neglected statue of a young girl suddenly sheds tears. Much like "the swimming pool" this comes at a cost, again in terms of sacrifice. The question is how far will the townspeople and possibly the characters go to retain this new found prosperity?

"Hillcrest Centre for Elder Living" is reputed to be a retirement home for the mafia, and there is some truth to that as one resident is an ex-hit man. Yet there are other secrets more difficult to explore than the other locations. This entry in *Mysterious Places* draws the strongest comparison with an episode of *The X-Files.* Events take on a personal touch in "The Whispering Wood," wherein the recently morally weakened characters are drawn into the clutches of the woods by voices. Here they encounter the remnants of a carnival, long lost within the woods. Joining this circus is enforced when the characters transform into carnie freaks, each character's appearance determined by personal vices. Near impossible to escape the surrounding thicket of thorns, the key lies in dealing with the residents of the woods and coming to terms with these vices. Of all the locations in this book, this makes the best use of the game's virtue and vice rules.

"The Junkyard" is much like "The University," in that the cause of its strangeness is left for the storyteller to decide upon. At its core is the idea that the junkyard is a repository for the cars we so personify and asks what becomes of this entombed personality once discarded as unwanted? Of course, the owners of the junkyard are less than savory characters, and the dogs and rats worse, but suggested options include the junkyard reanimating the dead, the owner carrying out grisly acts that he always forgets, and coming upon the yard via a student film, similar to *The Blair Witch Project.* The last of the nine places is "The Empty Room," an architectural anomaly that draws in its victims for exponentially longer and longer periods of time. Can these victims survive their periods of incarceration and what truth is there in the rumors that somebody survived "The Empty Room"?

[END SPOILER ALERT]

What *Mysterious Places* serves up is several slices of Americana along with a side order of the American Gothic. This is all well crafted, well written, and -- barring the occasional typographic oddity -- well presented. The many situations described herein evoke more a sense of creepiness that the Storyteller can ratchet up into outright horror, depending upon his whim and the dictates of the story. Some like "Swamp Indian Hollow" and "The Statue of Weeping Alice" are also quite touching in their own small way. The horror is for the Storyteller to create and impart, but with *Mysterious Places,* he certainly has rich material to work with. And even better, *Mysterious Places* is good not just for the *World of Darkness* -- it can be used with virtually any horror RPG.

More Powers for Powers

for *GURPS Fourth Edition*

by Reverend P. Kitty

While **Characters** introduced the psionic power framework to **GURPS** *Fourth Edition,* **Powers** took it to the next level and created powers for *anything.* From ancient Shaolin healing techniques to demonically powered deception of the senses, any concept can be turned into a robust, flexible power. The examples below follow the rules and guidelines from Chapter One of **Powers** and represent some common themes found in a wide variety of genres.

Density

"The closer we come to an atmosphere with only one sun -- a yellow sun -- the more our molecular density gives us unlimited powers."
-- General Zod, *Superman II*

Sources: Super
Focus: Density

This is the power to alter the density of oneself, other people, or any inanimate objects. Its users can increase their density to become incredibly tough and strong or decrease it to walk through walls. Opponents targeted by Density power generally experience the drawbacks instead; increased density can slow, stop, or even crush a target, while density can be *partially* decreased to make them easier to hurt. The quasi-scientific nature of this ability makes it poorly suited for a supernatural power; in practice, it is rarely found outside of four-color comics (Super).

Density Talent: 5 points/level

Density Abilities

Binding, with Unbreakable (and usually with Constricting); Catfall, with Feather Fall; Damage Resistance, with Tough Skin*; Improved G-Tolerance*; Injury Tolerance (any of Damage Reduction*, Diffuse, or Homogenous*); Insubstantiality; Lifting ST*; Permeation, but *not* with Tunnel; Pressure Support*; Protected Power; Radiation Tolerance*; Resistant to Knockback*; Striking ST*; Vacuum Support*; Walk on Air; and Walk on Liquid.

* These advantages can take a Nuisance Effect if the user becomes incredibly heavy when using them. Twice normal weight (minimum 500 pounds) is worth -5%. Ten times normal weight (minimum 2,000 pounds) is worth -10%. Knockback is a Common threat; resistance adds to ST instead of HT.

Density wielders can buy Afflictions to change the density of other people or objects. Afflictions which reduce density should have Advantage (Insubstantiality), to dematerialize the subject completely, or any of Attribute Penalty (ST), Negated Advantage (Damage Resistance), and Disadvantage (Skinny and Vulnerability to Physical Attacks), to partially lower the target's density, making them weaker and more fragile.

Afflictions to increase density should have Advantage (any marked with a * from the list above) and/or Disadvantage (Reduced Basic Speed, Cannot Swim, and either Very Fat or Increased Life Support (Massive), depending on whether you want the target to weigh twice as much or ten times as much). Very Fat should be treated as a non-metabolic variant which includes no skill bonuses or penalties. Selectivity will let you give your friends the advantages of increased density while saddling your opponents with the drawbacks; this isn't particularly realistic, but neither is the genre in which this power is normally found!

Power Modifier: Density. The advantage belongs to the Density power. This modifier is almost always Super (-10%).

Dream

"Now I rule the dreamworld. I will hide in dreams. I will be a wise and tolerant monarch, dispensing justice fairly, and only setting nightmares to rip out the minds of the evil and wicked. Or just anybody I don't like."
-- John Dee, *Sandman: Sound and Fury*

Sources: Divine, Magic, Psionic, or Spirit
Focus: Dreams and sleep

Dream power gives its users control over states of consciousness and the dreams that emerge from the deepest levels of sleep. They can interact with dreaming subjects, either communicating through their dreams or taking control of them directly. This power usually represents a specialized path of sorcery (Magic), being in service to the Dream Lords or their kind (Divine or Spirit), or a mental discipline somewhere between Astral Projection and Telepathy (Psionic).

In many settings, the dreams of every sleeper all float through the same ethereal sea. This is the dream world, with countless dream bubbles bobbing and drifting but (almost) never colliding. In such a game, this power also allows its users to visit this dream world via the Jumper advantage. If the campaign does not feature such a world, GMs may allow a Dream adept to project directly into a single person's dream instead, or disallow the advantage entirely.

Dream Talent: 5 points/level

Dream Abilities

Detect (Sleepers); Doesn't Sleep; Fatigue Attack, with Malediction and Hazard, Missed Sleep; Healing, with Affliction Only and Accessibility, Only Dream Afflictions (-20%); Illusion, with Mental*; Jumper (World), with Projection (+0%) and Limited, Dream World (-20%); Less Sleep; Mind Probe*; Mind Reading*; Mind Shield, with Limited, Dream; Oracle, as interpreting dreams; Protected Power; Telecommunications (Telesend)*; Terror*; and Visualization.

* These advantages must have Accessibility, Only on sleeping subjects (-20%) or Accessibility, Only on sleeping or daydreaming subjects (-10%). The latter includes dazed and hallucinating subjects as well.

Afflictions are allowed with Malediction and one or more of Coma, Daze, Hallucinating, Sleep, Unconsciousness, Advantage (any of Deep Sleeper, Doesn't Sleep, or Less Sleep), Disadvantage (any of Extra Sleep, Insomniac, Light Sleeper, Nightmares, Sleepy, or Slow Riser), or any Negated Advantage or Negated Disadvantage for the above. These are also the only Afflictions that Dream's Healing can neutralize.

With GM permission, Control (Dreams) may be included as part of this power, for 30 points/level. (See *Godlike Control* on p. 92 of **Powers**.) By default, it only applies to the dream which currently involves the user, or that of the person he's touching. With an IQ roll, the level of Control can be used as a bonus or penalty to any roll made by a participant in the dream. This can include Psychology rolls to analyze the dreamer, Fright Checks made by the dreamer, the wielder's Illusion rolls to change the dream, and so on. Control can lengthen or shorten the duration of a dream from the dreamer's perspective; use the guidelines for Control (Time). Depending on the setting, more esoteric uses may be available; for example, if a dream world exists, Control may allow you to merge the dreams of a number of people equal to its level.

Power Modifier: Dream. The advantage belongs to the Dream power. This modifier is typically Divine (-10%), Magic (-10%), Psionic (-10%), or Spirit (-25%).

Sensory Awareness

Sources: Biological, Chi, Divine, Spirit, or Super
Focus: Enhanced senses

"You're a detective with hyperactive senses! You're a monster, man, a human crime lab with organic surveillance equipment. What more could you want?" "Control."
-- Blair Sandburg and Jim Ellison, *The Sentinel*

Wielders of this power can use their five senses to their utmost acuity. Unusual senses are apppropriate as well, as long as they can be rationalized as being based on one or more of the wielder's existing senses. Senses that emit some form of energy to work (e.g., Scanning Sense) or that involve wholly supernatural methods of perception (e.g., Clairsentience) are never allowed; take ESP power for that. Sensory Awareness power may be the result of inborn mutation (Biological or Super) or intense training of the senses (Chi), but just as often represents a pact with an all-seeing god (Divine) or equivalent spirits (Spirit).

Sensory Awareness Talent: 5 points/level

Sensory Awareness Abilities

Dark Vision, with Hypersensory; Discriminatory Hearing; Discriminatory Smell; Discriminatory Taste; Enhanced Tracking; Hyperspectral Vision; Infravision; Microscopic Vision; Night Vision; Parabolic Hearing; Peripheral Vision; Protected Power; Protected Sense; Psychometry, with Hypersensory; Sensitive Touch; Subsonic Hearing; Telescopic Vision; Ultrahearing; Ultravision; and Vibration Sense, but *not* with Sense of Perception.

In a game that plays fast and loose with the laws of physics, some GMs may permit Scanning Sense (Para-Radar) with the No Intercept enhancement to be considered a passive, "hypersensory" extension of the normal senses and thus eligible for this power. No other Scanning Sense is ever appropriate, however. Note that while See Invisible is not part of this power, Dark Vision (with Hypersensory) and Vibration Sense will both allow the user to find and fight invisible foes.

Sensory Awareness users will benefit greatly from Acute Senses and extra levels of Perception, though neither qualify for the Power Modifier. See *Inappropriate Abilities* (**Powers,** p. 10) for an explanation.

Power Modifier: Sensory Awareness. The advantage belongs to the Sensory Awareness power. This modifier is generally Biological (-10%), Chi (-10%), Divine (-10%), Spirit (-25%), or Super (-10%).

Speed

"You'd leave me standing, son."
"I can leave photons standing, Jay."
-- Flash (Jay Garrett) and Flash (Wally West), *JLA: Crisis Times Five*

Sources: Biological, Chi, or Super
Focus: Personal acceleration

This power allows the user to accelerate the speed at which his body acts, down to the molecular level. The majority of its abilities involve multiple actions, high-speed running, and rapid recovery. Speed power is commonly found in the comics (Super), where it includes the ability to "match the atomic frequencies" of matter (Insubstantiality) or of other dimensions or times (Jumper). However, it is equally appropriate for the swift fists of wuxia fighters (Chi) or naturally fast prodigies (Biological).

Speed Talent: 5 points/level

Speed Abilities

Altered Time Rate; Chameleon, with Dynamic and Accessibility, Only While Running (-30%) but *not* with Controllable; Enhanced Dodge; Enhanced Move (Ground); Enhanced Time Sense; Extra Attack; Insubstantiality*; Invisibility, with Switchable and Accessibility, Only While Running (-30%); Jumper (Time or World)*; Protected Power; Recovery; Regeneration; Striking ST; Super Jump; Temperature Tolerance, for cold; and Walk on Liquid, with Accessibility, Only While Running (-30%).

* These advantages may not be appropriate in certain genres (GM's decision).

In a cinematic game, the GM may allow Speed users to take the Cosmic (+50%) enhancement on their Enhanced Move, negating the need for any acceleration time. In such a game, Warp may also be added as part of this power, with a special limitation, "Must Traverse Distance: You actually travel to the destination under your own power; you just do it instantly. You cannot warp to anywhere you could not get to normally, given time. -30%." This allows the speedster to travel across the country in the blink of an eye without being able to teleport out of a jail cell.

Increased DX, Basic Speed, and Basic Move are all *de rigeur* for anyone with Speed power, but they are not part of the power itself.

Power Modifier: Speed. The advantage belongs to the Speed power. This modifier is usually Biological (-10%), Chi (-10%), or Super (-10%).

Everything Is Coming Up Roses

a Campaign Setting for *In Nomine*

by Eric Funk

Located in a central location in the campaign city, somewhere between "downtown" and the largest hospital, there is a flower shop that has been in the news lately for its kindly deeds. The owners of "By Any Other Name" donate flowers to causes and worthy events, pay their taxes, and go about their lives. Unbeknownst to its owners, Servitors of Novalis have worked around the clock for months to help this business thrive. Only the combined efforts of a small team of angels of Flowers were able to protect it from sabotage and buyouts. The angels have also arranged for various Trade-connected businesses to offer their services. The shop now has cutting-edge over-the-counter security, surveillance, refrigeration, and a web page where one can order flowers to be delivered to anywhere in the city. Metal shutters cover the large front windowpanes at night.

It all began after Mark and Cindy Oswald retired, and started a small knick-knack shop. The business was barely profitable, selling a paltry number of party balloons and shirts. This all changed one day while Cindy was arranging some flowers she received for her birthday. A man was watching her at the store, seeming amazed. "Lady, you have real talent! Here is a number for a greenhouse I know." He bought a gag four-armed t-shirt and a tie-dye kit. The man scribbled a local phone number on a piece of paper, and in a twirl of his dreadlocks, he was gone, never to be seen again. The angel of Flowers who took the call was surprised to find a human phoning the line, but both parties seemed amenable, and soon the greenhouse had a new client. Sensing promise, the angel of Flowers called in some favors and soon a Mercurian of Trade and a Seraph of Trade were called in to help. These celestials are doing their best to nurture the growth of "By Any Other Name" from a careful distance, as direct celestial interference can inhibit the generation of a Tether. Few spend much time around the building itself.

Floor Plan

The shop itself is laid out in a square. Upon entering, the left and right walls are Floor plans floor-to-ceiling refrigerators filled with blooming flowers. The far wall has the desk and balloon sales. Behind this desk is the t-shirt press and publishing computer. They carry a large variety of balloons, stuffed animals, vases, and greeting cards. They also sell a small variety of bells and statuettes. The quality varies from major brand name merchandise to no-name brand, easily affordable goods. The emphasis is on giving gifts from the heart, not flashy toys.

Celestial Affairs

The elevation of this store in the minds of the local populace has begun to shift belief toward amiability and compassion. War-like and infernal Tethers in the area have noticed their power diminishing lately. Word is out on the infernal side that something "good" is on the rise, and is causing Infernal Tethers to shrink. The up-and-coming pretty thing is this establishment, so many Infernals are planning to give them "the business" even though they don't let themselves believe that they could actually *lose* one of their links to the celestial realm.

- **In the unlikely event that a Tether were to form here, the groups most likely to claim it are:** Flowers, Trade, Creation.
- **Those for the Tether:** Dreams, Stone.
- **Those against the Tether:** the Sword, War.

- **Infernal stances are as follows:**
  - *Active:* Factions, Death, Dark Humor, the Game.
  - *Passive:* Fire, the War, Technology, the Media, Nightmares.

The Superiors most interested will also react with the strongest reward/punishment.

Opposing Forces

Angelic

While not directly opposing Novalis, the war-like Servitors of War and the Sword are responding to their diminishing Tethers with military parades and historical recreations. Memorial events are quietly discouraged by those who see the up-and-coming florist shop as a possible cause of the diminishing Tethers. There is a another movement that encourages the association of flowers with heroes and dreams.

Mundane

Research into local current affairs will reveal two rival corporations having difficulties in one way or another:

The most obvious corporeal threat is the multinational corporation "Romanticorp." Its local director has taken the refusal of "By Any Other Name" to be bought out personally, and is preparing to move the huge levers the company has ready. His "threats" will be fresh in the minds of the Oswalds, but so far, there is no evidence linking the recent events to his office. In fact, he has yet to do more than order a deep examination of their business and personal past. If asked, he will be confident and honestly believe that their selling is in the best interest of everyone.

Busy Bee Flower Co. specializes in flower delivery and cheap cards. Its owners have invested their life savings into the business. Despite this, it is quickly approaching bankruptcy. It would not take much to push them over the edge (such as a Balseraph or Shedite) . . .

Infernal Affairs

Eager servants of Death and/or Dark Humor plot to taint the "send home" fertilizer with herbicide so the flowers are dead by the next day (the fertilizer packets that one puts in one's vase of water to extend the life of the bloom). Unbeknownst to them, Servitors of Technology plan to infect the flowers so they all grow thorns (or attract flies) after an hour in the fertilizer. The Vapulans' "Plan B" is to open an adjacent shop with secretly noxious fumes, and sells cheap gadgets (phone covers, music, accessories).

Other generic infernal plots might be mistaken for terrorist attacks or gang violence. In general, however, no Prince currently believes this shop to be a threat to their operations or Word -- any major movement would have tipped off the angels. Those Princes that do know of its operation have merely tagged it for observation in case it *does* become a real threat.

Metaplot: The Call for Help

The heat is being turned up. Bricks have been thrown through windows from moving cars, and fires started in garbage bins . . . Since the angels of Flowers have thus far been unable to catch the culprits in the act, they decided they need help. The Seraph Arthur (see below) deduces it must be him who calls for help as the angels of Flowers will be uneasy about hiring Malakim (whom he considers to be the best trackers). He cannot directly help, as he is preparing for a tax audit (instigated by an anonymous tip from the opposition). He cannot offer much of a reward. If there are Servitors of War or The Sword who need persuading to join, he might be able to get them on the list to beta-test some Jeanite weapons down the road.

The PCs will be assigned to one or more of the following areas:

a. As the characters go about their Role, they are to hand out coupons and business cards. If they encounter resistance, they are to pass information to b).
b. They are to investigate resistance and competing ads. If they find something suspicious, they are to report it to c).
c. Investigate companies that seem to have unusual antagonism toward "By Any Other Name." If infernal ties are found, report it to d)
d. Combat team. If things get really bad, call in the celestial SWAT team.

Word gets out (or the PCs discover) that agents of Baal (or Belial) are planning to strike at the shop on the same night. A human will drive a steamroller into the shop after midnight. Another human will be planting an explosive device later that morning if the first plan fails. The level of celestial backup will vary according to the visibility (and ability) of the PCs.

Rumors and Ruminations

It is said that local angels of Flowers have developed a technique to temporarily turn a flower into a Reliquary/1 until dawn. There is a special, rotating code word that one can say when ordering to have one included. A payment of 3 Essence is also required, either up front (preferred), or later. If the rumor gets out, demons may start mugging people carrying single flowers. Quick-thinking angels will capitalize on this, and eventually the balance will be restored.

Owners: Mark and Cindy Oswald

They are five-Force Humans in their late 50s. Regular churchgoers, they are often volunteers at charity functions. While not aware of the War or the nature of the angels working in the area, they suspect that their new employees are not working up to their potential. It is unknown at this time what their Force potential is or what their destiny and fate are (all this may change soon).

Arthur "Benité" ("Please, just Arthur."), Certified Accountant
Seraph Vassal of Trade, in service to Flowers (Corporeal: 2, Ethereal: 4, Celestial: 4)

He will rarely be encountered, except if one is investigating the fiscal operation of the company. Arthur is shy but has studied basic hand-to-hand combat. This Seraph is the only contact this operation has with the Jeanites, from former missions. His services are out-sourced from a nearby mini-mall.

Sally O'Gluke, Promotional Consultant
Mercurian of Trade, in service to Flowers (Corporeal: 3, Ethereal: 3, Celestial: 3)

She will be encountered behind the scenes at public events where the company is delivering or donating large arrangements. Her exceptional skills are her writing, choreography, and marketing. She will usually be busy darting from location to location, and thus rarely encountered for long or able to directly help or interfere. Some celestials believe her to be an Ofanite! She operates from one of Trade's consulting firms in the city.

"Charlie" Sing Wu, "Delivery Boy"
Malakite of Flowers (Corporeal: 4, Ethereal: 2, Celestial: 3)

Charlie's latest vessel appears to be a 70-year-old retired martial arts instructor. He claims to have killed a demon using only a rose on more than one occasion. (He will not elaborate on whether that is the same demon or multiple demons.) If Charlie knows he has a group of young celestials, the Malakite will describe the battle in as much detail as the crowd can take in the guise of a rambling war story. He enjoys delivering to hospitals and using his Cherub of Novalis attunement to take on the wounds of honorable people. Thus his own health (e.g. Body hits/Hit Points) is often

low, aiding his Role. If available, he should be considered skilled in a mundane style as well as [Celestial Kung Fu](#).

Joshua "Crazy Joey" Vallient, "Delivery Boy"
Ofanite of Flowers (Corporeal: 4, Ethereal: 3, Celestial: 2)

"Crazy Joey" is the most expedient delivery driver. Crazy Joey can do as he please, but he knows that if he gets bad publicity, he will get fewer orders. More importantly, if the car is damaged, it won't drive as quickly. When his car does break down, he has been known to use his Ofanite of Novalis attunement to get there.

k'Zak, Observer, Scenery
Kyriotate of Flowers (Corporeal: 3, Ethereal: 3, Celestial: 3)

For special missions, one could call upon k'Zak, a recently fledged Kyriotate of Flowers to go along with a delivery, but this is could be tricky as she is still naïve about many aspects of the corporeal plane. When not on missions, she watches the store from across the street, inside various potted plants hanging over ten feet in the air from street lamps.

Variants

Flower Power

In the 1960s, the rise of "Flower Power," the young citizens will flock in and buy flowers to distribute. This cross-community culture will be met with mixed feelings from the followers of Stone and Factions . . . In the late 90s, it may be nostalgia, but perhaps it can be in the rise in the campaign area.

Other Systems

While the mystical Word-power does not transfer well (except perhaps in aspected mana or aspected sanctity), the intrigue of foreign spy groups infiltrating a neutral city is timeless. The idea of two factions operating covertly in a medieval city or futuristic space station can apply just as easily. Each faction has businesses and business goals they approve of, with specialist departments that focus on improving the social circles they know. (e.g. one branch directs Technology Research and Development, another the Arts . . .) Case in point: The "angels" are code for a group of operatives working in the port city of Flagstaff. One of the cover operations (unknown even to its founders) is thriving almost unexpectedly, and is starting to make waves.

Eric Flint's 1632 Resource Guide & Role Playing Game

Published by Battlefield Press Inc.

Written by Jonathon M. Thompson

Cover by Brent Chumley

Illustrated by Richard A. Spake

Cartography by Cheryl Daetwyler & Anna Dobritt

212-page B&W softcover; $34.95

Eric Flint's 1632 and its sequels (co-authored with David Weber) have proved to be popular tales of an alternate history that in their way are a variant of *A Connecticut Yankee in King Arthur's Court.* They open in the year 2000 in the West Virginia town of Grantville, which suffers an inexplicable calamity that came to be known as the "Ring of Fire." An exact spherical area centering on the town is transposed in time and space with a location in the Northern Germany of 1630. The 3,000 inhabitants of the town find themselves in the midst of the Thirty Years War, the conflict that ravaged a Europe split by religious differences. On the one side is the Catholic Holy Roman Empire while the leading proponent of Protestantism is Gustav II Adolph, King of Sweden.

Fortunately the townsfolk of Grantville have some advantages in terms of technology and knowledge, equipment, and of course, an enlightened, modern attitude. Thus, led by members of the local chapter UMWA, the United Mine Workers of America, is enough of a basis for Grantville to not only survive and protect itself, but also go on to adapt itself to its newfound circumstances, forging alliances and establishing the new United States of America. All of this is detailed in the first book and its sequels, *1633* and *1634,* while **Eric Flint's 1632: Resource Guide and Roleplaying Game** sets out to give you everything needed to play in this history altered by the arrival of the West Virginians.

The sourcebook, written using the **Action! Core System** employed elsewhere in the Firefly Games' **Monster Island** and Gold Rush Games' **War of the Worlds RPG,** is designed to be a complete game including rules, a brief history of the Thirty Years War, maps of locations from the novels, a new short story, descriptions and statistics of characters from the books, and all intended to be totally canonical for the 163X universe. And while all that might be true, the end result is hardly going to keep the gaming devotee of the 163X-verse happy. The unfortunate truth is that **Eric Flint's 1632 Resource Guide and Roleplaying Game** is the victim of a number of failings.

Fortunately one of the failings is not the book's opening piece of fiction. John Zeck's short story "Family" is set during the latter events of *1632,* and is decent enough, but nevertheless enjoyable. Nor can use of the **Action! System Core Rules** be considered a failing. Generic by design, they allow the creation of any ordinary character for the 163X-verse, either a down-timer of 1632 or an up-timer of 2000. The 163X-verse is meant to be realistic, and characters designed for the game are intended to reflect this. That said, the generic nature of the mechanics means that a referee could adapt the stats for any of the characters from the novels to the game and system of his choice.

This is all well and good because the rules take up over three quarters of this book's length, and out of that roughly just the one page is given over to creating a character for the 163X-verse. This amounts to a pair of rules. The first is the number of character and skill points to be spent in character generation. The second is the guide to character creation

for 163X found way, *way* back in the rear of the book. This discusses the types of characters possible, and those unsuitable for the setting. That is, no Navy SEALs, CIA agents, or NASA scientists. It gives a link to an online resource listing every up-timer in 1632, and suggests an optional "Wild Card" rule. Issued one per player a Wild Card can be expended to either explain a character's unusual background compared to the average citizen of Grantville or why he might own a particular piece of equipment. An example of the former would be the cheerleader Julie Sims, noted biathlon athlete and superb shot, while Frank Jackson's hoarding of M-60 machine gun is an example of the latter.

But the problems with ***Eric Flint's 1632 Resource Guide and Roleplaying Game*** start with the presentation. The layout is at best pedestrian and at worst slipshod, with misaligned boxes of text, and others squeezed in to at best utilitarian effect. The artwork suffers from its own problems. Some of it is reasonable, but other pieces are anachronistic, and the constant repetition of artwork is both irksome and a waste of space, although none of this is the fault of the artist. Likewise the illustrations depicting various buildings suffer similarly, being both unlabelled and used over and over. The result is that the artwork does not serve the material, but merely serves to bulk the book out.

And then there are the maps. Those of the Holy Roman Empire are workmanlike and useful enough, but others are dreadfully useless. The only interior map borders on being indistinct, while the one of Grantville actually depicts the area transposed by the Ring of Fire in not so much a bird's eye view but rather the view as seen from the cockpit of an inverted Lockheed SR-71. Then this absurdity is compounded by the decision to quarter the map and place one quarter per page. It is just so indescribably useless . . .

And then there is the writing. The quality of the writing for the ***Action! System Rules*** is reasonable, but then it has been edited and used elsewhere. Little else has. In both describing the town of Grantville and several of the nearest new neighboring settlements in Germany and explaining Europe of the 1630s, the writing is at least informative. Otherwise the writing style is at best described as stilted and in need of a good polish.

As to the statistics and backgrounds of characters of the novels, these are sequestered away in an appendix again at the back of the book. The statistics are reasonable enough, but many characters receive less space than that given to the write up and description of an ordinary wolf listed earlier in the book. Too often this brevity does not do any justice to the characters of the novels.

Finally, there is the scenario, "The Last Valley," based upon the 1971 film of the same name. The players take the roles of up-timers sent out as a small party from Grantville to locate fresh sources of food and trading partners. There are encounters with local fauna, the chance to hunt it, and finally an opportunity to forge links with an isolated hamlet threatened by marauding mercenaries. It is not a bad scenario, and uniformly the nearest that the book gets to advice on running a 163X-verse campaign.

Eric Flint's 1632 Resource Guide and Roleplaying Game also suffers by its omissions: Index, bibliography of either of the novels or any other useful source material, glossary of the novels, chronology of the novels, gazetteer of the novels, advice for the GM to help him run a 163X-verse game or campaign . . . none of these elements are present. And there is also the dichotomy at the heart of the book, between rules and source material. The two are separate despite the book's organization that mixes the two over the course of its length. No serious attempt is made to write and adapt the rules to the 163X-verse.

The combination of all these factors is at least a disappointment, and an expensive one at that. Perhaps the gaming shelves have been spoiled by similar sourcebooks from Steve Jackson Games and Green Ronin Publishing, but this book does not succeed on so very many of its claims. Ultimately the result is that ***Eric Flint's 1632 Resource Guide and Roleplaying Game*** is a disservice to both the 163X novels and their authors.

Pyramid Review

The Hollywood Card Game

Published by [Fantasy Flight Games](#)

Designed by Bruno Faidutto, Michael Schacht, & Christian T. Petersen

Edited by Greg Benage

Art & graphics by Brian Schomburg, Szucs Gregory, & Daniele Bigliardo

64 cards, 16 reel counters, rule booklet; three to four players, full-color, boxed; $6.95

Hollywood has done some amazing things on a shoestring budget. When they do it, it's miraculous; when Fantasy Flight Games does one of their itty-bitty games at dirt-cheap prices, it's just business as usual. The twain have met at *The Hollywood! Card Game*, the gamers' chance to be a Tinseltown mogul.

The object of the game is to score the most points for your projects by the end of the game.

Each round, a set of 14 cards -- three Stars and 11 Films -- are laid out in a grid on the board. There are four columns, two containing four cards and two that have three cards. Players have a set of film reel counters with which they stake claims to various movie components, and a couple of cards that let them break a few rules during play.

You can only put your film reels on the cards along the bottom row. The next person to put their token on that card then "bumps" your counter one card up that same column. This means if you want the topmost card in a column, you have to be the first to play your piece there. Depending on what cards are aligned beneath it, you may or may not be able to count on other players to do the "bumping" for you. If they don't, you may have to commit most or all of your own counters to get that card, so it better be worth it.

Everyone has the same two Studio cards: the Double Reel and Clap Board cards. Playing the Double Reel lets you place two canisters in a single turn, while playing the Clap Board lets you pass your turn, forcing the next person to play his reel tokens (not having to place your tokens first can be a valuable strategy). Studio cards aren't returned after use; they're good once each per game, not per round (timing really is everything in Hollywood). When all reels are placed, the round is over and everyone collects the cards from under their canister counters. Two cards go unclaimed each round, and the rest must be laid out in front of their claimants one at a time. This may force you to finish a movie before you're ready, so the order in which you get your cards back is important. For the next round, a new grid is laid out and the person who goes first rotates one player to the left.

The movies that score best at the end of the game are the ones that have at least one Film card paired with a Star. Film cards are from one of three genres: romantic comedy, action, and science fiction. You can only have one of each type in the pipeline at one time, so if you get multiples in a single style, they're all part of one big production. Stars are directors and actors that work on your movie, and they're rated from one to three stars. To find the value of a finished movie, multiply the "star" power by the number of cards in that stack (and by any awards the film won -- one card from each genre offers this bonus). If you've put a lot of work into a large film but don't finish it, it may still score a few points at the end of the game. Blockbusters are standalone cards that give you a set number of points, and if you're playing the advanced rules you'll multiply movies again by any unclaimed cards of that genre.

For such a small game, the components are nice. Oh, sure, the tokens are hardy little fellows, and even the rulebook is

a stiff, colorful little affair, but the cards? Each one looks like a painted thumbnail of something that ought to be framed and selling at the art auction in a convention. If they go to these lengths for just a card game . . .

Also like Hollywood, there are "wrinkles." The components fit as long as the pieces haven't been punched out, but once you've got the reel tokens popped out you'll need a slim baby Ziploc baggie (or you'll have to forgo the game's tuckbox altogether and come up with your own method of storage). In game play the trouble comes from all the slight permutations the mechanics offer. There's a lot to keep track of, and it all affects your final score. Developing a strategy that takes all of these factors into account takes a good memory, and a decent computer spreadsheet wouldn't hurt either.

Finding out if you're willing to learn all the tricks and scorings takes you a long way into the game, though, so you'll have plenty of time to formulate an overall opinion. If you do stick with it, this is a fast game with surprisingly deep waters to plumb. As small as it is, it's not a trivial workout for your gaming muscles. (It's a wonder the whole gaming industry doesn't rise up against Fantasy Flight for its ability to come up with simple wonders of this nature.) ***The Hollywood Card Game*** is an impressive production with a small time investment for a trifling cost, and shows once again that this company can work under any conditions and still come out with a winner. To paraphrase the industry it so ably depicts, there are no small games, just small companies.

--Andy Vetromile

We'll Always Have . . . Where Are We, Again?

[Last week](#) we were talking about the suffering I endured by watching the movie *Soultaker* -- a movie where even MST3Kification could not disguise the fact that 90% of the "action" consists of people running through hallways. My advice was simple: Don't watch *Soultaker* . . . ever. Oh, and I also spouted off some gaming nonsense about making sure to shake up adventures by mixing up the scenery.

Anyway, last week focussed on trying to create a number of locations, even within a seemingly limited setting. The obvious examples are various ship-based campaigns; a show such as *Star Trek: The Next Generation* had a number of settings, including the bridge, conference room, captain's ready room, observation lounge, the engineering room, various crewmember quarters, a holodeck (an infinite setting itself), a haircuttery, and a bar. (And, of course, miles of exciting hallway.)

Now, even a seemingly limited setting can usually have some alternate places that can serve to shake up a session. Our worked example from 168 hours ago was a courtroom drama, akin to *Law & Order, Perry Mason,* or *Matlock* (one of my favorites). Now, last week we dealt with the locations that were in the same building as our hypothetical courtroom. But even remaining true to the idea of a courtroom drama, we can add a lot of locations to our campaign:

- Police station (discussing case with officers)
    - CSI lab (trying to get specific evidence for or against a client)
- DA's office
- The cite of a press conference (the steps of the courthouse, city hall, or the like)
- Client's home/office/other preferred meeting area
- Psychologist's office (for profiles, discussion of case)
- Bar (booze is the lubricant of law)
- Law office (if series focuses on defense council or civil law)
- Homes of any of the main characters

As you can see, it's easy to expand the idea of setting even in a seemingly limited setting.

Speaking of the last item on the list above, one technique I used to good effect in some of my old campaigns -- especially those set within modern eras or focused on one city -- is asking the players to come up with what their abodes are like. Having this information on hand allows for the GM to craft some interesting scenes, as well as allowing a natural flow should those set pieces come into play. ("We need a place to hide this witness." "What about my place?") A simple questionnaire can work wonders here:

- **Where does the character live?** (Part of town, type of neighborhood, etc.)
- **What is the dwelling like?** (cramped apartment, palatial house, Antarctic refuge, etc.)
- **What is the character's living arrangement?** (significant other, roommates, pets, etc.)
- **What are some special features of the apartment?**

And so on. I never forced players to provide the information, but there was the implicit understanding that, should a PC's home come into play during the game, I'd make up anything he didn't specify. ("Clearly evil-doers broke into your apartment." "How do I know that?" "Your exhaustive Wang Chung CD collection was stolen." "Waitaminute . . . I have a Wang Chung collection?" "Not anymore.")

As an aside, I generally didn't use this information to work over NPCs, per se; for example, if the character chooses to list that he's living with someone, but he hasn't taken that person as a dependant or other readymade-victim-type disadvantage, then I tend to make sure that extra doesn't exist merely to get captured or threatened. (On the other hand, they can make excellent plot starters unto themselves: "<BRRRRRRRING!> Hi, hon. Were you expecting ninjas? . . . Okay, good; I just knocked one out with a vase. He has some kind of note you might want to take a look at. Oh, and we need another extension cord.")

Now, when should the scenery change? Put simply, whenever the danger of having one background around too long threatens to be boring -- including, if need be, preemptively thwarting such boredom. This can be as simple as having "established" sets that happen periodically. For example, *Ally McBeal* had a near-daily evening round of boozing at their favorite watering hole. (As an aside, this is the second time in two weeks I've mentioned *Ally McBeal.* Clearly the *Futurama* episode I saw a couple of weeks ago with *[Single Female Lawyer](#)* has left an indelible mark on my soul.) Or it can be whenever the current setting has been around too long. There's actually a simple test for when you might want to consider changing the scenery: When folks forget where the scene is taking place, it's time to change the place. (And if you *do* remember the scenery, but only to remark about how boring it is -- such as an endless chase sequence in hallways -- it's almost certainly time to shake things up.) In the real world, setting is always on the forefront of people's minds; a date between two people in a fancy French restaurant will be very different from the same date at a sporting event. This isn't to say elongated usage of a location is necessarily a bad thing. The corollary of the rule mentioned above also applies: So long as people remember where they are (in a non-negative way), then it's probably fine to continue using that set piece even if the scene itself is running a bit long.

Many campaigns seem to have limited set-piece potential, yet all but the most constrained settings can usually have some change of pace. The trick is knowing where the bars are, and knowing when to nip out for a drink.

--Steven Marsh

Icosahedron Adventures

Refuge Part One -- Port Borough
Organizations and Neighborhoods of a Steel Age Fantasy *d20 System* City

by Owen K.C. Stephens

Most *d20 System* fantasy games are set in a campaign that borrows a lot from periods in our world's history, but take extensive liberties with those periods. It's much less common for the cities of these games to be based too strongly on a real-world location. Many of the things gamers take for granted (organized schools of magic with walled-off campuses, taverns on every corner, extensive middle-class shops were things can be bought off-the-rack) didn't commonly exist during the knights-and-swords era the campaigns try to emulate. And of course the influence of magic, especially the powerful magic typical of most *d20 System* fantasy games, is likely to change how a city is built, operated, and defended in ways no real city matches.

Since many gamers enjoy urban campaigns more than endless dungeon crawls and wilderness exploration, this leaves GMs needing cities that seem medieval, but are in fact more like modern communities with fantasy trappings. A fantasy city can help set the tone of a game acting as a base of operations, a source of adventures of its own, or an adversarial location from which numerous foes set out to make trouble for the PCs.

The tone of a game can be further tweaked by adding or removing particularly outrageous businesses. For example, if the campaign has Magic-R-Us, the custom magic item shop with a busty, broom-carrying sorceress as a corporate icon (franchised in 12 kingdoms!), PCs know the magic level for common people is high, and things may get a bit over-the-top. Similarly if you can order from the Ninja Rolls' Secret Delivery Restaurant, resulting in assassins sneaking the food into your backpack without you noticing, the campaign has taken a turn for the silly (especially in a city with a European flavor). Going the other direction, if the GM mentions the rows of small farms that ring the city for two days' travel in any direction, the players now more realistic concerns are being considered.

This article provides a look at the background of the fictional fantasy city of Refuge. Though specifically designed for a standard *d20 System* fantasy game, with a bit of work Refuge can be used as a setting (or one-shot vacation spot) for any fantasy game. The discussion of such *d20 System* tropes as magic shops, thieves' guilds, and court wizards are included for the standard game, but are not so pervasive they can't be toned down for more realistic settings or cranked up for over-the-top high fantasy. Each of the entries below presents a business, region, or group that exists in Refuge.

The main entry for each contain only common information anyone can turn up with minimal effort. Further information, including secrets behind the scenes, are presented with information check DCs listed. Since this is a *d20 System* article, such DCs are designed for use with Gather Information, Knowledge (local), Research, or similar *d20 System* skills or bardic lore checks. The information is not broken down by skill; it doesn't really matter what skill a PC uses to learn more about these places, just what information they can turn up. In most cases this information is just a sketch, leaving room for a GM to develop details to fit his campaign.

The City of Refuge: Overview

The city of Refuge is an independent city state located along the coast. It is not the largest trade city in the world, but it is nevertheless a popular stop for many merchant ships due to a combination of low tariffs and a policy of not searching ships or cargos that aren't intended for sale within Refuge. It's often claimed to be a pirate city, and it's certainly true it has deals with captains who can't claim any other city as home, but the city itself is ruled by a tyrant who has never left shore.

The city was originally established as an outpost for a neighboring empire. As the empire suffered losses, it left the

city to fend for itself. Without the empire's troops, many communities nearby were regularly raided by brigands and monsters. Survivors from those communities fled to the only walled city in the area, which quickly came to be called Refuge. Though physically strong, Refuge suffered years of internal political bickering as different groups struggled to claim rulership of the city, since the empire's governor no longer had the resources to maintain control.

Eventually a new king (known as the Domant) came into power, though his control was never absolute. In past generations, the city has been overrun by gangs, cults, and corrupt officials. Thirty years ago its fat, ineffective king died, and was replaced by a young, energetic son. The new Domant set out to clean up the city, and to a certain extent succeeded. Although corruption still exists, and many boroughs aren't safe at night, the thugs, gangs, and cults are much less powerful than they were when his reign began. Of course the Domant isn't young anymore, and no one is sure his "reforms" will last much longer, but so far he's replaced personal energy with a careful selection of underlings and alliances with those who have risen to power in the new city.

(The final installment of this series will include a rough map of the city, which is still in development.)

Organizations

Each major organization within Refuge is given a brief treatment in the description of its base of operations. A summary of the organizations is given here, since they're mentioned throughout the three articles detailing Refuge.

Military Groups

Refuge Guard: The elite warriors of Refuge, including its traditional knights. Drawn from the noble families, its loyalties are often divided among various rich families. Though the chief commanders are generally hand picked by the Domant, he can't be sure the Guard will support him against their patrons in case of a coup. They are funded by the Lower Court.

City Militia: The rank-and-file city watch, drawn from commoners. Paid and equipped by the Guild League, and often resentful of the Refuge Guard and their noble patrons. The Domant often keeps peace by placing the Militia in areas critical to the city's succees (public roads, docks, sewer entrances, marketplaces, and the outlying farms that support the city) and the refuge Guard in "high profile" areas (nobles' homes, the main gate, the royal yacht's dock). This results in both groups seeing themselves as the "real" defenders of the city. If the Domant must place Militia and Refuge Guard in the same area, a House Guard knight or Red Hawk is assigned to command over both forces.

House Guard: The Domant's private soldiers, loyal only to him.

Red Hawks: Elite soldiers and detectives loyal to Refuge first, and any of its factions second.

Political Organizations

The Domant: Legally the unquestioned ruler of Refuge, but realistically holds the post only as long as he can keep other groups in line.

Lower Court The council of the 12 most important nobles in Refuge. Have some authority in Refuge, but access to only their personal moneys rather than city taxes.

Guild League: An economic force made up of most of the craft and service businesses of the city.

Domant's Table A council of important people in Refuge, including lords, merchants, priests, and wizards. By law the Domant must consult them. Nothing says he must *listen* to them, and most previous Domants didn't. The current Domant has learned they are at the very least useful for finding what issues are genuinely bothering the various groups within Refuge.

Criminal Organizations

Criers: Officially, simply an organization that is paid to shout out laws, advertisements, and news. Unofficially, the largest organized crime gang in Refuge. Secretly, agents of the Domant.

Golden Mules: Officially, the porter's guild. Unofficially, smugglers and thieves.

House of Silks: Officially, simply a high-end provider of courtesans and companions. Unofficially, the thieves' guild for high-end, expensive products and drugs.

Ladies' Sewing Circle: Officially, advisors on all matters textile. Unofficially, rulers of the merchants in the Cloth Labyrinth.

Boroughs

Refuge has a number of boroughs, the most famous of which are detailed in brief below. There are numerous less-interesting sections of the city which serve as home and often employment opportunity for the majority of the city's citizens. In this installment we look at the biggest borough, the Port Borough, and the organizations most strongly associated with it.

Other Boroughs

Arches: The main market and craft center of the town, and home to the richest merchants and poorest nobles.

Canals: A failed experiment that's turned into an open-air sewer, the Canals is home to the smelliest industries (such as tanneries) and the poorest residents of Refuge.

The Shield: Land found between the two rivers that join to run through Refuge. Home of the Domant and other wealthy nobles in town.

Shingletown: The small neighborhood for the city's struggling middle class.

Port Borough

Much of Refuge's wealth comes from the sea, making the Port Borough an important part of the city. However, the constant influx of foreigners, sailors, and ruffians also makes it one of the most dangerous neighborhoods. To ensure peace throughout the rest of the city, the current Domant declared the Port Borough to be Within Refuge's Domain, but Outside the City. A wall cuts it off from the rest of the city, with only the Port Gate connecting the two. The people of the Port Borough were once resentful of their second-class status, but the new generation is proud they're so dangerous the common citizens fear them. People who live in this borough are generally called "dockers" or "port rats," and are seen by Refuge citizens as only one step up from thieves and beggars. For their part, Dockers see themselves as the lifeblood of Refuge.

Port Gate

Located at the western edge of the Port Borough, the Port Gate is a massive double door of wood and steel, backed by a portcullis and two massive towers. It is set into the city wall and kept open on most occasions. Catapults, facing out towards the Port Borough, sit atop the towers and walls, and no fewer than eight Refuge Guard are on duty here at all times.

The Port Gate is designed to overcome a significant flaw in the city's defenses. There is simply no way to prevent a

dedicated force of ship-borne invaders from landing in the Port Borough. The number of docks there is too great to be patrolled, and cannot be effectively cut without hurting the city's economy. Refuge lacks a navy strong enough to ensure it controls the seas around its harbor, and its deals with privateers won't hold up to a serious invasion. However, Refuge's main value is as a port and market, so any force attacking it is likely to try to capture it largely intact. That means a land force, rather than bombardment by sea.

A short wall exists just west of the docks themselves, but these have numerous gates to ensure the easy passage of cargo from ships into the Port Borough. A dedicated invasion could overcome this wall and lay claim to the Borough in just a day or two. To prevent such an invasion from ever breaching into central Refuge, the rest of the city is both walled separately and guarded by this gate. An invader who took the Port Borough would be forced to breach yet another defensive wall while facing fire from the Port Gate and its towers. No invader has ever been willing to pay the high cost in lives such a siege would require.

The other function of the Port Gate is to quell rioting in the Port Borough. Though no riots have required it to be shut in years, in Refuge's past such mob scenes were not unusual. Rather than fight to retake the Borough, the Domant simply closed the gate and let the rioters exhaust themselves. The Gate is still closed for a few hours at least once a month, to prove to the population that is still works and to remind them the cost of rebellion. Many citizens believe the gates are closed when the Refuge Guard is seeking some criminal they believe to be fleeing, but this is not true. Only agents of the Domant and the Red Hawks have the authority to close the gate, and this is done only rarely.

Most Refuge Guards assigned to guard the Gate considered it trash duty, as little of interest ever occurs here. However the commander, Sir Pepin Lachlan, doesn't allow such an attitude to affect his men's performance of their duties. He sees command of the Port Gate a sign of great trust from the Domant, and an indication he's destined for great things in the future. Pepin is extremely vane, and can often be convinced to look the other way while contraband is brought through if he's complimented enough. Attempts at bribery, however, offend his sense of duty, and bring down his wrath on the offender.

Heretic's Dock

Heretic's Dock is the main point of landing for foreign ships -- that is, any ship not owned or operated by a native landowner of Refuge, or carrying a letter of lading from the Domant's court. This long peer is also the main slip for passenger ships. As many as six passenger ships arrive at the Dock each day, on a tight schedule designed to prevent two ships ever coming close to one another. The Dock is well patrolled by 12-24 Refuge Guards at all times, and kept under observation from the Militia on the nearby wall. Should a hostile force ever unload here, it would face both a squad of Guard (with more arriving soon), and catapult fire from the Militia on the wall.

Back when Refuge was effectively ruled by religious cults, the Heretic's Dock was the only place a ship could land if it didn't have a religious patron in town (hence the name). Since the new Domant took firmer control of the city and excised the worst cults, anyone with a connection to a resident can use any dock, and most regular ships make enough contacts to avoid Heretic's Dock. But ships arriving for the first time, or those firmly sworn to foreign powers and unwilling to make local contacts, must still make due with the second-rate facilities here, and haul their goods farther to reach anything in the city.

The Lighthouse

The Lighthouse is built into the westernmost wall of the Port Borough. It is a very tall stone tower, topped by a massive, eternal flame that was created by the court mages of the Domant. The Lighthouse was built early in the current Domant's reign as a navigational beacon, and then used as the marker for where the Port Borough ends. The Lighthouse can only be accessed from the walls surrounding the district, and is patrolled and maintained by Refuge Guards.

The Lighthouse serves two important functions -- it allows ships seeking Refuge to find it from a great distance at sea (important since the seas are often overcast with mist and fog), and know how far they are from the port. The Guard

also use it as an observation post, allowing them to examine incoming ships with spyglasses long before the ship can gain similar details.

A less important but still noteworthy function of the Lighthouse is to serve as an icon for the reign of the new Domant. It's a symbol of harsh illumination and guidance, a fair description of how the Domant wishes to be seen. The Lighthouse is a symbol of a hard rule that burns those who ignore it. Life in Refuge is harsh, but those who give the Domant unquestioning loyalty are offered some level of security. This is symbolic of the way following the Lighthouse allows a ship to come into Refuge's harbor, avoiding other hazards, but also guides the ship to a place where dues and tariffs can be heavy.

A giant polished copper mirror directs the light of the Lighthouse, allowing it to shine a bright spotlight on any point within a few miles. Normally, this is used to shine the structure's light out across the ocean, scanning back and forth to be seen from the greatest distance. In rare cases the mirror directs the light into the Port Borough, allowing it to turn an area a hundred feet across into a zone of illumination equal to the brightness of the hour just before dawn. Though this hasn't been done it years, in the early days of the Lighthouse it was common to use this trick to light up an area just before a raid by the Refuge Guard.

Freejack's Landing

The best maintained and most convenient dock in Refuge. It is reserved for ships that have a mutual defense pact with the Domant, meaning they agree to defend Refuge in times of war and in turn can take asylum in its harbor. Captains willing to make such deals generally don't fly the flag (or "jack") of any other country, and are thus called freejacks. Others call them pirates, privateers, and freebooters.

Lore Check

DC 15: Although a freejack captain must have a deal in place with the Domant to use this dock, it is the Lesser Court that controls and maintains it. The families of the Lesser Court own all the warehouses and porters around the dock, and thus make considerable money off it even without access to the taxes levied on ship's cargoes. The Refuge Guard keeps a regular presence here.

Guildhouse

This vast building is officially the guildhouse of the Guild League, a coalition of all craftsmen and most merchants within Refuge. Realistically, it's the center of the Port's day-to-day government. Although the most important decisions come from the Domant's castle, such rulings are fairly rare as long as the League keep the money flowing in and no riots break out. In addition to running the Port, the Guild League has supervisory authority over anyone who makes a good, offers a service for coin, or sells a durable product within Refuge. Makes of consumables (food, drink, and even clothing) are exempt as the Domant dislikes driving up the price of such things. Similarly those who offer services for room and board are exempt, to ensure the noble class can have cheap servants and offer patronage to artists.

The guildhouse includes many meeting halls, warehouses, lounges, and apartments reserved for use by the senior members of the League as well as the head offices for the various branches of the League's organization. Generally decisions on who is allowed to use the regular docks (as opposed to the Heretic's Dock), who can move cargo without having it inspected, who can set up a shop within Refuge, what taxes are levied, and how much the Militia is paid are made within the building, though all such authority is granted by the Domant, who takes it back whenever he feels the League has made a mistake.

The Guild League also decides who can call themselves an apprentice of a craft within Refuge, who a journeyman, who a master, and who a grandmaster. Even the Domant may not override this one right of the League. Such distinctions are critical, as goods and services provided by a mere apprentice don't command as high a price (reduce gp

cost by 25%), while masters and grandmasters make considerably more money for the same work (increase gp cost by 25%). The League generally charges 100 gp to "consider" a candidate for each of these ranks, and may insist on a certain number of years of apprenticeship. Many grandmasters within the city do no work at all, instead forcing hopeful journeyman to run their shops for minimal pay, in the hopes the master will support a bid to upgrade the journeyman to master in a few years.

Lore Checks

DC 10: Control of the guildhouse is shared by numerous guild masters within the League -- armorers may run things one month while apothecaries call the shots the next. This is done to prevent any one group within the coalition from gaining too much control, but it also makes the internal workings of the guildhouse too complex for a casual citizen to understand. This is seen as an added bonus by the League, which insist everyone follow the regulations of the guilds, but prefers not to have to explain them.

DC 15: It's not unusual for ranking members of the Guild League to use the guildhouse to meet with the leaders of more minor guilds or individuals who seek the League's patronage. The back rooms of the guildhouse have seen many secret deals and offers of reciprocal aid made, in large part because they are soundproof and warded against prying spells. An invitation to the guildhouse is normally a sign of favor with the League, or at least a good opportunity.

Alley Alehouse

The Alley Alehouse is a working brewery and a public house. However, it's designed to be unappealing to the public. The main entrance is always closed, and the rooms nearest the main street never used. As far as a casual examination goes, this building is abandoned, and the Alehouse out of business. Since many inns throughout Refuge serve Alley Ale (a specialty local drink), travelers often ask why the inn is closed. Locals just shrug and claim it went out of business last month or so. Locals have been saying that for years.

The fact is, the Alehouse is open all day every day, but the entrance is actually off the narrow alley that runs behind it. Anyone who knows this can sneak up on a door that looks nailed shut (it's not) and whisper the current password. Or any password that's been recent in the past six months. Or just slip 1 gp under the door. Once you know the trick of the Alehouse, it's not hard to get in. The secrecy is designed only to keep most outsiders away, giving Refuge natives and well-liked travelers a place to get together away from the hustle and bustle of the city. The Militia is well aware of the deception, but as long as the Alehouse stays quite they don't care (in fact many Militia men go here for drinks after a long patrol).

Lore Checks

DC 10: Any of a range of passwords is enough to gain access to the Alehouse. (PC also learns an old password.)

DC 15: The Alehouse is run by Allard Wynne, a skilled brewer and merchant. He makes most of his money by selling his beers and ales to other inns in town, who happily mark it up and sell it to foreigners. Because of this he can keep prices within the Alehouse quite low. He also has more brewer equipment than he ever needs, and often lets customers use it for as little as 10 gp/week to create their own brews. On the first of every month, a contest is held to see what customer-made brew is the worst, with all patrons sipping and voting (though there is no prize other than free drinks for the rest of that night).

DC 20: The materials and equipment in the Alehouse are also sufficient to allow the brewing of magic potions or materials of alchemy, and a few underground spellcasters rent it out for that purpose as well.

Blubbering Whale

The Blubbering Whale is the largest building found directly on the docks in the Port Borough. Facing the main peers,

the roost is a convenient place for ship crews and captains to rest while waiting for a cargo or dealing with the Militia assigned to port control. Locals often stay at the Whale as well, using its common room to gather and unwind after a day of hauling cargo or fishing on the nearby peer.

The Whale's simple stone structure has become a home-away-from home for many visitors to Refuge, and welcomes members of every race and social class. Most rooms are small, though a few suites exist, but the drink and food are cheap and plentiful. No violence is tolerated, with enough off-duty Militia guards and Guild League kneebreakers spending time at the Whale to enforce this rule.

Baden Daire, an older woman who was never a great beauty, owns and operates the Whale, though she always has a fair-sized staff to help. Baden spent time at sea when she was young, and rumor claims she was a pirate before she settled down. She certainly knows the concerns of ship captains, and manages to be friendly and stern at the same time. She is extremely popular with many residents of the Port, as well as her regulars.

Lore Check

DC 10: Baden also runs a small ring of professional courtesans, who rent out rooms in the Whale and visit captains in their ships. She's very protective of the men and women who work for her in this capacity, and vengeful toward those who mistreat them.

DC 15: Baden is well-connected, and act as an information broker as well as an innkeeper, directing business to Guild League-run shops and trouble to Militia-patrolled areas. A visitor may not be able to find everything at the Blubbering Whale, but he will be told who knows where it might be for sale, trade or theft.

Cloth Labyrinth

The Cloth Labyrinth is a large open-air bazaar set up in the southern stretch of the Port Borough, and accessed by the Southern Gate. It is a barely regulated market for out-of-town merchants to sell their wares. Though inside the Port Wall, the Cloth labyrinth is officially not patrolled by any force of Refuge (though the Militia goes in from time to time), and being allowed into the Southern gate is no guarantee of access to the rest of Refuge. The Labyrinth is nominally controlled by the Guild League, who officially have final say regarding who can set up shop in the area, but often have difficulty enforcing their decrees.

The Guild League has a few simple rules. Sellers must not have shops within Refuge itself. Sellers may not set up permanent buildings or stay longer than 20 days. Sellers must pay the Guild League a tax of 10% of all monies made. Sellers may not block free access to the booths or stalls of other merchants. Sellers may only operate during the hours of daylight. Sellers may not sell anything of a harmful or controversial nature. All disputes are decided by the League, and any judgments are final and can't be appealed.

In reality, many of these rules are ignored because they cannot be enforced. Merchants set up their tents in one spot for a few weeks, then move to another to avoid the 20-day limit. Items the League would never approve of are sold openly whenever the Militia isn't present, and sales continue after nightfall behind tent flaps. Merchants with shops within Refuge allow their apprentices to sell damaged or out-of-date wares under assumed names. And the whole bazaar is a constant war of pavilions, tents, awnings and roped-off yards that shifts daily, with every stall vying for the best position in the ever-changing "streets" of walking trails. Only someone who is too lazy to move about, too stupid to conceal illegal activity, or too unpopular for his neighbors to not rat him out actually has much to fear from violating the Guild League's rules. Some people actually live in the Cloth Labyrinth, preferring it's permissive environment to the rules and stone of Refuge.

The Domant allows the Labyrinth for several reasons. First, while the merchants clearly cheat on their taxes paid, it still brings in a fair bit of income for little cost. Second, the ruler of Refuge assumes smuggling, black market deals, and shady trade practices are going to occur. By turning a blind eye to such things in the Labyrinth (which is officially outside his city, after all), he cuts down on such crimes within the walls. This both makes some neighborhoods safer,

and allows the Domant to simply close the city gates if he wants to cut off some product from the city streets. Third, the existence of the Labyrinth encourages merchants from far away lands to come to Refuge, which helps bring news of politics in those lands. The Red Hawks often patrol the Labyrinth to gather information on far away events that could impact the safety of Refuge. Finally, the Labyrinth is rife with spies from foreign powers, who the Domant sometimes uses to carry on unofficial diplomatic missions with both allies and enemies.

The wide array of craftsmen and merchants allow nearly anything to be bought or arranged for in the Labyrinth. Things with a cost of 300 gp or less can be tracked down in a hour. Anything pricier than that requires a Gather Information check or Bardic Lore check (DC 10 +1 per 1,000 gp of the price). There's a 1% chance per 1,000 gp of an item's cost that it's not currently available, but can be brought in 2-6 weeks if a 20% down-payment is made.

Lore Checks

DC 10: Despite the strict rules the Guild League claims rule the Cloth Labyrinth, the best merchants are here full time. Nearly anything can be found for sale here, if you have the time and the money.

DC 15: Since they can't depend on the Militia for protection or the League for quality control, the residents and regular merchants of the Labyrinth have developed their own government, the Lady's Sewing Circle. As the name suggests, its membership is mostly women, though many have nothing to do with sewing. The Sewing Circle has a rotating membership of councilors who publicly offer advice on all matters textile, and privately hear grievances regarding the Labyrinth. Since textiles are outside the Guild League's purview, the Sewing Circle even operates within Refuge itself.

DC 15: Whenever possible, the Sewing Circle solves problems with negotiation and diplomacy. When that proves impossible, they turn to the stronger and rougher members of the Labyrinth's merchants to form a brute squad. Such squads seek out a troublemaker and deal with him with as much force as is needed. Brute Squads always operate at night, and wear masks (sewn by the Circle) to hide their identity. Few people risk the ire of the circle twice, and those who do are often found dead, with eyes and mouth sewn shut.

DC 25: The Sewing Circle is currently run by Selma Hagan, a young woman who arrived in the Labyrinth just two years ago. Officially Selma is a washerwoman, cleaning and mending clothes brought to her stall with the help of her two "bleachers" (big albino thugs who rarely speak and answer only to her). In truth Selma is a professional assassin who fled to Refuge when she killed a king's heir. She originally intended to stay only a few months, and joined the Circle to keep an eye on anyone who might recognize her. She quickly found she had a flair for solving problems, especially as she could sometimes kill troublemakers without calling in a Brute Squad, and rose to lead the organization. She has learned to enjoy being a petty noble of a squatter's town, and isn't sure she's ever going to leave.

Next Month

In the next Icosahedron Adventures, we take a look at the richest and poorest boroughs of Refuge -- The Shield, and the Canals.

Space Station Peregrine

By Paul Drye

Homeline is on the cutting edge of only one field of technology: parachronics. In all other endeavors, timelines such as Shikaku-Mon, Caliph, and Gernsback surpass it. In most cases, there's little to be done except bring back technology and knowledge, and pass it along to Homeline scientists in the hope of catching up. When it comes to space travel, however, Homeliners have a peculiar advantage.

Zero-G

Travel in the reaches of Homeline's solar system doesn't happen any more. There were signs of it recovering from the post-Apollo lull, but when Paul Van Zandt discovered timeline travel, the industry collapsed in a short period of time. Excepting the need for weather and communications satellites, the money spent on space exploitation was used to explore alternate timelines instead. The last Homeline astronaut retired some time ago, and only China's automated asteroid mining projects --made practical because it's expensive to bring enormous amounts of iron through on conveyors -- keeps Homeline from having no presence outside of low earth orbit.

On the other hand, now Homeline didn't have *one* Earth worth watching from space . . . they had dozens, even hundreds. Some of them were advanced enough that they were already watching from orbit themselves, and Homeliners could tap into that. On primitive and empty timelines, however, agents were left without basic tools like weather prediction and comsats.

Putting space infrastructure in place around every world of interest was prohibitively expensive, but some creative thinking by the brains at Paralabs came up with a way around this. There were a few timelines like Lenin-2 and Vanish where a Space Age society had collapsed and equipment was free for the taking, if you could get into orbit. There were also a few where there was no Earth: a vehicle headed there popped into freefall. Combine the two and you had a plan, as one could drop a spacecraft into an Earth-less line, use a slow-but-cheap ion engine to build up a precise velocity, then cut over into the near-Earth space of another timeline in a stable orbit. After grabbing a satellite, one could then reverse the procedure, taking the booty to where it would do Homeline's bidding.

After some initial proofs of concept, the main benefactors of the plan -- the Survey and Surveillance divisions -- teamed up to acquire a permanent base for the project. After all, if you could go for little stuff in orbit, why not bigger?

Peregrine

The heist involved Grishin-1, where the collapse of the Soviet Union was far messier than on Homeline. A hard-line General Secretary provoked a war over East Germany in 1991, and the eventual nuclear exchange couldn't be stopped before full escalation. Years later the Earth in that line was still in bad shape; the United States' space stations had largely fallen out of orbit, and people were too busy trying to survive to watch the straggler Liberty. Infinity moved in, sent the mummified corpses of its last residents out the airlock, then hooked the station up to its own projector. Then they jumped it crosstime into orbit high above the American colony ay New Colorado where it served as a weather observation station and communications relay while it was being refitted.

The long-term plan, though, and the mission on which Liberty -- now renamed Peregrine -- has been embarked for the last four years, is as a movable base for Infinity's orbital efforts. Its projector is the key to this; with it, Peregrine can relocate to a 200-mile high orbit around any Earth on Quantum-5, and with a side trip to Homeline it can even move between timelines on different Quanta. The sole exception is those where some massive event has noticeably changed the mass of the planet or, more rarely, that of the Sun or the Moon. As long as the Earth is the same physically, Peregrine has the right velocity and position to stay in a stable orbit when it hops from one line to another. It will stay

in one location for a month or so, fulfilling whatever job it's assigned, then it moves on to the next item on the agenda.

The station is built around a Space Shuttle external fuel tank, which was put in orbit by Grishin-1's United States in 1984, cleaned, and refitted. Inside it has been subdivided into 10 sleeping areas toward the rear, a large common room and kitchen in the center, and a work area. Above the tank a truss connects to four solar panels that power the station, while below a series of radiators removes waste heat. Peregrine's projector and a large capacitor are attached to the top of the solar panels. Assuming the usual amount of light coming from the Sun (that has not been the case on missions to a few timelines!), the capacitor needs to be charged for 40 hours between transitions from timeline to timeline.

The station also has four subsections at its cardinal points. To aft is the ion engine added by Infinity; a tank containing a ton of liquefied krypton gas is within the main body of the station. The engine is used for adjustments to the station's orbit, including countering orbital decay. To forward is a command station, which runs both a communications relay and a large package of survey equipment. On the station's port side is Infinity's other major addition, the isolation quarters: a lab, life support module, and crowded accommodations for four people. These quarters are connected to the station by a truss that passes along electrical power and removes waste heat. Otherwise it is completely disconnected from the rest of the station. Even communications are handled via radio to the relay on the command station. At the starboard side of the station is an access tube to the dock for the station's two shuttles; one of the shuttles can also dock with the isolated quarters.

The station is used mostly for orbital surveys of new timelines where -- for whatever reason -- one of Infinity's bureaus can't get the information it needs from probes inserted on the ground. Peregrine also makes a useful base for training agents who are going to be in 0-g, usually on lines with large orbital presences. Space is at a premium on Homeline's wandering station, but a few days is enough for someone to get a feel for free fall, and for Infinity to see how he handles space sickness.

Emissary and Envoy

Shorter crosstime missions are handled by the workhorses of the station, its shuttles *Emissary* and *Envoy*. Both are refurbished spaceplanes, similar to the canceled Homeline X-38 though more advanced. On arrival at a destination timeline, they normally stay in orbit to surveil but they can also coast into any earthly location its occupants desire, using a parasail to slow down and steer after entering the atmosphere. When it's time to leave, each has its own built-in conveyor and a bolted-on ion engine under a heat shield. Using the conveyor a shuttle goes to the Earth-less Aterra-1 timeline (described below), then discards the shield and uses the engine and some high efficiency solar panels to build up the necessary velocity to match up with Peregrine. It then transits again and docks with its mother station around whichever version of the Earth it happens to be orbiting. This normally takes about three days, which is half the life-support limit of the shuttles. This limit resets every time a shuttle docks with Peregrine, or spends more than 12 hours on Earth.

In most cases it's easier to use a regular conveyor when planning to land on a new timeline; if you want to end up on the ground, start on the ground. However, a space approach does allow for a mission abort that's difficult with pure point-to-point travel. Any time Infinity feels a need to keep a bit of distance from a destination -- especially a new timeline where it's difficult to plan due to lack of information -- the Peregrine and its shuttles are considered. A good example is Gotha and other plague lines where putting the agents in a shuttle with a three-day-long return/incubation period (with the added potential of housing them in the isolation section of a station away from Homeline) is a wise precaution.

More often, though, the station's missions are space-related. The shuttles stay in orbit, and are used for spying or even rendezvous with native space assets if the natives won't notice.

The Aterran Timeline

Discovered in 1999, Aterra-1 was a curiosity until Infinity hit on the idea of using it for easy access to space. To all appearances it was a perfectly normal timeline with a small difference that was big only from the standpoint of

parochial humans: there was no Earth. The Sun was there, and so were the other planets and the rest of the galaxy so far as anyone can tell, but there was no trace of the third planet. The Moon circled the sun by itself as the smallest of the planets, though in an eccentric orbit. So far, differences in its orbital inclination and eccentricity as compared to Peregrine have kept its shuttles from getting too close to the moon: the nearest approach was a little over a million kilometers four years ago. Back then that was still too far away for easy access, though the station's higher-ups are planning on sending *Emissary* for a look at the next close approach,

Manning the Station

Peregrine was designed for eight people for three months; transferring supplies back and forth via crosstime jaunts is easy enough that it can support 10 for four weeks at a time. In times of crisis, four more people can be housed in the isolation quarters, and two on each of the shuttles for a total of 18. When that happens, though, the station's life support is good for only a week before it needs a supply delivery from Homeline.

As well as rotating personnel, the station has several permanent crew. In some campaigns these positions may be filled by players' characters, but if the adventurers are just visiting the "careerists" can play valuable roles.

Captain Anatoly Baika

A former Russian astronaut, and the youngest to fly aboard Homeline's last station (the USSR's *Mir*), Anatoly was recruited by Infinity Incorporated as an agent in 2001. His area of expertise was working in the orbital facilities of advanced timelines, and he has seen every kind of space technology in his 30-year career. Now 59 years old, he's been the commander of Peregrine since it started its mission; it's widely acknowledged by Infinity personnel that his experience aboard Mir and with free fall in general makes him invaluable.

The Captain is short, just 5'8" and 150 pounds, with dark gray hair in an astronaut's buzz cut. He's in good health for his age, but worries correctly that if that ever changes he will be relieved of duty -- Peregrine is just too isolated for long periods of time for it to be otherwise.

After the breakup of the Soviet Union, he became a devout -- if quiet -- member of the Russian Orthodox Church. Most people don't find out about this unless they go in his quarters: there he has a small icon of the Virgin Mary surrounded by cunningly crafted penlights made to resemble candles.

Captain Anatoly Baika   *134 points*

Attributes: **ST** 10 [0]; **DX** 12 [40]; **IQ** 12 [40]; **HT** 10 [0].
Damage 1d-2/1d; BL 20 lbs.; HP 10 [0]; Will 12 [0]; Per 12 [0]; FP 10 [0].
Basic Speed 5.5 [0]; Basic Move 5 [0]; Block 0; Dodge 8; Parry 9 (Brawling).

Languages: English (Accented/Native) [5]; Mandarin Chinese (Broken/None) [1]; Russian (Native) [0].

Advantages: Improved G-Tolerance (0.3G) [5]; Military Rank 3 (Captain of the Peregrine) [15].

Disadvantages: Code of Honor (Soldier's) [-10]; Sense of Duty (Crew of the Peregrine) (Small Group) [-5]; Xenophilia (12 or less) [-10].

Quirks: Careful; Mutters in Russian; Prefers Zero-G [-3].

Yun Ha-Neul

Mission Specialist Yun is the station's chief surveyor, which is to say she is in charge of running the survey equipment in combination with a few temporary staff assigned for specific missions. When Peregrine is short on people she works all of it herself, if more slowly.

Ha-Neul is a Korean woman of average height and weight. Her appearance is quite bookish, with long, plainly styled black hair and round glasses.

Her area of expertise means that she's the one who first assesses a new world. She can read the results from her survey equipment, and note every place this Earth diverges from Homeline. She's particularly good at using satellite photos to figure out where a timeline's most advanced culture can be found, and just how advanced they are.

A former member of the Korean Army, she learned her trade looking surreptitiously across the border using every tool the West had to offer. Since coming aboard, she's also developed a good feel for what the Earth "should" be like -- not only its physical outlines, but a sense if she's seeing too many or too few city lights at night, how much radio chatter Peregrine is picking up, and other details that give an idea of what she and the rest of the crew are up against.

Her background got her interested in tactics as well, and her main hobby is learning every strategy game the world has to offer. She mastered Go many years ago, and is currently working on chess. In particular, she likes taking unconventional (and suicidal) handicaps like having no queen and only one rook, then winning anyway unless her opponent is skilled.

(((END BOX)))

Dr. Sergio de Assis Tostes

"The Doc" is Peregrine's expert on parachronic physics. This means he runs the projector perched on top of the station, but he is also in charge of analyzing new timelines for differences in physical laws. He looks for oddities like strange square-cube laws (in the manner of Microworld), impossible technologies (like on Lucifer-5), and mana use.

Captain Baika was profoundly unhappy when Dr. de Assis Tostes was first assigned to the station, since at first impression he's quite insane. He's obsessed with the physical differences between timelines, and is pursuing a mad theory that projector-capable timelines (in particular, Homeline) are susceptible to massive changes in nature's laws. He believes Aterra-1 is another example, and that led to the destruction of that timeline's Earth; the fact that the station's projector can't move it to other Quanta from there is explained away by the disaster. Whether this is genius or insanity is hard to say. He hasn't managed to convince anyone else, at least.

Shortly after he came on board, the Doctor gained Baika's trust. Crazy or not, he's committed to keeping the station flying. (How better else to prove his theories?) When he can be shifted off his obsession, he's even a charming and seemingly normal man. Most of the time, though, he lives in makeshift quarters set up in the access corridor between the main body of Peregrine and the conveyor. Visitors might not meet him at all, as he prefers to talk to the other crew through the comm system, so he doesn't have to leave his beloved experiments.

Cody Wheelright

The station's shuttle pilot, he was -- until two years ago -- a test pilot for the US Air Force. After using an X-54 to make a crater in New Mexico, he was sidelined from active duty, then assigned to Peregrine. Some days he desperately wishes he was back home doing what he loved, other days he revels in taking space planes out for spins on new timelines.

Most of the time he looks and acts the part of the cocky test pilot. He's physically fit and clean cut, and annoyingly gung-ho. To some extent this is over-compensation for his humiliation over the X-54. He's also spooked by the station. He dwells on the fact that people died aboard the Peregrine before she was drafted by Infinity, and sometimes thinks he hears strange sounds when the SET is dark.

Cody Wheelright   *146 points*

Attributes: **ST** 11 [10]; **DX** 13 [60]; **IQ** 10 [0]; **HT** 11 [10].

Advantages: 3D Spatial Sense [10]; Appearance (Attractive) [4]; Fit [5]; Improved G-Tolerance (0.3G) [5].

Disadvantages: Compulsive Carousing (12 or less) [-5]; Phobia (Ghosts) -1 (12 or less) [-5].

Quirks: A little too enthusiastic about action; Affects a Southern accent even though he's from Oregon; Broods over crashing the X-54 [-3].

Skills: Carousing-13 (HT+2) [4]; Current Affairs/TL8 (Sports)-11 (IQ+1) [2]; Driving/TL8 (Automobile)-13 (DX+0) [2]; Electronics Operation/TL8 (Electronic Warfare)-9 (IQ-1) [1]; Gunner/TL8 (Machine Gun)-13 (DX+0) [1]; Gunner/TL8 (Rockets)-13 (DX+0) [1]; Guns/TL8 (Pistol)-14 (DX+1) [1]; Guns/TL8 (Rifle)-15 (DX+2) [4]; Guns/TL8 (Submachine Gun)-14 (DX+1) [1]; Judo-13 (DX+0) [4]; Piloting/TL8 (Aerospace)-15 (DX+2) [1]; Piloting/TL8 (High-Performance Airplane)-17 (DX+4) [12]; Piloting/TL8 (Low-Performance Spacecraft)-16 (DX+3) [8]; Savoir-Faire (Military)-11 (IQ+1) [2]; Sex Appeal-13 (HT+2) [4]; Spacer/TL8-11 (IQ+1) [2]; Tactics-10 (IQ+0) [4]; Vacc Suit/TL8-12 (DX-1) [1].

Adventure Seeds

That Can't Be Good: After four years of transiting through Aterra-1, the Powers That Be have finally scheduled a mission to go take a look at the Moon in the hopes of getting some clues as to the timeline's change point. The orphaned body will be swinging less than a million kilometers from Peregrine. One of the shuttles is to dock with a decommissioned four-man lander purchased on Detente-3 and then the whole assembly will be fired into lunar orbit for a look.

Upon arrival, however, things are rather different than expected. The theory was that there'd be some newly rearranged terrain thanks to the Earth's tidal forces being removed from the Moon, but something far more serious must have gone on. The Moon is badly battered and partially roasted; there is residual radiation which is a potential problem over the course of the time that the crew was supposed to explore. Still, there'll be no other opportunity to investigate for years more, and that much devastation begs for investigation. What if whatever caused it comes back? Up to four brave souls can head to the surface . . .

Not a Lost World, Just Misplaced: About 130 million years ago, most Earths had a large magma pulse in the southern Indian Ocean which, over time, produced a small continent. On Homeline (and the real Earth) this land has all but disappeared -- only the small, sub-antarctic Kerguelen Islands remain. On a few timelines, though, it stayed above the water line. Unfortunately, it's difficult to explore: the point-to-point nature of parachronic travel means that a projector has to be placed several thousand miles from the nearest inhabited land before a transition to "Kerguelania" can be made. There are also no known Kerguelanian lines with civilized humans, so even jumping from elsewhere on Earth then chartering a boat is impossible.

The Survey Division has decided to investigate using a pre-existing asset rather than set up a new base on Homeline's Kerguelen. Peregrine's crew is assigned to use a shuttle and land on the surface of Laetoli-2, which has a large Kerguelania about the size of Greenland. Upon arrival they will find a cold paradise of dense pine forests and flightless birds that -- with an entire continent free of mammals -- have got back in touch with their inner dinosaurs and evolved into every available ecological niche. They will also find evidence that someone from Homeline has been here before. The Homeline Kerguelens are owned by France: has their notoriously difficult government been up to something on the sly? Or is there a more sinister plot underway?

Out In The Great Wide Open: A transition error has left Peregrine in orbit around an Earth that can pick them up on radar and -- more importantly -- send someone up to investigate. Can the crew get the station off and away before the Secret is shattered?

CyborGladiators

Published by [Firefly Games](#)

Written by David L. Pulver, Marc A. Vézina, Scott Bennie, Mark Arsenault, & Patrick Sweeney

Art by Bart Willard, Bryce Nakagawa, & Richard Cox

Edited by Patrick Sweeney

64-page b&w softcover; $14.95

Let's not kid ourselves. A game like *CyborGladiators,* about man-to-man combat among enhanced humanoids, isn't exactly a new concept. But give the fine folks at Firefly Games their props, because they've managed to make it feel fresh and new.

The background is pretty straightforward. Aliens called the Dzerini drop by planets once in a while, collect a few promising specimens (like, say, humans), and use them as pawns in a galactic game of mortal combat. Not all aliens are created equal, of course -- some of them might have a thick carapace on their backs -- so it may be necessary to *re*create them equally. If you die in the arena, oh well. You probably weren't going to be worth sponsoring anyway. On the other hand, if you show that you can take on an enemy who's a little bit bigger or a tiny bit faster than you, it's worth their while to fix you up and send you back for round two.

At that point, though, you're an investment, and in all likelihood a cyborg. That arm you lost last time has been replaced with a tough but utilitarian chunk of steel. If your owners are feeling particularly generous, you may have a small-caliber weapon attached to the end of it, or a taser, or a flame thrower. Your legs can be modified to fly or, if the rules prohibit such freedoms for this round, refitted to provide a meters-long bounce in your step. The more you win, the more money they pump into you, and the more powerful you -- and your enemies -- become.

If you want to know how the game works, you need look no further than the [Action! System](#), available free at the [Gold Rush Games](#) website. The whole thing was built to take advantage of those core rules. Characters have four basic attributes for their mind and body, and several formulae are given to get secondary stats like how fast you are or how many skill points you get. (You'll need to bring your own six-sided dice to the table.)

Most of the skills fall into fairly narrow confines; the name of the game is beat-down, so you'll learn weapons and fighting before anything else. Rules for jumping, climbing, or otherwise traversing the arena, as well as how to hurt people on your way by, form the workmanlike entrée of the rules. Your dessert -- the crunchy bits you came for -- includes all the gear you get to play with. Devices for seeing in the dark, lung improvements, even cyber-hair that obeys your commands, make you less human but more bankable. Just like the aliens who took you, you're not limited to humans as competitors. The reptilian Tuara get bonuses to their Toughness and have their own poisoned-fang attack, and the feline Kisa can see in low light to rend you with their claws. Should anyone live long enough, they become the galactic champion and retire.

Beyond that, the rules of the game are literally that -- the rules for the Dzerini's brand of combat. One fight may happen in a lava field, the next on a spiked dais. Some weapons may be allowed, others prohibited, or you may have to fight for what few arms are left scattered about for the participants. They have their own "leagues," depending on how

much cash has been spent on your upgrades. A stable of starting characters lets you select a couple and jump right into each other's face, or you can butcher your own. Character sheets, scoreboards, and even a page for mapping out your stadium fill out the back of the book.

The artwork all by itself is worth the cover price. Why Richard Cox (or is it Bart Willard? The pieces are unsigned) isn't the talk of the game-art town is strange. With smooth lines and heavy detail in pieces that speak to action without *technically* leaving the page, this omission is either an oversight or an outright crime, depending on which way you look at it. Bryce Nakagawa also serves, illustrating the classy cardboard standup sheet of cutout figures you can use to make your own tabletop warriors.

This isn't a roleplaying game as much as a combat training manual that uses similar rules, but if you can read this volume and don't find yourself swamped with the RPG possibilities, you've probably got the right cover wrapped around the wrong interior text. It's a rich buffet from which to choose your weapons, and designing the arenas is almost as much fun as the characters. It all fits into just about any ongoing campaign, and ditching their system for your own is easy -- the two types of material are kept separate, so you can steal the ideas you want and round-file the ones you don't (there won't be many of the latter).

The concept is as old as the hills, and they have a pretty narrow arena in which they work their magic, but within those restraints Firefly Games expounds on just about anything you can think of that brings the subgenre alive. *CyborGladiators* is like a really entertaining laundry list of what makes this sort of visceral pastime such a perennial favorite in fiction, and that may make it a mainstay on your shelf as well.

Serenity Role Playing Game

Published by [Margaret Weis Productions](#)

Written by Jamie Chamber with James Davenport, Tracy Hickman, Tony Lee, Andrew Peregrine, Nathaniel C.J.S. Rockwood, Lester Smith, Christopher Thrash, James M. Ward, & Margaret Weis

Fiction by Margaret Weis

Illustrated by Lindsay Archer, Dan Bryce, & Ryan Wolfe

Cover by 11TH HOUR

226-Page Full Color Hardback; $39.99

What is probably one of the biggest licenses in recent years has arrived, fuelled by a firm fan favorite television series and by the buzz of its big budget movie sequel (recently released on DVD). The former is *Firefly,* what Joss Whedon did after *Buffy, the Vampire Slayer* and *Angel,* cancelled just after just a few episodes; and the latter, is *Serenity.* It is this movie that the ***Serenity Role Playing Game,*** published by Margaret Weis Productions, is based upon, allowing gamers to play in the 'Verse.

This is the setting for the new Science Fiction RPG, one that is more horse opera than space opera. Indeed the setting is *sans* aliens, blasters, and noisy ships in space, or the Black as it is known; and in tone and feeling owes much to the Wild West after the American Civil War. In the 'Verse, its equivalent was the Unification War that ended seven years ago in 2511. Fought between the Alliance Government of the central worlds and the Independents of the Rim worlds, the Alliance Government won and continues its efforts to bring the planets and moons of the frontier under its control. Despite their losing, there are still men of the Independent forces, known as Browncoats for the long dusters they wear, that prefer to live free of the Alliance. In the television series and film, one such man is Captain Malcolm "Mal" Reynolds, owner of *Serenity,* a *Firefly*-class transport. He and his crew fly the Black, taking on jobs both legitimate and illegitimate in order to make ends meet. This is also the default set-up for the RPG, in which the player characters crew a ship and fly the Black, bringing with them a panoply of backgrounds, connections, and secrets; all to be explored during the course of a game.

The RPG comes as a sturdy hardback, the contents decently laid out in full color, and illustrated with stills taken from the movie. It also comes with quite a few problems, all of them omissions. There is no character sheet, its stead taken by an advertisement for another game. There is no index, surely a cardinal sin in this day and age of modern RPG productions; and if I found it difficult to locate various facts for the purposes of this review, what then of trying to use the book during play? While there are plenty of character examples, there is no example of character generation. Likewise, there is no fully worked example of combat -- personal, vehicular, or between spaceships; or even a fully worked example of actual play. None of which are particularly complex, but for a game that is pitched at *Firefly* fans that want to try the game (as well as the fans that already game), they are all serious hindrances in their trying to understand and play the game.

Another potential problem is that the ***Serenity Role Playing Game*** is based solely upon the film of the same name, and

not on the television series, *Firefly.* Actually, this is not really a problem, as the book mentions some characters from the series by name, and gives the statistics for others by type rather than by name, in particular, Badger and Saffron. Also missing are character statistics for the character River Tam, as she is depicted in the film. This is done -- and they tell you this -- for purposes of game balance. This is understandable, but why not give them later in the GM's section for completeness' sake? Also missing is a starting scenario, something that experienced gamer will have no problem with, but a neophyte will.

Now some of these problems -- in particular, the character sheet and the scenario -- will be addressed with a QuickStart Rules download available from the website. Yet, at the time of writing, months after the game's launch at Gen Con, there is no sign of this material on the website.

With the bad points out of the way, what of the good? Well, the main cast get full write-ups; there is plenty of information about the 'Verse; there are spaceships galore, many with full-color (and very pretty) deck plans; and then there is the appendix. Not just a guide to the 'Verse's language and idiom, it also gives you all of the phrases and curses in Mandarin you will ever need. Which is, as they say, shiny. (Of course, the translation of these phrases and curses is toned down here, but a web search will reveal them all in their gorram glory.)

Characters are themselves created from a pool of points (determined by a campaign's Heroic Level) which are used to buy dice by type, one for each of the six attributes. The dice types include the d2, d4, d6, d8, d10, and d12; and the bigger the die type, the better it is. In addition to attribute dice, a player purchases Traits, either Assets or Complications. These include Allure, Mean Left Hook, and Religiousity; and Easy Mark, Leaky Brainpan, and Things Don't Go Smooth. Many come as Minor and Major, the latter requiring activation with Plot Points. Skills are purchased from a separate and larger pool of points, and are also rated by die type. They have a limit of d6, after which a character specializes with a higher type. Thus a character can have a Guns skill of d6, but a Pistol skill of d10.

Mechanically, the game is simple. Roll attribute plus skill dice to beat a target, the average target being seven. Attribute checks involve rolling two dice of the appropriate type; and an unskilled check is made against a single attribute die only. Dice do not explode, but bonuses and penalties for an action increase or decrease its die type.

Combat uses the same mechanics, rolled against a target or an opposed roll. Better rolls give bonuses to basic damage inflicted, with weapons inflicting Stun or Wound damage. Weaponry listed in the equipment section is generic, with bigger weapons possessing larger die types. Except for a couple of weapons given in the cast write-ups, including "Vera," no weapon is named, which is a pity as brand naming would have added flavor. Vehicular and spaceship combat works in the same fashion but on a larger scale. Again no record sheets are provided for either.

Conversely, spaceships do get named, including the *Firefly*-class transport. Others listed include passenger liners, colony ships (the equivalent of settler wagons), plus Alliance Cruisers and Gunboats, many accompanied by gorgeous deck plans. The spaceship design rules are nicely done, each vessel being treated just like a character. There is no starting point limit, but the more points spent on a ship, the higher the maintenance costs for the ship during play. Unlike character generation, there *is* a fully worked example of ship creation.

Game play emphasizes the use of Plot Points, with which a character begins with six. They are expended to improve an action die by type, to keep a character alive, manipulate the story in small ways, and to activate a character's major assets. In turn, they are gained for good play, achieving character goals and playing to their Complications. Only six can be kept between game sessions, the remainder becoming Advancement Points. Overall, the mechanics are light and quick, much like the other Joss Whedon derived RPGs, but with its multiple dice use harking back to both the [*Deadlands*](#) and [*Savage Worlds*](#) RPGs.

The game comes with a decent amount of background, the most complex of which is the setting's economics and exchange rate. Besides this, there is a reasonable amount of generic equipment, descriptions of various organizations, planets, and moons, though the map of 'Verse is more pretty than practical. There is also a sample ship and its crew, owned by a high rolling gambler, which if used, lends itself to numerous adventure ideas, as does the description of 'Verse. There is also advice for the GM, which is hardly spectacular, but good enough if you are new to RPGs.

Certainly, there is a lot to like in the **Serenity Role Playing Game,** the simple system, the background, the spaceships

and the rules for constructing them, as well as the writing itself. This is done in a style appropriate to the 'Verse, and is both light and engaging. But the game is marred by its omissions, in particular by the lack of full examples and index that only serve to make the game feel underwritten -- at least in those places, because in others it is not. As to the lack of an adventure, inspiration can be found in almost any space opera science fiction RPG, whether **Traveller** (BITS' **101 . . .** series would be useful here), **Star Wars,** or **Star Trek**; all the GM has to do is a-Westernify the end result.

Yet despite the irritating omissions, the actual end result is really rather likeable. Certainly nothing particularly groundbreaking, it is successful in imparting a sense of time and place, as well as the feel of the 'Verse. The rules themselves are light enough to hang your game on without impinging upon play. Perhaps I am influenced by my like of both *Firefly* and *Serenity,* but the **Serenity Role Playing Game** is far from unplayable.

--Matthew Pook

My Road Seem Dark As Night: Robert Johnson

"I got to keep movin'
I've got to keep movin'
Blues fallin' down like hail
Blues fallin' down like hail . . .
And the days keeps on worryin' me
There's a hellhound on my trail."
-- Robert Johnson, "Hellhound On My Trail"

Robert Johnson was the greatest blues guitarist that ever lived. Little else about his life is certain, but it's certainly uncertain in interesting ways. His birthdate is unknown, although it's assumed to be May 8 of 1909, 1911, or 1912; his death date (August 16, 1938) is only known thanks to the discovery of his death certificate in 1970. The cause of death is listed only as "no doctor," and Johnson's grave, in a churchyard in Morgan City, Mississippi, is unmarked. Only two photographs survive of Johnson, and only 41 recordings of 29 songs. Even his name has blurred edges -- he was raised Robert Spencer, only taking the name "Robert Johnson" when he discovered his mother's affair with Noah Johnson. He claimed the middle name "Lonnie" (which evoked the older bluesman Lonnie Johnson to him) and went by "R.L." (or "Robert Dodds") to muddy the waters still further. (His actual middle name was Leroy, making him another of America's mystical kings, *les rois.*) No canonical record of Johnson's tour dates, or even of his residences, survives; he fathered a number of children by many women, not all of them recorded either. With the exception of copious reminiscences from his contemporaries, gathered decades after the fact, less is known of Robert Johnson than of William Shakespeare. And like Shakespeare, the source of Robert Johnson's genius remains -- you guessed it -- unknown.

"Early this mornin'
When you knocked upon my door
Early this mornin', ooh
When you knocked upon my door
And I said 'Hello, Satan,
I believe it's time to go.'"
-- Robert Johnson, "Me and the Devil Blues"

The version of the story that most people have heard is that Robert Johnson sold his soul to the Devil at the crossroads of Highway 49 and Highway 61 in Clarksdale, Mississippi some time in 1931. Before that date, bluesman Son House recalled Johnson as a personable, but annoying kid trying to play guitar -- badly. He was, if anything, a harmonica player, and a pretty good one. Six months to a year later, by House's later recollection, Johnson's guitar playing was transcendent -- "When he finished, all our mouths were standing open." For the next five years, Johnson toured all over the Delta country and elsewhere in the South. He remained cagy about his music, and would turn his back during some numbers to avoid revealing his best riffs; if the scrutiny got too intense, he'd walk off the stage in the middle of a set. In 1936 and 1937 he recorded 29 songs in two sessions in San Antonio and Dallas; his biggest hit on record was "Terraplane Blues." After his records, he toured even more widely, gigging in Chicago, Detroit, New York, and even Windsor, Ontario. Wherever he went, he could always charm his way into female companionship, which is quite possibly what killed him. In a juke joint outside Greenwood, Mississippi, the story has it that Johnson was overly friendly to the bartender's girl. The bartender got revenge by serving Johnson a half pint of whisky laced with strychnine, and he died three days later. After seven years, the Devil had called Johnson's note due.

"I can be as fascinated by occult musings as the next guy, but it is long past time for music journalists to get over the cliche of always linking Robert Johnson and the Devil. For at least a few years, I propose a moratorium on sentences like 'Persistent themes in his blues were religious despair and pursuit by demons,' or 'Johnson seemed emotionally disturbed by the image of the Devil, the "Hellhound."' Such sentences tell us less about the realities of Johnson's music than about the romantic leanings of his later, urban white listeners."
-- Elijah Wald, *Escaping the Delta: Robert Johnson and the Invention of Blues*

Unless Johnson died of syphilis, or of even less diabolical pneumonia, that is. Although other bluesmen such as Tommy Johnson and Peetie Wheatstraw did indeed claim to have learned guitar "at the crossroads" (Wheatstraw even called himself "the Devil's son-in-law"), the story of Robert Johnson's deal with the Devil comes from a single Son House interview in 1965 and from the earnest mythmaking of a *Rolling Stone* reporter in 1979. Son House was not above embellishing a story (or above pranking stuffy white ethnomusicologists), and it's more likely that Tommy Johnson's authentic Devil tale (which the Coen brothers include in the movie *O Brother, Where Art Thou?*) simply migrated to the far better known (but unrelated) Robert Johnson. Only two or three of his songs reference anything infernal ("Preaching Blues" is subtitled "Up Jumped the Devil" but has no demonic content), compared to the nine or 10 that focus on traveling or women, both well-documented Robert Johnson passions. "Cross Road Blues," for example, is a lot easier to read as a song about hitch-hiking unsuccessfully (possibly as a metaphor for alienation, possibly as a metaphor for trying to pick up women, or just possibly as a metaphor for hitch-hiking) than about diabolical contracts in Clarksdale.

"One individual, who appeared to me of a sallow complexion, melancholy air, and bright eye, affirmed that he . . . had distinctly seen, while I was playing the variations, the Devil at my elbow, directing my arm and guiding my bow."
-- Nicolo Paganini, letter published in the *Revue Musicale* (1831)

And it's not only Johnson's contemporary bluesmen, or their rock successors, who get tagged as diabolically trained. The tale of "the Devil's musician" predates the Devil's music by at least three centuries, with one Anthony Wood in 1658 describing a music professor's amazement that the virtuoso Thomas Baltzar had no hooves. This may stem from the motif of Death playing a fiddle in the Renaissance "Dance of Death" imagery, the *danse macabre* celebrated by such composers as Saint-Saëns and Liszt. Liszt, like Tommy Johnson at least, was widely considered to have sold his soul to the Devil for musical genius; to seal the deal, as it were, Liszt composed not only a Faust Symphony but four Mephisto Waltzes. Even closer to our theme, the violinist Giuseppe Tartini composed a "Devil's Sonata" in 1713 after dreaming that the Devil had given him a violin. But the ultimate "demon violinist" of the classical era was Nicolo Paganini. Unlike Johnson, Paganini demonstrated his talent early -- at thirteen, he was rejected as a student by the famous violinist Rolla, who claimed he could teach Paganini nothing. Paganini began touring Italy in a black coach driven by black horses. He composed a series of variations on a Sussmayr ballet, which he called *"Le Streghe,"* or "The Witches' Variations." Like Johnson, Paganini died in mysterious circumstances -- he refused to take the sacraments before his death, and so could not be buried in consecrated ground.

"If you want to learn how to make songs yourself, you take your guitar and your go to where the road crosses that way, where a crossroads is. Get there be sure to get there just a little 'fore 12:00 that night so you know you'll be there. You have your guitar and be playing a piece there by yourself . . . A big black man will walk up there and take your guitar and he'll tune it. And then he'll play a piece and hand it back to you. That's the way I learned to play anything I want."
-- Tommy Johnson, as quoted by his brother LeDell

And where did we bury [the unconsecrated dead](), back in Paganini's time and before? Why, as it turns out, at the crossroads. The crossroads is a classic "liminal space," a boundary of no-place where the normal rules don't apply. It's outside of town in the wild, which is creepy enough in ancient Greece and Depression-era Mississippi alike. The addition of a second road opens it out still further. Anyone (or anything) could come down either road from any direction; it's a focal point for chaos, which if you think about it is yet another contradictory notion. It's a [mirror]() of two roads, or a fork of three; it thus evokes choice and fate and chance both geometrically and symbolically.

The gods associated with the crossroads are therefore also often gods of fate and chance, of choices that determine lives. Hermes -- whose name seemingly comes from the word for "roadside cairn" -- was thus the god of gamblers. Such gods often extend their sway into the land of the dead, a natural extension of the concept of crossroads as boundary between worlds. Odin was "chooser of the slain," while Hermes was a psychopomp, a guide to the dead. A Mayan underworld god, Lord Maam, is depicted on a throne at a crossroads, and the goddess Hecate, queen of death and magic, was worshiped at the crossroads as Hecate Trioditis, Hecate Going-Three-Ways. (The connection between Hecate and Johnson's blues "Little Queen of Spades" about "a gamblin' woman" with a "mojo" is left for the student.) Hermes of the crossroad was Hermes Trikephalos, the Three-Headed, or Hermes Looks-Three-Ways. The Voudun loa Legba, the Opener of the Way, has a [Petro]() reflection known as Maitre-Carrefour, the Master of the Crossroads. He

knows the secrets of the dead and teaches necromancy, just as Legba opens the way to the other loa. Legba must be invoked before any Voudun ceremony; the African-American version of Voudun, hoodoo (more a magic than a religion) likewise requires many of its rituals to be done at the crossroads, rituals including dickering with the Devil (or "the black man" or "the rider") for knowledge and skill. Interestingly, the crossroads is also the place hoodoo conjurors dispose of dangerous used magical ingredients like candle wax, footprint dust, or incense ashes. The rituals of the Roman feast Compitalia, the offering to the Lares Compitales or "spirits of the crossroads," could only be performed by slaves, a reversal of normal priestly practice. Hermes killed Argus, the Hundred-Eyed watcher, at the crossroads to cover up Zeus' adultery, a disposal of a monstrous Titan in the service of illicit acts. The crossroads is not just a source of knowledge, but of dissonance and disturbance.

"There in the narrow hall, outside the bolted door with the covered keyhole, I often heard sounds which filled me with an indefinable dread -- the dread of vague wonder and brooding mystery. It was not that the sounds were hideous, for they were not; but that they held vibrations suggesting nothing on this globe of earth, and that at certain intervals they assumed a symphonic quality which I could hardly conceive as produced by one player."
-- H.P. Lovecraft, "The Music of Erich Zann"

Which is as good a time as any to mention the "Devil's interval," also called the "diabolus in musica" by medieval composers. This dissonant interval (called a tritone, because it spans three tones) was frowned upon (and perhaps even banned) in church music before the advent of equal temperament tuning. With Bach and the "well-tempered clavier" -- interestingly appearing right around the time of Tartini's dream of the Devil's wondrously tuned violin -- the Devil's interval could be modulated more pleasingly. (You can hear it in "Enter Sandman" by Metallica, in most of *West Side Story,* and in the opening vocal bars of "The Simpsons" theme -- "The/Sim-" -- by Danny Elfman.) My musicological mojo is nowhere near good enough to explain it any further, but I did note that one major tritone is the "diminished fifth." If, as Wikipedia seems to think, this is the same as a "flattened fifth," then it's the same as the "blue note" -- a key element of the "blues scale," which is to say, then, that the music Robert Johnson played better than anyone was tuned to the Devil's interval.

"Standin' at the crossroad, baby
Risin' sun goin' down
Standin' at the crossroad, baby
Risin' sun goin' down
I believe to my soul, now
Po' Bob is sinkin' down."
-- Robert Johnson, "Cross Road Blues"

Which leads, somewhat circuitously, to the notion beloved of the locals in Rosedale, Mississippi, that Robert Johnson made his famous deal at *their* crossroads, at the intersection of Highways 8 and 1, which would be a crossroads of an octave. But what if, mirror-wise, we've got it backwards? What if Johnson, raised with no name and no picture, was intended to be -- fated to be -- the avatar of the Devil, of the Master of the Crossroads, of Maitre-Carrefour. But then he loses his bride Virginia and their unborn child in 1930. That's the last straw for the easygoing harmonica player. He doesn't fold, he rebels. He practices guitar in graveyards for seven months with the bluesman Ike Zinnerman -- a mysterious figure in his own right, perhaps a Legba called to thwart Maitre-Carrefour. Then, on the night of the Compitalia, Johnson comes to the crossroads of the octave outside Rosedale. He sees "the blues walkin' like a man," as he says in "Preaching Blues (Up Jumped the Devil)", dissonance and death incarnate. But Johnson reverses Paganini and traps the Devil in his own interval, in the spaces between his notes. Before the "deal," Johnson had a slight cataract in one eye, which we will note as the stigmata of Odin. After the deal, his eye clears up -- he doesn't trade an eye for knowledge, but rather the opposite. He's beaten Hermes -- inventor of the lyre, after all -- at his own game.

But like all such victories, it's a chancy, partial one. He has to start travelling constantly; perhaps Hecate's (three-headed?) hellhound is on his trail. As he says in "Drunken Hearted Man," he's "been dogged and I been driven/eve' since I left my mother's home." Perhaps he picked up a lamia, a Dark Lady at the crossroads -- where one buries vampires -- and she weakens him even as she feeds him inspiration. Again "Preaching Blues" gives us a hint; "blues is a low-down achin' heart disease/Like consumption/killin' me by degrees" -- recalling our tubercular vampire spirits from Lovecraft country. In San Antonio as late as 1936, he thinks he might be able to escape her -- "I Believe I'll Dust

My Broom" and "Rambling on My Mind" both deal with abandoning a cruel lover -- and he sees "Sweet Home Chicago" on the horizon. On his tours he stops playing blues exclusively, but rather mixes in jazz and even Bing Crosby. But as he closes in on midsummer 1937, he's less sanguine. In Dallas, he records not just "Little Queen of Spades" and "Hellhound On My Trail" but "Stones In My Passway." In that blues, Johnson says "my road seem dark as night . . . my enemies have betrayed me/have overtaken poor Bob at last." And, in a creepy echo of Hermes of the roadside cairn, Johnson knows his enemies "have stones all in my pass." In "Traveling Riverside Blues," also recorded in 1937, he knows Hecate "got a mortgage on my body, now, and a lien on my soul." Perhaps he plans a rematch: "Lord, I'm goin' to Rosedale, gon' take my rider by my side." (Odin, the Rider God of the River?) But it's too late. On Hecate's feast day, August 13, he drinks strychnine in a roadhouse outside Greenwood -- at a juke joint known as the Three Forks.

Murphy's Rules

All Downtime, All The Time

As folks who've been with us for the past 14 days know, my past [two columns](#) were about establishing a change of scenery in places where it may not be obvious to do so (such as in a legal thriller). Of course, such thoughts seldom fail to conjure ideas that are not 100% antithetical to the idea at hand. Fortunately, I'm able to recycle these irreconcilable notions in future columns, secure in the knowledge that most of you will forget any earlier incongruities.

Unless, of course, I make a point of bringing it up as my introductory paragraph.

<ahem> Anyway, the high concept -- one which I haven't been able to wrap my mind around fully -- is this: What if you had a campaign that was nothing but downtime?

I've discussed before about how [downtime](#) can often be one of the most enjoyable parts of an RPG campaign. And in a lot of stories (especially serial television shows) it's not the main courtroom-type drama that's where the action is; it's in the between-plot plot . . . such as *Ally McBeal.* (And with this -- my third-week-in-a-row *Ally McBeal* reference -- I have now accomplished the coveted *Ally McBeal* hat trick.) Couple this fact with my relative ho-hum-ed-ness toward [combat](#) in a lot of campaigns, and I can't help but envision a campaign that forwent the usual structure of "setup:adventure:downtime" and instead focused as much as possible on the latter.

To a certain extent this has been done before in some media. For example, the comic book series *Young Heroes In Love* was conceived as a *Melrose Place* of superheroes, where the main thrust (no pun intended) of the action was on the interpersonal relationships -- with an eye toward prime-time-soap-opera-type romance and sheet-romping. ("Oh, no! My powers are based on fire . . . why am I so attracted to the one whose abilities are based on *ice?!*") And, arguably, the TV show *E.R.* was one of the first to focus on the interpersonal relationships of the staff of the hospital more than on their patients.

Of course, this idea has a number of problems right out of the gate. First, it's the "in between" adventuring-type stuff -- the dungeon-crawling, the city-saving, the whatever -- that most often provides the grist for these downtime campaigns. ("Gee, I haven't been able to forgive you for leaving us to die while you went off to explore that interesting-looking corridor . . .") Second, without the downtime material filling in for "real" adventuring, but instead becoming the main course, it can be difficult to envision how such story hooks would originate.

So that's why I haven't been able to wrap my mind around the idea entirely. However, there are a few other observations I'd like to offer here, branching off from this main -- probably unworkable -- idea:

1) What if you had two GMs running a campaign, one who really likes running combat and "meat & potatoes"-style adventures, and one who likes the fluffier downtime stuff? Well, then, you have a potentially perfect combination to hand off the campaign back and forth! One GM can set up the adventure and act as the liaison to the plot-type adventures, and then -- once everyone is back home and falling back on their own machinations -- the campaign can be handed off to the subplot GM, who's free to serve as the tour guide through the downtime realms. Even better, neither GM will have reason to get bored or burned out, since the campaign will get passed around akin to an ant farm shaken like an Etch-a-Sketch. (For ideas on cooperative GMing, I recommend Robin Laws' **Rune RPG.**)

2) What if you have a group that's primarily interested in downtime, but the group (including the GM) can't get past the need for the plotted adventures to stir the pot? Well, then, what if those portions of the campaign are handled by a different game -- say, a **Mage Knight: Dungeon, HeroClix,** or **When Darkness Falls?** For a truly quasi-structured, quasi-narrative game, the group might try a game such as **Once Upon a Time.** Obviously, this introduces problems such as how do characters translate over between the two games (if the "real" RPG characters even *have* stats); this will probably also make the campaign feel not entirely unlike a *[Baby Pac-Man](#)* machine. Still, if everyone has a non-RPG game they really like and can envision it as the catalyst for downtime adventures, then it could serve as an interesting experiment.

3) As a final possibility, what if the GM and players abstract what those "real" adventures would be? The GM could

sketch out vague, broad plots and let the players draw them from a deck; for example, cards might say, "You must either betray another character or accuse another of betraying you," or "Your family or loved ones are placing a complication on your adventures, OR they are encouraging your adventures in an unexpected way." (As an aside, see how there were a couple of options on each of those sample cards? That way there's more flexibility for the players and less feeling like they drew the *CERTAIN DOOOOOM!* card.)

As an alternative on this idea, players could use their "experience points" (or whatever they would be called in this type of game) to bid on the vague notions of the card. For example, the GM might say, "What am I offered for this family-based subplot?" or "Who has an interest in a political subplot?"

Regardless of how these proto-plot cards were acquired, it would be up to the group to decide how this arrangement would work. One idea is for the player to run the vague sketch of an idea by the GM first for approval; another is allowing the players simply to start talking about the plot, akin to *Once Upon a Time.* ("Oh, did I mention to everyone? My mother's coming over. We need to give her a good impression of the organization; she wants me to quit and go back to NASA.") In this case, the players might want to have a means of "voting off" plot threads or changes that are too disruptive; perhaps each player can veto a certain number of plots, or perhaps the group can have an up-or-down vote if the need arises.

The all-downtime campaign is, as I said, at best a half-popped idea at this point. However, it combines some of the more interesting aspects of freeform roleplaying with the structure of more "classical" campaigns, while tossing something new into the mix. (What would a *Dungeons & Dragons* campaign that was all taverns and traveling scenes look like?) And perhaps the idea will fully pop for one of you all. If so, let me know; I'll bring popcorn.

--Steven Marsh

Designer's Notes: *GURPS Powers*

by Sean Punch

When I set out to write **GURPS Powers,** I realized that I had a daunting task before me: provide guidelines for creating almost every superhuman ability from nearly every genre that features such abilities (which, when it comes to RPGs, means *most* genres). Given that I had a finite number of pages to play with, I had to make a few hard choices before I even sat down at the keyboard:

- The book would only cover "built-in" abilities, not "add-ons" such as magic items, power armor, and super-gadgets -- most of which would simply be abilities from the **Basic Set** and **Powers** modified with gadget limitations (pp. B116-117).
- The book would emphasize "active" abilities that let the user *do* something (like shoot energy blasts or fly around) over "passive" abilities that just sit there (like tough skin or being a giant).
- The book would focus on advantages and largely omit attributes (even *super*-attributes, such as super-strength), disadvantages (however exotic), and skills (ditto!).

"That should make things simpler," I thought. Oh, how wrong I was!

First, I wrote too much. Then, when I got to the playtest -- and it was a *great* playtest -- I discovered that I had also omitted too much. I added whatever I could get away with while making almost no cuts . . . despite the pressing need for them. Fortunately for me and my readers, editor Andrew Hackard was able to trim enough excess verbiage that everything could stay. Let the public record show that I owe this man a beer.

The upshot was that there were relatively few outtakes. However, the playtesters proposed a lot of great ideas that I simply couldn't act on -- either because the proposals were very involved and would take up too much room or because I had already included something that was *just* similar enough that I couldn't justify the overlap. As such, I'd like to dedicate the rest of this article to the playtesters. Almost everything here was proposed by them, except for the occasional shred from my first draft. I'm not going to single out anyone for credit, because most of the items below were group efforts.

One last thing: all of these items come with a warning! If we realized that something wouldn't fit, we didn't spend a lot of time playtesting it . . . which means that everything here needs tinkering and tweaking to make it work. With a little experimentation, though, you should find at least a few ideas that are useful for your games.

Chapter 1 -- Building Powers

Most of the discussion focused on Chapter 2, but we had a few oddball ideas for Chapter 1. Two of these concerned power modifiers.

Technological Powers

In a few settings, technology -- implants, nanotech, and so on -- is as valid a power source as magic or psionics, making "Technological" a reasonable modifier. As *Gadget Limitations and Powers* (p. 107) suggests, unrealistic and largely unexplained technology should simply rename the Super power modifier "Superscience" for this purpose and keep both its effects and its -10% value. More realistic technological intervention that stresses the user's system might use Biological under a new name; that, too, would be worth -10%.

However, in some settings it's valid to treat a whole array of cybernetic implants as a power and

allow the possessor to grow more adept at using his artificial parts by buying a Talent. Simply use some of the modifiers suggested for *Cybernetics* (p. B46) as the power modifier. A typical power might consist of abilities that require weekly maintenance by the user. That's like Temporary Disadvantage, Maintenance (1 person; Weekly) [-5], making this a -5% power modifier. This *can* ultimately return more points than the Maintenance disadvantage because the effort required is *per ability*. A hero with 20 abilities must spend 20 hours/week with his tool kit! Most macroscopic implants are also subject to technological countermeasures that can detect them (such as X-ray scans) and interfere with them (EMP, jamming, etc.); that's worth -5% more. The total modifier comes to -10%.

Beneficial Modifiers

Most power modifiers are limitations, but it's valid for a power modifier to include a small enhancement -- or even be an enhancement overall -- if the power is *more* capable under certain conditions: in high-mana areas, when the stars are right, etc. Decide on the effects in terms of one or more general enhancements, and then reduce the enhancement value to 80% normal if the benefits are Very Common, 60% normal if Common, 40% normal if Occasional, or 20% normal if Rare.

The most likely enhancement is a conditional Reliable modifier (p. 109), which is worth a base +5% per +1 to use the ability. This becomes +4% for Very Common, +3% for Common, +2% for Occasional, or +1% for Rare.

Another common option is a reduction to the FP cost to use the power's abilities under the right conditions. This lowers all FP expenditures for any reason: regular use, extra effort, stunts, and anything else the GM comes up with. This is conditional Reduced Fatigue Cost, which is a basic +20% per level, so FP reduction is +16%/level if Very Common, +12%/level if Common, +8%/level if Occasional, or +4%/level if Rare. Note that this is very powerful, because it allows the user to use extra effort *for free* in some situations.

The GM can mix and match, if only to get a round multiple of +5%. For instance, a Divine power might be at -1 FP cost and +6 to skill rolls on certain high holy days and in a few major temples -- which the GM deems Rare -- for a +10% power modifier.

A genuine outtake was a formal system for pricing Talents. Mostly, everyone agreed that it was too much work to use -- and the numbers didn't seem very universal. Still, a GM who's willing to sit down and assign numbers applicable to *his* campaign might find it useful.

Pricing Talents

Talent costs a flat 5 points per level. Those who enjoy extra detail might want to increase this cost for exceptionally broad Talents or reduce it for unusually narrow ones. To do so, use the optional rules below -- *not* enhancements and limitations! No modifier of any kind ever applies to the price of a Talent.

Scope

The GM may wish to charge more for a Talent if the associated power has unusually numerous, flexible, or potent abilities. Talent should rarely cost more than 10 points/level, and should never go beyond 15 points/level.

Optionally, the GM can rate a power's "Scope" numerically and use this number to find the cost of

its Talent. Determine Scope as follows:

1. Start with the number of distinct advantages the power offers as abilities.
2. Add 1 for each advantage that the buyer can purchase more than once, regardless of how often he can take it -- but only if each "copy" works differently. This normally means that the advantage has several sub-traits (e.g., Scanning Sense or Telecommunication) or a user-defined property (e.g., Detect or Resistant), or offers special modifiers that make each version of the base advantage a different trait from all the others (e.g., Affliction or Innate Attack).

   The following advantages count *if the power permits multiple versions:* Affliction, Binding, Detect, Enhanced Move, Innate Attack, Jumper, Obscure, Permeation, Protected Sense, Resistant, Scanning Sense, Shapeshifting, Telecommunication, and Terrain Adaptation.

3. Add 1 for each advantage that has an open-ended number of levels or that otherwise lets the user spend as many points as he wishes. Add this only once per distinct advantage, no matter how many versions are available.

   Certain reasonably common abilities *always* qualify, unless the power specifies a cap: Affliction, Binding, Chameleon, Damage Resistance, Dominance, Enhanced Move, Growth, Innate Attack, Metabolism Control, Microscopic Vision, Mind Shield, Parabolic Hearing, Penetrating Vision, Shapeshifting, Shrinking, Silence, Stretching, Striking ST, Super Climbing, Super Jump, Telekinesis, Telescopic Vision, Temperature Control, Terror, and Wild Talent.

4. Add 1 for each advantage worth 50 points or more in its most basic form, before any modifiers. For traits that come in levels, consider only the price of the first level. For those that list "Variable" cost, use the minimum allowed outlay.

   Examples include Clairsentience, Insubstantiality, Jumper, Mana Enhancer, Mind Control, Morph, Neutralize, Possession, Shadow Form, Snatcher, Super Luck, and Warp.

Example: ESP power in the ***Basic Set*** has 12 abilities: Channeling, Clairsentience, Danger Sense, Detect, Medium, Oracle, Para-Radar, Penetrating Vision, Precognition, Psychometry, Racial Memory, and See Invisible. One of these abilities allows multiple versions (Detect), one is open-ended (Penetrating Vision), and one is worth 50+ points (Clairsentience). The Scope of ESP is therefore 12 + 1 + 1 + 1 = 15.

See the *Talent Cost Table* (below) for the effects of Scope on the price of Talent.

Variety

Most powers include abilities that require success rolls against two or more of DX, IQ, HT, Will, and Perception . . . and possibly other scores. But if a power's abilities only ever call for rolls against *one* score (or skills based on it), then its Talent represents a narrower bonus than usual and the GM may wish to reduce its cost to 80% normal, as indicated on the *Talent Cost Table.*

The GM can safely ignore this discount if he feels that it's splitting hairs. Few powers can claim it in any event! Nearly every advantage calls for the occasional roll against a score other than the one that usually governs it; for example, Warp calls for an IQ roll to activate but requires a DX-based Body Sense roll to avoid disorientation. In particular, if a power includes *any* ability that allows use of the optional rules in Chapter 4 for active defenses, extra effort, or stunts, it should *not* get a discount.

Talent Cost Table

The following table gives the point cost of Talent based on the Scope of the associated power and the variety of die rolls affected.

Scope of Power	Affects Any Score	Affects One Score
1-25	5 points/level	4 points/level
26-50	10 points/level	8 points/level
51+	15 points/level	12 points/level

This entire process is *optional.* It can be tedious to count up abilities, figure out which ones are multifaceted or exceptionally potent, and consider all the success rolls they might require! The GM is welcome to declare a cost of 5 points per level for *all* powers and be done with it.

Chapter 2 -- Building Abilities

We had a *lot* of ideas here! Most concerned specific advantages.

Allies: Some Helpful Advice

What ability do you give a character who can summon something -- say, animals or demons? Allies with the Summonable enhancement. What about someone who has no limits on what he can summon? Modular Abilities (Limited, Only Allies with Minion and Summonable, -50%). That's expensive, though, and most summoners have a more limited catalog. A more affordable option is to take a separate Allies advantage for each creature or group of identical creatures you can summon and then make them exclusive via *Alternative Abilities* (p. 11). For instance:

> Ally (Demon Lord; 150% power; 15 or less; Summonable, +100%)* [60]
> Allies (Gang of Imps; 25% power; ×10; 15 or less; Summonable, +100%)* [8]
> Ally (Demon Knight; 100% power; 15 or less; Summonable, +100%)* [6]
> Ally (Lesser Demon; 50% power; 15 or less; Summonable, +100%)* [3]
> * Alternative abilities; only one can be summoned at a time!

Another Alternative to Invisibility . . .

One option we had to cut from *Alternatives* for Invisibility was Affliction (Area Effect, +50%/level; Based on Will, +20%; Disadvantage, Delusion, "You can't see me," +15%; Emanation, -20%; Malediction 1, +100%). It's basically an alternative to Invisibility with the Glamour limitation (p. 111), for those who'd prefer a Quick Contest to an unopposed resistance roll.

. . . and One for Illusion

A fun alternative to the Illusion advantage is the "Cosmetic Ability" perk. It takes a turn to use and looks just like one specific ability, which the player can design in as much detail as he wishes. However, it's just a light-and-sound show -- a set-piece trick, not a controllable illusion. The GM should restrict such perks to those whose powers have a source or focus capable of explaining the necessary special effects. The Illusion power (p. 129) always qualifies!

Jumper as Time Stop

We eventually settled on Temporal Stasis (p. 118) as our time-stop ability, but there was a proposal to create a new variant of the Jumper advantage to let the user stop time for *himself:*

> *Jumper (Time Stop):* You can't travel through time, but you can jump *out of* time. Activate your ability normally. If it works, then you drop out of the normal flow of time. While out of time, you perceive the world as frozen. You can't affect it (and vice versa) -- only observe and move through it. You can interact with items you brought along, subject to the usual limits on carrying capacity; this lets you patch your wounds, reload your guns, read magical scrolls, and so forth. Time passes for you (you tire, grow hungry, age, etc.), but it's subjective. You can use your ability again to return to normal time at the instant you jumped. *100 points.*

Yet Another Special Enhancement for Leech

This modifier for Leech came out of the same discussion as the one for Neutralize (below):

> *Boosts Abilities:* Each HP you steal gives you a character point you can use to heal yourself or temporarily boost abilities. You store these points in a "battery" with a capacity of two points per level of Leech. Once this is full, you can still drain HP but gain no points. On your turn, you can take a Ready maneuver to drain this battery to heal yourself permanently: 1 point repairs 1 point of crippled abilities, 2 points heal 1 HP, and 3 points restore 1 FP. You can also spend stored points to improve abilities (anything but skills) temporarily. You can't reallocate points once used. Points drain away at the rate of one per second, unused ones first. You lose enhanced abilities as the points drain away. This modifier is incompatible with all other special modifiers. +100% if you can only heal or enhance one power, set at character creation; +200% if you can use the points freely.

The +100% version is probably overpriced, but the +200% version seems useful.

Thoughts on Modular Abilities

There's a little system for creating new forms of Modular Abilities on p. 63. I wanted to present the various cases in the ***Basic Set*** and ***Powers*** as illustrative examples, but there was no space for it. Here they are:

- *Computer Brain.* Per slot: 6 points ("all the software on the net" is just about unlimited). Per point: 4 points (downloading is fast and hackers won't pay a cent, so external interference -- network conditions -- is the sole limit).
- *Chip Slots.* Per slot: 5 points ("all software burned onto ROMs" is a huge category, but smaller than the one above). Per point: 3 points (swapping out is fast, but chips are expensive *and* can be yanked out).
- *Divine Inspiration.* Per slot: 6 points ("anything my god allows" is close to unlimited). Per

point: 4 points (the prayers are free and fast, but a god has veto power).

- *Super-Memorization.* Per slot: 5 points ("any skill represented in a book" is more limited than "anything on the net," but still larger than a short list). Per point: 3 points (the only thing keeping this from being arduous and awful enough to rate 2 points is the unrealistically fast memorization time).

We also left out a radical proposal under *Alternatives:* "Wildcard Abilities." We didn't have time to explore it thoroughly, but the basic idea was to allow a hero to buy an advantage with an expensive form of the Cosmic enhancement -- worth at least +300%, maybe more -- that lets him use it as *any other advantage,* with several important caveats: the player would have to explain the emulated advantage as a feat performed with the enhanced advantage, the feat would require an attribute roll, and the point value of the emulated advantage couldn't exceed the point value of the basic, underlying advantage (or perhaps a multiple of this, if the enhancement value were very high).

For instance, Flight is 40 points, so Flight! might cost 160 points. It would permit the hero to do *anything* that's consistent with being amazingly adept at flying. A DX roll might let him push his speed beyond its usual limit (+40 points of Enhanced Move), use his amazing lift to move heavy objects around (+40 points of Lifting ST), or even suck things along in his vortex (+40 points of limited Telekinesis).

It would need tweaking for each campaign, but it definitely has potential!

A Variation on Power Theft for Neutralize

The following enhancement eventually became a variant of Power Theft, but some might find it useful on its own:

> *Power Boost:* You can use the powers you neutralize to boost your own. You receive a pool of temporary character points equal in value to the abilities you neutralize. On your turn, you can take a Ready maneuver and allocate these points to improve your own abilities (anything but skills) on a one-to-one basis. You don't have to "spend" all the points at once, but you can't reassign allocated points. Determine duration normally. You cannot use Neutralize at all until this time is up; then you lose your boosted abilities but may use Neutralize again. +100% if stolen points can only enhance one ability, set at character creation; +200% if they can improve one power; +300% if they can boost anything.

Disadvantageous Alternate Forms

If you uncontrollably assume a form that you have no control over, then the "Were-Creatures" solution on p. 74 -- an Alternate Form with Uncontrollable Trigger and Unconscious Only -- is a little unfair. The easiest fix is to treat such a form as a disadvantage, worth -5, -10, -15, or -20 points for Rare, Occasional, Common, or Very Common trigger conditions, respectively.

The point value of the form isn't important . . . unless the GM feels it is. Turning into something extremely vulnerable, like a clam, can be a problem. Becoming the Death God can be useful if you abuse it properly; just be sure you're on enemy territory when the trigger gets pulled. As such, the GM might wish to add a percentage of the point-value difference between the shapeshifter's base template and the shifted template to the above cost -- perhaps 5%, 10%, 15%, or 20% depending on rarity; perhaps more.

We didn't get to playtest this, so it's very experimental. Have fun!

We also had a few really wild thoughts on enhancements and limitations.

More Abuses for Cosmic

Everyone liked the idea of using the Cosmic enhancement to create mind-blasting divine abilities such as a god's voice (see *Powering Up* for Rapier Wit, p. 70) or appearance (see *New Special Enhancements* for Terror, p. 84), and to let Payload stow things outside of reality (see *Alternatives* for Snatcher, p. 76). There were many other suggested uses for Cosmic. Some are hidden in the examples in Chapter 3, but others didn't make it in. Here are just a few of these:

- Cosmic, +50% on Enhanced Move to allow acceleration to full speed in just one turn.
- Cosmic, +50% on both Enhanced Move and any underlying movement ability to gain complete maneuverability: turn on a dime, never make maneuver rolls, etc.
- Cosmic, +50% to be exempt from any one of the limiting rules in Chapter 4. For instance, it could eliminate the FP cost for *Abilities and Exertion* (p. 159).

Mega-Abilities

Beyond Cosmic, the GM might want to allow "mega-abilities" that use the *Size and Speed/Range Table* (p. B550) to calculate effect, as *Powers* does for Super-Speed (p. 42), Super-Effort (p. 58), and high levels of Injury Tolerance (Damage Reduction) (p. 118). It's hard to assign a fair price, but one possible mechanic is to charge a special enhancement -- perhaps as high as +400% -- on a trait that comes in levels and rule that this enables the user to perform greatly enhanced feats. At the cost of 1 FP per use (the GM decides what a "use" is), the user may look up the purchased level in the "Size" column of the table and find his effective level for that feat in the "Linear Measurement" column. So one level acts as three, 10 levels act as 100, 20 levels act as 5,000, and so on.

What kept this out of *Powers* was the amount of space it would take to give fair enhancement costs for all affected abilities and sufficient guidelines for FP cost. Altered Time Rate has no FP cost and needs only about +20% to be balanced, while Lifting Strength definitely needs its FP cost and +400% enhancement value. Who knows what's fair for other abilities? But the brave GM might want to play with it and find out.

Chapter 3 -- Examples

Dozens of proposed sample abilities and powers came and went during the playtest. Most of these have shown up on our [forums](#) since then. Rather than try to find them all, I'll just give two genuine outtakes.

Death Touch (+390%): Toxic Attack 2d+1 (Cosmic, Irresistible attack, +300%; Cosmic, Lingering special effect, +100%; Melee Attack, Reach C, Cannot Parry, -35%; Selective Effect, +20%; Variable, +5%) [49]. *Notes:* Injures a living target regardless of armor. Only supernatural healing can repair this injury; it doesn't heal naturally. Selective Effect lets the attacker "wither" body parts by touching and injuring a single hit location. *49 points.*

Reinforced Skeleton: DR 1 (Accessibility, Only to avoid broken bones, -80%) [1]. *Notes:* An armored skeleton. Only a single blow that breaks the skeleton can cripple a limb or extremity; accumulated injury won't suffice. This has no effect on HP loss or maximum possible injury, but subtracts 1 HP per level from wounds for crippling purposes. For instance, a hero with 13 HP and Reinforced Skeleton 5 needs 12 HP in a single blow to cripple his arm instead of the usual 7 HP -- but blows to his arm still injure him normally, and injury past 7 HP is still lost. This trait provides

no overall DR. *1 point/level.*

Chapter 4 -- Powers in Action

A new concept that snuck into *Powers* was the idea of abilities that let characters "spend" character points to create lasting or permanent changes in the game world -- in the spirit of *Player Guidance* (p. B347). For instance, Regrowth (p. 71) has a "Doubling" special enhancement that lets the possessor spend points on the fly to gain new body parts, Create (p. 92) has a "Creation Pool" mechanic that turns points into more-or-less stable matter, and there are even guidelines under *Wishes* (p. 119) for an ability that lets a godlike being grant advantages to others . . . if they have the points.

Some of the playtesters wanted other character point-powered abilities, but we didn't have time to get into it. Here's how such a thing might have looked.

Character Point-Powered Abilities

Some abilities that show up in fiction for narrative and dramatic purposes have the potential to wreck a game. One way to control them is to fuel them with a precious, limited resource: unspent character points. Because the cost to use them is so dear, of course, such abilities ought to be a lot cheaper.

Build a character point-powered ability normally, then divide its point cost by five. However, it normally does *nothing*. The player must spend character points for each use. The precise cost is up to the GM. He might require one point per use . . . or one point for a *dramatically appropriate* use and more for less-fitting uses . . . or even points equal to the cost of the ability (that is, 1/5 normal ability cost). Finding the costs that work best in a given campaign is definitely an exercise for the GM.

Caritas Sorcery

for *GURPS & In Nomine*

by William J. Keith

Then shall the King say unto them on his right hand, Come, ye blessed of my Father, inherit the kingdom prepared for you from the foundation of the world: For I was hungry, and ye gave me meat: I was thirsty, and ye gave me drink: I was a stranger, and ye took me in: Naked, and ye clothed me: I was sick, and ye visited me: I was in prison, and ye came unto me.
--Matthew 25:34-36

From the humane swipe across the throat of an expensive bullock, to a chatty evening with a kidnapped virgin and an icepick, to a symbolic sacrifice of your God himself nailed up on a hill, many a proud and ancient religion has been founded on a good sacrifice. Blood-letting of one kind or another offers the devout a spiritual return on a physical investment of time and resources. *GURPS Fantasy* discusses the basic principle behind most historical beliefs about sacrificial magic: resources are ritually destroyed and thereby consumed by a spiritual agent which grants boons. However, sorcerers in Hermetic or *In Nomine*-style sorcerous traditions are notoriously independent-minded. They may prefer to alter the Universe themselves rather than give a middleman a cut. One of the basic principles of historical thaumaturgy may allow them to do just that.

Caritas Sorcery is described herein with standard *In Nomine* mechanics (a non-canonical *GURPS* conversion of the Sorcery rules can be found at http://www.sjgames.com/in-nomine/articles/new/Players/Resources/ginsorcery.html). It requires the usual prerequisites of any Sorcerer, as determined in standard or *GURPS In Nomine.* In any other fantasy setting, Caritas Sorcery would be a clerical-style magical system with a limited selection of subtle effects that mostly enhance the caster's abilities. In such settings, use the following *GURPS* mechanics:

At least one level of Power Investiture (Sorcery) and a Will of 12 are required. In most settings, the principles involved also assume that a practitioner is a corporeal being with physical needs such as food, rest, and the like. Use a core skill of Caritas Sorcery (M/VH), and default a ritual described as "Focus/n" to Caritas Sorcery-n as a Hard maneuver. Ritual skills cannot exceed the level of the core skill, and require a certain level of base knowledge: if the core skill Caritas Sorcery is known at less than level 12+n, a Focus/n ritual is performed at an penalty of -1 to skill. Where an Essence cost is listed, double this to find the Fatigue cost in a more typical magical setting.

Example: Transplant, a moderately difficult ritual, is listed as "Focus/3." If the sorcerer knows Caritas Sorcery at a level of 16, then the default for Transplant is 13, and can be bought up to 16 with 2 to 5 points like any Hard maneuver. If the core skill were only at 14, though, Transplant would default to 11 and could be bought up to a skill of 14 -- but would be *cast* at a -1 penalty.

Though limited and low-power in most such settings, Caritas Sorcery has one distinct advantage: self-initiation. A seeker need not have any potential as a standard mage, and Power Investiture (Sorcery) can be obtained without intervention by any pantheon or demonic powers.

In a world where Caritas Sorcery develops there is unlikely to be any region of anything other than normal sanctity for the tradition. (Players should discuss this assumption with the GM before purchasing the necessary traits, of course.) Thus, it makes an attractive path for someone to follow who desires supernatural abilities but lacks more common means to power, such as inborn Magery or the favor of a deity. Demonically-assisted magic, another option for persons in such straits, is considerably more powerful . . . but then, the moral risks of *that* are widely known, if sometimes foolishly disregarded.

Philosophy

Caritas Sorcery is a sacrificial tradition based on Hermetic principles rather than propitiatory ones. The core of any Caritas ritual is an act of physical sacrifice, but instead of resources being destroyed, they are released into the Symphony at large for the benefit of other people. This change in the Symphony is ritually harnessed to drive change in the sorcerer's own life, turning a benefit granted to others into a benefit gained oneself. This is based on the Hermetic principle that man reflects the Universe at large: as without, so within.

The only skill Caritas sorcerers learn in *In Nomine* is Focus, which is the basis for the standard rituals Sacrifice for Essence, Store Essence, and Symphonic Awakening. Interestingly, Focus is based on Precision, which means that high Will (beyond the 6 required to become a Sorcerer) is *not* of primary importance for Caritas sorcerers. Alchemy is much practiced by Caritas sorcerers, as well.

It may be that Caritas Sorcery represents an attempt by Heaven to alter the memetic basis of sorcery in a way that lessens Hell's grip on the practice. Certainly Caritas Sorcery finds sheer willfulness less useful than regular Sorcery. It also rewards asceticism and community spirit. On the other hand, some of its rituals are pagan or even blatantly infernal, and the sacrifices aren't always made by the sorcerer. Whether this represents a different source polluting the practice or a Heavenly attempt gone awry is entirely up to the GM.

Style

Style is very important for *In Nomine* Sorcerous traditions. GMs are encouraged to give bonuses to skill for appropriate settings and penalties for similarly disadvantageous conditions. Visually and aurally, the simplest Caritas rituals appear to be quiet prayers or mantras in a foreign language, combined with a few hand gestures vaguely reminiscent of blessings. Longer and more complicated rituals sometimes require that the sorcerer use his finger to trace certain eldritch symbols on a subject. Only Store Essence, Protective Ward, Permanent Ward, and The Last Gift require the obviously-occult trappings of a pentagram, circle, and other such paraphernalia.

Caritas Sorcery may be nearly unique among *In Nomine's* supernatural traditions in that it gains effectiveness among large crowds of strangers. Nearly every Caritas ritual involves at least one other person in its casting, and Caritas benefits from a sorcerer being in touch with the community of humanity. If the sorcerer does his casting completely alone, a -1 penalty to skill is reasonable; more if other people are very far away. If in the presence of at least one other person, skill is at base level; if the Caritas sorcerer can manage to quietly do his casting in close contact with ten or so others, a +1 bonus is called for, while interacting personally with a hundred people over the course of a casting is worth a +2 (assuming the sorcerer's concentration is not broken during the casting time!).

Asceticism is also valued by the tradition. Flashy jewelry, expensive cars, a fine meal eaten recently, and other such luxuries penalize skill at -1 *per item,* while casting in plain clothes in a simply furnished home after a nourishing meal is at base skill. A ritual performed while wearing clothes threadbare from use, in one's bare sleeping quarters, after fasting for a day, could be at as much as +3. The GM can weigh whether sundry mortifications of the flesh would also qualify for bonuses.

Caritas Rituals

One important characteristic of Caritas Sorcery is that would-be sorcerers can self-initiate. The Symphonic Awakening ritual grants the Advantage of Awareness, of a type suitable for the setting -- Symphonic Awareness in an *In Nomine* game. Once this is performed, or if Awareness is not required in the setting, the Sorcerous Initiation ritual grants the Caritas Sorcery Attunement (in *GURPS* settings, Power Investiture (Sorcery)). The sole exception is a *GURPS In Nomine* game, wherein Power Investiture (Sorcery) and Essence Control equal to 2/3 HT automatically come with Awareness. In such a case, the GM may simply rule that the character's Sorcery is inaccessible until the proper initiation is completed.

Standard Rituals

Symphonic Awakening (Focus/1): Symphonic Awakening is unlike the other rituals listed here. While it can be studied as a maneuver based on Caritas Sorcery with the mechanics described above, it can also be studied as its own separate Mental/Very Hard skill with no default, and can be performed without Power Investiture (Sorcery). Success awakens any setting-appropriate Awareness in the subject, who must meet all other requirements in the setting and have enough unspent points available. In *GURPS In Nomine,* Awareness must also come with Power Investiture (Sorcery) and Essence Control equal to 2/3 HT. (A subject without sufficient points may, at a GM's whim, gain the listed traits and sufficient mental Disadvantages to make up the difference, to simulate a mind-wracking awakening.)

Every Sorcerous tradition has its own details. The Caritas version of this ritual requires that the subject be undergoing a nightlong vigil; the subject will preferably have spent the week beforehand in absolute silence, doing no significant work except meditating upon the principles of the Art. This is not strictly required, but helps a non-Aware mundane reserve the necessary Essence when attempting to initiate himself.

Time: 1d hours
Essence: 7 - check digit (or degree of success), with a minimum of 2.

Sorcerous Initiation (None): as per *Corporeal Player's Guide.* There is no skill involved, merely a Will roll by someone who meets all the other requirements to become a Sorcerer. The Caritas version requires the would-be initiate to ritually sever an important life tie. Moving to a new city, quitting your old job or getting a divorce are generally agreed to suffice; killing an old enemy or giving away a substantial portion of one's earthly wealth also work. The seeker should make it personal; the GM is strongly encouraged to grant bonuses or penalties to the Will roll based on the act undertaken. In *GURPS In Nomine,* this ritual is unnecessary; Power Investiture (Sorcery) comes with Symphonic Awareness. In other settings, this ritual grants one level of Power Investiture (Caritas Sorcery). Whether more levels are obtainable with deeper initiations is entirely up to the GM, who is invited to consider what the higher ranks of such an art might entail.

Time: no standard casting time
Essence: 0

Sacrifice for Essence (Focus/2): This is where Caritas Sorcery begins seriously differing from the standard model. Caritas sorcerers have a large array of sacrificial rituals that obtain Essence not from destruction of living creatures or artifacts, but from the diffuse Essence of every Symphonic act. In this sense, they are very similar to Rites. Each takes 30 minutes to prepare and has an initial casting cost of 1 Essence. Among the many Sacrifice for Essence rituals Caritas sorcerers practice are:

- *Blood Sacrifice:* the sorcerer donates blood, encourages others to do the same, or assists in such a donation. The ritual's effect lasts hours equal to the CD, or the degree of success on the skill roll. Whenever blood donated under this ritual umbrella is later used medically, the Sorcerer gains 1 Essence per pint thus donated. While this Essence takes days or weeks to arrive and comes at a random time, a Caritas Sorcerer assisting in a modern blood drive can amass a significant potential Essence reserve from what has effectively become an assembly-line blood sacrifice operation. (Even simply donating himself can allow the Sorcerer to reap a small benefit: 1 pint of blood is often split and used for up to three patients.)
- *Heave!:* the Sorcerer volunteers manual labor, for which he must accept no payment, either in money or other favors. For every 2 hours of labor, he gains 1 Essence; thus, in an eight-hour day of work, the Sorcerer can net 3 Essence.

Other versions are available; GMs and players are encouraged to come up with suitable charitable acts.

Store Essence (Focus/3): as per *Corporeal Player's Guide.* Occasionally used by circles of Caritas sorcerers. In Fatigue-based settings, use the mechanics of Manastone.

Caritas Sorcery permits the use of the rituals Protective Ward and Permanent Ward. In non-*In Nomine* settings, use the mechanics of Astral Block and the enchanting of a permanent Astral Block, respectively. It also permits the making of a Spirit Anchor, which non-*In Nomine* settings should treat as a one-use Bind Spirit enchantment. It does *not* have a version of the standard ritual Siphon Essence! Such theft is antithetical to the underlying philosophy of the

tradition. For details of all these rituals, see the *Corporeal Player's Guide.*

New Rituals

The real strength of Caritas Sorcery is revealed in the array of rituals unique to the tradition that harness universal benefit to achieve personal strength. Performing these rituals requires that one be initiated as a Caritas sorcerer.

Tithing (Focus/1): the Sorcerer gives away 10 percent of his income over the last year, beyond any legally required taxes, to charities of which he does not expect to benefit. The effect of the ritual is to ensure that his assets, less his debts, will not cause his Wealth level to lower over the next year. Primarily, this means unexpected debts or lawsuits will not impact his finances severely; attempts to make huge purchases on credit will merely be declined, shady dealmakers will get nervous, and other attempted abuses will fail.

Time: 1 hour
Essence: 1

Zakat (Focus/1): If the Sorcerer is a faithful and observant Muslim, he can substitute zakat for tithing. This ritual requires instead payment of zakat to eligible persons; this is 2.5% of all assets above nisab -- the amount necessary for the Sorcerer, and any dependents, to maintain Status 1 for a year (Status 0 in *GURPS* settings) -- and assures the Sorcerer that his assets, less his debts, will not fall below nisab.

Time: 1 hour
Essence: 1

If local religion sets other traditional amounts, these can be used. In settings where such tithing or zakat *is* governmental taxation, the required payment is a similar voluntary contribution above this.

Excalibur's Scabbard (Focus/2): This ritual requires that at least a pint of blood be donated. If the casting is successful, then for the duration of the effect the donor does not bleed: he loses no HP due to the bleeding rules, the Hemophilia disadvantage is negated, no Essence is gained from sacrificing him, vampires find him tasteless and less filling, and any other effects the GM considers reasonable for the setting. (The donor still *has* blood; for example, blood agents still work.) The sorcerer can cast this ritual upon other donors (often bodyguards) as long as the caster is not the recipient of the blood. The effect lasts until the blood is replaced -- two months naturally for a human, though magical or high-tech healing may shorten this.

Time: 1 hour, which can be simultaneous with the donation process or prior
Essence: 1

Transplant (Focus/3): the Sorcerer ritually marks the body of a person preparing to donate an organ, who must be alive at the time. (The markings are visible only to Symphonic or other suitable Awareness.) If the organ is successfully donated thereafter, the Sorcerer's analogous organs gain great toughness: he may treat the next successful attack to the vitals as a simple hit to the torso, or if a cornea was donated an attack to the eye as a hit to the face. Multiple successes at this ritual add uses of the ability. A powerful version of this ritual (Focus/6) allows the Sorcerer himself to donate a kidney; upon successful transplant, the ritual takes permanent effect, as long as the sorcerer had the points available to pay for the No Vitals advantage.

Time: 30 minutes, or 1d hours for the greater
Essence: 2, or 6 for the greater

I Was Hungry, And Ye Gave Me Meat (Focus/3): In high traditional fashion, the sorcerer slaughters an animal, thereafter giving away the food to the poor. Technically, the slaughter is not required -- potable water is also useful to give away -- but the ritual is performed at a penalty if the sorcerer doesn't put his heart into it. He must have owned the comestibles, and have been in sight of them at least briefly; a short incantation over the goods is required. Performing this ritual reduces the sorcerer's needs for calories and water by as much as was given away. The sorcerer can

accumulate days of caloric and water needs over the course of several castings, to be stored and used when desired; in *GURPS In Nomine* or other *GURPS* settings, the sorcerer can accumulate up to HT days of satiation. In standard *In Nomine,* use (Corp. Forces × Strength). This ritual has the additional advantage of resisting Gluttony attunements, especially Consume -- powers which cause hunger, dehydration or starvation must "burn through" the sorcerer's stored satiety before affecting the sorcerer with any remainder.

Plenty of Caritas Sorcerers enjoy a good deer hunt -- one deer provides sufficient calories to max out the ritual's effectiveness for most Sorcerers. Others are too empathetic toward any form of life to enjoy such a thing, and find it more pleasant to give away overflowing cornucopias of fruits of the harvest.

Time: 1 minute
Essence: 1

Naked, And Ye Clothed Me (Focus/3): It's not that cold anyway . . . For each item of clothing ritually marked before being given away, a Caritas sorcerer can later summon a memory of such clothing at need. Effects are at the GM's discretion, but at a minimum should include Temperature Tolerance 10, resistance to sunstroke, and similar moderate environmental protections. If the Sorcerer springs for body armor to be sent to soldiers or policemen who need it, summoning equivalent DR as a Blocking maneuver is not unreasonable, either (roll against a skill the same as the original ritual). The clothing is merely an aura not visible to the eye, and effects generally last as long as the current situation requires -- hours for a jacket in a snowstorm, one bullet for a tac vest.

Time: 1 minute to mark, instant to resummon
Essence: 1 to mark, 1 to resummon later

I Was A Stranger, And Ye Took Me In (Focus/3): the Sorcerer houses someone who needs it; despite the name of the ritual, the recipient of the largesse does not have to be a stranger, merely someone honestly without a roof to call their own. For every night the Sorcerer so houses someone in need under the same roof, a successful casting provides the ability to skip one night of sleep without accumulating the mental effects of lost sleep. In standard *In Nomine,* up to Precision such days can be so accumulated; in *GURPS,* up to IQ.

Time: 1 hour
Essence: 1

I Was Sick, And Ye Visited Me (Focus/4): The sorcerer assists the sick as part of this ritual. The requirement is fairly broad; it is equally efficacious to work at an AIDS clinic or make chicken soup for an elderly shut-in with a fever. For each recipient of personal assistance, the sorcerer adds 1 to the target number of the next roll associated with disease, such as resisting initial infection, avoiding effects, or shaking it off. Alcoholism, drug addictions, and Songs of Pestilence are all possibilities beyond normal diseases. Bonuses may stack as high as the sorcerer cares to stockpile, at 1 Essence each, but all of them will be spent on the next necessary roll.

Time: 1 minute
Essence: 1

Between the lack of needs for food, water, shelter, and sleep, and near-immunity to disease that these four rituals grant, a human with all of these effects active simultaneously could very nearly pass as a celestial in a vessel -- an observation that has struck some Caritas Sorcerers and led to some intriguing lines of research.

I Was In Prison, And Ye Came Unto Me (Focus/5): This delicate ritual requires that the Sorcerer labor to expand the horizons of the imprisoned. In return, the sorcerer will not lack for aid when required -- in *GURPS* terms, the next attempt to employ a Contact, Favor, Ally, or Patron is guaranteed to make contact with the desired person. In standard *In Nomine* terms, a successful casting means the sorcerer can summon at will one manner of aid of a type rendered to a prisoner, appearing seemingly by coincidence. The return is proportional to the investment: a correspondence with a prisoner will ensure a Contact, a visit will requite a Favor, engaging in a teaching program for inmates guarantees an Ally, and actually seeing an innocent man freed or early parole granted promises a Patron. Equivalent means are usable, naturally, and can be "spent" on less labor-intensive advantages if desired. Only one assurance at a time can be

readied.

Time: 10 minutes
Essence: 3

A different version of this ritual requires that the sorcerer personally free the prisoner, regardless of innocence or guilt. This version of the ritual costs no Essence, instantly grants 1 Essence, and occasionally attracts the attention of a human Sorceress of great skill and power. She tends to be favorably disposed toward the Sorcerer and can teach many peculiar and useful rituals. She appears extremely rarely, though: roll 3d6. She appears on 17 or *more*; this number can be decreased one-for-one by spending additional Essence on the ritual, and at the GM's discretion by addressing her in the casting with promises of service. (Wise Sorcerers will note that, while she is verifiably a human, it is essentially a kind of critical failure which summons her; conclusions are left as an exercise for the thaumatologist.)

The Last Gift (Focus/6): the sorcerer gives his life that another may live. This working may take two forms: in the full ceremonial form, the sorcerer prepares the dead body of someone he wishes to raise, and commits ritual suicide. The soul of the deceased is drawn out of its current realm of existence (although souls cannot be removed from the Higher Heavens or Lower Hells); if the soul disbanded upon death, this effect fails. Any necrosis in the body is reversed, though not fungal infections, killing wounds, and the like; an assistant with appropriate healing Songs nearby is recommended. An alternate form, a brief prayer, can be employed if the sorcerer is dying after aiding someone in mortal danger. In either case, the various versions of this ritual guarantee that the sorcerer himself will become a dreamshade, anchored in the Domain of a particular ethereal god (determined by the version, and doubtless promulgated to likely candidates by servants of the god). The primary benefit of this is to the god in question, but Sorcerers fearful of disbandment might find the relative surety comforting. (Naturally, this ritual will not function if the Sorcerer is undead. However, few if any undead ever become Caritas Sorcerers in the first place.)

In a broader fantasy setting, the ritual guarantees the Sorcerer his afterlife of choice -- perhaps stealing a judgment often made by the gods. Still, a notably evil sorcerer that forced his way into a Heavenly afterlife might find that angels make even scarier wardens than demons. Demons could be bribable, after all . . .

Time: 24 hours or instant, as description
Essence: all remaining (minimum 1)

Adventure Seeds

- **Birthing Pangs:** If the speculation as to Heaven's involvement is correct, angels will be needed to get the information into the occult community. Even if it isn't, angels could be assigned to spread the word of this pleasing new development. Typical duties for angels could include shepherding Heaven-written manuals on the subject through Media barriers to publication and advertising it on underground message boards, as well as competing with demons for the loyalties of potential sorcerers ready to choose a tradition.
- **The Old Guard:** At a mid-powered game level, all of this may have been a plan of the (canonical but unnamed) Angel of Charity -- who, if Caritas Sorcery gets a foothold in human occult circles, may become the second celestial after Hatiphas, Demon of Sorcery, to become an initiated sorcerer. Hatiphas protects her monopoly with all the jealousy and viciousness one would expect of a demon, and her connections are considerable. Direct assaults are entirely possible, as are subtler attacks with pollutant practices to be spread through the subject.
- **Plan Revelation:** For a higher-powered game, Caritas Sorcery makes a fine "research project" for Eli to have been spending his time on over the last 50 years, wandering the masses of humanity. Perhaps he was seeking enough connection to humans to grasp the principles of an art he could not himself perform, and *had* to estrange himself from Heavenly society to do it. If Hatiphas gets reasonably firm intel that this is what Eli is up to before it gets out, she and Kronos will want to nip it in the bud -- powerful demons may find themselves with entire chapters of the Black Order at their disposal and a directive from Kronos to trap and destroy, or at least memory-strip, an Archangel.
- **Out of the Light:** The Last Gift would make a fine Unusual Background for a character with unique Advantages or Disadvantages of some holy or unholy type; even a short stint in Hell or Heaven would no doubt leave a soul with deep and lasting changes of personality. Coming into contact with the raw energies of the divine or infernal

realms could easily justify any number of unusual abilities in an NPC driving a plot.

Peter Landstrom, Dirty Cop

for *GURPS*

by Wayne Ligon

Any cop in the precinct will tell you Homicide Detective Peter Landstrom is a good guy. He stands by his men, doesn't talk down to the uniformed officers, and he's a good man for a gold shield. A good cop. None of them know about his other activities: informant for the local crime boss, planting evidence, perjury, smuggling, drug-running, and murder-for-hire.

He wasn't always like this, but he discovered the money is better when you play for the other side. It started just after he made detective, one of the youngest ever in the precinct. He took a bullet for his partner and the operation to remove it left him in constant pain. He recovered, but became addicted to painkillers, needing to turn to illegal sources for his "fix." Those sources led him to other sources, who let it be known how much they would appreciate an inside voice in the precinct. Peter had been married for two years and he and his wife been discussing children. The extra money would allow that to happen, and might let him hang onto a wife that he could sense was already slipping away from him. The first cash payments were the start of Peter's downfall.

No children were forthcoming, and Peter's wife divorced him five years later. Since then he's slowly let his "work" consume him. Peter's done almost everything in the book, up to and including murder. What are worse are the good cops he's corrupted in his years on the force. He's created his own little cabal within the department and managed to hide this cancer from Internal Affairs and the occasional crusading DA. These lesser lights act as a shield for Peter, and he won't hesitate to betray any of them if it keeps him out of jail and above suspicion. Some he blackmails while others serve him willingly, but they all know that they will be silenced if they step out of line. He will kill without hesitation to protect his secret, or theirs.

Peter has been quite circumspect about his private activities but he's made minor missteps along the way, especially in the early years. Probes and sting operations have come close to him a few times, but he's always managed to deflect suspicion. He had his closest call yet a few years ago. Jerry Lane, a newcomer to the department, overheard a conversation he wasn't supposed to hear and deduced what was going on. He was torn between exposing a crooked cop and the loyalty he felt to his fellow officers. Unfortunately for Jerry, he confided in a member of Peter's cabal after an abortive attempt to talk to Internal Affairs.

Landstrom arranged for Jerry to be found concealing missing evidence and made sure that anything he might have said to Internal Affairs was discredited. Lane ended up taking his own life; after that, Internal Affairs tended to look elsewhere when accusations of corruption came up. He's made a lot of money over the years, but he continues to live simply. All that cash is waiting in numbered offshore accounts for the day he hands in his gun and badge. At that point, he'll be a millionaire, although perhaps one hounded by the numerous warrants for his arrest once he's no longer around to keep his house in order.

Peter has a lucrative relationship with the local crime boss. He looks out for the boss's men and sees that they get warned about certain investigations. He also leans on the boss's enemies. In return, the boss gives Landstrom useful information; sometimes Peter uses it himself, other times he passes it on to another in his cabal or someone he's grooming so they can get credit for a bust and gain in status. The boss also provides Landstrom's drugs, and other pleasures.

Landstrom is a skilled policeman and detective. He's very good at his job and he's received several commendations but he causes little problem for the Captain. He's no action-movie maverick or hotdog; he's methodical, polite, and doesn't rock the boat. He understands and plays office politics as needed but doesn't seek out a position of importance for himself. More than once, he's been labeled a good team player. He's trying to keep his head down until retirement and then go on permanent vacation out of the country.

Landstrom's "inner circle" consists of:

- Homicide Detective Mark Conway (Peter and Mark are old high school buddies, and Mark has been a willing accomplice for years)
- Robbery Detective Kevin Holms (Landstrom has proof Holms took a series of bribes a number of years ago to cover up an investigation)
- Officer Warren Burns, a clerk in the property room (Burns gets a cut from Landstrom, which he uses to finance his gambling habit)
- Denise Harrison, a scientist in the crime lab (Landstrom and Denise had a stormy affair three years ago and she still thinks about divorcing her husband)
- Vice Detective Carlos Ruiz (an undercover officer who is Landstrom's primary source of narcotics info and also his chief executioner; if there is a man in his cabal that Landstrom fears, it's Ruiz.)

A handful of lesser officers are involved in Landstrom's web of corruption, but most of them don't even know it. They help him by simply trusting him and doing their jobs in ways he subtly directs, and he's constantly on the lookout for someone that can prove useful to him. He has a good rep as a mentor for young officers looking to move up in the department. He also maintains numerous contacts in the local prison among both guards and convicts. He can insure someone has a relatively easy time in confinement, or that he winds up knifed in the showers.

Encounters

Landstrom can be a major secret thorn in the side of any character that needs to deal with the police on a regular basis, especially if they are criminals not on Landstrom's "approved" list or super-straight do-gooders. Landstrom does not hesitate to deal with problems as they occur; he learned early on that a problem ignored simply becomes a bigger problem. Anyone who crosses him gets a beating from some street thug, or they get a "mugging with a message." If that doesn't deter someone, he escalates the violence very quickly. Direct threats to his operation or someone discovering his secret involvement always end with ruination or death for the snoop. Landstrom is a very dangerous and ruthless Enemy to have.

Investigators can run across any number of operations connected to Landstrom but he's been very careful to conceal his tracks. A masterful detective or vigilante might uncover him but ordinary police work stands little chance unless something changes (such as his mob boss buddy dying and someone uncovering records of their working relationship) or Landstrom himself makes a fatal mistake. The most likely way for this to happen is through his little "getaways." For the most part, Landstrom lives like any other working Joe, but three or four times a year his crime boss buddy arranges for him (and perhaps a member or two of his inner circle) to have a very pleasant week in a remote location. It's not unusual for one or two of the woman "working" these parties to disappear. A diligent investigator working backwards from a body found near one of these party sites could trace things back to Landstrom.

Landstrom could be brought down by his lieutenants, any of which has enough evidence on him to at the very least launch a serious investigation. Even if Landstrom managed to deflect the charges and stay out of prison, he'd still be "outed" and unable to operate as he does now. He might even keep his job if there wasn't sufficient proof, but he'd be watched from that point forward. The key to turning any of Landstrom's lieutenants is in either getting them free from whatever hold Landstrom has on them or by making sure they are safe from his revenge.

An interesting twist would be to work backwards from Landstrom to all the lives he's touched and ruined. An unrelated Federal sting operation destroys the offshore bank contacts he has, and millions in laundered money disappears in an instant. Landstrom, distraught, eats his gun in a bus station toilet and the heroes have to work backwards from that sordid end to discover his web of corruption before the rest of his cabal can destroy the evidence.

If a character is a policeman, he could be approached by Landstrom, or blackmailed by him into joining his inner circle. Or he could discover evidence of Landstrom's web of corruption, but not be aware of just who he can trust.

Description: Peter Landstrom is an average-looking man who is aging rather well. He has dark brown hair that hasn't

thinned nearly as much as his colleagues, though it's tinged with gray. He has light brown eyes that don't even require reading glasses yet. He's kept himself trim but he's starting to develop a bulge over his belt. He dresses in off-the-rack suits from department stores and drives a 10-year-old car.

Peter Landstrom, Dirty Cop   *100 points*

Age 42; Human; 6' 2"; 180

ST 10 [0]; **DX** 11 [20]; **IQ** 13 [60]; **HT** 10 [0].

Space 1889: The Steppes of Thoth
Space 1889: The Siege of Alclyon

Written by James Swallow *(The Steppes of Thoth)* **& Marc Platt** *(The Siege of Alclyon)*

Published by [Noise Monster Productions](#)

Directed by John Ainsworth

Starring Simon Williams (Captain Roger St. John-Ffolkes), Ivor Danvers (Sir Henry Routledge), Ian Brooker (Professor Golightly), Jo Castleton (Miss Georgina Golightly), Sam Peter Jackson (Hauptmann Werner Lenz), Toby Longworth (Sergeant Horace Carstairs), Jon Weinberg (Mr. Lucas Tyler), Tam Williams (Prince Skerrun), Robert Curbishley (Captain Archer), Christopher Fletcher (King Daryoon), Katarina Olsson (Miss Charlotte Wong), & Philip Madoc (General Karl Heinz Hagen)

Illustrated by Alex Mallinson

70-minute Audio Dramas on CD; $14.95 each

The Steppes of Thoth is the second in Noise Monster Productions' audio dramas set in the world of the original Victorian-era RPG, *Space 1889.* That cast all of the attitudes, morals, manners, and Imperial outlook beyond the confines of our atmosphere to the worlds within the inner Solar System. Traveling the Ether, mankind has found other peoples and species on both Mars and Venus. A lush swamp world, Venus is home to lizard men and dinosaurs, while Mars is dry, dying, and the cradle of a now ancient civilisation. Its huge cities are kept irrigated and connected by a system of canals, also used for travel and trade. The skies are filled by screw galleys and kite barges, kept aloft by the mysterious Liftwood that is only found on the Red Planet. Earth's leading nations have established colonies and legations on Mars, and they continue the feuds they brought from home, while warring with native city-states, projecting power via aerial gunboats and zeppelins.

To this strange new world come the remnants of the crew and passengers of the commercial Ether liner, the *Purbindesh.* Her last voyage and loss was detailed in the first of these audio dramas, *Red Devils.* That told a tale of secrets, greed, social mores, and resentment all of which culminated in the betrayal of the ship to both pirates and German perfidy. Aboard the *Purbindesh* was an artefact known as the Sacred Arena Stone of Alclyon, carried in secret to be handed back to its original owners on Mars. In this way, the British government hoped to cement good relations with the city of Alclyon and her king, and thus secure an important trade route.

The Steppes of Thoth begins mere weeks following the loss of the *Purbindesh.* Sir Henry Routledge, passenger aboard the ill-fated liner and newly appointed Governor of the Crown Colony of Syrtis Major, faces his first crisis in office -- diplomatic and military overtures towards the city-state of Alclyon. Their success can only be prevented if the Arena

Stone can be returned, but the artifact is believed lost aboard the *Purbindesh.* Yet this loss must be kept quiet, or all will be for naught. Under the guise of a mission to search for survivors from the wreck, Sir Henry directs Captain Roger St. John-Ffolkes of the Queen's Own Martian Rifles, to recover the Stone. Accompanied by his loyal batman, Sergeant Carstairs, and guided by the happy-go-lucky American, Mr. Lucas Tyler, already hired by Miss Georgina Golightly, whose father was aboard the liner when she crashed to Mars' surface, the good Captain's journey takes the party along the canals and out into her deserts. Not only are the party threatened by a spate of ill luck and the dangers of the desert, but an old enemy along with other interested groups are hard on its heels.

Just over an hour long, *The Steppes of Thoth* is an exciting tale told in crisp, clear sound that just feeds the listener's imagination. The story nicely touches upon and makes use of key facts about the Mars of *Space 1889.* This includes the differences between the Hill and City Martians, the anti-Earther Ground Cleanser cult, travel by both canal and by air, as well as more of the politics first brought to light in *Red Devils.* This is aided by the appearance of several characters first seen in the previous story.

The cast for *The Steppes of Thoth* all give fine performances. If Simon Williams' Captain St. John-Ffolkes, Toby Longworth's Sergeant Carstairs, and Jon Weinberg's Mr. Lucas Tyler, at first strike the listener as clichés, the actors all take their roles beyond that. Further, with a roll of the dice and flip through the rules, it is not too hard to imagine the various members of the cast as characters from the RPG.

A nice addition to the CD is the accompanying booklet. This showcases various characters and elements of the story, but at only a few pages does bound to leave the reader wanting more. But this is a just a little extra to what is a fine adaptation of a gaming setting to another medium. Indeed, any games publisher wanting to take their intellectual property into the audio format could no better than take a look at, or rather listen to this series of dramas from Noise Monster Productions. If a fan of *Space 1889* or Victorian set Science Fiction, then The *Steppes of Thoth* is a very worthwhile addition to your library.

* * *

The Siege of Alclyon brings to a close the trilogy of audio dramas released by Noise Monster Productions and set in the new interplanetary age of the RPG *Space 1889.* It brings to a head elements, plots, and personality clashes that have been brewing throughout the first two parts, [Red Devils](#) and *The Steppes of Thoth.* All collide and, with luck, are resolved in the Martian city-state of Alclyon, located on an important trade route for British interests on Mars. It is through this city that the British Crown Colony of Syrtis Major obtains its supply of Liftwood, necessary to keep her aerial gunboats in the air, and thus be able to project the power of the British Empire.

Important to any Martian city is its founding stone, and of late, the Sacred Arena Stone of Alclyon has been held by the British back on Earth. In returning it to the King of Alclyon, the newly appointed governor of Syrtis Major, Sir Henry Routledge hopes to win the friendship of the King and thus secure the trade route. Unfortunately all efforts to return the stone have so far failed, thwarted by the underhanded doings of Imperial Germany.

The Kaiser's agents are already suspected of assassinating both Alclyon's King and his heir, as well as having a hand in the loss of the *Purbindesh,* the passenger liner that brought many of the protagonists of these audio dramas to Mars, and whose betrayal and destruction was chronicled in the first part of this trilogy, *Red Devils.* The next in line to the throne, Prince Skerrun, late of both Oxford University the *Purbindesh,* is rumored to have survived the crash of the liner to the surface of Mars, but with his whereabouts and status unknown, it leaves his younger brother, Prince Daryoon to ascend the throne. As King, Daryoon is unprepared to fulfil his new role and the inexperienced monarch has turned to Imperial Germany for help and advice. Nevertheless, with the counsel of the Kaiser's invited representative, he is trying to do the best for his people. Yet General Karl Heinz Hagen finds the young King a wilful charge and also resistant to his suggestion that Alclyon be established as a full German protectorate. Of course, this has not gone unnoticed, and Sir Henry Routledge has placed the city under siege, further straining the relationship between King and General.

Fortunately, King Daryoon is not without friends. One his governess, Miss Charlotte Wong, also late of the *Purbindesh* and until recently the "ward" and "neice" of Sir Henry Routledge, while the other is Captain Roger St. John-Ffolkes of the Queen's Own Martian Rifles, imprisoned after having been found wandering the deserts of Mars. Can he persuade

young Daryoon to unavail himself of General Hagen's offer of protection and as to the benefits of being friends with the British Empire?

After the adventures of *The Steppes of Thoth,* this third audio drama returns to the intrigues first seen in *Red Devils.* It is also more character driven, focusing upon the quartet of General Hagen, Miss Wong, King Daryoon, and Captain St. John-Ffolkes as they try to influence the future of Alclyone from within its battered and beleaguered walls. As the third title in the series and the last of a trilogy, *The Siege of Alclyon* is not a suitable jumping on point, nor does it help that the opening few scenes are initially confusing to the listener -- even if he has heard the previous two instalments. Once past this, this is very much a character piece, which the cast play very well up to. Of note is Katarina Olsson as Miss Charlotte Wong, who has a much greater role than before and who is much better served by the script than in *Red Devils.* Here she is exposed as a frail character despite her duplicitous nature, always looking to take best advantage of the prevailing wind.

As the third and final part, *The Siege of Alclyon* brings the trilogy to an enjoyable, if not rousing, conclusion, one that manages to be in turns both surprising and expected. It is as technically perfect as its predecessors, helping the listener to imagine and realise a conflict on an alien world. It marks the end of a very enjoyable series that has brought to life a popular roleplaying game setting that might not have been so well treated and so well presented in any other format other than the audio drama. It is also clear that there are still tales to be told of the characters still left on the Red Planet, and hopefully, Noise Monster Productions will be allowed to visit them again in future releases. In the mean time, the next and fourth release in this line ***Space 1889*** audio dramas, The Lunar Inheritance, will take us to the Moon. If as good as this trilogy, it is going to be well worth the wait.

Old World Bestiary (for Warhammer Fantasy Roleplay)

Published by [Black Industries](#)

Written by T. S. Luikart & Ian Sturrock with Kate Flack, Ewan Lamont, Alessio Cavatore, Tuomas Pirinen, Chris Pramas & Gave Thorpe

Cover by Christer Sveen

Illustrated by Kori Christensen, Caleb Cleveland, Paul Dainton, Carl Frank, Dave Gallagher, Mark Gibbons, John Gravato, John Hodgson, Neil Hodson, Paul Jeacock, Veronica Jones, Michael W M Kaluta, Karl Kopinski, Travis Kotzebue, Pat Loboyko, Chuck Lucas, Britt Martin, Michael Phillipi, Wayne Reynolds, Karl Richardson, Adrian Smith & John Wigley

128-page full-color hardcover; $29.99

Traditionally, monster books have not been the most exciting supplements in the world. The basic format has been the same since "D&D" carved it in stone and too few writers have tried to diverge from it. In the *Old World Bestiary* supplement for [Warhammer Fantasy Roleplay](#), authors T. S. Luikart and Ian Sturrock diverge like crazy.

The first half of the book tells us what the inhabitants of the setting think about monsters, while the second half contains the stats and rules. This means that players can read the first half without learning every monster's stat line. I often want to show my players a great illustration and then think, "No, they'll see how many hit points it's got and the magic will be lost and the world will end!" There's no danger of that here.

The player-friendly information is split up again according to whether your character has the appropriate Common Knowledge or Academic Knowledge skill. Some is trustworthy, and some isn't. Most of it is given in-character so that by the end of the book you'll know exactly what Old Hob the peasant thinks about a variety of beasts and how that differs from what sundry scholars and Witch Hunters claim is true. Sometimes there's even information from the being in question's point of view, which is amusing -- especially the Ogre's explanation for why he likes eating dog-onna-stick.

Altogether, this means there's a lot of material for each monster. Even the relatively mundane Vampire Bat has six different in-character quotes about it. Some of the less-informative quotes could definitely have been trimmed to make room for a greater variety of creatures.

The Game Master's section starts with some new rules, including new careers for Shamans and spirit-magic spells for them to cast. There are also new Talents to deal with supernatural abilities like Daemonic Aura and the consequences of being gigantic like Unstoppable Blows. The creatures themselves have a new descriptor called Slaughter Margin to give the Game Master a clue how likely to massacre the average soldier each beast is. It's obviously a bit of a joke at the expense of *Dungeons & Dragons'* Challenge Rating, as well as a suggestion of the game's differing tone.

The stats are fair and easy to read. ***Warhammer Fantasy Roleplay's*** percentile system comes into its own here; lacking an in-depth knowledge of the rules you can still compare a Treeman's Weapon Skill of 81% to a Dryad's 48% and see who's going to come out on top in a way that would be more difficult with abstracted figures. Where there's a lot of variance in a monster type there are multiple examples -- five different Skaven are shown to and there are five varieties of Daemon.

It's possible to easily differentiate or power-up individuals by using the careers, either the creature careers like Shaman and Brute or the careers aimed at player characters, which would be just as applicable to Ogres, Vampires and other intelligent, social creatures. A Vampiric Pit Fighter will possess a very different skill set to a Vampiric Courtier, which is a cinch to model with the game's famous career system.

Comparing it to the first edition's bestiary, there are fewer monsters. However, the first edition did have a lot of goofy animals like the Goldworm, which only ate precious metals yet could only travel 100 yards in a random direction before dying. Outside of banks and Dragon's hoards they must have been pretty damn rare. I can't say that I miss them, or the leeches that disguised themselves as treasure chests either. For the nostalgic, Black Industries have brought back some of the less lame of the older monsters as pdf downloads on their website.

The mostly color artwork is top-notch and does well at evoking the game's grim tone. A band of Elven Corsairs drags a bound human slave, a horde of Zombies stretches to the horizon, and Cultists hold up entrails as offerings to the Fly Lord. I recommend arachnophobics turn the page with the hideous Giant Spider quickly, though.

Overall, the ***Old World Bestiary*** is a breath of fresh air, although not without its flaws. As well as cramming too much flavor text into some of the entries, there are a lot of typos. However, these nitpicks don't stop it from being one of the best examples of its type around -- it won the ENnie award for best adversary/monster product with good reason. This book reminds us why fantastical beasts are such an integral part of fantasy games, and it's not because they make good combat fodder. The ***Old World Bestiary*** presents its creatures as a vital part of the setting rather than just opponents to be killed and looted. No matter how you look at it that's a good thing.

Fortune and Glory, Kid . . . Fortune and Glory

One of the biggest challenges of presenting a game setting is trying to answer the question, "What the heck kind of world is this, anyway?"

I find myself asking this question after getting caught up on the *CSI Season Four* and *CSI: New York Season One* DVD sets in the past week. This is the first extended television viewing I've had in a while, thanks to the DVD mini-player I perched right below my screen last weekend; this was a *lot* of crime-scene-investigation drama action to take in at once. To paraphrase Crow T. Robot, outside of never being able to feel joy again, I don't think *CSI* had any effect on me.

But that's beside the point. See, one of the things that struck me about this series is that the agents of the various CSI teams have enough adventures in a season to assure their ability to write a half-dozen books; many of the cases they handle are "career-maker" cases, assuring a lifetime of Courtroom TV appearances and Larry King interview slots.

Of course, people don't watch television for *The Mundane Adventures Of Boring Cops,* and the need to fill out 22 or so episodes each season puts the pressure on keeping things exciting.

But it raises the question -- how much more or less exciting are these folks' lives supposed to be, compared with what should be expected of them?

There are four possibilities here which spring to mind, relying on a logic diagram comparing rarity versus competency.

The PCs aren't doing anything particularly special. This is the route taken by *CSI, Law & Order,* most comic companies' supers universes, and other franchises. Basically, although their adventures may seem exciting to us as outside observers, the "workload" the heroes are undertaking is normal. Thus when the *CSI: Miami* team meets the *CSI: New York* team, the latter doesn't say, "Wow! Aren't you the ones who cracked the case of the dead actress whose body parts were being mailed to those federal judges?!? We'll never have anything *that* exciting!"

The advantages here are that it's the most common and, arguably, straightforward of the options; you can have as many exciting adventures as you want, without needing to worry about justifying about how they'll fit in with the rest of the campaign world. Sure, someone might have the heroes on for a mid-afternoon talk-show program after keeping the baddies from releasing the anthrax into the water supply, but no one is likely to mention it again.

One disadvantage is that it can be tough to come up with a *really* exciting adventure -- one which is supposed to impact on the campaign world as a whole. In addition, if there is a demand for the heroes to start becoming noteworthy among their peers, either because the GM wants to refocus the campaign or because the players want some more of the limelight, then coming up with an in-game justification for this might be challenging (if such justifications are important to the players).

The PCs aren't encountering anything particularly rare, although they are more competent than average. This was the approach taken by the original *Star Trek.* According to canon (as I understand it), the original *Enterprise* was one of a dozen or so ships of its type to go out on various five-year missions, but the *Enterprise* was the only one to return alive, thanks to the power of Kirk-Fu and the Spockaroonies. In this type of setting the heroes will be looked up to by the "mundanes" of the campaign world. A similar example is the *Stargate: SG1* television series. Here the primary team -- SG1, natch -- are smarter than the average bears. However, there are lots of other teams roaming around, having similar adventures. (In fact, some episodes are even devoted to those exploits.)

The advantages here are that it's easy to explain why the heroes are a part of the action; they're the best they are at what they do, so if the spit is hitting the fan then the Powers That Be would be wise to call them. There's also no shortage of adventure possibilities; not only do the heroes have the chance of dealing with any tales of their own . . . they might also be called upon for mop-up duty for another team's failures.

The disadvantages here are trying to mold the game and players' expectations with the justification as to why these competent folks are all in one spot. For example, the adventures of the *Enterprise* would have been remarkably different if, instead of Scotty the Ultra-Competent Engineer, they had Big Earl the Career Electrician Who's Counting the Days to Retirement. This is easier to handle in some campaigns (for example, if the heroes all gained unique super-powers because of the same origin story) and may not even need explanation to some. Another disadvantage is trying to determine why, exactly, these people are special within a game context. For example, a *Star Trek*-esque game that represents the crew's improved competency via more powerful characters (those built on more character points or the like) will have a different feel than one where their abilities are explained via Fate Points or similar game-affecting mechanics.

Finally, another disadvantage can be that, in a remotely realistic campaign, it's hard to come up with continued justification as to why the heroes don't retire or try to "cash in" on their fame; let's face it . . . once you save the world you can pretty might write your own meal ticket, and trying to justify why your characters are still living in a modest efficiency apartment a week later can take some work.

The PCs are dealing with rare events, and they're more competent than average at dealing with it. This is how some one-off action/adventure movies or book series are dealt with. Thus the NPCs may note that the heroes are world-famous for their exploits, or others might track down the PCs for them to handle One More Mission, because they're good.

The advantage here is that it is probably the most cinematic of the options; the situation is rare, but the heroes are souped-up beyond normal expectations to handle it. (Let's face it; Robert Langdon, the protagonist from *Angels & Demons* and *The Da Vinci Code,* has handled situations far beyond what most Professors of Religious Symbology can reasonably expect, tenure or no.) It's easy to envision the sweep of the camera, and the pacing allows for more "epic" events, even interpersonal ones; you'd better kiss the gal at the end of the scene, because you might not get another chance! One disadvantage is that the longer the campaign continues, the less the "rare" tag applies. It's one thing for Indiana Jones to acquire the unique Ark of the Covenant. It's another if that's one of a dozen such artifacts he's been exposed to in his life. **The PCs are dealing with rare events, but they aren't any more or less competent at dealing with it than normal folks.** This is how most realistic crime novels, "everyman" tales, and -- indeed -- real-life tales play out. It's also the approach taken by most realistic (or semi-realistic) war movies. Basically, the heroes in these stories relied on luck, making the right decision, and determination or pluckiness to prevail.

The advantage is that the drama and excitement are probably more heightened than any other campaign type; after all, since the heroes aren't any more special or skilled than anyone else, there's a significant chance they won't make it!

The disadvantage here are that it can be tough to come up with a focus or reason for the story to have a narrative coherance. For example, it could be argued that the historical event of World War II's D-Day was a "mathematical" heroic event; a large number of soldiers started out fighting there, and a much smaller number survived. In a movie or story, the "camera" would likely remain focused at least in part on the group that survived, since having a book end midway through with, "... and the heroes all died, not knowing that their friends were going to survive." followed by 181 blank pages isn't bestseller material. However, a more realistic "let the chips fall where they may" RPG campaign may not have any choice but to end in such a way unless ideas are put in place ahead of time (such as allowing the players to take over other characters should the first ones fall early on.)

Any of these four campaign types can have problems if there is an attempt to shift the focus. For example, the *Ghostbusters* movies seem to fit the mold of the "rare events, hyper-competent heroes (more or less)." However, the premise of the *Ghostbusters RPG* is that these events aren't as rare as it seemed, and neither are the heroes; the franchising of the Ghostbusters name to new adventuring teams within the *Ghostbusters* universe is required for that premise to work. Likewise any new tales in, say, the *Star Wars* universe needs to deal with the issue of just how special *were* the actions of Luke, Han, Leia, and Jar-Jar.

Of course, none of this matters if it turns out we're all actually living in the *CSI* universe. There, everyone breaks down to murderer, victim, and CSI agent . . . in this case I'd bet good money that I fall firmly in the "dies in the opening scene" category.

--Steven Marsh

Ye Olde Majik Shoppe V

The Final Five Odd, Strange and Just Plain Weird Magical Items

by K. David Ladage

So, after 21 glimpses into the mind of Kendalge, what do we know of him? We know he was married, but we cannot say for sure how many times. We know that he was very old when he died, but we cannot say for sure just how many centuries passed from his birth to his death -- or how this man that appeared to be human managed to live so long. We know that he was a father, but cannot say to how many children. We know that he was brilliant, intelligent, wise, and possibly even insane.

We know that the Second Age was defined by the man; we even know that he was quite possibly the greatest wizard, sorcerer, enchanter, and philosopher of his time (or any other era). Yet, the one thing we cannot say for sure is if the man ever really existed at all. All that we can say with real certainty is that the impact of this man's legacy is all that remains -- and perhaps that is enough.

There are the treaties that bear his name, and what remains of his enchanted works, to be sure. But these are not as lasting as the morality tales that grow in predominance and stature each passing generation. Stories in which the Great Kendalge teaches children and adults alike the virtues of a life lived in harmony with the will of Higher Powers. Even if Kendalge was not one man, or never really existed at all -- would it cause anyone any harm to listen to the echoes of his voice today?

Below are five more looks - our last in this series - into the legacy of a man that may not have existed . . . but was as real as any who ever lived.

Velveteen Cloth

The Velveteen Cloth was a gift from Kendalge to the Lady Gwen of Three-Rivers, Viscountess of Eastwick, during the reign of King Archibald the Wise. At that same time, he sent an identical gift to Lady Charlotte of Greybonne. The gifts were delivered as six bolts of fine velvet. The cloth was as fine as the highest quality silk; especially soft to the touch and flowed as though it were as light as air. One diary entry from Lady Gwen indicated that the cloth "feels much like you are being caressed by a cloud, as though walking nude in a cool fog bank."

The exact enchantments and

[1] According to the writings of Luscious Von Griever (Court Jester of King Archibald the Wise as well as King Frederick XIX), Lady Gwen was well known in the courts for using her feminine charms to get her way. She had just spent three months making all manner of attempts to seduce the King's son, Prince Frederick. She wanted him to ask her hand in marriage. This would be a strong political move for her, given the fact that the Three-Rivers family has lost favor in the courts (and thus, much land) to the family of Lord Dewar of Greybonne, Viscount of Timberland. Lord Dewar had an eligible daughter, Charlotte, whom Prince Frederick had taking a liking to.

Lady Gwen had her finest seamstresses design and create a gorgeous dress for her to wear to the Prince's birthday celebration. Once the dress was completed, it is said, that some proclaimed it to be the most beautiful garment ever produced (although many believe that this is just an embellishment of the story). One day after the dress was completed, all of the thread seemed to disappear creating a seamless gown. When Lady Gwen put it on she is said to have remarked that the garment was so light, "it is as if I were not wearing anything at all."

Not knowing that Kendalge had delivered six bolts of the cloth to Lady Charlotte as well, Lady Gwen was shocked to find that Charlotte was also wearing a fine dress made of the same Velveteen Cloth. Still, records of the time indicate that

magical properties of the Velveteen Cloth are not known. What is known is that the cloth will create seamless connections to itself when sewn -- the thread used seems to disappear in this transition. The fabric is exceptionally sturdy and light. It has the same weight as silk, while maintaining a protective equivalent of heavy leather, or light chain. Some writings claim that the cloth can shift colors, or even reconfigure itself into other styles of clothing to fit the nature of the surroundings. However, these writings are from third- and fourth-generation sources, and are largely discounted.

What happens to the wearer is also in debate. Some claim that the cloth reveals the motivations of the wearer, or the intent of a given action. Others claim that the cloth does nothing to the wearer at all.

she, being a consummate politician, did not even smirk. Charlotte, however, was not as controlled.

As was customary, each eligible Lady was to have one dance with the Prince. Lady Gwen was among the first. As they danced, Lady Gwen claims to have become overcome with a sense of warmth, well-being, comfort, and calm. She smiled gently into the eyes of the Prince, kissed him, and smiled before she excused herself. She went back to her seat, where she is said to have fallen asleep shortly thereafter.

An hour later, it was time for Lady Charlotte to dance with the Prince. As Prince Frederick was already smitten with her, it was not long into the dance that they embraced and kissed. However, at this point Charlotte is said to have gone berserk. She slapped the Prince in the face, and began screaming. She accused him of hurting her, then moved on to accuse the Royal Court of conspiring against her. At that point, Charlotte was removed from the Palace, and the King decreed that his son would marry Lady Gwen of Three-Rivers. Six years later, King Archibald died, and King Frederick XIX assumed the throne with Lady Gwen at his side.

Those that do not believe that the Velveteen Cloth reveals intent and motivations point out that Lady Gwen wanted to marry the Prince due to political motivations. However, for all of her political maneuvering, her intent was neither malicious nor Machiavellian. She was trying to re-establish her family name; after marrying the Prince, she was a faithful and trusted partner. Charlotte, history states, had other plans. While imprisoned, she confessed to having concocted a plot to seduce the Prince, assassinate him once he ascended to the throne and maneuver her family into position to take control of the crown. She was beheaded three months before King Frederick's coronation.

all. The only first hand account to survive is from the Court Jester of King Archibald the Wise [1]. Of the 12 bolts of cloth delivered to Ladies Gwen and Charlotte, they only used four bolts between them. Both Ladies were buried in the dresses that they made.

Wolverine-Skin

If ever someone were going to classify an enchanted item of Kendalge's as *cursed,* the top two contenders would be the Infernal Loom and the Wolverine Skin. Most who know of the item swear it could not be something that Kendalge created -- granted, those are the same people that claim that the Infernal Loom could not have been created by Kendalge either. The Wolverine Skin seems to serve no real positive purpose; the stories surrounding it tell no morality tale, and in the end Kendalge seemed to have no control over the thing. But several texts (including second and third generation sources) describe his many attempts to apologize for having unleashed the accursed item upon the world. In other words, Kendalge claimed it as his own (no so handi-) work; in this volume we will make no attempt to refute that claim.

The wolverine skin, under all forms of physical and magical observation, appears to be nothing more than the prepared skin of a huge wolverine [2]

[2] The Wolverine-Skin usually appears as a skin from a wolverine. However, their are some texts that suggest that the skin can appear in other forms as well. The form is always a mammal -- badger, bear, horse, lion, tiger, and wolf are all described. It is not clear if these are the same items, or if they are separate items all together; if they are separate, it is not known if Kendalge created

(perhaps a giant or dire version of that creature). The skin is of such quality that it could be -- and often has been -- used as a nice-sized rug. During all phases of the moon save the full moon, the skin is completely inanimate. In reality, the skin is alive: it is some sort of hybrid magical creature that seems to be equal parts construct, animated dead, and lycanthrope. During the full moon, the skin will occasionally transform into a hideous, blood-thirsty construct/undead/were-wolverine killing machine.

The few accounts that describe the beast are so contradictory as to be nearly unusable. What common elements exist describe a humanoid bestial creature standing between eight and nine feet tall, with long, powerful arms that reach the ground; this allows the creature to run in a hunched posture on all fours, much like an ape. The claws are retractable; the fully extended talons are about 12 inches long.

One account with the beast, however, is considered definitive. Written by Sir Chaddwyke Earl of Overcliffe approximately six years before he was knighted, Chaddwyke describes an encounter with the beast around midnight during the Winter Festivals in the Year of the Emerald Star. He and his entourage were returning home after a night of revelry when they chanced to meet the beast as it was engaged in combat with Sir Greybar of the Verdant Wood. Writes Chaddwyke: "[T]he beast was most certainly derived from a wolverine. However, much of the beast seemed to be made of inanimate matter. I could see wood, clay, stone, and even polished metal making up portions of the exposed skeletal framework. If I were to venture a guess, I would say that the beast absorbs items near it when it makes its transformation . . ." In the combat, both Greybar and Chaddwyke were injured, and three others lost their lives before the beast ran off into the darkness of the nearby trees.

them all, or if the creature can infect other animals, much akin to standard lycanthropy. If this is the case, one has to wonder about the fates of Sir Greybar and Sir Chaddwyke.

Also, it is not known if the skin is able to be destroyed when it is not animate (since no such attempt has ever been recorded), nor is it clear what happens if the beast is destroyed (since none have ever been able to do so).

In several texts, it is clear that the skin does not transform during *every* full moon. What causes the transformation to take place during some full moon cycles and not during others is not understood; some claim it is totally random.

Xavier's Battle-Axe

Of all of the weapons that Kendalge enchanted over the years, none is quite so odd as Xavier's Battle-Axe. Sir Xavier, the rather infamous knight, was more formally known as Lord Xavier, Earl of the Eastern Seaboard, Duke of Chesterfield, Wolfsbane, Wyrmslayer. He was a man of few words (although his battle cries are said to have been so fierce as to be capable of producing nightmares in some); he was fairly handsome and highly charismatic -- a man of action. But mostly he was dangerous. Not only to those that would dare to oppose him in battle, but also to the men that he brought into that battle. As a tactician, he felt that accomplishing his goal quickly -- no matter the cost -- was best. Protection, defense, and preservation of forces was something he felt could be considered when the battle was won.

Sir Xavier commissioned an axe from Kendalge. Xavier wanted an axe that could destroy any foe in one hit. Kendalge tried desperately to explain to the knight that what he needed was to plan his battles around the ideas of accomplishing his goal with the fewest casualties. Unfortunately, Xavier was a popular nobleman, and had many that thought much as he did -- the peasantry that made up the bulk of the fighting forces was an expendable (and cheap) resource.

What Kendalge created would be discussed for a century after its creation. The great axe was incredibly sharp and durable. Xavier is said to have commented that he had wielded the axe in several major battles, had cut through flesh, bone, and armor -- yet the blade had not one scratch, nor had it dulled in the slightest. During the Battle of Three Rivers Valley, Xavier needed to stop an advancing line of chariots -- and so it is said he felled an oak tree with a single swing of the axe, blocking the Camden Road, giving his men time to advance into position. Many other common and relatively uncommon weapon enchantments were included in the axe as well. Xavier even discovered that the axe was effective against incorporeal creatures. He was quite happy.

It was seven years after the axe was completed and delivered to Xavier that he would discover the most important quality that Kendalge had placed into the axe: it had a quasi-vampiric nature. One of Xavier's battle cries (which one is a subject of great controversy) was enchanted into the axe as a trigger. When spoken loudly by the wielder, the axe would draw life energy from Xavier as well as all of his allies within 30 feet. This energy was then converted in a negative-life energy and unleashed onto the next thing that was unfortunate enough to be struck by the axe [3]. Allies that were struck down by this life drain, as well as those slain by the negative energy that was released by the axe, were immune to all forms of magical healing. Unfortunately, this mattered not to Xavier.

Xavier came to use this ability far too often, and this would lead to his death . . . less than six months after discovering the ability. His demise would lead to a struggle to control the axe. The so-called War of the Axe lasted nearly 45 years, and came dangerously close to shattering the Royal Courts.

[3] Unlike most of the magical items discussed in this series, Xavier's Battleaxe needs a rules-level discussion to be fully understood and appreciated. Below, you will find the rules for using this magical axe in *FUDGE, GURPS Fourth Edition,* and the *d20 System.*

The life-energy-drain/redirection ability is activated when the trigger word (or phrase) is spoken in a loud, clear voice by the wielder. Anyone slain by the life-drain that come from this cannot be raised, resurrected, reincarnated, or otherwise brought back to life. Once charged, the energy in the axe will remain until unleashed, or for one month -- whichever comes first. The axe cannot be charged multiple times. If the axe has negative energy being stored within it, then no further charging of the axe can take place until that energy has been released.

FUDGE

Xavier's Battle Axe is a powerful magic item. It is indestructible, can strike incorporeal beings without penalty, and is treated as a Battle Axe that receives a +2 magical bonus to to-hit rolls and to its Offensive Rating.

When the triggered ability is activated, the wielder is immediately drained of life energy (two wounds, each of severity 2dF+3; each wound rolled separately); each ally within range is also drained of life energy (one wound, severity 2dF+3; each ally rolled separately). The total of all of the wound rolls is the amount of negative energy the axe is storing. The next individual (or object!) that is struck by the axe takes damage from the axe as normal, with an additional bonus to the Offensive rating equal +1 for every 3 points of negative energy stored (round down), to a maximum of +5 (at 15 points of negative energy).

Example: A skilled warrior is wielding Xavier's Battle-Axe; he has six allies in range. He activates the ability, and is immediately drained of life, suffering two wounds (severity 3 and 4); each of his allies that are in range are immediately drained of life, suffering one wound each (severity 2, 2, 3, 3, 4, and 4). This is a total drain of 25 points of negative energy. Assuming that the warrior survives, if the warrior strikes something with the axe at some point later in the battle, it will take damage applying all standard and magical offensive factor modifiers including an additional negative-energy bonus of +5. The axe has been drained of negative energy.

GURPS Fourth Edition

Xavier's Battle Axe is a powerful magic item. It is indestructible, and is treated as a Battle Axe that has the following enchantments on it: Accuracy +2, Penetrating Weapon (5), Puissance +2, and Ghost Weapon.

When the triggered ability is activated, the wielder is immediately drained of life energy (see chart below); each ally within range is also drained of life energy (see chart below; each ally rolled separately). The total of all of the damage drained is the amount of negative energy the axe is storing. The next individual (or object!) that is struck by the axe takes damage from the axe as normal, with an additional magical bonus of +1 point of damage for every point of negative energy stored, to a maximum of +15 points.

Life Drained From . . .

Roll	Wielder	Allies
1	3 hps	1 hp
2	4 hps	1 hps
3	4 hps	2 hps
4	5 hps	2 hps
5	5 hps	3 hps
6	6 hps	3 hps

Example: A skilled warrior is wielding Xavier's Battle-Axe; he has six allies in range. He activates the ability, and is immediately drained of life (rolls and loses 4 hit points); each of his allies that are in range are immediately drained of life (after rolling, they lose 1, 1, 2, 2, 3, and 3 hit points). This is a total drain of 16 points of negative energy. Assuming that the warrior survives, at some point later in the battle, if the warrior strikes something with the axe, it will take damage, including a +15 bonus from negative energy. The axe has been drained of negative energy.

d20 System

Xavier's Battle-Axe is an artifact. It is indestructible, and is treated as a +3 Adamantine Battle Axe with the Ghost Touch quality in addition to the triggered life-drain-and-redirection ability.

When the triggered ability is activated, the wielder is immediately drained of 1d6 hit points per two character levels of the wielder (round up). Each ally within range is drained of 1d6 hit points per three character levels of the wielder (round down, one die minimum; each ally rolled separately). The next individual (or object!) that is struck by the axe takes the normal damage, plus 1d6 negative-energy damage per die that was drained by the axe, to a maximum of +20d6.

Example: A 5th-level fighter is wielding Xavier's Battle-Axe; he has six allies in range. He activates the ability, and is immediately drained of 3d6 hit points; each of his allies that are in range are immediately drained of 1d6 hit points. This is a total drain of 9 dice of drained life energy. Assuming that the fighter survives, at some point later in the battle, if the fighter strikes something with the axe, in addition to the normal damage, it will deal +9d6 negative-energy damage. The axe has been drained of negative energy.

Yarmulke Of Absolute Truth

As has been discussed, Kendalge paid homage to many religions -- praying to some 60 or more gods. Over the course of this life, he was active in at a dozen organized religions. Most of the time, he would study the faith, find elements of truth, and thus take an active interest in the tenets of the faith. After time, he would discover

[4] So now what? You have this mystery that involves a set of oddly written *truths* and a yarmulke that may or may not have anything to do with them. Was Kendalge playing a practical joke

inconsistencies, or elements of the faith that required that he set aside common sense, believe in things that were patently absurd, or even disbelieve that which was observable. So, in those stages, his interest would become jaded and he would move on. At no time, however, did he lose respect for those that believed in the faith; after all, in each faith he learned new things -- new truths of the world, new truths within himself.

Near the end of his life, Kendalge began studying all of the religions he had once practiced. He looked at those elements of faith that they had in common and those things that -- although not common -- did not contradict another religion. He began to see patterns that he described as "akin to looking into the sky and seeing the clouds forming into the shapes of letters and words."

From this work (which took him nearly three decades) he began to formulate the basic elements of faith in what he called the *Universal Church of Truth.* The idea of this church was that it followed no particular god, no single dogma; it followed the truths that were evident in all gods, that were practiced or preached in all dogmas. Although he died prior to completing the work on this Universal Faith, he did manage to write down a listing of 216 core concepts that, he claimed, formed the basis of *absolute truth.* This list would later become the foundation for the *Church of the Eternal Flame,* founded by Gerard d'la Raven (a distant cousin to the infamous Atlas d'La Raven) in the second century of the Third Age. Gerard called them the *foundational elements of absolute truth.* The major problem with this listing is that all 216 are written as koans (short, riddle-like paradoxes) that have caused no end of debate over their true meaning.

In the final scroll of the writings that Kendalge produced on this topic, he discussed a yarmulke (or a *skull cap*). This struck many as odd, as the yarmulke is worn only by the male practitioners of the more orthodox and conservative faiths practiced by those inhabitants of the lands far across the Great Western Ocean-Sea. He claimed to have found this piece of headgear while negotiating a trade treaty with the Kingdom of the Setting Sun. The yarmulke, he claimed, was the key to understanding 36 of the core concepts. Unfortunately, Kendalge does not specify *which* 36 concepts it is key to the understanding of; and none of koans make any mention of a yarmulke, skull-cap, hat, helm, or any other form of headgear for that matter. The particular yarmulke Kendalge had has been lost to history; the followers of the Church of the Eternal Flame wear the yarmulke to this day.

So what is the meaning of the 216 so-called *foundational elements of absolute truth,* and how does the yarmulke fit into all of this? Nobody is sure; it remains one of the many unsolved mysteries surrounding the life of Kendalge. [4]

on everyone, or is their something to this? If you want their to be something to this whole thing, their are several ways it can be done. Below is one example of how to use this mystery in a campaign:

The *National Treasure* Option: The Yarmulke of Absolute Truth contains an enchanted map. The map can only be seen if the yarmulke is placed over the crystal ball of the Dreamcatcher and the words of the first koan are spoken (in fact, the yarmulke could have been incorporated into the sleeping cap of the Dreamcatcher without anyone realizing it). This map reveals the location of the Ring of Kendalge. The ring allows the mystery of the 2nd and 3rd koans to be understood or seen, which leads to another of Kendalge's magic items and the truth of 1-3 more koans. And so on and so forth . . . until a clue reveals the meaning of the 36th koan and that takes our heroes to the Naos Sanctum. Here, the heros find the truth in the rest of the 216 koans which leads to . . . [insert huge, earth shattering, campaign altering truth here].

Other options include: The *Dragonslayer* option (where the koans are an incantation that will allow the yarmulke to bring Kendalge back to life to fight some great and terrible evil that requires that he sacrifice himself to defeat it); the *Stargate* option (where the yarmulke is a powerful magical item that opens up into a huge gateway that can wisp the heroes off to any one of 216 possible dimensions depending upon which koan is spoken into the gate once it is activated); or even the *Scooby Doo* option (where the whole thing is a hoax designed to draw in unsuspecting persons seeking power and Things Man Was Not Meant To Know and send them to their doom -- and it would have worked, too, if it were not for those meddling kids!).

Zodiac Plant

Kendalge's third wife, Charmaine, had a love of azaleas. This was the plant that was used as a basis for the first [Houseplant](#) after all. So it should not come as a shock to know that Kendalge created other enchanted items using the beautiful flowering bush as a basis. The one that swept the heart of Charmaine, and was used as a gift during Kendalge's proposal, was the Zodiac Plant. The Zodiac Plant is a bush- like plant, similar in size and appearance to a [Catawba Rhododendron](#). The flower of this plant, however, is the interesting part.

The Zodiac Plant blooms 12 times per year. Each blooming will come with the new buds forming over a period of one or two days. After a total of 14 to 16 days, the flowers are at their peak in size and brightness. This will be maintained for about 10 to 12 days. Then the flowers fade, wilt, and are shed completely after 28 to 32 days, after which the cycle starts up again. Most remarkable is the fact that the flowers will have a different appearance each time -- and that the appearance of the flowers is consistent between all Zodiac Plants everywhere at that time. The shape of the flower, color of the flower's petals and filament, as well as the scent are all variable.

A decade or so after the marriage to Charmaine, Kendalge used the Zodiac flower in his alchemical experiments. This resulted in a mutated version of the Zodiac Plant that has highly enchanted flowers. The exact effect of these flowers is highly variable. Some texts suggest that the appearance of the flower can give some clue as to the nature of the effects but this has never been verified. The only way to release the magical properties of the flower is to carefully cut it from the plant, place the entire flower in a cup of hot water and drink the tea that results.

A complete rendering of the possible magical properties that the Zodiac Plant can produce is far beyond the scope of this volume [5]. The effects have been beneficial (such as having curative properties, or creating a sense of euphoria) to the benign (such as causing people's eyes to change color, or making hair grow quickly) to the baneful (such as inducing nausea or causing people's memories to fade). The effects range from temporary (mere moments) to long lasting (man years). It it believed, however, that short of death, no effect of the Zodiac Flower Tea is permanent.

[5] The appearance of the flowers of the Zodiac Plant vary with (a) the shape of the flower, (b) the color of the flower petals, (c) color of the flower filament, and the (d) the scent of the flower. To randomly determine the appearance of the flower, roll d66 four times and cross reference the results.

Color Of Petals (roll 2d)

Roll	Shape Of Flower	Or Filament	Scent Of Flower
11	Bell-shaped	Black	Aromatic
12	Bell-shaped	Black	Aromatic
13	Bell-shaped	Black-Grey	Aromatic
14	Bowl-shaped	Grey-Black	Aromatic
15	Bowl-shaped	Grey	Citrus
16	Bowl-shaped	Grey	Citrus
21	Cross-shaped	Grey-White	Citrus
22	Cross-shaped	White-Grey	Citrus
23	Cross-shaped	White	Exotic
24	Funnel-shaped	White	Floral
25	Funnel-shaped	White-Red	Floral
26	Funnel-shaped	Red-White	Floral
31	Lipped	Red	Floral
32	Lipped	Red	Floral
33	Lipped	Red-Orange	Floral
34	Pea-shaped	Orange-Red	Floral
35	Pea-shaped	Orange	Floral
36	Pea-shaped	Orange	Floral

41	Salverform	Orange-Yellow	Fruity
42	Salverform	Yellow-Orange	Fruity
43	Salverform	Yellow	Fruity
44	Saucer-shaped	Yellow	Heavy/Musky
45	Saucer-shaped	Yellow-Green	Heavy/Musky
46	Saucer-shaped	Green-Yellow	Heavy/Musky
51	Star-shaped	Green	No Scent
52	Star-shaped	Green	No Scent
53	Star-shaped	Green-Blue	No Scent
54	Trumpet-shaped	Blue-Green	No Scent
55	Trumpet-shaped	Blue	No Scent
56	Trumpet-shaped	Blue	No Scent
61	Tubular	Blue-Indigo	Peppery
62	Tubular	Indigo-Blue	Peppery
63	Tubular	Indigo/Violet	Spicy
64	Urn-shaped	Indigo/Violet	Spicy
65	Urn-shaped	Violet-Black	Sweet
66	Urn-shaped	Black-Violet	Sweet

Shape: examples of each of these shapes of flowers can be found at http://theseedsite.co.uk/flowershapes.html. As an option, you can roll on this chart twice and cross the effects (i.e.: tubular-bell-shaped, lipped-star-shaped, bowl-saucer-shaped, etc.)

Color: for the color of the petals, this is the *primary* color. If two colors are listed, this means that it is a shade of the first color that leans toward the second (i.e.: blue-green is blue that leans toward the green side while green-blue is green that leans toward the blue side). You may roll a d6 to determine the number of additional colors on the petals if you would like (1-3: 0 additional colors; 4-5: 1 additional color; 6: 1d3 additional colors). These secondary colors can come in highlights, spots, splashes, or anything else you can think of.

Scents: these are general categories of scent. For more information of the scents of flowers, go to http://www.flowers.org.uk/flowers/trivia/scent.htm.

Pyramid Review

Breaking the Ice: A Game of Love For Two

Published by [Black & Green Games](#)

Written by Emily Care Boss

Cover by [Barry Deutsch](#)

Illustrated by [Barry Deutsch](#) & [Jennifer Manley Lee](#)

42-Page b&w softcover; $14

Breaking the Ice: A Game of Love for Two is a little game that deals with that most difficult of subjects -- love. Few if any RPGs really address this subject, perhaps the most notable being the Shoujo titles *Heart Quest: Romantic Roleplaying in the World's of Shoujo Manga* and *[Hearts, Swords, Flowers,](#)* the latter better than the former. Yet both draw from a very specific genre and culture -- Japan's Shoujo Manga -- and in comparison few if any occidental set RPGs approach the subject to the same degree although it may figure mechanically and thematically.

Breaking the Ice is different, tackling the subject directly in the form of two people playing a couple going on their first three dates. Taking it in turns, they narrate and guide through the major events -- the sort of memorable things that they might be able to tell their grandchildren someday -- of the three dates, aiming to create and find compatibilities between, and increase the attraction between the pair. Hopefully enough, that the couple will form a long and lasting relationship, if not actually marry. In doing so, the game sets out to model the romantic movie and its various sub-genres such as the dramatic *(Romeo and Juliet),* dark humor *(Grosse Point Blank),* comedy *(When Harry Met Sally),* screwball comedy *(His Girl Friday),* and so on. There is also potential for plugging *Breaking the Ice* into both other RPGs and genres to handle what they do not.

From start to finish, a game of *Breaking the Ice* lasts just a couple of hours, an evening at most, and that includes character generation. And for all that, the participants need nothing more than the rules, the joint character sheet, paper and pencils, and a handful of six-sided dice. Before the game begins the players sit down and decide upon its genre (as above) and its rating. The latter is given in terms of American movie ratings (G, PG, PG-13, R, and NC-17), indicating whether or not sex will figure in the story and how. Lines and veils can also be agreed upon, further defining the game's sexual boundaries and how it will be represented.

The game's interaction really begins character generation and a radical switch. For the latter, the players take a difference between each other and then swap it for their characters. This can be by gender, sexual preference, ethnicity, politics, social grouping, and so on. The default though, is a gender switch, which admittedly is not to everyone's taste, which is why there are so many other options. The game's long running example does employ this default, but tastefully so, and is best displayed in Barry Deutsch's humorous depiction of Jed and Meimei.

A character is defined by several Traits, usually between four and six. Falling into three categories -- Self, Work, and Play -- they are drawn and defined from a Word Web created cooperatively by the players. This is done for both characters and is really an exercise in word association that begins with each player's favorite color. For example, Keri puts yellow down as her favorite color, and together with Geoff, they evolve her character's Word Web thusly: yellow-sun-beach-swimming-sunburn-lotion, yellow-bright-happy-sunglasses, yellow-cornfield-farming-countryside, and yellow-cowardice-scared. From this Keri and Geoff work out her character's Traits as happy (Self), works in a pharmacy (Work), grew up on farm (Self), and likes sunbathing (Play). All right, it's not the best example, but it shows

the basic principle. In addition, a character possesses a Conflict, representing a difficulty for the forthcoming date. It can be as mundane as going through a messy divorce or as outré as having to baby-sit a leopard or being a hitman on the job.

Once created, the players are ready to undertake the first date. Each date consists of several turns, with a turn representing one scene and lasting as long as it takes to play out a particular set of notable events during that date. Besides playing their characters, the players undertake two different roles during a turn before swapping for the next turn. One is the Active Player; this person sets the scene, establishes the time of the date, and makes all dice rolls, primarily Attraction Rolls. The other is the Guide, who -- besides representing his own character -- holds all of the dice, gives feedback to the Active Player, and awards all dice used in Attraction Rolls. The Guide is also free to ask the Active Player for more details, to encourage him to roleplay, and even make suggestions that the Active Player can choose to incorporate into his narration.

Dice rolls are made throughout a turn, and consist of more than the Attraction Roll, though these are the game's mechanical heart. Initially, only one die is rolled in an Attraction Roll, this equal to the potential couple's starting Attraction Level of one. The aim here is to roll enough successes (one success being a throw of five or six) to raise the Attraction Level for the next. Fortunately, the Active Player can be awarded more dice by the Guide under certain circumstances and at his whim. Bonus Dice are awarded, up to three per turn, when the Active Player involves the traits of either character in his narration, has his character be nice to that of the Guide's, narrates well, or accepts a Guide's suggestion. Bonus Dice are rolled with the Attraction Roll, and any Bonus Dice that do not roll successes become Re-Roll Dice. They are awarded for the exactly the same reasons as Bonus Dice, except that where Bonus Dice are awarded for adding favorable elements to the story, Re-Roll Dice are given out when the Active Player brings negative complications into it. Conflict Dice are a singular award of three dice for involving a character's Conflict in the story. These are rolled immediately, but failures do not become Re-Rolls. Finally, Compatibly Dice are a two dice award gained once per turn when both the Active Player and the Guide jointly narrate a shared Trait.

So what do you with what seems like a lot of dice rolls? All of the successes count within a turn. Three successes are enough to increase the couple's Attraction Level by one, and thus the number of dice available on the next date. The Active Player is also required to explain why the two characters are more attracted to each other in terms of the story told so far. With four successes a single Compatibility can be created, a shared Trait that can figure in a later date and grant Compatibly Dice.

A turn ends when the Attraction Level has been raised, a new Compatibility has been created, all possible dice have been awarded and thrown, or the Active Player decides to end it. The roles then reverse. Should no successes have been rolled during a turn, then this also needs to be explained. Turns continue in this manner until it agreed that the date is over.

The same mechanics and narrative process are used for the second and third dates. After the third date has been played out, a final Attraction Roll is made with a bonus die gained for every Compatibility shared between the couple. Each success rolled here makes an Attraction Level permanent, and it is this that counts when the players take stock of their trio of dates. An Attraction Level of five achieved in this way, and five or more Compatibilities are enough to ensure that the newly formed relationship has a future.

Although the dice drive the game, they are very much fueled by player narration and interaction. Further successful dice rolls top up this narrative fuel reserve with increased Attraction Levels and Compatibilities, which give the Active Player more to draw from in his storytelling.

If the mechanics underlie and drive the narrative forward, imitating the filmic structure that **Breaking the Ice** draws from, they also emulate the genre and structure with the dice types. Most notably, the Re-Rolls represent the mishaps that can occur on a date, and the Conflict Dice bring in the character's problems.

Breaking the Ice is clearly written, pleasingly illustrated, and comes with running advice and examples, the former also covering the more mature aspects of the genre. Suggestions allow for multiple pairs to play, and using **Breaking the Ice** to play in ostensibly other genres and genres. Examples include *Star Wars, LadyHawke,* and *Crouching Tiger, Hidden Dragon.* These guidelines could certainly be applied to most RPGs, and **Breaking the Ice's** mechanics could

be employed to handle romance in such games. The final page of advice suggests how ***Breaking the Ice*** could be used as a method of exploring deeper issues.

Even though ***Breaking the Ice*** is designed to handle a single narrative path -- go on three dates and (hopefully) find love -- flexibility comes in how the path is followed, in the collaborative and cooperative process of narrating and creating the story of those dates. Of course, ***Breaking the Ice*** is unlikely to appeal to the gamer that prefers to "roll the dice and talk with his sword." Even in appealing to the more mature player, the game's genre and subject is a touchy one, if not full of potential potholes. For those that can handle its softer and more subtle subject matter (and that does not just include the ladies), ***Breaking the Ice*** is a disarmingly simple, clever little game.

--Matthew Pook

More Questions Than Answers

Loving Your FLGS to Death

by Heather Barnhorst

Sometimes, a person can love something so hard that he loves it to death -- as is often the case when gamers love their FLGS.

In *Call of the Mall*, Paco Underhill chronicles the rise and fall of the great suburban mall -- that mecca for both stay-at-home mothers and angst-ridden teenagers looking for a shopping sanctuary where they can get out from under their parents' gimlet gazes. Mr. Underhill discusses how malls came to be seen as "quasi-public" spaces that developed an accretion of usage; different groups used malls for different purposes. Consumers, charitable groups, and seniors looking for a safe place for their exercise regimen all used malls in ways not anticipated by their designers. Malls responded by, in some ways, being all things to all customers; the idea was that once a mom dropped off little Debbie for her dance demo that she might just head over to Starbucks for a cup of coffee. Yet, not all usages were entirely compatible and tensions between different user groups developed.

Malls as shopping juggernauts have fallen into disrepute as outdoor malls, pedestrian shopping centers and factory outlet stores have succeeded in loosening the American purse strings in their favor. But look around you -- the concept of the quasi-public space within commercial/retail space still thrives. Consumers value retail businesses for their own reasons which are often outside of the pure consumer experience. This idea may be particularly applicable to places that you and I both love -- book stores, coffee houses, and yes, the Favorite Local Game Store.

Consider the retailer: The retailer's goal should be the same as any other entrepreneur's; he wants to make money. Maybe he has a family to support; perhaps he wants to create a nest egg for when he retires; alternatively he is retired and he is living out his dream of being his own boss; then again he may simply want to try his hand at building a business from scratch. But the point is that he is a game retailer for both fun and profit. If there isn't any profit, there won't be much fun. He likes filthy lucre (I know, hush my mouth) and if he tells you any differently then he is either lying or he is about to learn some very nasty lessons in the realities of the world.

Fledgling retailers have told me that they are not in the business to make money. They want to create a place where gamers can come to play games and be around other gamers. They want to provide the kind of store they could never find and they are willing to suffer for their "art" to make it so. This is complete bunk. Me? I've loved games (as some of you may be aware) since my first *Candy Land* game. Game-playing and the art of creating something wonderfully social and interactive out of a sterile void are satisfying pursuits but I will arm-wrestle anyone to the death who tries to tell me that loving games and selling games are antithetical activities. Making money off of games should never be seen as a betrayal to the spirit of playing games. Every day, I experience the opportunity to take customers who want a game and pair them up with a game that they will enjoy. In my line of work it just doesn't get better than that, but I do defy anyone to tell me that I don't deserve a living wage, professional respect, and good benefits as a result of my hard work. I would even suggest that any retailer who disagrees with me is probably a retailer who either has a very large trust fund (also read as understanding and loving spouse) or who will be out of business in only a few years -- not only out of business but probably a much-embittered unemployed retailer as well.

What a terrible thought --- your FLGS goes out of business because the owner refuses to treat his store like a business. Let's pray that this self-same proprietor wakes up some day (and some of them do), looks around him, and says to his long-suffering but darling wife (or husband, as the case may be), "Honey, I do believe that I have been lying to you and to myself -- we cannot live on air and idealism." This retailer suddenly discovers his brain and decides to run his business like it *is* a business and very unlike the artist's garret that he had previously stated was his appropriate and acceptable domicile.

Joyfully enough, the idea of making money off of a business dovetails nicely with one of the FLGS's important users -

- the Consumer. Oh, blessed be the consumer. He visits the FLGS to buy games and sees no conflict of interest in that the retailer desires to sell him those same games. He has no expectation that, and would be quite shocked if, as he walked up to the front counter to make his purchase of precious games, he heard a strength-sapped voice call from the office, "I'll be right up as soon as I finish my bowl of gruel, sir. No, no I am quite all right, just a trifle lightheaded from hunger . . . yet how can I help but be happy here when I am surrounded by all these wonderful games?" Retailer and consumer -- truly a symbiotic relationship. One has what the other is willing to pay for.

But the retailer (now reformed of his burdensome idealism) loathes the Locust, that pseudo-consumer who treats the FLGS as a showroom for online discounters; a shameful practice that none of you, my lovelies, would ever engage in. The Locust trods our sacred aisles riffling through books with Cheetos-stained fingers, tossing miniatures blisters about with disdain, and asking difficult questions which require intensive research and then rewards the retailer by carrying only one small item to the counter.

"The MSRP is $14.95. I can get it online for only $7.00. What do you say?"

"But that is less than what I paid for it," moans the hapless retailer.

"What? You wish to make money from selling games, my good man? Outrageous."

And if the Reformed Retailer is unwary and he feels the prick of the Locust's scorn, he might find himself bowing low (scraping his forehead in the process). "You are, of course, correct." He wrings his hands. "$7.00 is a completely reasonable price even though it means I will not be able to feed my 12 wee ones this week. But what is that compared to suffering for our art?"

The Locust is satisfied. He has made a deal and once again proven his shopping virility. Except that next time he visits his FLGS, the windows are boarded over, dust lies on empty racks, tumbleweeds bounce across the cracked paving of the parking lot and, if he listens carefully, he might hear Sergio Leone spaghetti western music whistling in the distance. When he asks around, he is told that the retailer went into the poor house with his darling wife and 12 wee ones following close behind.

Locusts are few and far between. Mostly retailers see Consumers and Gamers. Gamers demand that a FLGS offer not just a game room but a whole schedule of events, tournaments, artist signings, and demonstrations to go along with that play space. In this, they are often joined by game publishers who are also undeniable users of the retail space though they may never set foot in your FLGS -- whose product do you really see sitting on those shelves? So speaking of publishers, I can and will digress.

The way a retailer does things is that, in general, he figures out which product lines should sell and then he displays them in an inviting manner (called merchandising) so that you, the customer, will feel an irresistible urge to buy, buy, buy. Quite honestly, while a retailer will confess to favoring certain games, he doesn't really care which items out of the bajillion that he displays you decide to purchase. He makes his money off of any them. But publishers care -- they care very deeply -- which item sells, because they only get their money if the retailer specifically buys and then sells (to you) their games. Each publisher feels that every retailer should hand-sell each of their games in a loving and earnest manner, placing them in the very best spot for display in the store, and they can become quite irate if the retailer does not go far and beyond the call of duty. They are often full of sometimes helpful ideas on the proper methods to be used to sell these games, including devoting X amount of play space to tournaments promoting their games. Once more than two or five or five hundred publishers all demand this extra effort from our favorite retailer, he can become just a bit frazzled. Wizards of the Coast has been known to make play space a requirement before the company will give "premier" status to a store. Premier status is needed if your FLGS wants to buy direct from Wizards of the Coast at slightly more favorable terms than it can obtain through a game distributor. Gamers and publishers are in one accord -- give us your play space and we will make it ours.

Back to our gamers. Here is where most game shops do define themselves. Not all gamers find it conducive to play games at their FLGS. Many of them are older with families and with a high degree of disposable income. Their venues of choice for play time are often their own homes or more upscale spaces, such as a coffee house or a book store. Very often the group of gamers who uses the game room is comprised of the ones escaping a roommate or a parental

situation, or where the FLGS can provide special tables, terrain or equipment that promotes play within the store. Once again, when the relationship is working, both the retailer and the Gamer are quite happy. But there are so many ways in which it can go wrong -- mainly when gamers stop buying product at the store but continue to feel entitled to playing at the store. Then the retailer is simply providing free play space to loiterers. That's a harsh statement, I know, but also apt.

Loiterers can become a financial disaster for most retailers. They love to tell their friends where they can find the best deals for games by buying online. They have no issues with tearing down the retailer or insulting their FLGS as they are using it. Somewhere along the way, they decided that their FLGS was a quasi-public space and they feel entitled to it.

"But I am an Alpha Gamer, my dear sir. If you dare to impose any rules upon my conduct while I am in your establishment, I shall tell all my friends, of which I have many, not to patronize your business. And they shall tell their friends and their friends and their friends. You do not want to make me your enemy."

"But what does it matter if you tell your friends to play elsewhere? You are already telling them where to buy elsewhere."

If a Loiterer is left unchecked, he can do great damage to a FLGS, in essence harming the store that he started out loving.

Nearly all of these users -- Consumer, publisher, gamer -- can live in happy cooperation if they understand that the retailer needs to run their FLGS as a business and that they need to share. There is no entitlement, no quasi-public space but simply one person running a business profitably by trying to make as many of his customers happy as possible. The retailer needs to make money if the FLGS is to stay open for many years.

So when you love your FLGS just don't love it to death. Learn to share . . . and while you are at it, buy a game once in a while.

Murphy's Rules

Pyramid Review

Relationship Tightrope

Published by Uberplay

Designed by Reiner Knizia

Art by Alvin Madden

61 cards (nine relationship, two instant forgiveness, 50 bidding), 50 balancing sticks (25 each of blue and pink), & rulebook; three to five players, full-color, boxed; $19.95

Ah, romance. Flowery. Delightful. Fulfilling. A lethal minefield. Make one wrong move and you find yourself listening to Bob Dylan albums and gorging yourself on junk food. The trick lies in making sure you're no more or less annoying than your partner in learning to navigate the *Relationship Tightrope.*

The object of the game is to have the most balanced relationship by the end of the game, represented by the lowest score.

The game is played over as many rounds as there are players, so for example with three players there are three rounds. (It would seem poetic that a game like this would be played with partners or couples, but it's for three to five players, so that torpedoes that theory.) Everyone is dealt nine bidding cards (valued one through 50), and the relationship deck is placed in the middle of the table, along with a pile of pink and blue balancing sticks.

The dealer goes first, and flips over the top relationship card. The upper half of each has the man's sin in blue; at the bottom, the woman's transgression appears in pink. He plays golf or forgets an anniversary, and she can't kill a spider or bother to tell him her mother's coming to visit. Their offenses are matched (well, maybe they aren't, but you can take that up with Reiner Knizia) so that both have the same point value. There are two instant forgiveness cards, one for him and one for her, worth zero points (the gesture is so nice, the giver can do no wrong that turn). When drawn, they are paired up with a regular relationship card. For example, if his forgiveness card is pulled it's used to cover the upper half of the normal card, making his half of the card worth zero while hers remains at the printed value.

The dealer plays a bid card face up, then the player on his left, and so on (giving the last player a distinct advantage). Whoever bids the most gets the card's value in blue balancing sticks. The low bid gets pink sticks. Anyone in the middle gets nothing. Subsequently that high bidder flips the next relationship card and makes the first offer. As you get balancing sticks, you discard pairs. If you got three blue sticks from the last auction and you get the low score this time on the five card, three of your pink sticks match up with the three blues and are discarded, leaving you with two pink sticks. After nine rounds, your unpaired sticks are tallied and written down.

Now the player to the left of the original dealer shuffles and deals the cards anew, and those nine cards are played. If you manage a score of zero at the end of a later round, you may erase your highest score from a previous round. When everyone's had a turn as dealer, all the scores are tallied and the lowest total shows you know how best to balance your loving relationship. And since variety adds spice to anything, they also suggest playing only with those cards that equate to the number of players times nine (i.e., with three players, play with bid cards one through 27), or keeping the bids secret to level the playing field between those who would otherwise reveal their cards first or last.

While the cards are good material, and the illustrations they sport show both talent and an understanding of male/female relationships, they do feel oddly as though you've got two cards in your hand. (You'll find yourself rubbing them between thumb and forefinger to assure yourself you haven't drawn too many.) And according to rules

set down by our forefathers, the sticks are exactly that -- pieces of wood, fit for balancing relationships or starting romantic fires.

In an effort to distinguish themselves from other offerings in the market, trick-taking games have a tendency to get awfully cute with their mechanics, but this usually means more to think about and not a more entertaining game. *Relationship Tightrope* has the interconnected, well . . . *relationships* among its component processes to make it an absorbing idea, but it's simple enough to produce an approachable pastime. You never feel at the mercy of random draws and plays, but start -- and remain -- in control of your game.

Uberplay's rules are the good kind -- you'll read them through once, check them as you play your first round, and then never look at them again. Players are challenged by their opponents, not their rules memorization (though if you can keep track of what everyone has played, more power to you). Play is casual enough that you can keep up a constant stream of conversation with your fellow romantics and get up to refill everyone's drinks without tripping yourself up. And with harmony like that, you'll fall in love all over again . . . with gaming, anyway.

--Andy Vetromile

'Til Death Do Us Part . . . Now Define "Death"

for *GURPS*

by Eric Funk

"I wonder what it's like to be inside your head, behind your face."
--*Lost in Space* theme

Jack Farthington was a promising young magical researcher specializing in illusion and far-sensing. He grew up in the city, and has always been fascinated by the mechanics of magic, even to the point of learning the basics of Thaumatology through books in his local library. Being a bookworm, his social skills are lacking. He made few professional connections while he was a student, and was later surprised to learn how many friends he had made.

Carla was a mage of minor power who likes people and animals. Her family lives in the suburbs, long-time practitioners of weather-harnessing nature magic. She is not that interested in the inner workings of magic, but studies its effects on society. At college, she affirmed her disinterest in her family's traditional college, and instead followed her dreams. This, too, was a bit unrealistic, but it all changed one day.

They met in college, sharing hobbies and a few classes. Soon they discovered themselves taking elective classes in each other's majors. Finally, they realized they were in love. After graduating from basic studies, they were married, and life continued. Together, they played musical instruments, performed research, and played roleplaying games.

It all changed with an experiment gone wrong. During extracurricular studies between school years, a nearby lab's project went out of control and caused a chain reaction. When Carla regained consciousness in a hospital, she was shocked to learn that when the smoke had cleared, Jack was gone! His body was not among rubble. Their colleagues were stumped by his disappearance. Even mediums were unable to contact his spirit in the beyond. After a time, Carla was contemplating suicide from heartbreak. Just at that moment, Jack appeared to her, explaining that he is somehow trapped in her mind.

It seems that Jack is now living in her head. He can use magic spells as per normal rules, and those he knows at level 20 or higher can be activated instantly. In low-mana zones, Jack cannot maintain the Phantom for long, but can use lesser illusions. In a No Mana Zone, Jack is almost completely isolated, and if not allowed a time-share of the body (likely in a private area), will soon become paranoid and introverted. They are currently seeking a temporary fix with a combination Soul Jar plus Golem (perhaps using a variant of Simulacrum or Doppelganger). Jack uses Wizard Eye and Phantom to create an image that can interact. While he normally uses her sensory input, he can choose not to use all the senses if, for instance, if she enters a perfume shop.

Jack can help in any situation where it helps being a hologram -- no life signs, body heat, breathing, weight, or the like. Since his image is not technically a person, it will not set off most traps. He is also handy to have around for helping in hazardous areas -- he is essentially a hologram (albeit with DR10 to 15, DX 20, ST 20 or 40; see p. M97 and also Spirit Hologram, p. TM49). That level of DR makes him immune to ordinary flame (1d-1, see p. B433), and his DR can be even higher if the Phantom spell is cast Ceremonially. Essentially, any adventure where one could benefit from a sometimes-insubstantial ghost to watch one's back, listen to conversations after one leaves the room, and so on. At night, Carla and the body can sleep while Jack reads using magic.

Adventure Seeds

Revenge of The Exorcist

Carla comes to the party and needs assistance. A voodoo shaman is trying to "help" her by exorcising the spirit that is

"haunting" her: Jack. The heroes must confront the shaman and convince him that the spirit is not malignant. (Perhaps Carla's family hired him . . .)

For added spice:

- What if, after the heroes have gotten this straightened out, someone independently starts wreaking havoc with illusions . . . much to Jack's detriment.
- Alternately, the party is first hired to get rid of Jack, and then discover he is benign. They are only told that he is a ghost, a stalker pretending to be him, or something else.
- Combining these two complications, what if both occur and the adventurers must sort out the confusion of a rampant spectre that *looks* like Jack. The simulation might be such that even Carla can't visually distinguish the illusions apart.

The Show Mustn't Go On

While "teaching a brute a lesson," Jack impresses a noble. Although Jack can interact in courtly situations, the illusion cannot be relied upon to shake hands or maintain other physical contact, so the heroes must come along. This is a good opportunity for them to climb the social ladder.

For added spice:

- The "brute" was a popular sports competitor who has been dishonored. The heroes are needed to help take his place and protect everybody from the poor sport.
- Jack and Carla are entertainers on the side using *semi-solid* illusions. They need the money to help someone, but now the illusion can't go on.

Letting Go

A visiting researcher has been studying Carla and Jack, for reasons they aren't entirely sure about. Recently, the couple has had an ever-growing suspicion that he is hiding something. They are unable to make progress, so they turn to the adventurers to determine what is going on.

For added spice:

- The heroes discover that the researcher believes he may have a sure-fire cure, but he will not release it; Carla and Jack are too fascinating a case, and he doesn't want to lose the opportunity to study the situation some more. (In this case, the researcher believes it is easier to undo that recreate.)
- Although the researcher seems willing to help separate Jack and Carla, when the time approaches to undo the problem he holds out, insisting they do "one last job" for him which requires their powers . . .

A World of Good

The research shows that Jack's body *does* still exist, but in another world/time. With this option, the opportunity exists to have a disturbing complication: In this alternate dimension, both may be in *his* body. They are currently studying this phenomenon with the goal of moving completely to either location.

The PCs are hired to find a certain spell ingredient/formula/item that will help separate Jack or rematerialize his body. This could be a MacGuffin to send the PCs to another dimension or world, or to travel to an unfriendly location. It might involve a trip involving a magic-dead area, through which the couple would be reluctant to travel.

Variation: Magic School Adventures

As presented, the characters are low-level graduate students with some connections and skills. To make them

beginning students in a moderate power game, just remove half their skills and spells. On the flip side, they could easily become teachers with the addition of some protection spells!

Carla Farthington (née Alstair)   125 points

Description: Human female, 5'9", ~160 lbs, mid-20s, shoulder-length strawberry blonde hair.

ST 9 [-10]; *IQ* 12 [40]; *DX* 10 [0]; *HT* 11 [10].

Damage 1d-2 thr 1d-1 sw; BL 16; HP 9
Will 14 [10]; Per 10 [-10]; FP 14 [9]
Speed 5.25; Move 5; Dodge 8.

Advantages: Ally (Jack, Constantly)[20]; Animal Empathy [5]; Attractive [5]; Charisma +1 [5]; Honest Face [1]; Magery 2 [25]; Pitiable [5].

Disadvantages: Code of Honor (Scientist) [-5]; Dependant (Jack, Loved One, Constantly) [-8]; Duty (School, Always) [-15]; Obsession (Be bodily reunited with Jack) (12) [-10]; Pacifism (Cannot Harm Innocents) [-10]; Reputation (-2, "split personality," Small Class, 7) [-1]; Sense of Duty (Family, friends) [-5]; Xenophilia (12) [-10].

Quirks: Collects Illusion-scapes with scenes from far-away places; likes to draw; dislikes places with less than Normal Mana; dreamer

Skills: Administration-11 (IQ-1 A) [1]; Area Knowledge (City)-12 (IQ E) [1]; Connoisseur (Magic)-11 (IQ-1 A) [1]; Current Affairs (Pop Culture)-12 (IQ E) [1]; Diplomacy-12 (IQ*,** H) [1]; Dreaming-12 (Will-2 H) [1]; First Aid-12 (IQ E) [1]; Hazardous Materials (Magic)-11 (IQ-1 A) [1]; Hiking-9 (HT-1 A) [1]; Hobby Skill (Games, various)-12 (IQ E) [1]; Lip Reading-11 (Per+1 A) [4]; Literature-10 (IQ-2 H) [1]; Musical Instrument (Flute)-11 (IQ-2 H) [1]; Naturalist-10 (IQ-2 H) [1]; Philosophy (Local Mage Guild)-10 (IQ-2 H) [1]; Professional Skill (Research Mage)-12 (IQ A) [2]; Public Speaking-13 (IQ+1*,** A) [1]; Research-12 (IQ A) [2]; Savoir-Faire-14 (IQ+2*,** E) [1]; Sociology (Magical Influence)-12/10 (IQ-1 H) [2]; Staff-9 (DX-1 A) [1]; Swimming-10 (DX E) [1]; Teaching-15 (IQ*,** A) [2]; Thaumatology-12 (IQ*** V) [4]; Writing-11 (IQ A) [1].

* Includes +1 for Appearance
** Includes +1 for Charisma
*** Includes +2 for Magery

Note: +2 from Bless not included in skills or spells.)

Spells:

Specific: Major Healing-13 (V) [4]; Recover Energy-15 [4].

Generic (-12 [1] each): Analyze Magic; Apportation; Aura; Beast Soother; Beast Speech; Colors; Copy; Dancing Object; Detect Magic; Dye; Find Weakness; Identify Spell; Lend Energy; Lend Vitality; Light; Master; Minor Healing; Musical Scribe; Recover Energy; Restore; Scribe; Seek Magic; Sound; Stop Bleeding; Voice; WallWalk.

Jack Farthington   125 points

Typical Appearance: human male, ht 5'11, wt 170 lbs, age mid-20s, dark red hair (almost black) clean-shaven
Alternate Appearance: "familiar": black cat with white paws (white feathery wings optional).

ST 20 Phantom (*ST* 40 in parentheses); *DX* 20 Phantom; *IQ* 16 [120]; *DR* 10 (average, see Phantom, p. M97).

Will 14 [-10]; Per 12 [-20]; FP 14
Speed 5; Dodge 8; Move 5 (Illusion Speed).

BL 80 (320)

Max lift: 800 lbs (3,200 lbs)

Damage*:

Punch w/brass or shield bash: 2d (cr) C (4d (cr) C)
Large Cat 2d+1 (imp) C,1 (4d+5 (imp) C,1)
Broadsword 3d+3 (cut) C,1 (7d (cut) C,1)

* Requires a living creature to fail a contest, see p. M97.

Advantages: Ally (Carla, Constantly) [20]; Autotrance [1]; Combat Reflexes [15]; Deep Sleeper [1]; Magery 4 [45]; Serendipity 1 [15].

Disadvantages:

"Racial": Dependency (Rare: Carla, Constant) [-150].

"Personal": Dependant (Carla, Loved One, Constantly) [-8]; Duty (School, Always) [-5]; Pacifism (Cannot Harm Innocents) [-10]; Phobia (No Mana Zone, 12) [-10]; Quirks (Enjoys arm-wrestling brutes who poke fun at "wimpy" mages; enjoys reading; hates to see books damaged; overconfident; hates "human" maintenance) [-5]; Sense of Duty (Family, friends) [-5]; Xenophilia (9) [extra -5].

Skills: Acting-15 (IQ-1 A) [1]; Area Knowledge (City)-16 (IQ E) [1]; Artist (Illusion)-15 (IQ-1 H) [2]; Broadsword-19 (DX-1 A) [1]; Connoisseur (Magic)-15 (IQ-1 A) [1]; Current Affairs (Magical Research)-16 (IQ E) [1]; Disguise-15 (IQ-1 A) [1]; First Aid-16 (IQ E) [1]; Forensics (Magic)-14 (IQ-2 H) [1]; Hazardous Materials (Magic)-15 (IQ-1 A) [1]; Hobby Skill (Games, various)-16 (IQ E) [1]; Innate Attack-19 (DX-1 A) [1]; Lip Reading-13 (Per+1 A) [4]; Meditation-14 (Will-1 H) [4]; Musical Instrument (Flute)-14 (IQ-2 H) [1]; Philosophy (Local Magic Guild)-14 (IQ-2 H) [1]; Professional Skill (Research Mage)-15 (IQ-1 A) [1]; Research-17 (IQ+1 A) [4]; Shield-19 (DX-1 A) [1]; Staff-19 (DX A) [1]; Swimming-20 (DX E) [1]; Teaching-15 (IQ-1 A) [1]; Thaumatology-19 (IQ+3* V) [4]; Traps/TL-15 (IQ-1 A) [1]; Ventriloquism-15 (IQ-1 A) [1].

* Includes +4 for Magery

(+2 from Bless not included in skills or spells)

Note that DX use of skills can use Carla's DX of 10 or the Phantom's DX of 20 depending on whether he's using her body to perform the action or not.

Spells:

Specific: Far-Hearing-20 [4]; Phantom-20 (V) [8]; Recover Energy-20 [4]; Wizard Eye-20 [4].

Generic (-18 [1] each): Analyze Magic; Apportation; Bless; Complex Illusion; Detect Magic; Haste; Hinder; Hush; Identify Spell; Ignite Fire; Keen Hearing; Keen Vision; Lend Vitality; Light; Mage Sight; Mage-Stealth; Perfect Illusion; Recover Energy; Seek Earth; Silence; Simple Illusion; Sound; Stop Bleeding; Telecast; Teleport.

Equipment: They are currently renting a 100-sf Lab (see p. M211), and own a small variety of powerstones (at least 5 × 1pt, 2 × 2pt and one 3pt).

Variants

Evolution

This duo might serve as starting characters at 125 points each, with 25 more to expand (+37cp -12cp). Carla is a balanced character, but Jack is not. With real world exposure, the pair will increase Contacts, Perception, and Will quickly.

In Danger Again . . .

What if Jack can only manifest when Carla is in danger? She may begin to place herself in hazardous situations just to see him. In this scenario, she tags along with the PCs (or is hired for the same mission as them) and she seems to be On The Edge [-15*] (p. B146).

No One Here By That Name . . .

In a setting where Jack is legally dead, add Delusion ("Jack is Alive") [-10] to Carla, and the advantage Zeroed [10] to Jack. Even if he is "alive," he might be classified as a Second-Class Citizen, like one of the undead. In fact, he may even have difficulty proving that he *exists,* and is not the product of the overactive imagination of her obsession over a registered mage. In a secret magic/power campaign, they have little hope of proving his continuance. Only reversing the process could

Variant Settings

Horror

There is always the possibility that it is not Jack, but a parasite/symbiant (see *Pyramid* article ["Ashes of Her Ladyship"](#)) that is reading off her memories.

IOU/Supers

They can be a super team! She's the mage and he's the Brick . . .

Raising his level with the Phantom spell to 30, Jack can sustain a DR20, DX30, ST 60 Phantom indefinitely! (Who would suspect that Superman is actually mild-mannered Lois Lane?) In a pure IOU campaign, the student/teacher ideas may work well, although Mundanes may make dynamic illusions tricky to set up. Alternately, the presence of a seemingly black box or a flickering effect may allow it to pass as a holographic effect.

Transhuman Space

As a Shadow/Ghost, they are less likely to "suddenly" appear as an accident, but it is possible if Jake is thought dead and lost, and is brainpeeled by an ally while Carla is out of contact. It's not *that* unusual of a character, if one considers "shadow swapping" (See *Transhuman Space: Deep Beyond,* p. 88). Using Augmented Reality, he could actually have a "hologram" that appears to interact with people!

Space

This idea is similar to the ***Transhuman Space*** plot seed, but Jack uses holograph projectors to make appearances. If there is sufficient superscience, they might even be solid!

Spirits

Perhaps she (or his/her wedding ring) is the anchor (see "Anchor/Place of Power," pp. SPI 29,35). In this scenario, he is a different character with a separate Fatigue score. Her observance of his continuance is enough so he does not need to roll to stay on this plane. However, things could get very complicated if she were to be knocked unconscious for days . . .

Voodoo

Perhaps the entity now calling itself Jack only has his memories, or what she thinks are his memories . . . and can possess her, as per Spirit Warrior!

The Lovelorn Gaze Of Lady Lytton

A Tale of Cupid & Psycho

by Michael Anguiano

Lady Lytton is a creature of sublime beauty and exotic charms, who has bewitched the eye of every man in the kingdom. Her husband, Lord Lytton, is known to be a fierce warrior, but she nevertheless has her share of admiring courtiers as well as jealous would-be rivals. Indeed, rumors abound in the court that she has a courtly love who is devoted to her, body and soul. That someone would fall so deeply in love with her is not surprising, but that she would return the sentiment is the stuff of mythic romance. That lucky man is the envy of many, despite the danger of discovery by her husband.

The odd part is . . . it's you.

Hopefully, you'll figure it out before Lord Lytton does.

(This scenario is not meant as a stand-alone, but rather as an entangling background situation that can be integrated into almost any standing fantasy campaign, facilitating a variety of options for roleplaying, adventure, and humor. It only needs a male PC; Lady Lytton will supply the rest.)

Background Information

What Everybody Knows

The handsome and dashing Lord Raramund Otho Corvallis Lytton comes from a large and well-respected line of nobility -- the House of Corvallis -- which has provided him with a large measure of his wealth. However, his title, lands, and manorial estate were a grant from the king, in recognition of his great and invaluable service to the empire. Indeed, Lord Lytton is widely regarded as a hero, both for his military victories and for his personal adventures. In particular, his swordsmanship is known to be, quite literally, second to none.

Two years ago, the Marquessa Sasskia Cervenka arrived from her remote homeland with only her handmaiden Mariska, a coachful of luggage, and a trunk full of books in her native language. Two short days and one highly orchestrated ceremony later, she became the Lady Lytton, thereby cementing an alliance of interests between the powerful House of Corvallis and the distant Cervenka Dynasty. Lytton Manor, situated just outside the capitol city and a stone's throw from the palace, is thus a focal point of growing economic and political power.

Pity that no one really lives there. The sprawling estate is typically kept up by a few trusted servants and only rarely occupied by the Lady Lytton, with Lord Lytton an even rarer guest. An inveterate traveler, he spends the vast majority of his time abroad, usually engaged in one adventure or another. His visits home are few and short.

As a consequence of her husband's absence, Lady Lytton passes most of her days as a guest of the palace, where she has become a fixture at the royal court and a figure much admired, at least by the men. Her foreign blood, exotic looks, and curious ways have turned many a head. Her native language has a musical lilt to it, all the more so because nobody at court can speak it but she and her handmaiden. Even her incomplete grasp of the language is charming, probably because her accent is so cute. At least, that's what the men think.

The ladies of the court, and of high society in general, are somewhat less enthusiastic in their evaluation of her. She is scorned most jealously (if privately) and more than a few would delight to see her humbled and humiliated. Many slanderous rumors have been circulated about her, but she remains aloof from such things.

The Lady

Lady Sasskia Cervenka Lytton is like a new kitten: adorable, self-absorbed, and not very bright. She is astonishingly beautiful, especially in conjunction with her distinctly exotic looks, and has a natural grace. She is also very sweet-natured, with little of the arrogance that might be expected of one born with great beauty as well as great social advantage. However, she is still quite young and remains a bit immature, so that her world revolves around her . . . and she assumes that everyone else's does, too.

Lord Lytton is evidently not of the same opinion.

This has left Lady Lytton a very lonely woman. Her family and friends are far away, her husband is far away, and she has little real company except for Mariska. While Mariska has picked up the language quickly and has no difficulty communicating, Lady Lytton herself has become discouraged and makes little effort to improve her grasp of the language. Mariska has thus become the primary conduit through which she communicates with others.

Mariska, unfortunately, is enjoying the situation immensely. This has given her an opportunity to manipulate the woman to whom she has been a servant since their childhood. It has also given her an opportunity to line her own pockets at the expense of Lady Lytton's would-be suitors, as well as carry off a few discreet affairs of her own.

In her private moments, Lady Lytton reads. Her personal library is a trunk full of books in her native language, all of them "classical" tales of courtly romance and tragic love.

In short, Lady Lytton is ready to fall in love. More to the point, Lady Lytton is ready to fall into what she thinks is love.

Her Husband

Lord Raramond Lytton is the very picture of a dashing adventurer and chivalrous knight. His manners and bearing are impeccable, as befits a child of nobility. His humble and unassuming demeanor of *noblesse oblige* makes him an appealing popular figure. His tactical skills are considerable and he is a bold military leader, much admired by his men. His bravery and courage are beyond question. His swordsmanship is nothing short of legendary.

He is also as dense as a plank. Much of the problem is not just that he's clueless, but that he's clueless about being clueless.

His lack-of-clue has remained a well-kept secret. Initially, it was the efforts of his family to shield him from others and from possible ridicule, if only for the sake of protecting their own reputations. His pursuit of a military career made this more difficult, since the family could no longer closely regulate his contact with others, but this problem soon took care of itself because of the loyalty and admiration he inspires. Soon, his aides and associates found themselves shielding him from others and from possible ridicule.

Indeed, while some would grumble that his military victories are largely a matter of unbelievable luck, the rank-and-file under his command tolerate no bad-mouthing of their beloved leader, who had often risked his own life in personally leading an attack that others might consider foolhardy.

After leaving the military, Lord Lytton found himself drawn to adventures in foreign lands. During one such adventure, he came to the attention of his wife-to-be's family after a heroic battle in the snows of a high mountain pass. With only the barest assistance, Lord Lytton managed to defend a vulnerable peasant village while inflicting scores of casualties on the attacking horde of brigands. As usual. In this instance, however, the pass proved to be a key point in an intended invasion, which was effectively foiled by Lord Lytton's defense. The brigands were hired mercenaries who were to pave the way for a following army, which would have moved through in the springtime to flank the unprepared home forces. So through his bravery and swordsmanship (and, perhaps, unbelievable luck), Lord Lytton saved a kingdom and earned the admiration and attention of that land's most powerful noble house, the Cervenka Dynasty. The House of Corvallis was quickly contacted, a marriage was arranged, and the rest is recent

history.

Lord Lytton himself is rather indifferent to the whole thing. Fame, wealth, and the like are simply a byproduct of his love of adventure and travel.

It's not that he doesn't love his wife, he just doesn't really notice her. He tends to view her as simply one of the accoutrements of a gentleman's life: an estate, a military commission, a wife, etc. Of course, he would never be unfaithful to her because he is a man of honor and principle. Accordingly, should he discover that some blackguard has compromised his wife's honor and brought shame to the House of Corvallis, he would be forced to take most strenuous and appropriate action to redress the grievance.

In short, Lord Lytton would challenge her paramour to a duel.

To the death.

And Lord Lytton would win.

Her Lover

That would be you.

You caught the eye of Lady Lytton while you were briefly on the palace grounds some months ago, and she was quite impressed by your handsome looks and fearless demeanor. She also was rather flattered that you so carefully avoided meeting her eyes, which she took as a sign of your interest. What won her heart, though, was how you loved her despite the many risks, should Lord Lytton find out . . .

You lucky duck.

The Scenario

The Set-Up

The PCs are engaged by one of the ministers at court to recover some stolen goods. The minister explains that a woman on the palace household staff recently absconded with a number of items taken from royal guests. The suspected thief has traveled to the nearby residence of a bandit leader of great reputation, presumably to fence the stolen goods outside of the immediate jurisdiction. The guests are currently being stalled with a variety of lame excuses, so time and discretion are of the essence. Consequently, the minister has chosen to engage the heroes to recover the items, rather than send a contingent of the Royal Guard, which he explains would take more time and draw more attention. The minister will not give further explanations of his reasoning or of the incident, nor will he give an itemized list of the stolen goods. He insists that the PCs will be well-paid for their efforts and their discretion (with implicit penalties should they fail in either regard).

In truth, the minister doesn't really know what was stolen. He only knows that his own wife has stupidly engineered a scandal and he is desperate to head off the consequences. His wife arranged for some goods to be "stolen," which would be subsequently discovered in the bedchambers of Lady Lytton who, it would surely be assumed, was an unprincipled harlot. Apparently the items were then stolen, for real, from Lady Lytton's chambers by a young housemaid who subsequently fled the city. Upon further investigation, the minister has learned that the housemaid is a close relation to the nearby bandit leader, leading him to the conclusion that she had escaped to the relative safety of his stronghold.

(Actually, Mariska found the stolen items in Lady Lytton's chambers first and suspected what was up. Acting quickly, Mariska simply cornered the gullible maid and convinced her that if she didn't flee to her bandit cousin, she would be turned in as a thief and executed.)

The bandit leader's reputation is undeserved, as the heroes will learn. With only moderate difficulty, the adventurers defeat the bandit group and recover their booty, among which are a number of obviously valuable knickknacks, presumably stolen from the palace. Among these particular items are a lady's fan, superbly constructed of ivory and silk, decorated in gold thread with obscurely foreign designs. The fan is a quite distinct item, probably the most valuable of the stolen goods. Any party member with experience at court might recognize that it belongs to Lady Lytton.

(Mariska had thrown Lady Lytton's fan in with the rest of the "stolen" goods, knowing that Lady Lytton would be heartbroken by the loss of this prized memento.)

The bandits are only a moderate threat and the heroes should succeed in defeating them and recovering their loot.

The PCs have three options at this point:

1. keep all the booty and hoof it, soon to be chased across the countryside by large companies of Royal Guard;
2. return all of the various knickknacks to the minister, who will pay the heroes very handsomely and then have everything returned as diplomatically as possible;
3. return only some of the various knickknacks to the minister, who will pay the heroes very handsomely and then have everything returned as diplomatically as possible.

If the party chooses to return some or all of the items, Lady Lytton will see them at some point when they visit the palace to meet with the minister. If the heroes choose to return Lady Lytton's fan, she will inadvertently witness them handing it over. If they keep the fan, she will see them from a distance and Mariska will take to opportunity to point one of the heroes out as the one responsible for stealing the fan. Lady Lytton will immediately assume that the fan was taken and kept out of romantic longing.

At this point, Lady Lytton will become smitten with whichever PC most deserves the punishment.

And They're Off!

From here, the GM can use Lady Lytton, Mariska, and the royal court as springboards for a variety of scenarios.

Most obviously, the PCs can become regular employees of the minister who initially hired them, who would find them a useful alternative to official actions of the Royal Guard. This could involve aboveboard jobs like finding stolen goods or cracking down on the Thieves' Guild. Or, less openly, the minister could have them steal documents from court rivals, raid the caravans of uncooperative business interests, or discreetly handle a potentially scandalous situation involving a royal nephew.

Alternately, any adventurer with significant social standing can become a fixture at the royal court, where the GM can use courtly politics for any number of diplomacy scenarios.

Lastly, the PCs could simply pass before the palace on a regular basis on the course of their adventures.

In any case, the eyes of the Lady Lytton will be on her beloved . . . whichever hero that happens to be. Others at court will begin to notice that Lady Lytton is more distracted than usual and soon the speculation will begin. Soon, the court will be gossiping that Lady Lytton is in the throes of a courtly romance, surely to have a tragic end once her husband finds out . . .

Mariska, of course, will manipulate the speculation for her own amusement, but initially she has no idea with whom Lady Lytton is smitten.

This should play out over time. Lady Lytton should be merely a background figure for at least an adventure or two before the effects of her infatuation would be felt at court. After that point, the GM can have the speculation become widespread, so the targeted PC is aware of it but nobody yet has an idea who her beloved is.

On the other hand, the GM could have the hero be completely unaware of the speculation, even as the court (with Mariska's help) begins to see the PC as her chivalric suitor; consequently, he finds himself the object of increasing attention from a larger and larger circle of influential people (all of whom think they have something to gain from the situation). Of course, other would-be suitors of the Lady Lytton will take a dim view of the hero's reputed intentions, leading to seemingly unmotivated confrontations. Conversely, other would-be rivals of Lady Lytton would see opportunities as well, leading to seemingly unmotivated seductions . . .

Either way, this situation can be stretched out for quite some time. Eventually, however, someone will act on this unresolved infatuation. Hopefully, the heroes will act to resolve the situation. An ethical PC will try to clear up the confusion, which will only increase the speculation and certainly won't convince Lady Lytton (who will see denials as affirmations). An unscrupulous PC will try to seduce Lady Lytton, which will lead to full-blown obsession on her part, with unfortunate consequences for everyone. A slightly more cunning but still unscrupulous adventurer will try to seduce Mariska, who gains much from manipulating the speculation but will gain nothing if the speculation is confirmed in one direction or the other, and so who will aid and abet the PC in any endeavor that will maintain her status quo.

If the PCs don't act to resolve this, then it is up to the GM to bring on the endgame: Lord Lytton will return home.

Finishing It

With Lord Lytton's return, the heroes now face a suddenly narrowed field of options:

1. run;
2. act casual; or
3. stand and fight.

Simply explaining the truth to Lord Lytton himself is not an option, because they simply won't be able to get through the protective circle of friends and advisors who shield him from common contact.

If the heroes run, then the speculation and gossip will soon reach those who protect Lord Lytton from himself. However, Lord Lytton will hear little and understand less, until Lady Lytton has a fainting spell at court. She will then be bedridden, stricken ill that her beloved had to flee. Lord Lytton will, with help, put two and two together. He will then pursue the adventurers, accompanied by several trusted family retainers and closely followed by a couple dozen noblemen who are making bets on how quickly the duel will end (since they have no doubt about the outcome). The GM must determine what sort of fast-talk, begging, or fake death would be sufficient to placate Lord Lytton, who will catch up to the alleged beloved PC sooner or later. Of course, that pursuit could be several adventures as well.

If the heroes simply act casual, then the speculation and gossip will soon reach those who protect Lord Lytton from himself. The PCs will then find themselves hired at an outrageously high wage for an immediate job that requires them to leave the country. The employer, of course, will be Lord Lytton's family. In their absence, Lady Lytton will pine away for a while but, eventually, she recovers to love again. This option allows the heroes to escape intact, while also giving the GM an opportunity to completely change campaign settings.

If they decide to stand and fight, they must decide if they will face Lord Lytton with honor. If so, then Lord Lytton will only challenge the PC with whom the Lady Lytton had become smitten. Lady Lytton, of course, will be overcome with tearful declarations of love. Lord Lytton and the PC will cross swords at dawn, and the hero will be stone dead at dawn plus one minute. If the other PCs are able to raise or resurrect their dead comrade, they should remove the body to a safe location first; Lord Lytton hates to have to kill someone twice, so he'd kill the rest of them as well to make sure. Lady Lytton, of course, will pine away for a while but, eventually, she recovers to love again.

If the PCs decide to fight Lord Lytton without honor, then they must decide whether to conduct an open assault or attempt an assassination. Either way, they fail. Any heroes who participated in the attack are severely wounded and taken into custody by the Royal Guard. Once in jail, the PCs are able to escape with some quiet assistance from an unidentified outside party (Mariska). Once out of jail, the PCs can try to flee the countryside. Lord Lytton, however,

will not join the pursuit, because now the heroes are enemies of the state and rightfully belong to the king's justice. To this end, several companies of Royal Guard will pursue the party until they are safely out of the country. Nevertheless, the heroes are advised to avoid crossing paths with Lord Lytton in the future.

(Scavenger) Hunting For Love

Welcome to our eleventy-jillionth Valentine's Day issue devoted to loooooove. This is my first post-marriage Valentine's Day, and I gotta say that it's pretty different approaching this whole holiday when you're wading in wedded bliss.

Unfortunately, this column might be a bit more devoid of gamerly-type information than normal, since we're about two hours from going out of town to visit my parents (the first post-wedding visit for my side of the family). And, frankly, I'm not sure I have much more inspiration for the world of Eros this time around that hasn't been covered in the half-dozen previous years. So, in a kind of "real world" trial, I thought I'd present what I did for my sweetie, as a kind of "Valentine's Day for Gamers."

The day started with a home-printed card for her in a handmade envelope on the door:

I Heart You!

(I shamelessly stole this idea from another site, but the resolution on their card wasn't high enough so I needed to pop in my own copy of *Indiana Jones and the Truth About Cats & Dogs* and work some computer software mojo.)

There was some mushy stuff inside, concluding with the heartfelt sentiment, "If you ever have the need to rip out any organs to further your dark goals, I'm sure it'll only be because you love me."

Technically, I get a bit ahead of myself. See, the previous day -- February 13th -- was our six-month anniversary (or the 0.05%-of-a-millennium anniversary, as I like to think of it). So I was trying to come up with an idea that would keep her occupied and thinking warm-and-fuzzy thoughts for me for the next 24 hours.

Unfortunately, it didn't work.

See, my idea was to send her a series of Mystery E-Mails, numbered #0 through #9, throughout the course of her day on the 13th. The #0 e-mail was designed to show her that the other nine e-mails were attached together tic-tac-toe style, creating a Sudoku grid. Unfortunately, since this was the first clue of the scavenger hunt, it was kind of important for it to be interpreted (more or less) correctly, rather than languishing in an inbox.

Anyway, never one to be undaunted by the grinning spectre of failure, I went ahead and printed out the fully assembled Sudoku puzzle for her to have when she got home.

Unfortunately, she didn't seem in the mood to try the puzzle at that time. "Will this give me something to do on the plane trip in a few days . . ." Since the resultant clue of the Sudoku puzzle -- that the next clue was hidden in the VCR -- wouldn't make a whole lot of sense at 20,000 feet, I decided to lay all my cards on the table. I told her that this was the first piece of a scavenger hunt, and that she was free to complete it whenever she wanted (or not to do it at all), but that the Valentine's festivities I'd planned were pretty much tied to the scavenger hunt. It was at this point that she seemed to get it, and proceeded to solve the puzzle. (Whether she was genuinely interested at this point, or merely did it to humor her husband, is a matter of debate among top scientists at MIT.) The Sudoku puzzle was a standard one swiped . . . errr, *adapted* from one found online from PrintSudoku.com. See, the trick with all scavenger hunts is that there needs to be a way of getting a clue that leads to the next clue; ideally, in the case of puzzles, it's best if the puzzle needs to be wholly (or at least mostly) completed before the next clue can be gleaned. Unfortunately, my beta-tester (a.k.a. The Missus) indicates that she was able to solve at least the first part of the Sudoku's revelation before finishing the rest of the puzzle. However, she was good enough to finish the puzzle before darting off to the next clue.

Anyway, the puzzle I adapted -- PDF page 4 (print page 2) of the Easy Book (solutions in a separate book) -- happened to have a the center row and the center column incomplete, making those ideal spots to hide clues. The solution of a standard Sudoku puzzle will be such that all numbers from one to nine will be used exactly once in any given nine-box row or column. As such, it's trivial to hide a message in there, by merely offering a key:

1 = A
2 = V
3 = G
4 = N
...
etc.

The interesting challenge here, then, is to come up with a nine-letter phrase where none of the letters repeat. (Technically the non-repetition isn't a requirement, since I could make a key where numbers represent the same letter. However, I considered a challenge to do so, since then -- in theory -- the Sudoku could be represented entirely by letters.)

In this case I colored the blank horizontal row blue and the vertical row red. I offered a key for the blue one with the puzzle; when completed, it spelled out:

GAZEINVCR

Or, "Gaze in VCR." (Yes, gaze isn't the most obvious word. As an exercise for the home reader, I challenge you to come up with a nine-letter phrase that indicates the person should look in the VCR for the next clue.)

Inside the slot of the used-once-in-a-blue-moon VCR was a cryptogram (no doubt a favorite puzzle type of many long-time readers), which yielded a riddle. The riddle I stole mercilessly from this site:

"Here on earth it is true, yesterday is always before today; but there is a place where yesterday always follows today. Where?

In a dictionary."

(I had the answer -- "in a dictionary" -- in mind when I went searching for the riddle. Interestingly, Googling for "riddle" and "in a dictionary" popped up valid possibilities almost immediately.)

The inimitable Nikki didn't have much experience with cryptograms, but she came through with flying colors on this one, and got the next clue right away.

Since she'd been working hard for the past couple of puzzles, I designed this step as a "gimmie"; I had a key marked:

RED
1 = A
2 = H
3 = U
4 = I
...
etc.

Nikki immediately recognized that she was to go *back* to the Sudoku puzzle she solved and use this new key on the old puzzle -- this time applying it to the red column.

This yielded the letter sequence "WITHMULAN," and soon she was popping open the *Mulan* DVD case.

Inside there was the (unbeknownst to her) final puzzle: a word search (one of her favorites) with the words needed to search taken from "trivia" questions about us she'd need to fill in ("The three states we took mini-honeymoons in were _____ (8), _____ (9), and _____ (13).") This 15×15 word search was generated using the free site online at http://puzzlemaker.school.discovery.com/WordSearchSetupForm.html.

The leftover letters spelled out a sentence that led her to a tin canister, a present from my parents which formerly held chocolate but had since succumbed to a mysterious balding looter, whom I am *very* close to positively identifying. And that canister contained . . . her present.

Really, it's a lot of work for her to get her nine-pack of Godzilla movies (the gift that keeps on giving fiery destruction). But she seemed happy with it; curiously, it took her about as long to solve it as it did for me to make it -- about two hours. And for a few of the puzzles I was able to be snuggled up with the Missus, watching her figure 'em out.

So, now that this narcissistic streak is almost over, what have I learned that I can steal and apply to the gaming world?

- If it's crucial for the PCs to pick up a clue for the adventure to continue, the clue needs to be *really* obvious.
- Although it's possible to reinvent the wheel, it's usually a lot easier to steal someone else's work (when it's for non-professional reasons, of course . . . otherwise that's not research; it's plagiarism).
- For that matter, shortcuts are fine in most cases. As a more extreme example, for some cryptograms I've simply typed the words as normal and then switched the font to something symbolic (such as one of the Wingdings fonts).
- One of the interesting aspects of puzzle-based scavenger hunts (especially the types you might see in an RPG) is that it's fun to watch the participant squirm and sort out the answers. It's useful, too, since you can see where the players are having the most fun.

Beyond that, scavenger hunts are an interesting type of game that can be a fun diversion, whether for the one you love, for friends, or for a gaming group. Create the dots, let the participants connect them, and everyone will hopefully have a good time.

--Steven Marsh

The Bridal Suite

by Elizabeth McCoy

This location could have been created by twisted magics, cunning robotics, or fiendish ultra-technology. It might be a common problem, or a one-of-a-kind annoyance -- or horror.

Appearance

The Bridal Suite, by default, is a small dwelling -- it could seem a mobile home, or a "hobbit hole" construction, set partly into a hillside. It has a bathroom and bedroom, and possibly a tiny kitchen; a larger one may have a pair of bedrooms. At first look, there is little to make it obviously expensive or a threat. (It would also be perfectly feasible to make an entire mansion, hidden asteroid base, or "bigger on the inside" dimension into a Bridal Suite.)

Construction

A Bridal Suite is not flimsy. That would defeat its purpose. Even the most mundane, robotic one has steel behind the cheap wallpaper. Setting them into rock, or placing them in hard-to-reach locations, is also quite in keeping with the theme.

Purpose

Bridal Suites are designed with roughly the same purpose in mind as megalomaniacs have when they lock attractive young princesses up in towers -- to coerce matrimony in fine passive-aggressive style. Once activated, they will not allow the prospective bride to leave, while the would-be groom (and any guests) are able to go freely.

(Magical and ultra-tech force fields can be selective. Teleporter pads by the door can redirect attempted escapes. More mundane technology may employ "airlock" techniques, so that certain doors only open when the captive is not in that room.)

While water and bathroom facilities are present, and the temperature is comfortable no matter how ragged clothing may be, food must be brought in from outside. (A more palace-like location may produce food via magic, invisible servants, or nanotech culinary replicators.)

Rescues . . . are also not permitted. Attacking an activated Suite is asking for trouble. Some are merely incredibly sturdy. Others may have point defense systems, offensive spells, or robotic minions who emerge from the walls.

Another thing a Suite is likely to guard against is anyone *else* tarnishing the "bride's" virtue. This is small consolation to whoever is locked up against her will.

Activation and Deactivation

A magical or ultra-tech Suite only needs its owner to state his intent or desire to wed someone who is also within the boundaries of the Suite. A mundane tech Suite may require a stint with a computer, designating the bride-to-be and activating the security and defense systems.

Deactivating the system happens when the would-be groom claims his bride -- this can be as metaphoric or literal as the GM desires. Magical Suites may impose magical compulsions to go through with even a "agreement" based on lies; magical ultra-tech may have similar mind-control abilities!

Naturally, there are other possible loopholes: the groom might be convinced to renounce his interest (or marry someone else by mistake), the Bridal Suite itself might be fooled into mistaking someone else for its owner, it could be tricked into expending its defenses until it no longer had the power to stop the captive from leaving, or some other expression of PC ingenuity.

Ownership

In general, a Bridal Suite is either made by or *for* someone, and that person is the owner. Upon the owner's demise, there is usually some way to shift its loyalties. It may depend on the bloodline, and only obey the wishes of someone of the appropriate genetic code. It could obey anyone who enters after it has lain empty and disused for a certain period of time. It might be particularly easy to fool, and function for anyone whose appearance is similar to the original owner. Other options include accessing the computer and changing the pass-codes, spilling blood in the mouth of a symbolically demonic statue, or other rote rituals.

Adventure Seeds

Robinson Ca-groom-so: An old Bridal Suite has fallen into the possession of, essentially, a hobo who found it and moved in. He is unaware of its power, and unfortunately is not a "drifter with a heart of gold," but is chauvinistic and selfish -- and likely to make a remark in jest which the Bridal Suite will take in all seriousness. Once a PC (or associated NPC) is imprisoned, however, he's happy to take that in stride and wait for her to recognize his natural superiority.

The Ancient Tradition: The PCs uncover the (large, palace version) Bridal Suite of a lost civilization -- which need not even be of the PCs' species -- with a ritual period of "captivity" as part of an honorable marriage ceremony. It even comes with instructions for its use! The question is, can the PCs keep it from falling into the hands of someone who would use it to keep a non-consenting harem?

The Odd Couple: *Bickering* PCs come across a Suite unawares. The enchantments (or programs) governing its behavior are not functioning as well as they could . . . to put it mildly. Anything which *might* be interpreted as a proposal will activate it, and it's not inclined to let the propos*er* escape, either!

A Modest Proposal: The PCs have been contacted by a desperate friend (or servant) of a captive. Time may be of the essence -- the would-be bridegroom is away on a trip (leaving the friend/servant to obtain food for the prisoner), but for how long?

Pyramid Review

The Secret of Zir'An RPG

Published by [Paragon Games](#) & [White Wolf, Inc.](#)

Written by Jason Armenta, Martin Caplan, Marcus Flores, Aram Gutowski, & Chris Hockabout

Illustrated, designed by Cory Allameier, David Ryan Paul, Steve Ellis, Jess Hickman, Chris Hockabout, Erwin Madrid, Chris Martinez, Dennis Nguyen, Joshua Gabriel, Timbrook, UDON with Greg Boychuk, Eric Kim, Jim Zubkavich, Michael Withem, Nick Wynlock, Dean Yuen, & Michelle Prahler

294-page b&w hardcover; $39.99

Zir'An is a ravaged land where Fate tries to maintain a balance of good and evil despite the effect on those caught in the middle. This may be why things go in cycles in *The Secret of Zir'An:* the world gets destroyed (or darn close) like clockwork every few millennia. This time, the Endwar leveled most everything worth living in, then consolidation efforts smacked the recovering peasants around, and most recently the evil Fane took over several locations. The savior Kah wandered the land like a nomadic John Connor, riling people up to take the fight to the Fane. Now the Treaty Nations hold back Fane incursions (the bad guys still hold bits of dirt and citizens hostage here and there), but theirs is an unstable peace. The seven gods mystically communicated to all races their departure from this world, and "the Hegemony," continues to pose a threat, though this group gets mentioned seldom and doesn't rate a listing in the index.

The core gamebook introduces the Finesse System. Each character has four primary stats rated one to 10: physique, mass (yes, mass), intelligence, and acuity. These define the persona's general mind and body, and are used to get derived stats like the damage they can do (and take), their speed, and their Shadow (a catchall representing your magical and spiritual attunements), among others. The three aptitudes -- knowledge, personal, and social -- are rated one through five. Once skills are added, points of Practice are associated with each (again, one to five). Finally, both skills and the difficulty of the task attempted are rated for the finesse level: basic, expert, advanced, and elite.

For the difficulty, this just tells the Hand of Fate (the GM) the matching target number: 15, 20, 25, or 30 respectively. To hit that number, roll a 10-sided die and add it to your stat, aptitude, and skill. For the character, finesse tells him what effects he may employ in combat depending on the chosen weapon type. For example, you may be able to ignore some armor, or even all of it if you "finesse" a called shot to the vitals. Beyond combat, the effects are a little less intimidating . . . you're allowed to narrate the extras you get from a superior success. If you were just trying to haggle for a heavy winter coat for your trip up the mountain, a good total might let you say, ". . . and I negotiate so warmly the merchant gives my traveling partner the same good deal on his outfit."

It's not a simple point-based creation system, though. You take an origin that offers you a base PC you like. This entitles you to skill packages, and where you came from, your age, and what your final numbers are come into focus. You also get Valdreyr, the book's fancy term meaning "those things that make you you." Colloquially, they're just pros and cons -- positive traits such as keen hearing and negative ones such as clumsy or allergies. This is all layered onto your chosen race, the races being . . . well, the names used in the book aren't important. They amount to human, dwarf,

elf . . .

There are the requisite chapters on equipment, combat, and magic. This last splits into two categories: rune and shadow magic. Runes greater and small are marked on the thing to be used. They can be sketched onto paper for quick effects, but the lasting items are those carved into rocks or etched onto the gear they'll affect. It's not a fast form of magic, but it sees a lot of use in towns for generating power or lighting the streets. Shadow mages are usually born and not made, and they've learned to use their own dark reflection to protect themselves, teleport, or assume new shapes. It's more cinematic, and while not all users are evil, neither are they the most popular dinner guests.

The illustrations fall mostly on the better end of the quality scale. Some of them are really well done, others are a bit sketchy (no pun intended), but none look to be completely devoid of talent. The creatures are well done insofar as you get the right creepy vibe looking at their portraits (even though calling the chapter "Adversaries" seems a bit potent since the things there are mostly critters).

This isn't your traditional fantasy land -- at least, it's not supposed to be -- as there are guns, airships, radios . . . essentially it's the kind of place where Indiana Jones, Frodo, and Sky Captain would all feel at home. The (comparatively) high-tech advancements mentioned earlier give way to mostly ordinary fantasy stuff by the book's end, so the consistency of vision suffers somewhat. It's as though the writers split the book in two and never spoke to each other. It's the sort of volume that has a new name for everything, and so you either learn all-new setting-specific terminology or get used to re-renaming everything back to something you can remember.

It's not a bad book, and the Finesse System is nice, but the setting doesn't seem to know what it wants to be. Plenty of background still doesn't really tell you who the best bad guys are. They may think the information has been imparted to the reader more fluently than it really has, because by the end, even if you've been paying close attention to all the interactions and political intrigues, the Hand of Fate still has to come up with his own adventures. It could be that they try to shove too much in one book because it has a not-quite-done feel that's probably going to take us into additional releases.

The editing isn't awful, just notably lacking. The writing is competent, and there are good ideas sprinkled through the early chapters -- would that these narrative bits were expanded to actual plot seeds. The cover makes a promise of adventure that the text just can't live up to. And *The Secret of Zir'An*? It pretty much stays secret.

--Andy Vetromile

Icosahedron Adventures

Refuge Part Two -- The Shield and the Canals
Organizations and Neighborhoods of a Steel Age Fantasy *d20 System* City

by Owen K.C. Stephens

This month we continue our look at sections of the city of Refuge with its richest and poorest boroughs, the Shield and the Canals.

The Shield

The Shield is the westernmost borough in Refuge, home to the Domant's palace, the River Wardens' boathouse, the nobles' Demesnes, and a very few businesses with noble patrons (the Silk House, Garden of Delights, Arcane Forge, and Gilded Forest). Though the Shield is one of the smaller boroughs, it holds more power than any other section of Refuge. It is home to the wealthiest, most influential, and most powerful citizens of the city.

The Shield is restricted in territory by strict terrain features. Its westernmost edge is a curved, elevated rock outcropping known as the Pauldron, which rests on solid bedrock. West of the Pauldron the land is soft and wet, good for growing some kinds of plants but poor for building heavy stone buildings or defensive walls. Its north and south borders are marked by the two rivers that flow into Refuge (and the ocean) from further inland. These rivers join just east of the Pauldron, creating a triangle-shaped slice of land that is elevated and protected on two sides by a natural moat of river water. This results in a roughly shield-shaped section of land.

These natural defenses made the Shield an obvious choice for an early fortification, and the first rulers of Refuge built their keep here. The keep evolved into the Domant's palace, and his court evolved into the nobility of Refuge. Because there is no good way to expand the space available in the Shield, and no one living there is willing to reduce the size of their own holdings, a home and grounds within its boundary is a status symbol among the movers and shakers of the city. A noble family that holds a Demesne within the shield is automatically a member of the high court, and wields political influence separate from whatever they can manage through diplomacy, bribery, patronage, and threats of force. Similarly, a noble family forced to move outside the Shield is limited in what official avenues of power they can explore (though many have found unofficial avenues just as effective).

The Shield is patrolled by the Domant's House Guard, though members of the City Militia and Refuge Guard are fairly common as well. The Domant takes a heavy hand in matters of the Shield, on the assumption that control of the Shield equals control of Refuge. As both the Red Hawks and River Marshals keep their headquarters here they are also common sights here, though neither has primary responsibility for keeping order (and the Marshals are well known for causing it, though less often in the Shield than outside of the city).

Red Hawks

The Red Hawks are the elite agents of the city, acting as a patrol in times of peace, long-range scouts and couriers in times of war, and investigators in times of mystery. They are chosen from applicants who may come from any social background but must pass extensive training and testing for ability, truthfulness, and loyalty to Refuge. This training and testing is undertaken by the Domant's house guard, members of the major religions sects, the City Militia, and arcane spellcasters working for the Guild League. All these groups must sign off an a trainee before he gains the badge of a Red Hawk.

The result of this rigorous system, with its built-in veto power held by four different groups (each with their own agendas and sub-groups), is twofold. First, anyone who successfully passes is sure to truly be a capable, trustworthy

agent with the best interests of Refuge at heart. Second, there are always many more applicants than accepted members, and the Red Hawks are always undermanned. In a city with an official census count of 100,000 souls (though no one truly knows how accurate that count was even when it was taken 15 years ago) there are generally no more than 50 Red Hawks at a time. Only when the city is facing a serious threat do the various factions that control the Red Hawks' recruitment put aside their differences and promote anyone who deserves the post, regardless of internal politics. Since such threats are often hard on Red Hawks, their numbers are depleted again shortly after the threat ends and politics cuts recruiting back down.

Once empowered with a writ from the Domant and given the traditional badge (a simple heraldic device with a red hawk on a field of black) a Red Hawk has considerable authority. A Hawk can arrest, question, and detain anyone not of noble blood, and can question even a noble or the Domant himself with 48 hours' warning. Red Hawks can commandeer Refuge Guard or City Militia, though they are loathe to do so. By law, Hawks also have the right to be heard in any trial (even those held in secret, though no law requires they be notified of such trials), and retain the old right of trial-by-combat. Red Hawks may go armed in the presence of any noble (or the Domant) and are immune to charges of theft, trespass, treason, and assault. Naturally this vast power causes jealousy among other guards, and has occasionally led to abuses. On the whole, however, the organization has proven its worth enough to be given the benefit of the doubt by most Refuge citizens.

Red Hawks can also be accused of a unique crime -- "actions not worthy of a Red Hawk." Anyone may level this accusation, but the Red Hawks themselves handle such cases. If at least 10% of the Hawks see merit in a charge, a trial is held by a group of 12 Hawks (4 chosen by the accused, 4 voted on by all Red Hawks except the accused and his 4 jurors, and 4 chosen by the Domant). If 5 or more Hawks vote guilty, the accused is banished or killed (depending on the offense). Such trials are rare, and often the crux of more complex political plots.

The Hawks are famous for taking anyone who can pass the entry exams, including women, nonhumans, wizards, and even ex-criminals. Such applicants are often weeded out by the prejudice of the groups that vet them, but existing red hawks discourage such prejudice whenever possible. A few make it through, resulting in a broader membership than any other military unit in the city.

River Wardens

The River Wardens are the closest thing to a navy Refuge has, and it's not that close. They are supposed to be guardians of the two rivers that lead into Refuge, clearing it of river pirates, brigands and natural threats to encourage traffic, and control the rivers' approaches to the city in time of war. Realistically, no serious threat to Refuge has come by river in more than two generations, and the River Wardens has become a place to put younger sons of major nobles, and older sons of rich merchants, to keep them out of the way of real business while allowing them to "honorably serve" Refuge.

The River Wardens have a dozen longship, essentially big canoes, they use to patrol the river. They also use them to compete in races, smuggle winter wine and illicit herbs, hold parties out of sight of the city's walls, and sleep off the effects o their revelries. The warden's boathouse is officially their territory, and within it the Wardens are immune to any other legal authority. Of course the Wardens have to come out regularly to gain supplies for their vices, so while a wrongdoing young noble may take haven within the boathouse, eventually he has to face proper authority unless the issue can be resolved.

The River Wardens are not entirely useless. They are trained to sail the river (though few would be able to handle a larger, seagoing vessel), use crossbows, short swords and spears, and tend to their own gear. Of the 120 or so River Wardens who tend to hold a badge at a time, as many as a dozen may actually be dedicated to their jobs and work to keep the city safe. The one thing that actually gets the River Wardens to act together is the death of one of their own, which drives them into a vengeful furor of activity. Most criminals and pirates know this, and thus flee the Wardens rather than fight them.

Garden of Delights

The Garden of Delights is a bordello enveloped in marble stone and gilded trim. This two-story building is only slightly ornamented on the exterior, but the inside is a marvel of gaslights, heavy blue satin, ornate plaster and woodwork and chandeliers of finely cut glass. The first impression of the Garden of Delights is that it's a private love nest, but that only remains if customers don't look behind curtains to find enforcers or speak to the staff to determine the price of a given activity. The entertainers here include pretty women, some half-elven, and a handsome young man or two. In the past it has offered less savory partners, but the current Domant has discouraged such options, and the Garden has complied by removing them from the establishment. Because of who runs the Garden, its staff is free of infection or disease.

Master Thurken is the proprietor of the Garden of Delights. He is an attractive older man who obviously understands the business of seduction. He is also a priest of a goddess of love and sex, though his choice of employment does not sit well with others in his church. He sees the Garden as a temple bringing pleasure to those who would otherwise be unable to glorify his deity, and uses his clerical powers to protect and augment his business. Most of the money he makes is either channeled back in to the Garden, or given to charity.

The Garden is seen as a seedy place to gather for secrecy of any kind by the powerful of the Shield, and is used for plotting as much as rutting. It's the ultimate unreachable destination for most common folk in Refuge, and many list it as the first place they's visit upon suddenly becoming wealthy. It's also the most prized post of every streetwalker and courtesan in town, and competition for one of its staff positions is fierce.

The Silk House

The Silk House is a large building near the center of the Shield. Once a noble family's demesne, it is now the headquarters of a merchant cartel that deals only in high-price items, including silks, spices, slaves (though these are never brought in to refuge itself, as they are illegal), and magic items. The proprietor, Euston Riversend, makes most deals with patrons personally, though he has a staff to ensure no one gets an appointment with him unless they have the coin to be worth his time. Riversend has managed to convince the Domant that magic items are too dangerous to allow "untrained" merchants to deal in them, and as a result it's illegal to buy or sell anything magic with a cost of greater than 1,000 gp anywhere but within the Shield. Since no other business within the Shield is interested, this gives Riversend a virtual monopoly. Only the fact that nobles themselves sometimes buy and sell such things, and that the Domant has friends among those who buy them from Riversend, prevents the Silk House from charging outrageously for anything magic. As it is, anything with a cost of less than 10,000 gp is likely to be special ordered as an afterthought, and may take weeks to arrive (payment is always in advance).

All business in the Silk House is done in a cool, large central chamber. Refreshments are served, and minstrels play in the background. Given the expenses Riversend deals with daily, such minor costs are considered trivial compared to the goodwill and aura of respect they generate. Riversend also often entertains friends, major nobles, and Refuge Guard captains to ensure Riversend is aware of any potential threat and his building is well-guarded. Riversend himself has numerous constructs he uses as guards.

The Canals

The Canals are found west of the Port Borough and south of the Shield. Officially the Canals are several separate districts (Tannery Row, Almoner's Quarter, Foreigner's Quarter, the Courtyards), but not even the residents of the borough care about such distinctions anymore. Only the poorest residents of Refuge live here, and even then some prefer homelessness. The Canals is the most run-down, smelly, damp, unpleasant section of the city, and represents the greatest failure of the rule of past Domants.

The Canals were built 30 years ago under the grandfather of the current Domant, and were supposed to bring great wealth and prosperity to Refuge. The idea was that since the city thrived on trade brought from both the twin rivers that flow into it and the ocean it sits on, a series of canals that increased the connections between these two waterways would bring new trade. An extensive system of canals were built to make a whole new "merchant's quarter," with white stone buildings, broad waterways to use as transport for goods, and streets big enough a cart drawn by eight

oxen could turn in them. The cost of expanding the city and its defenses by so much was great, but the Domant was convinced the return would be worth the expense.

The promised wave of prosperity never occurred. The problems that prevent the canals success were manyfold, and in retrospect should have been obvious. First, the cost of the project was massive, and as a result the Domant was advised to charge heavy taxes on anyone who bought and sold goods within the new merchant quarter. This discouraged anyone already doing business elsewhere in Refuge from moving their trade to the canals, which in turn prevented it from looking appealing to new customers, and thus making it a failure for those few merchants who did set up shop. The Domant revered the tax structure once this problem became evident, but by then the Canals had a reputation for bad business.

Second, no wealthy families wished to move in. The new tax structure made just living in the Canals expensive, and no one who could afford it was willing to leave their quarters in the Shield for a territory with unknown benefits. A few families that had moved out of the Shield in the past few generations due to economic hardship did see the canals as a second chance for influence, but soon found their reduced fortunes couldn't afford the pricey new borough. Once the Domant eliminated the high costs for living in the Canals, it was flooded by the poor and homeless, ensuring it would never be seen as an affluent section of the city.

Third, the canals themselves didn't perform as promised due to engineering efforts. While river water did flow through the stone waterways, the volume of space used by the canals compared to the entry and exit points of the system meant the water moved very slowly, and in some areas no current at all developed. Especially as the area become a slum for the destitute, the canals began to act (and smell) more like an open sewer than an attractive new way to move around. Since the Domant was already nearly broke from building the region, no money was available to re-engineer the canals, and the project was declared a failure. The Canals became a place for the poorest to live. A few businesses did move in -- including tanneries, dyers, and slaughterhouses -- since they found the cheap space and reduced complaints from neighbors worth the unpleasant working conditions. Because the winds off the sea blow past the canals last, this is a state of affairs that makes the rest of Refuge quite happy.

Channel of Lanterns

The northernmost of the canals is a long stretch of waterway lit at all times with a wide array of lanterns. This area is notorious for prostitution, gambling, robbery, and shady deals. It's only lightly patrolled by the city, and the assumption that such things are going to happen somewhere, and the canals is a better place than elsewhere in the city. People from all over Refuge come here for cheap thrills, though often they pay an unpleasant hidden cost in the form of disease, burglary, or blackmail.

This row is also home to the most powerful criminals in the Canals -- the Hundred Hands. This organized gang of thugs run most of the illicit and illegal activities of the Canals. They take a heavy percentage of everything, and arrange for robberies, smuggling, and extortion to fatten their coffers. They are intelligent enough not to bring down the attention of the Domant or the Red Hawks by killing people of important or allowing crime sprees to exceed what a community can afford, and leave healers and the sick alone. Within those restrictions, however, they squeeze the canals (and those who visit regularly) for every copper penny that can be pried lose.

Most of their money comes from semilegal loans, running illicit entertainments, robbery, and the synergies that come from combining these. Someone who comes to gamble regularly is given a chance to borrow money when he runs out, then escorted home when he exceeds his "credit." If he can't afford the weekly fee for the loan, he's forced to sell his goods or aid in future illegal activities. If he can afford the fees and pays off the loan, he's targeted for a burglary to lighten his excess funds. If any activity seems to be drawing undo attention from the authorities it is stopped (and if necessary, a scapegoat turns up dead with evidence to suggest he was guilt of said operation).

The Hundred Hands aren't rich, but they are secure and doing better than most residents of the Canals.

Healing Court

This area was originally designed to be a large open-air market, and sits in the center of the Canals. It is easily accessed by both street and canal. As the Canals sank into slum status, many homeless and poor began to build shelters here. A decade ago, the court was the center of a massive plague that threatened to spread out of the canals and into the city. The current Domant ordered the cleric of every temple in town to go stop the plague, and rather than face his wrath they obeyed. The outbreak was prevented, but cases of the disease kept popping up in the canals (though in low numbers). The healers cleared out the population of the court, and set up tents for their own use and to treat patients. Over the course of years they could never say the plague was "over," and thus the Domant insisted they stay. Soon, anyone with an injury or disease knew to come to the healer's court for treatment.

Although there are many healers here, their talents (and spells) are taxed near the limit just keeping the dirty, underfed, hard-living population of the canals healthy. The Domant still requires every temple in the city to provide a number of healers for the court (based on the temple's size), as a precaution against further plague. As a result the temples have few healers beyond those they send to work (and often live) in the healer's court. The powerful nobles of the Shield can afford their own private clerics for their health needs, and the most devout within each temple receive care if sick, but anyone wishing to buy curatives with a donation must travel to the healer's court and find a cleric with time and magic to spare (which may take a day or three).

Because the priests and trained healers of many different temples work together in the court, it has also become a place of learning. Herbalists, bards, priests, and churgeons from a dozen different religions and traditions have worked together in the court for a decade now, trading lore and experimenting on the poor to see what works best. Recently word of the new healing techniques and magics being developed in the court has drawn apprentice healers from far away here, to observe and learn. The Domant sees this as a good thing, and encourages it with deliveries of bread and tents to new healers joining the court (a cheap price for more healing in the city).

Gueter Hauk

Gueter Hauk is both a persona and an institution on the canals. He's a freelance poleman, pushing a small skiff through the canals, taking passengers and cargo where he's paid to, as long as both destinations are within the canals. He sleeps and lives on his skiff, and makes regular runs to and from the healer's court. He's the only poleman who regularly operates in the canals, and has a keen awareness of what parts of the borough are safe, both in terms of clogged canals and crumbling buildings and where thieves or spies might be found. He keeps much of this information to himself, but can be drawn out to give hints and clues. Anyone making a Gather Information check about something happening in the Canals gains a +2 bonus if they pay Hauk a cp, and a +4 if they give him a sp (no bonus is granted for giving out more money, it makes Hauk suspicious).

Brainhouse

The Brainhouse is the largest slaughterhouse in Refuge, found on the far west of the Canals where cattle are often brought in large herds. The cattle are brought live, kept in pens near the Brainhouse until sold, then often slaughtered and salted for transport overseas. The name of the place comes from the large, blood-splattered men who are paid to hit each animal in the head with a maul when it's brought in, killing it in one blow by spraying its brains across the floor. These men are called "brainers," though they are often dull-witted at best, and also serve as the Brainhouse's security.

The Brainhouse is the cheapest slaughterhouse, and thus the most used, but it has an unsavory reputation. It refuses to prepare meat in any special way, making it unpopular with religions with dietary requirements. It's also a common source for material components for wizards in refuge, selling bone chips, blood, and similar items. If a worker is injured on the job, any body part he loses is claimed by the owner and sold as material components as well.

Additionally, people claim bodies are often hidden here by the Hundred Hands, perhaps mixed in with other meats, and some whisper it's secretly a temple to dark gods of death. In fact, both rumors are true, and only the fact the Brainhouse is owned by a powerful wizard able to block most divinations has kept the place from being raided by the Red Hawks or decried by respectable temples. The wizard, Amond Shea, was also responsible for the plague that broke out a decade ago (see the Healer's Court), and is slowly building a cult of the poor and oppressed to eventually

overthrow Refuge. For now, he's building strength and keeping quiet, though he does gather the faithful once a month for a human sacrifice.

* * *

Next Month: We look at the last two boroughs, and present the Refuge Map.

Kings in Darkness

by Bevan Thomas

"As flies to wanton boys, are we to th' gods, they kill us for their sport."
--William Shakespeare, *King Lear*

The black magician, the diabolist, the necromancer, the sorcerer. Whatever you choose to call him, he is one who has bargained with dark forces for his power, and he is one who is found in many stories and many roleplaying games. Though some such sorcerers walk alone, denying the existence of any power greater than themselves, many choose to bargain with outside forces, from dark deities to lesser malignant spirits (known as demons). Through the gifts and teachings of these creatures, the black magicians receive great power and knowledge. However, they also lose much of their coveted freedom, and they frequently even lose their souls.

This article looks at the different relationships and bargains that a sorcerer may strike with dark gods and demons. It includes no rules, only advice and ideas, and thus is appropriate for any roleplaying game that includes such malignant forces, including ***Call of Cthulhu, In Nomine, Dungeons & Dragons,*** and various ***GURPS*** settings.

"The Patrons"

There are many reasons to serve a dark patron. In some campaign settings, it is the only path to supernatural power. In such situations, people are required to give service to malignant forces in order to gain the magic that would grant them dominance, frequently sacrificing their souls in the process. In other settings, service to evil forces is not the only way to gain supernatural power, but it is still one of the easiest. The acquisition of arcane knowledge is a long and difficult path, and bargaining with demons and their ilk offers an effective short cut. Though their masters may require them to do a variety of blasphemous and repugnant things, most black magicians consider themselves above mundane ethical considerations anyway. And though it is said of sorcerers that they have handed their souls over to dark forces, sorcerers are nothing if not egotistical, and most believe that they will find a way to slip that particular noose.

Sorcerous patrons fall into two main categories: dark gods and demon. Dark gods are or were part of the pantheon of deities that helps to create and define the universe, and are therefore very powerful and inhuman. Though not necessarily evil, dark gods are at least amoral and usually associated with the more malevolent elements of creation. Demons are lesser malignant spirits; in some cultures they are servants to dark gods, though in others they are answerable only to themselves. Demons are more approachable and more easily bargained with than gods. However, they lack a deity's power and are frequently more treacherous.

Dark Gods

For the purpose of this article, the term "dark god" is applied to a deity that, though not necessarily malignant, is very dangerous, and has a system of values quite different from conventional morality.

There are four kinds of dark gods:

1. **The Enemy:** In some religions, dark gods are enemies of the principle pantheon of gods (sometimes referred as the "gods of light"). An example of this is in Zoroastrianism, where the dark god Angra Mainyu strives to overthrow the benevolent Ahura Mazda. This is the simplest kind of dark god, as it creates a visible boundary, clearly defining what is good and evil. A sorcerer who bows down to an Enemy is placing himself in opposition to the sacred order of things. The Enemy is also the most common kind of dark god in roleplaying games and fantasy novels.
2. **The Necessary Evil:** Though the Enemy is very prevalent in fantasy fiction, the Necessary Evil is much more common in mythology. This kind of dark god is tolerated by the rest of the pantheon; for whatever reason, he is

needed for the universe to properly function. One of the best examples of a Necessary Evil is the Egyptian god Set, who is tolerated by the other gods despite his traitorous and violent nature since they need him to drive back Apep, the serpent who attempts to devour the sun. Another example is Hecate of Greco-Roman mythology, who has an important function as goddess of the moon and prophesy, though she is also the patroness of witchcraft and murder. This kind of dark god has a more intricate role in the religion than the Enemy does. Because the god is a necessary part of the pantheon, worshipping him does not automatically make the sorcerer an enemy of society, but still sets him apart from it.

3. **The Twisted Pantheon:** In some worlds, the entire pantheon of gods is malignant. Arguably, the Aztec Pantheon is an example of this, with a variety of alien gods that must be fed with numerous bloody sacrifices. It is also prevalent in horror fiction, such as H. P. Lovecraft's Cthulhu mythos (which features such deities as Azathoth, the Blind Sultan of Chaos; and Shub-Niggurath, the Black Goat of the Woods with a Thousand Young). The Twisted Pantheon is usually only appropriate for a horror campaign. In such a setting, worshipers of the dark gods are not enemies of the universe, since it is the dark gods that embody the universe.

4. **The Shadowed Side:** In many religions, gods have various aspects, some benevolent and some less so. For example, Odin, the king of the Norse pantheon, is both the god of rulership and poetry and of sorcery and madness. As a divine being, Odin transcends mortal ethical considerations and encompasses both sides of human nature: the good and the bad. Another example is the Baron Samedi from Voudoun folklore. He is the patron of the dead, and is both a benevolent entity who guides souls into the afterlife and the spirit that sorcerers invoke to bring death to their enemies. The Baron represents both sides of death: everlasting peace and final destruction. The Shadowed Side is the most complex kind of dark god. It makes the gods more difficult to classify and means that they do not easily fall into camps of good or evil. It also places the sorcerer in an interesting position, he pays homage to a "god of light," but in a darker manner. Either this form of worship is accepted the orthodoxy, an acknowledgment of the dual nature of the deity, or it is branded a heresy, at best coldly tolerated, and most likely viciously persecuted.

The appropriate kind of dark god for a world depends greatly on the campaign that the Game Master wishes to create.

For example, having the Twisted Pantheon would create a very dark and perhaps even nihilistic campaign, where spirituality and faith ultimately derive from a monstrous source there would be very little hope in such a world. In a campaign with a Twisted Pantheon, people might take up sorcery in desperate self-preservation or for the greater good. After all, if they ally themselves with the dark forces of creation, those forces might deign to spare them and those they hold dear. One of the reasons that the Aztecs sacrificed so many people was because they believed that the Sun would die unless fed on human hearts. These sorts of cosmological truths might trap otherwise good people in evil situations, forcing them to commit acts of murder and torture in order to help the greater good. Perhaps the fields need to be watered yearly with the blood of a young virgin to feed Bechorath, goddess of fertility, in order for the villagers to grow their crops. If there are no crops, the village starves, and therefore appeasing the goddess is necessary: the ends justify the means.

Furthermore, in a Twisted Pantheon campaign, sorcery is frequently the only way to gain real power. Technology can only do so much, and it is often regulated by the gods. If a person does not pay homage to the dark gods and accept their gifts, he will be in no position to do anything, for good or evil. In order to make a positive change, that person needs to worship the Twisted Pantheon.

Though the Twisted Pantheon could be a very interesting and challenging type of campaign, it is not for all people. Many players would find it gloomy and depressing after a while, and a lot of players like the idea that they are changing the shape of the campaign world, frequently for the better. In such a campaign as this one, such changes would be almost impossible.

Therefore, most campaigns would employ one of the other options for dark gods. "The Enemy" is the most common choice, with one or many evil gods causing mischief and mayhem in opposition to the more prevalent good pantheon. As mentioned previously, this creates a clear good-and-evil dichotomy, allowing the player characters to easily tell who their friends and foes are, and leading easily to high adventures of the epic quests and monster-slaying variety. However, "The Necessary Evil" or "The Shadowed Side" could make a fascinating alternative.

The kind of dark god chosen helps to define the role sorcerers take in the campaign setting. If worshipping an Enemy, sorcerers are clearly in the adversarial position. They serve are deity who is anathema to the benevolent status quo, and therefore set themselves apart from society and common decency. With a Twisted Pantheon, sorcerers are still generally malevolent, but they are the status quo, and it is the benevolent forces, if they exist at all, who are ideological outlaws. However, since the dark gods are the source of most, if not all, power, it means that good people might need to practice black magic, and are therefore less likely to be purely evil. In "The Necessary Evil" and "The Shadowed Side," the dark gods are an accepted part of society, or at least versions of accepted deities. They have a certain place in the status quo, and their sorcerous servants may be tolerated, if not necessarily liked. Because of this, the sorcerers do not need to be evil, and in fact could be fulfilling a pivotal aspect of the culture or cosmology. This makes religious interaction more complex and morally ambiguous, leading to a radically different sorcery-based campaign.

It is, of course, possible to have a campaign that combines the different kinds of dark gods. Perhaps in their war against Naharai, god of evil (an Enemy), the gods of light have grudgingly accepted Sargon, patron of assassins and spies (a Necessary Evil), and Iri, goddess of the sun, is both a healer and destroyer (a Shadowed Side). In this campaign, sorcerers would probably face less censure invoking Sargon or the dark side of Iri as opposed to invoking Naharai, and in fact might be sanctioned by society as long as they are not too excessive.

Demons

For the purpose of this article, demons are considered to be malignant spirits who lack the vast power and elemental nature of gods. Whereas gods are pivotal aspects of creation, and in fact may be the instigators of the universe, demons are much less important beings. They also tend to have more comprehensible powers and goals. While a sorcerer can treat many demons as equals or even inferiors, there exist creatures that, while not on the same level as the gods, will be far more powerful than most sorcerers can ever hope to be. These beings are referred to herein as demon lords.

In certain campaigns, such as those based on Christian folklore, demons are the only entities that can grant sorcerous power. In others, they are merely an alternative force to bargain with for black magic. Perhaps the demons are servants of the dark gods, or perhaps they operate under their own hierarchy. Either way, demons have their own goals and desires, which the sorcerer can use to his advantage.

A benefit of demons is that they can be bargained with on more equal grounds than gods. Though the more powerful demons are much more powerful than a mortal sorcerer, even they are more approachable than a deity. A demon's demands are usually more specific and easier, such as "feed me the hearts of 20 innocent men" or "recover the Staff of Lost Souls" as opposed to a vague and lengthy list of rites and sacrifices that would be expected of a god's disciple.

However, demons are frequently more treacherous than gods. Even the basest dark god usually has loftier goals than a demon, and generally treats his worshippers more fairly. Demons, on the other hand, tend to lie and cheat anytime they think that this would give them an upper hand. Which makes dealings with demons chancy at best.

The Infernal Pact

The relationships between sorcerers and dark gods tend to be reasonably open-ended. The sorcerer sacrifices to his deities and preaches their gospels, and they sometimes deign to grant him power. In most cases, the gods are too powerful for the sorcerer to bargain with them on anything close to an equal level, and so the most he can do is serve them to the best of his ability and hope to eventually gain their favor.

The sorcerer's relationship with demons is somewhat different. A sorcerer generally binds lesser demons to his will, or at worst, pays for their services with fairly minor favors (for example, keeping his imp familiar fed on sheep eyes). Even in the case of more powerful demons, sorcerers will usually only do the demon's bidding in return for immediate benefits. Therefore, the demon and the sorcerer draw up an agreement: an infernal pact.

In many campaigns, the demon is forced by his very nature to abide by the pact, and is physically unable to break it. In

others, he can break it if he chooses, but usually finds it in his best interests to honor it. After all, if word got around that demons broke their side of the bargain, no more mortals would deal with them (and so the demon lords would probably punish any demonic violators very harshly). In most settings, the demon is only forced to hold to the letter of a pact, leaving him free to ignore the spirit (forcing sorcerers to phrase pacts in the most exact manner possible, so that the demon has no room for interpretation).

The pact itself may take a variety of forms. In some campaigns, it only needs to be a spoken agreement, perhaps sealed by a handshake, a mingling of blood, or something similar. In others, a physical contract is required, possibly made of ghoulish components such as the blood of a hanged murderer written on parchment made of human flesh, and signed with the blood of the participating sorcerer. The second kind would place those who cannot read at a disadvantage, but in most cases, demons are required to truthfully read out the words of the contract.

Depending upon the campaign, the pact may not necessarily require the mortal's soul. But that is still the most common price, and so this article will discuss it first.

Selling Your Soul

In many campaigns, especially ones based on Christian belief, all deals with demons damn a person's soul. It shows the ultimate foolishness and shortsightedness of the sorcerer that he trades a few years of great power for an eternity of torment. In these campaigns, the loss of the soul is frequently not so much a part of the agreement between devil and mortal, but is instead a by-product due to the pact being a sin. The learning and practice of black magic is an attempt to defy God's will and consort with His enemies, and therefore is just as damnable an act as murder or treachery.

Why would someone willingly sell his soul? Surely being able to control minds and ravage bodies for a few short years is poor compensation for an endless existence of misery and pain? In some cases, such as when the loss of the soul is simply a by-product of the pact, it does not need to be mentioned in the contract. The demon is simply doing the sorcerer a favor or two, never telling him the consequences of these "favors." Of course, priests and preachers claim that dealing with these powers causes damnation, but the average sorcerer pays little attention to such sources.

Even if the sorcerer knows he is selling his soul, there are many reasons for the sorcerer to accept. Dark magicians are nothing if not egotistical, and frequently believe that they will be able to outsmart the forces of Hell and cheat their doom. Furthermore, their demon patrons usually behave as the epitome of selfless friendliness and warmth when speaking to the black magician, and many sorcerers come to believe that their associates do not really mean what they say about "damnation" and if worse comes to worse, in Hell they will be still be good friends. Also, some will sacrifice everything for a particular goal. A person might be willing to face damnation as long as they are able to avenge themselves on the person who ruined their lives, gain the love of an individual, or feed their starving family. Most demons are masters at capitalizing on the weaknesses of others.

Other Pacts

In some campaigns, the practice of black magic merely angles the soul toward Hell, and does not cause instant damnation. In others, the damning of the soul does not benefit the demon in question. After all, it's all very well if the learning of black magic will cause the soul of Sir Edmund Bartleby to fall into the clutches of the Prince of Darkness upon his death, but it does not benefit the demon Aeyoet, who would want something else from the deal. In both these cases, the demon will demand something for himself as one of the conditions for the infernal pact.

The demonic requests depend upon how powerful the demon is, what the mortal wishes out of the deal, and how much the demon thinks he can get away with asking for. An imp might be satisfied with a few pints of the sorcerer's blood a month, but a duke of Hell would require a little more.

Some demons wish to be worshipped as gods, with sacrifices made to them. Others require food: these can range from rich cakes to precious pearls to human flesh. A demon might request a specific task, such as assassinating a particular person, starting a cult, or recovering an artifact. Some demons wish for the sorcerer to sin, further binding him to them and their masters. In certain campaigns, demons have province over particular sins, and want to expand them, thus a

demon of lust might convince a sorcerer to seduce a married woman, whereas a demon of wrath would prefer the sorcerer to provoke a feud. A particularly horrific form of payment is to bear a demon child (either by copulating with a demon or by being artificially inseminated with demonic energy). Though more common with female sorcerers, male ones occasionally undergo this unnatural labor as well.

Malefic Rituals

Many dark gods and demons crave sacrifice and worship. These rituals can serve a variety of purposes, such as supplying energy to the spirits through the act of devotion, feeding them on the sacrifices made, supplying moments of entertainment, and giving a chance for their servants to wallow in sin, turning them away from the path of righteousness.

Dark gods generally prefer complex rituals of worship, whereas demons -- often being of a more pragmatic mind -- concentrate on the sacrifice. A ceremony for a dark god will usually be very long and drawn out, similar to an act of worship in a more "wholesome" faith. It might contain long sermons about the power and majesty of the god, readings from his "holy" texts, and hymns sung by his worshippers. The sacrifice is usually very reverent, and highly stylized in its presentation. Conversely, a sacrifice to a demon is often much simpler, almost like a business arrangement, with the sorcerer simply announcing something along the lines of "Rakkath, prince of the Abyss, I offer to you the hearts of three white lambs and of the shepherds that guarded them. In return give to me the secrets of the three Black Grimoires of Dibon." However, some demons prefer to be worshipped and some gods prefer the quick fix of burnt offerings without all the empty benedictions.

Sacrifices, Body and Blood

A common sacrifice in medieval lore was a baby goat, frequently one with black fur. This derives from the association of Satan with goats. Another favorite was a white lamb, which is identified with purity, humanity, and Christ, and thus the destruction of the creature in a demonic ritual is a perversion of purity. Other animal sacrifices that might be of interest to demons are doves (symbols of purity and peace), dogs (the guardians of humanity), and cows (the givers of food and drink).

Human sacrifice is another favored choice. It is more difficult, however, as humans are harder to acquire than animals, and their loss is more easily noticed and likely to cause a commotion. In some campaigns, properly sacrificing a person automatically places the victim in the power of whatever dark entity the sacrifice was dedicated to, instantly damning the poor soul. However, in other campaigns, the spirit still goes to its just reward, and therefore only those people which the dark god or demon lord feels that they would have no chance of corrupting (or are considered too unimportant to bother corrupting) would be sacrificed.

Another example of sacrifice is the giving up of the sorcerer's own body parts or life essence. For instance, a sorcerer might sacrifice an eye, some of his fingers, or even an entire limb to his patron, giving up physical wholeness in return for power. Alternately, the demon might take a few years of his life, his health, or even an emotion or memory.

The most prevalent form of personal sacrifice is through demonic familiars. Some sorcerers are served by familiar spirits who act as mediators between them and the Spirit Realm. In order to feed these familiars, sorcerers must feed them some of their own blood. This is usually taken from a cut in the palm of the hand or suckled from a nipple like mother's milk. The familiar may suckle from a normal nipple, or a special one that was created through sorcerer's initiation ritual. In the Middle Ages, this extra nipple was called "the Witch's Tit" and was considered one of the surest proofs of black magic.

Other possible sacrifices include destroying objects (such as treasured heirlooms, magical items, or relics of opposing faiths), giving up semen, spit, or other fluids, or offering up food.

The merits of a sacrifice frequently depend upon the nature and tastes of the sorcerer and patron involved. For instance, a demon might prefer lambs' eyes to cow kidneys, or a human sacrifice might be welcomer if it is of the

sorcerer's closest friend or a family member. The heart is a favored body part to sacrifice, since many cultures consider it the seat of consciousness, and thus the container of the soul. Other popular offerings include eyes (windows into the soul), brains (the mind), and tongues (due to the great importance of speech in interacting with the world).

Sometimes particular sacrifices and rituals must be done at particular places (such as crossroads, graveyards, or dark forests), times (some people call midnight "the Witching Hour"), or days (such as the nights of the full moon or Halloween). These might depend upon the patron in question or apply to all dark spirits. Furthermore, the treatment of sacrifices usually varies from patron to patron (a god of the sea might wish all sacrifices to be tossed into the water at high tide, whereas a demon of travel might prefer his victims to be hung at the crossroads).

Acts of Worship

Acts of worship take many forms, depending upon the patron in question. Among the more morally acceptable dark gods, they are frequently relatively normal religious services, with a preacher leading prayers to his god, granting benedictions, and singing hymns. The service might cumulate in a blood sacrifice, but it will still be in a strict and civilized manner.

Other gods and demons prefer more colorful displays. Some services may be nothing more than orgies, with their practitioners showing their superiority to the "common herd" by indulging their every whim and experiencing every perversion. Ironically, the attempts of many sorcerers to cast off the shackles of society end up making them slaves to their baser desires. Their dark lords usually prefer it this way, as the sorcerers become more and more dependent on them to feed their blasphemous needs.

There is a Christian belief that the Devil cannot create, only pervert (as true creation is the sole province of God). Therefore, the rituals that Satan grants his worshippers are distortions of Church rites. The most well known of these is the Black Mass. It is supposedly performed on Friday night, and includes such activities as reading the Bible backwards, stamping on the cross, and cursing God's name. Through the Black Mass, sorcerers show their loyalty to Satan, and further alienate themselves from God and the community by desecrating the holy sacraments. Obviously, ceremonies such as the Black Mass would only exist in a world where the dark gods and demons are in opposition to deities of light, since otherwise there would be no sacred rituals to pervert.

The Final Word

The role that the forces of darkness play within a world can serve as the backdrop for exciting adventures or even entire sagas, providing adversaries, temptations, and treachery. But before a campaign's protagonists can fight against the darkness (or be seduced by it), the GM needs to know what the darkness demands, and what it offers in return.

Truth & Justice RPG

Published by [Atomic Sock Monkey](#)

Written by Chad Underkoffler

Cover by Greg Holkan

Illustrated by Greg Holkan, Scott Kane, & Randy Milholland

133-page PDF document, $13
133-page b&w softcover; $25

One of the most interesting roleplaying games of 2004 was Chad Underkoffler's ***[Dead Inside: The Roleplaying Game of Loss & Redemption,](#)*** detailing as it did the loss and eventual regaining of its protagonists' souls in the dream-like Spirit World. He has since followed it up with the surprisingly deep but nevertheless zany and knockabout ***Monkey, Ninja, Pirate, Robot RPG,*** based on the Origins-Award-nominated board game of the same name. The third of his titles tackles an altogether more traditional genre, that of the superhero comic book.

Commercially this is already a crowded market, but unfazed by such pressures ***Truth & Justice*** is not just a complete roleplaying game but also a platform from which Chad can cast his eye over the genre. This is evidenced in the opening chapter, which describes and analyses each of the genre's elements, forms, and eras. Both an interesting read and an excellent good introduction to the genre, this is intelligent and informative and about as dry as you would want without being scholarly. Pleasingly, this explanation comes right up to date in including the animated version of the genre, best typified by *Batman: The Animated Series.*

But before all this analysis, the author explains what ***Truth & Justice*** is all about: the struggle to uphold the two elements of the game's title against lies and injustice, and their unfair and corrosive influence, plus the heroic ideals necessary for truth and justice to prevail. This is a world of "mad beautiful ideas" too numerous to mention set on a stage upon which the protagonists perform much more than is normal. Such protagonists (or player characters) are indeed super, able to command great forces, tap into ancient sorceries, comprehend science beyond our ken, build amazing gadgets, and have trained themselves in skills and knowledges without peer. Whatever the style of world set by the GM -- Four Color, Grim 'n' Gritty, Cinematic, or Animated, the heroes should stand for what is right and upstanding . . . in other words, ***Truth & Justice.***

As with the other two games, ***Truth & Justice*** employs Atomic Sock Monkey's PDQ -- or Prose Descriptive Qualities -- System, the ***Fudge***-like system that encourages the players to define their characters and abilities. These can represent a character's personality; physical, mental, or social skills; relationships; professional abilities; resources; and flaws. Each quality is assigned a rank: Poor, Average, Good, Expert, or Master. Each rank is assigned a value ranging from -2 to +6 applied to a 2d6 roll when handling any conflict situation under the PDQ System. Whether involving physical, mental, or social conflict, all are handled neatly on the same scale, with damage levied directly from a character's qualities, rank by rank. Superpowers are handled on a higher scale, but still in a similar fashion. This means that all can be equally effective; for example, a blast of fire might take down one villain, but not (say) an invulnerable Brick more susceptible to some witty repartee.

A character's superpowers, origin, and motivation for using his abilities are added on top of the ordinary character, with the superpowers needing to be defined and agreed upon by both GM and player. This places a greater demand

upon the player and his imagination, because the powers as described are suggestions on how they *might* work, not how they *do* work. What might be termed the problem powers -- intangibility or phasing, super speed, sorcery, teleportation, and time control -- are all handled well. Likewise, so are powers that let you do lots of things, such as weather control. Ultimately though, the GM has to set the limitations on how each works. Highly skilled individuals are also allowed for, with the Intense Training quality enabling the creation of characters similar to Batman or The Punisher. The aim here is encompass any hero type, and by place them on the same scale allow them to operate side-by-side.

Where powers and qualities are broad in scope, a hero can narrow and refine them through stunts, tricks, new applications, and the like. Thus a hero with weather control powers can use them to temporarily fly, or a hero with super speed could run up walls or across open water. Stunts require the expenditure of Hero Points to activate, but can be turned into signature stunts and become a permanent part of a hero's repertoire.

Where *Truth & Justice* becomes more interesting is in its encouragement of each player to undertake the hero's role through the use of Hero Points. They are expended to bring new facts to light about a situation, resist a character's motivation, to create a contact, or temporarily improve a quality or power, amongst others. They are awarded for a character following his motivation, being heroic, accepting Revolting Developments (adverse plots or story lines inflicted on the character by the GM), being affected by a power's limitation or character's vulnerability, and for playing to the game's genre. In addition to backgrounds, origins, motivations, vulnerabilities, and limitations sparking story hooks, so does the first damage suffered in conflict, this being related to the reduced quality. Again like *Dead Inside,* the game's rules and mechanics are geared towards a certain type of play.

A character's Hero Point pool is known as the MAX, which can be increased. Accrued at either a slow or quick rate, the GM adds a tick against the character's MAX whenever he is awarded Hero Points. Once the number of ticks exceeds MAX, it is increased by one and the tick tally resets. MAX is also used to pay for new or increased power and quality ranks, as well as signature stunts.

Mechanically, *Truth & Justice* possesses two potential drawbacks resulting from the PDQ System's adaptation to the genre. One is the time necessary to develop stunts mid-game, and the other is the increased complexity of PDQ conflict resolution in *Truth & Justice.* It has more to keep track of than in *Dead Inside,* but a fully worked and explained conflict example helps to offset both of these problems. So does the GM's advice, which does not start with the basics like other PDQ titles, but is nevertheless both appropriate and useful. It includes an array of heroes and villains, some of whom appear in the three settings, plus a selection of gadgets, trophies, MacGuffins, and plot hooks.

The game comes with not one official *Truth & Justice* Universe, but three very different settings. All are well explained, come with a host of NPCs, campaign suggestions, and model sub-genres particular to the superhero genre. The first is "Second String Supers," an animated style campaign that is the most traditional of the three and reminiscent of *Batman, The Animated Series.* Here the characters help the leading hero of Drakesville, Dragon Knight, while he is busy with the Justice Alliance. "SuperCorps" is a cinematic setting, some 20 minutes into the future, where the multinational corporations or multi-corps possess more influence than they do today. Heroes join or form super-consultancies, agencies that hire out individuals to undertake the type of tasks that only superheroes can accomplish, torn between greed or heroic altruism. The third setting is also the most interesting. In "Fanfare For The Amplified Man," the player characters are ordinary men and women who have in their own smaller way acted heroically. In a dream they are gifted with powers, which they are expected to put to positive use. Set in the here and now, this setting also has the most constraints upon choice of powers for the characters, and, being very player driven, it asks each to wonder what they would do with great power and great responsibility.

Finally, *Truth & Justice's* excellent bibliography not only showcases the author's tastes, it is also full of good reading, playing, and viewing suggestions. If the majority of the artwork leaves much to be desired, *Truth & Justice's* writing is never less than assured and always on target. In bringing his sensibility to the genre, the author makes *Truth & Justice* more narrative or story driven than most superhero games, particularly with the conflict rules that activate story hooks and reward Hero Points for suffering Revolting Developments, and for in-character and in-genre play. *Truth & Justice* has the feel of old-school supers RPGs, say, *Marvel Superheroes* from TSR and Games Workshop's *Golden Heroes* (especially the latter's campaign focus), but its mechanics reflect a more modern and flexible approach,

offering choice in character creation without the resort to points and bean counting.

With rules that successfully enforce the genre and reward good play (probably a bonus to anyone wanting to play a supers RPG), three fine settings, and a first-rate bibliography, *Truth & Justice* is everything we have come to expect from this author. As one man's take on the superhero genre, *Truth & Justice* is superbly realized and successfully showcases how the light and easy PDQ System handles an often-difficult genre.

--Matthew Pook

Scenes and Sensibility

As foretold in our last installment, this past week was spent visiting my parents. Among other fun activities (including attending a Ren Faire in my wedding outfit and sitting through a time-share sales pitch for a $118 gift card) I actually got to watch a couple of movies on my parents' Luxembourg-sized big-screen TV. The second movie was *Steven Spielberg's Tom Cruise's H.G. Wells' War of the Worlds,* a movie that I was so thoroughly disgusted with that I hated practically every character in the movie and found myself heartily rooting for the aliens, going so far as offering to ship our would-be invaders the latest in anti-viral medication if it would just shut up the nonstop barrage of characters who alternate between screaming everything five times each without saying anything pertinent, and screaming incoherently without bothering to listen.

Typical dialog:

Dad: Get in the car.
Son: What's going on?
Dad: Get in the car. Get some food and get in the car.
Son: Won't you tell me what's going on?
Dad: DON'T ARGUE WITH ME! GET ALL THE FOOD YOU CAN CARRY AND GET IN THE CAR!
Son: No! I'm not going anywhere! You're not my primary caregiver and I love mom more!

Suggested revision:

Dad: Get in the car.
Son: What's going on?
Dad: I just witnessed several hundred people get vaporized. Their ashes are what I'm shaking off onto the kitchen floor. Your choices are 1) get all the food in the house and get in the car, or 2) stay here and free me up to have a new first child. You have three seconds.
Son: ... Well, I get to pick the radio station.
Dad: Fine.
Son: I'll be playing nothing but John Williams.
Dad: Stay here and die.

Anyway, *War of the Worlds* has the privilege of being the only movie I can think of where I actually had to leave the room for 20 minutes or so during the movie to detox, closing the door lest I be exposed to its damaging radiation. By the time I returned, the movie had advanced to a state where aliens were going door to door in the 100,000,000 basements in the country (and, presumably, around the rest of the world), meaning that things had gotten *much* more logical in my absence.

The second movie I had the chance to witness was *Flightplan,* a deceptively titled movie in that, as best I can tell, no flight plan was actually involved anywhere significantly involved with the plot. Really, *Ticket Stub* would have provided a more accurate snapshot into the action.

Oh, I feel this is the point I should include the standard disclaimer that I will do my darndest to tie this into gaming Real Soon Now.

Anyway, *Flightplan* was an enjoyable enough movie; Jodie Foster is always a joy to watch, the direction was neat, and the story was diverting enough. Really, there were only two crimes the movie committed. Its second-biggest crime wasn't its fault at all; the DVD we were watching was the full-screen version, since my mom chooses that edition so she can watch the bigger picture without glasses. Unfortunately, on the widescreen television this gave Jodie Foster's normally cute face the appearance of a cross between an Alien Grey and Miss Piggy.

The second crime, however, is the fact that the plot -- while eminently enjoyable to watch -- had the resilience of a soaking wet piñata, as if any hole poked in the film would reduce it to liquid tissue paper.

And it was sometime during the discussion of this film I found myself asking a question, one which pertains to (ta-DAH!) gaming: What obligation do we have for our plots to make sense?

It's a question that, the more I thought of it, the more I realized wasn't as easy to answer as I thought.

So, what are our possible answers to this question? Well, here's some I thought of.

The plot must make sense, from an absolute viewpoint. This view holds that, ideally, the plot must withstand intense scrutiny from the players, their characters, and the GM. After all, if the plot revolves around a master villain who's spent a decade hashing out all the details of his plan, then it stands to reason that he's considered just about every possible complication and contingency.

While this may seem to be the logical place for most plot-crafters to aspire, it's also (obviously) the most difficult. See, the problem is that, in most action-adventure plots -- especially those that want to seem suitably epic -- there simply aren't that many foolproof options for most villains to exploit; they either need to have relatively unambitious plans (such as robbing one bank), or they need to have lots of accomplices and help, any of whom have a reasonable chance of turning or otherwise.

The plot must make sense, but can contain aspects that can be explained away retroactively. Some plots may seem to have plot holes, but they're small enough that they can be explained away. **The plot makes some sense, but only in a vague way; the odds of success are so slim that the plot is basically illogical.** This is the tack taken by a lot of action-adventure movies with dramatic overtones, where the hero will say something along the lines of, "Did you really think you could get away with this?!" Really, every James Bond plot ever falls into this mold; the number of things that can go wrong in a standard Bondian scheme are such that, even if 007 stayed home eating nachos and playing Dreamcast, there'd still be less than a 10% chance the bad guy would succeed.

The plot doesn't need to make sense; all that's important is that *someone* thinks it makes sense. This is actually an interesting option for the gaming world, because it's something the players don't often think of; in this case, the master villain's plot can range from the slightly off-base ("If I kidnap the Prime Minister, then she'll fall in love with me!") to the completely cuckoo ("If I can kill all first-born males in the city with four-letter names, then I will be king . . . because 'king' has *four* letters!").

The plot doesn't even need to make a lick of sense to the participants. Frankly, this is a surprisingly common approach, especially in more fast-paced adventures. Most Jackie Chan movies fall into this mold, as do many adventure serials. In these tales, the villains may *seem* to have a master plan, but on some level you get the impression that not even they are buying it. A clue that the adventure might fit this description is that there is a piece of dialog that goes something like, "Don't you see?! If he gets control of the Rakahara Ruby, he'll control all drug imports on the East Coast! He's already murdered Officer Murphy; who's *next?!*" And the next scene begins with another murder, a fight for the Rakahara Ruby, or a battle on a cruise ship made entirely of drugs. A good real-world example of this is the 1966 *Batman* movie, where the master plot somehow involves using a dehydrator to dehydrate and capture world leaders to hold them for ransom . . . or something.

The advantages of this approach are numerous; the GM doesn't need to worry about making sure the plot is airtight, and can spend more time making sure the set pieces are as exciting as possible. Of course, the downsides are also considerable; it will generally be up to the GM to guide the players along, since logic and reason alone can't be relied upon to advance the plot. (Fortunately, bad guys in these stories are often klutzy with their clues: "Well, he got away; but that last punch seemed to knock something out of his pocket: a matchbook for the Tasty Tuna Undersea Bar & Grill. Let's go!") In all, I think that the sensibility of a plot is like so much of the gaming world: it doesn't much matter what the answer is, just so long as all the players know ahead of time that they're along for the same ride. Of course, that's usually the default assumption when you're on a plane with Jodie Foster.

The Big Box Magic Store

Inexpensive Magic Items for *GURPS Fourth Edition*

by Matt Riggsby

Sure, enchanted items are neat, but they're *expensive.* You can get a wand that hurls explosive fireballs or a sword that can penetrate plate armor as though it weren't there. However, that wand costs $40,000 (including the cost of a rather gaudy ruby), and the armor-ignoring sword costs over $800,000! Even lesser enchantments cost thousands. With most enchantments starting at twice the standard starting wealth of the sort of TL3 setting where most fantasy campaigns take place, what's a poor character to do?

As it turns out, the cheapest enchantments cost between $1 and $60. Only a handful of enchantments are that cheap, about 50 spells in all, and some of them aren't suitable for magical items. Tangle Growth, for example, permanently entangles an area, which is no good for the thrifty adventurer on the go. Others may not be suitable for most fantasy campaigns (say, Seek Radiation or Seek Plastic before TL6), or next to useless if they are (for example, Mature and Preserve Fuel). Still, there's a handful of enchantments which may be both useful and affordable. This article will deal with enchanted items available for $1,000 or less and how to use them.

Adjustable Clothing

This $50 enchantment may not seem particularly useful for most adventurers, but depending on how strict the GM is, it might save a fortune in clothing for some lycanthropes and other shape-changers.

Alarm

As an enchantment, Alarm costs $60 per casting. How it might be used depends on how the spell works in the campaign. The GM may rule that the alarm goes off at the same local time every day (say, every morning at the local 6:00 AM). If that's the case, a batch of alarm objects can be used for timekeeping that doesn't require a sundial or astronomy skill. Someone standing a two-hour watch knows that he can wake up the next guy and go to sleep himself when the next alarm object goes off, rather than having to guess when two hours have passed or keep an eye on the stars to figure it out. A military organization might *love* that.

However, if the alarm goes off at the same absolute time (that is, not correcting for time zones), it becomes an aid to navigation as well. For example, consider an alarm that goes off at noon. If a character with a little skill in astronomy checks the height of the sun when the alarm goes off, he'll be able to figure out how far east or west he is of where the alarm was set based on the difference between its current height and its maximum height, a feat not possible in mundane navigation until the beginning of TL 5.

Armor Enchantments

Where The Money Goes

We'll take as given the economic assumptions spelled out in *GURPS Magic:* Enchantments cost $1 per point of energy up to 60 points, then $33 per point for enchantments which take more energy than that. There's a large gap between enchantments which cost up to $60 and those which start at $2,013. Of course, much depends on assumptions. A lack of ready assistants for enchanting drives the $33 threshold down, while a higher average skill for enchanters could push it up. If, for example, master enchanters had an average skill of 24, the maximum energy for cheap enchantments would rise to 100, making a vast number of other enchantments readily available. Different pay for magicians would likewise lead to different prices. Even under the circumstances assumed in *GURPS Magic,* there'd be some fuzziness around the 60 energy point, with a number of lesser enchanters not quite able to use five assistants and a handful of highly skilled enchanters able to use more. However, since the 60 energy break point is what's in the

Slightly enhanced armor is well within the reach of the frugal adventurer. +1 to DR from Fortify is available for $50 for a full suit of armor, but anything higher than that is out of reach, and Deflect for full suits of armor is unavailable in the price range. However, since there are discounts for casting most armor enchantments on individual pieces, it's possible to build up a well-enchanted suit of armor from parts. The chart below shows the cost of affordable armor enchantments by piece (*not* including the cost of the armor itself).

Part	*Fortify* DR +1	DR +2	DR +3	*Deflect* DB 1	DB 2	DB 3
Full	$50	NA	NA	NA	NA	NA
Torso	$25	NA	NA	$50	NA	NA
Groin	$5	$20	$80	$10	$50	NA
Neck	$2	$5	$20	$3	$13	$50
Arms	$8	$30	NA	$15	$75	NA
Legs	$15	$60	NA	$30	NA	NA
Hands	$3	$10	$40	$5	$25	NA
Feet	$4	$15	$60	$8	$38	NA
Head	$5	$20	$80	$10	$50	NA
Skull	$3	$10	$40	$5	$25	NA
Face	$3	$10	$40	$5	$25	NA

The Lighten enchantment is also affordable for individual pieces. This chart shows the cost for enchanting individual pieces of armor for each level of weight reduction:

Part	-25%	-50%
Torso	$50	NA
Groin	$10	$20
Neck	$3	$5
Arms	$15	$30
Legs	$30	$60
Hands	$5	$10
Feet	$8	$15
Head	$10	$20
Skull	$5	$10
Face	$5	$10

Beneficial Charms

Several inexpensive protective charms are available within the price range: Amulet, Bless, and Talisman. Prices for such charms in our price range are listed in this table:

Spell	Cost
Amulet +1	$50
Bless +1	$10
Bless +2	$20
Bless +3	$30
Talisman +1	$15
Talisman +2	$45

The main drawback for these inexpensive enchantments is that they provide a limited number of uses. Amulet and Talisman are also extremely specific. However, if adventurers research their opposition well, they can pick out a few appropriate amulets and talismans to give them short-term but vital protection against their enemy's most powerful

abilities.

Cook

An enchantment allowing a cooking pot to cook one meal a day costs $30, and an enchantment cooking two meals costs $60. This is, of course, a luxury rather than vital gear, but it can be very convenient for frugal adventurers. It can save some money on long journeys, letting them cook fresh food purchased along the way rather than having to carry quantities of preserved food, and might give a small bonus to Survival rolls, since the cooking process will likely kill mundane bacteria and parasites in wild foods.

Curses

There are two "curses" available in this price range: Curse ($10 per point of penalty up to -3), and the version of the Itch enchantment which causes the bearer of an item to itch uncontrollably ($50). Stealthy characters might drop these into the pockets of enemies, although they'll fall victim to their ill effects while carrying them, so they'd best make the attempt under ideal conditions.

Darkness

Darkness ($12 per square foot up to 5 square feet) and Blackout ($15 per square foot up to 4 square feet) could be cast on long strips of rug, which could be unrolled to create a six-foot-tall barrier of blackness. They wouldn't be particularly useful in a combat situation, but they could be used to conceal small encampments at night. A group of adventurers could surround their position with Darkness or Blackout rugs. Within the perimeter of the rugs, they could cook on fires, light candles for reading, and so on, and remain essentially invisible to people outside (from a distance, anyway; the darkness doesn't stop sound).

Impression Blocker

This enchantment is available for containers holding up to three pounds at a cost of $20 per pound. Characters limited to this level of expense might not ever carry something important enough that it matters whether or not it's associated with them, but small-time smugglers might want to be sure illegal goods can't be tracked back to them.

Inscribe

For $30, characters can buy a pen or brush which leaves a mark on any solid surface without needing ink or paint. This could be useful for leaving navigation marks in underground labyrinths, outlining secret doors, and so on. Charcoal is infinitely cheaper, but an Inscribe-enchanted object could leave marks in a bright color, more visible in dim chambers and on dark backgrounds.

Knot

A one-yard length of rope may be permanently enchanted with the Knot spell at a cost of $60 (longer pieces of rope, unfortunately, cross the 60 energy threshold). It's not enough to produce a secure means of tying a climbing rope, but that should be just enough to tie someone's arms or legs, making it somewhat harder to escape from. It may also be used to more securely tie animals to a hitching post if there's a chance that they'll be stolen or try to run away themselves.

Missile Enchantments

Both Accuracy and Puissance are at a considerable discount if cast on individual arrows. It's a very high premium ($25 for each), and any more than a +1 to hit and damage takes it the cost well out of the discount price range, but a few special arrows might give an archer the edge he needs for a really important shot.

Odor

The Odor enchantment, available for $40, is cheap enough to be a popular consumer item. Socially oriented characters might carry one or two as a low-cost alternative to perfume. However, there's a potential adventuring use as well. If a character can find an enchanter who can become familiar with his own personal scent (which may require a non-human enchanter or one with spells enhancing his sense of smell), he could get an Odor-enchanted item which could be used to deceive anyone attempting to track him using scent.

Pentagram

At a cost of $1 per square foot, it's possible to create a pentagram just under six feet on a side for $60. A reasonably large pentagram could be installed on any budding magician's floor.

Preserve Food

This enchantment, $20 per pound up to three pounds of food protected, may be of little use in most circumstances, but can pad out the amount of fresh food a character can carry in harsh environments. It may be particularly useful used with the Cook enchantment.

Purify Air

An enchantment allowing the user to cast Purify Air costs $50. Poisonous gasses are rare at low TLs, but it would be very useful for clearing out smoke and could be of some use in underground chambers where the air is stale.

Seek Spells

A number of Seek spells are available for reasonable prices, listed in the chart below:

Spell	Cost
Seek Air	$60
Seek Earth	$50
Seek Fire	$50
Seek Fuel	$60
Seek Plant	$50
Seek Power	$60
Seek Water	$40

The important caveat here is that an item enchanted with Seek Earth can only find one type of earth, which is set at creation and requires a one-ounce sample. It can, therefore, be a useful tool for prospecting, but requires some forethought and perhaps significant additional cost. Depending on the price of gold, a Seek Earth tool is likely to require an additional $60 to $120 for the one-ounce sample. Although a Seek Earth tool could be set to search for silver, copper, or other metals, metals other than gold are rarely found in a native state. A prospector would be wiser to get one set to find far more plentiful ores instead of pure metals. Seek Water would be very useful for characters traveling through wilderness, perhaps giving a bonus to Survival skill in dry environments.

Skull Spirit

For the character hoping to do a little damage, this may be the most cost-effective enchantment available, at a mere $40. Skull spirits are both frightening and very difficult to kill, making them excellent for diversions and harassing attacks. Still, like many other cheap enchantments, this is another one-shot spell; the enchanted skull crumbles into dust and can't be reused. It may also be illegal to cast the spell and carry around a dangerously enchanted skull in most civilized regions.

Smoke

The Smoke enchantment, available for $50, is another good bet. A Smoke-enchanted item lets anyone (including mighty warriors, who may have plenty of fatigue to burn) put up an eye-stinging smokescreen to cover their retreat. It will, of course, be particularly useful indoors, with no wind to blow the smoke away. On the other hand, since Purify Air is a relatively cheap enchantment as well, smoke clouds may end up being dispelled quickly.

Sound Spells

Objects can be enchanted to make sounds constantly with Sound ($50) or Voices ($20 per word up to three words). Unfortunately, the Link enchantment, which could be used to turn the sounds on and off, costs far to much to use here, so adventurers using these enchantments will have to live with enchanted objects that won't shut up. However, they might be muffled by wrapping them up in the middle of any other baggage the adventurers may be carrying. They might be used as a distraction or deception. For example, an object might be enchanted with the sound of marching feet, making it sound like an out-of-sight opponent has a far larger force with him than he really does, or the sound of snoring, so that a character can slip of out his bed and sneak around at night without people listening at the door being any wiser.

Stench

The Stench enchantment, $60, produces effects similar to Smoke but even more potentially harmful. Adventurers might use Smoke if there's reason to make the cloud appear natural (or at least mundane), or Stench if they don't mind their enemies knowing that they've got at least a bit of magical ability. Again, cheap Purify Air enchantments may render this far less useful.

Stored Spells and Energy

These enchantments probably give you the most bang for your buck. Six enchantments involve charging up a small, valuable stone with mystical power for later use: Powerstone, Single College Powerstone, Manastone, Spellstone, Spell Arrow, and Blank Spell Arrow. Spellstones and Spell Arrows in particular give adventurers access to magical abilities they might not otherwise have.

There are a number of drawbacks to these items, though. Again, most are single-use. Manastones can be recharged, but only when you've got access to a moderately skilled enchanter. The second and more important factor is that the enchantments may not be expensive, but the necessary materials are. Small enchantments may be cast on tiny and relatively inexpensive stones, but the cost of the stone increases with the square of the cost, putting items with the these enchantments out of the price range of the average starting character at about seven points of energy. The chart below shows the costs for powerstones and other spell and energy-storing items which cost up to $1000.

Power	Powerstone	Manastone	Single College Powerstone	Spellstone	Spell Arrow
1	70	55	62	70	80
2	165	135	149	165	185
3	280	235	256	280	
4	425	365	393		
5	595	520	555		
6	790	700	742		
7	1000	895	944		

Teleport Shield

A small rug or bit of wood or tile no larger than a square foot can be enchanted with Teleport Shield for $50. By itself, that's hardly any protection at all. However, a series of Teleport Shield tiles might be used to pave a larger area in which no one can teleport for a reasonable price.

Touch

An item with the Touch enchantment, $50, might be used by someone not entirely confident with his Stealth skill. For example, he might come close to a sentry, use the Touch object to "tap" him on one shoulder, then quickly come up from the opposite side.

Working To Avoiding Cancellation While Avoiding Work

At the beginning of the fall season there was a promising show, the premise of which was one of the more interesting ones I'd heard in a while. It was called *Reunion,* and it had, to me, a sure-fire hook: a 20-part series, each part of which would take place in both the modern times and one year of the past, starting with 1985. The story centered around a group of five friends, one of whom was murdered on the eve of her 20-year high school reunion, supposedly by one of the others.

The show had a fair number of interesting twists and fake-outs; for example, the identity of the *victim* wasn't even revealed until the end of the fifth episode, with the first four episodes told from the point of view of the police interrogation of the friends. Unfortunately, the show's ratings were just below the 5:30AM rebroadcast of *Farmer Jed's Extreme Bass Fishing and Farm Report,* and it was canceled after nine episodes. The who in the whodunnit was entirely unrevealed (although the show's creators have shed some light on who their likely suspect was) and the whys are completely unknown.

In short, all nine fans of the show were completely cheated by the opening offering: "Stick around for 20 years of nostalgia and mayhem and a murder mystery which will, presumably, be resolved."

While I don't begrudge FOX (the show's network) its decision to stop airing the show; they have really busy schedules, mostly taken up by canceling other shows. But it does bring up a reason that I don't like to become attached to many shows: they have a habit of getting canceled.

While this doesn't affect my enjoyment of most self-contained episodic TV shows (such as the long-gone cult Nick-at-Nite series *On The Television*), it's obviously a problem for shows with any more developed story arcs. And, of course, this problem has come to plague many of my own RPG campaigns, as well as those of many other campaigns, games, and game lines. Because, when I develop a campaign outline, I'll often have a continuing arc in mind, with the seeds for plot developments and revelations dropped in that first adventure. And, just like a TV series, I've had more than my fair share of campaigns peter out after an adventure or two (for various reasons), never to meet again. And all those glorious storylines are doomed never to see the light of day.

Unfortunately, even though I'll have all these great ideas in mind, I'm still not able to do much with them when the series is over. In my case, the problem's usually two-fold. First, I'm usually in denial that a series is actually over. Second, the problem with these kind of plot nibblets is that their summation usually doesn't have much impact out of context:

"Oh, you know how the king was coughing in the first adventure? He was actually a zombie."

See, that should elicit little more than a "Huh."

Even with a bit of elaboration, it may not be much more satisfying:

"Oh, you know how the king was coughing in the first adventure? It turns out he'd died a decade ago, and was being kept alive by his necromantic adviser, unknown to all (including the king). In the sixth adventure or so, you were going to uncover the adviser's true nature, and defeat him. Unfortunately, that means the king wasn't receiving his monthly potion, and he was going to start deteriorating rapidly. This was going to set the stage for a decision on your part as to whether or not you'd dabble in necromancy to maintain the status quo."

As a player, I've faced the same problem: elaborate character backgrounds, lots of juicy secrets and plot hooks, the works . . . only to have the series end after a session or two. Sometimes, I feel like I need to provide explanations after a campaign dies: "See, my character wasn't *really* trying to steal from you; he's just under a magical compulsion by a fairy to experience something new each day, and for the most part he satisfies that urge by touching things that don't

belong to him." But, really, there almost isn't much point.

So how can you, as a GM or player, mitigate the possibilities of wasted effort, while still coming up with things that will still be sufficiently nuanced and interesting? Well, here are a few tips I use myself:

Paint in broad strokes. Really, it's usually enough (for me, at any rate) to come up with some broad ideas, and hash out specifics later (assuming there *is* a later, of course). In the case of GM plots or character backgrounds, all that's necessary to come up with is the external manifestation of what the PCs experience. In our king example above, all that's necessary to conceive is that the king is coughing, and in the character example all I need to know is that my character likes to touch stuff compulsively.

Latch on to details after the fact. If there's a trait of the adventure or character that has struck a positive chord with the players, then it's possible to make a note of that and incorporate it later. This is an even lazier option than painting in broad strokes; in this case, if you include a bit of detail about the king coughing (without any further plot in mind), and the players pick up on it and *think* it's important, then why not indulge them? And if the campaign gets canceled before then, then no real effort was wasted!

Think for the long term *and* the short term. It's not always necessary to have plot threads dangle out there that'll take a year in game time to be unwound fully. Sometimes it's enough to do the same thing. (And, of course, a successful plot that spans *two* adventures can often be revisited.) So maybe the king's necromancer makes his play for power in the second adventure, and the king's health deteriorates in the third. The shorter the timeframe, the greater a chance of seeing the plot to fruition. And, of course, making sure each adventure is as self-contained as possible will do a lot to keep the pieces satisfying even if the greater whole isn't contained by the group.

Regardless of how this thorny problem is tackled, it's possible to have long-term story ideas without having those ideas lost if the campaign doesn't last. Just make sure you don't tell the executives at FOX about your game; it'll never make it past a month.

--Steven Marsh

The Cannibal at the North End of the World

by Bevan Thomas

In many fantasy stories and roleplaying games, deities, spirits, and such creatures are polarized into camps of good and evil with clear distinctions made between the two. However, the relationship between the human and supernatural worlds is often far more complex in mythology, requiring people to achieve an understanding with the dark primal forces that surround them.

Such a force is Baxbakwalanuxsiwae, a mighty spirit that haunts the legends of the Kwakiutl people of British Columbia, Canada (and is comparable to the Algonquin ice giant Wendigo). His name has been translated as "Cannibal at the North End of the World," "He Who is First to Eat Man at the Mouth of the River," and simply "Cannibal." To most, he is a being of terror, sweeping down from the cold north hungry for human flesh. However, to those who know his sacred rites, he is also a source of knowledge and power.

This powerful spirit is appropriate for any campaign where such beings control aspects of human existence. Though a creature of Kwakiutl folklore, the Cannibal can easily be adapted to other cosmologies, presenting an unexpected source of danger and knowledge to those who stumble upon the enigmatic entity.

Baxbakwalanuxsiwae   *1,388 points*

Age indeterminate; 9'; 1,000 lbs. In his true form, the Cannibal resembles a bear, with a hunched-over body covered in dark, tangled fur. However, his face is that of an ogre, with burning red eyes and huge tusks. Most hideous of all are the gaping, bloodstained mouths that cover his body. They speak in unison when the Cannibal talks, creating a ghoulish choir. He is usually naked unless dressed in his shape-shifting cloaks (see below).

Attributes: **ST** 25 [250]; **DX** 14 [80]; **IQ** 18 [360]; **HT** 14 [40].

Secondary Characteristics: Dmg 2d+2/5d-1; BL 125; HP 25 [0]; Will 21 [15]; Per 21 [15]; FP 14 [0]; Basic Speed 7 [0]; Basic Move 7 [0].

Advantages: Alternate Form (hokhiku; can be stolen 10%) [26]; Alternate Form (raven; keeps IQ; can be stolen 10%) [14]; Discriminatory Smell [15]; Humanoid Man-Eater [29]; Jump (world, only to and from Spirit World -60%) [40]; Possession (spiritual -20%) [80]; Speak with Animals [25]; Spirit [261]; Temperature Tolerance 10 (cold) [10]; Terror (hearing, -3 to fright checks) [60].

Disadvantages: Bloodlust (12) [-10]; Callous [-5]; Code of Honor (Hospitality) [-5]; Curious (12) [-5]; Frightens Animals [-10]; Gluttony (9) [-7]; Needs to Eat and Drink [-10]; Odious Personal Habit (Eats other sapients) [-15]; Restricted Diet (Fresh Meat) [-10]

Quirks: Always calls out "Hap! Hap!" when attacking; Proud [-2]

Languages: Haisla (Accented) [4]; Heiltsuk-Oowekyala (Native) [6]; Kwak'wala (Accented) [4]; Spirit Tongue (Native) [0]

Skills: Area Knowledge (Pacific Northwest Coast)-18 [1]; Area Knowledge (Spirit World)-18 [1]; Brawling-17 [8]; Dancing-14 [2]; Detect Lies-21 [4]; Diplomacy-17 [2]; Fast-Talk-18 [2]; Gambling-18 [2]; Herb Lore-18 [8]; Hidden Lore (Spirit Lore)-20 [8]; Intimidation-21 [2]; Literature (Pacific Northwest Coast)-18 [2]; Meditation-20 [2]; Musical Instrument (Whistle)-17 [2]; Naturalist-18 [4]; Navigation (Air)-18 [2]; Observation-21 [2]; Occultism-20 [8]; Public Speaking-18 [2]; Religious Ritual (Kwakiutl)-18 [4]; Ritual Magic (Pepaxalai)-18 [8]; Singing-15 [2]; Sleight of Hand-13 [2]; Stealth-16 [8]; Survival (Arctic)-21 [2]; Survival (Woodlands)-20 [1]; Symbol Drawing (Pepaxalai)-18 [4]; Teaching-15 [2]*; Theology (Kwakiutl)-18 [4]; Tracking-21 [2] *Includes 3 for Callous

Humanoid Man-Eater   *29 points*

The natural form of the Cannibal.

Secondary Characteristics: SM+1

Advantages: Claws (sharp) [5], DR 3 (skin) [9]; Extra Mouths (all over the body) [50]; Fur [1]; Penetrating Voice [1]; Teeth (fangs) [2]

Disadvantages: Disturbing Voice (ghoulish choir) [-10]; Horrific Appearance [-24], Semi-Upright [-5]

Hokhiku   *45 points*

When hunting, the Cannibal dons his transformation mask and cloak of feathers, and takes on the form of the hokhiku. This creature is a bird with a long, thin beak, feathers as black as night, and a wingspan of 60 feet. Its voice is similar to the hooting of an owl, though the words of the Cannibal's hunting cry can still be made out. He uses the hokhiku's beak to crush his prey's skulls in order to consume their brains.

Secondary Characteristics: SM+1

Advantages: Acute Vision 3 [6], Claws (talons) [8], Enhanced Move 1 (Air Speed 28) [20]; Flight (winged -25%) [30], Night Vision 5 [5], Penetrating Voice [1]; Silence 3 [15]; Teeth (sharp beak) [1]

Disadvantages: Disturbing Voice (echoing croak) [-10]; No Fine Manipulators [-30]

Biography

Deep in the Spirit World, at the North End of the World, there is a huge mountain trapped in an eternal blizzard, its pine trees forever buried in snow. This mountain is known as Naualakum (Supernatural-Face-Mountain), and it is on its slopes that the Cannibal makes his home. His lodge resembles a longhouse such as those found in the villages of the Pacific Northwest Coast, but it is of massive size and the smoke that constantly billows from its chimney is red as blood. The inside of the longhouse is always covered with red-cedar bark, and usually smells of cooked meat. For much meat must be cooked to fill the Cannibal's great belly.

Baxbakwalanuxsiwae shares his home with his wife Qominaga. She is the one who usually prepares the bloody meals with the assistance of her slave Kinqalalala. Though Qominaga appears similar to her husband, she is usually dressed in red and white cedar bark, and is more domestically inclined (her skills focus more on cooking and housekeeping than on hunting). Her powers are more-or-less identical, and she even possesses similar shapeshifting cloaks. The few times that Qominaga goes hunting, she takes the form of the gelogudzayae ("crooked-beak-of-heaven"), a large bird with a strange hooked beak (and stats comparable to that of the hokhiku).

A long time ago, a young Kwakiutl man wished to know the secrets of the Spirit World, and so he set out to find Baxbakwalanuxsiwae and learn from him. After overcoming countless hardships, the man finally arrived at Naualakum and presented himself to the Cannibal. The spirit was impressed by the man's dedicated, courage, and cunning, and as a reward, possessed him. This drove the man insane, and he ran screaming back to his village, hungry for human flesh. Eventually, the man managed to regain his sanity, resist the hunger, and even learned how to channel the spirit's power. The man became a prominent pepaxalai (a shaman, literally "powerful one"), and the creator of the Hamatsa cult, a secret society dedicated to the veneration of the Cannibal and the channeling of his power.

Motivations

Above all, the thing that motivates Baxbakwalanuxsiwae is hunger. He craves fresh meat, particularly the flesh of humans and other sapient beings, and is absolutely merciless in getting it. He is a very wise spirit, and when not eating, usually spends his time in contemplation and the pursuit of knowledge. He is venerated by a mystic order known as the Hamatsa, and is pleased by their rituals, which serve to pacify him and decrease his hunger for flesh. However, not even the Hamatsa can stave off his hunger for long, and the Cannibal must always return to the hunt.

Encountered

The mortal world is usually too warm during the spring and summer months for a creature who has made its home at the North End of the World. Therefore the Cannibal only goes hunting in the mortal world during autumn and winter (making due with much less filling spirit prey during the warmer months). When leaving his home, he dons a transformation mask and magic cloak of black feathers, exchanging his bear-like form for that of a bird's. Depending upon which mask and cloak he takes, the Cannibal will fly off as either a raven or the hokhiku bird. The raven is used for spying, reconnaissance, and to feast on fresh carrion (in this form, Baxbakwalanuxsiwae has a taste for eyes). The hokhiku is used for hunting.

The Cannibal prefers to hunt at night, particularly during storms, and will fly through the night, almost invisible against the night sky until he detects worthy prey. Then he comes down like a thunderbolt, calling out his hunting cry in a bizarre, twisted voice. The cry is "Hap! Hap!" which means "Eating! Eating!" Those who hear the horrible cry and see Baxbakwalanuxsiwae bearing down upon them are often paralyzed with fear, allowing the Cannibal to devour them at his leisure.

If he is feeling particularly hungry, then the Cannibal will consume his prey's eyes and brain then and there, leaving the ruined carcass for scavengers. However, the Cannibal prefers to simply stun his victim, and carry the unconscious prey off in his talons back to the slopes of Naualakum and to Qominaga's stew-pot.

When full, or at least less ravenous than usual, Baxbakwalanuxsiwae is contemplative and inquisitive. He often tests those he encounters, presenting them with challenges to see if they are worthy of knowledge or mystic advice. The Cannibal will temporarily possess those he deems particularly worthy, transforming them into hamatsa. Though this can be an opportunity to learn much, it is also dangerous in the extreme. For unless the people are the Cannibal's guests in his lodge (and thus protected by the laws by hospitality), he would feel no compunction about devouring them should he get hungry. However, he is impressed by courage and ingenuity, and if particularly impressed by a person's bravery and cunning, Baxbakwalanuxsiwae may decide to seek prey elsewhere.

Variations

Though Baxbakwalanuxsiwae is presented as an ambiguous figure by the Kwakiutl, some nearby Native groups portray him as entirely malevolent. For example, in an Owikeno legend, the Cannibal kidnaps a chief's daughter and forces her to be his wife. After the chief's sons rescue their sister, he invites the Cannibal into his lodge for dinner and then pushes the creature into a concealed fire-pit. After the Cannibal is completely burned, his ashes transform into the first mosquitoes, creatures that will feed on humanity forever. Such a creature is a clear-cut threat, a monster the PCs can battle without misgivings. This version of the Cannibal would lack the Curious disadvantage, probably possessing Sadism instead.

Hamatsa   *30 points*

Advantages: Blessed [10]; Channeling [10]; Medium [10]; Patron (the Cannibal, 6 or less) [10]; Reputation +3 (with all people who respect the Hamatsa, recognized sometimes) [4].

Disadvantages: Bloodlust (12) [-10]; Duty (performing the Hamatsa rituals) [-5]; Gluttony (12) [-5].

Skills: Hidden Lore (Spirit Lore) (A) IQ [2]; Religious Ritual (Kwakiutl) (H) IQ -1 [2]; Theology (Kwakiutl) (H) IQ-1 [2].

Variant: If the GM wishes for the Hamatsa's powers to instead be represented by magical spells, then replace the supernatural advantages with skill in Ritual Magic (Pepaxalai) and Symbol Drawing (Pepaxalai) and add levels of Ritual Magery. Mages who invoke the power of the Cannibal would likely favor spells from the paths of Animal, Communication and Empathy, Food, Knowledge, and Necromancy.

A long, long time ago, a young man was brave enough to travel to the North End of the World and petition Baxbakwalanuxsiwae to grant him power. Once the man regained his sanity, he taught to others the secrets that the Cannibal had taught him, and thus was the Hamatsa, the Cult of the Cannibal, formed. A secret society dedicated to pacifying and channeling the Cannibal spirit.

Anyone wishing to join the society must first stay in the wilderness for four days. If found worthy of membership, he is possessed by Baxbakwalanuxsiwae and driven temporarily insane. On the fourth day, the initiate runs back into the village in a frenzied state, biting anyone he can reach. He must be lured inside the Hamatsa's sacred longhouse (representing an integration of the Cannibal Spirit with the village and its inhabitants), where he is forced to participate in a ritual dance and must then consume and disgorge large quantities of salt water and raw meat. As the initiate vomits forth the meat, he cleanses himself of most of his insanity, while still retaining the Cannibal's power.

The Hamatsa perform dances during the Kwakiutl winter ceremonies. The dances reenact the adventures of their mythic founder and serve to both pacify Baxbakwalanuxsiwae and draw upon his strength and wisdom. They are an attempt to balance the civilized human world with the gluttonous savagery of the wilderness. They also allow the people to participate in the cycle of predator and prey that embodies the natural world, providing purification for all present.

When not participating in these ceremonies, the Hamatsa serve as intermediaries between the material and spirit worlds, seeking to balance the needs of the spirits with the needs of the tribe. They also receive visions that assist them in their duties as advisors. However, this power comes at a price, for each hamatsa must wrestle with the gluttonous nature that the Cannibal has instilled in him.

The Cannibal in the Campaign

Baxbakwalanuxsiwae is most obviously appropriate for a Horror, Illuminated, or other kind of setting in which characters explore variations of real-world legends and ghost stories. However, he could be transplanted to a Fantasy campaign with ease: the Cannibal could be affiliated with some tribal culture akin to the Kwakiutl, or be entirely on his own, his lodge on some isolated mountain, waiting for a group of adventurers to stumble upon him.

The most obvious use for the Cannibal is as a villain, with the PCs struggling to stop the spirit from pursuing any more prey. However, another possibility is for him to possess knowledge or capabilities that the characters require, forcing them to try and strike a bargain with Baxbakwalanuxsiwae. This bargain may entail some difficult task (such as scaling Naualakum or beating the Cannibal in an arm-wrestling match), or might even require that a PC be possessed by him.

Depending upon the situation, the Hamatsa could serve as patrons, allies, or enemies for the PCs. They are sources of spiritual knowledge and wield a lot of power in their tribal communities, as well as being some of the few people able to mollify the Cannibal. This would make them useful friends, and even more dangerous foes.

Social Treasures

for the *d20 System*

by Lloyd Brown III

Familiarity breeds contempt . . . even if it's gold and shiny. Creating new and interesting ways of rewarding characters besides yet another round of gold coins is always a challenge for a Dungeon Master.

Offering characters unusual equipment or monster body parts helps offer a little variety from time to time, but that leads to rampant cases of packrat-ism: characters buy huge transport devices so that they can return an entire dungeon's contents back to town for sale. Unusual goods are a stopgap measure on the path to interesting treasures.

Social treasures, on the other hand, not only solve questions of portability, but they carry prestige. A single diamond, once spent, is gone. A seat on the town council provides the character with bragging rights and adventure opportunity for much longer.

Social treasures have no meaning outside of a society, so they might not be appropriate for all campaigns. Pure dungeon-crawling campaigns, where cities exist only for the conversion of loot into gold, will find little use. On the other hand, in urban-based campaigns, in which most activity takes place within a town or city, social treasures encourage roleplaying around them.

The best way for a DM to use social treasures is as a reward for accomplishing a mission rather than as items found in a hoard. The DM can use them to augment a fair treasure gained during an adventure, or offer only very light treasure in the course of the adventure, relying on social treasures for the bulk of the party's reward for that story. Attaching a value to these incentives, which many DMs use already, helps keep the heroes' buying power in line with their level.

Characters may not sell social treasures. If they choose not to accept them, or if they decide they no longer want them, they usually revert back to the person who gifted them. Characters who abuse their privileges may find them revoked.

Room and Board

Self-sufficient (less than 50 gp): Free provisions of this level might include the right to stay in an inn's stable or use an old tool shed that the character might be able to repair into a suitable lodging with sufficient time and effort.

Meager (75 gp): Meager provisions generally offer the same boarding options as the self-sufficient lodging, but it supplements it with the occasional meal and a helping hand with the laundry, sewing and other mundane chores.

Poor (150 gp): Poor room and board might include a room in a small cottage or a boarding house, although the character probably shares bathing facilities. The character can count on solid (if tasteless) meals, as well as feed for one mount or animal companion.

Common (500 gp): Private rooms are standard, including bath. Such boarding is comparable to a small manse or rectory and is either on church grounds or inside the local lord's keep. The character can afford the space to house a guest, a servant, or a spouse. The character's mount is both fed and groomed and even maintained in the character's absence reasonably well.

Good (1,500 gp): With a good lifestyle, the character can afford to go to the theater, eat in popular restaurants, and ride in a coach on special occasions. The food is good and plentiful. The housing is private, fairly secure against common thieves, and both spacious and attractive enough to entertain a moderate number of guests on regular occasions.

Extravagant (2,500 gp): An extravagant lifestyle allows for epicurean eating, wanton purchases of new clothes or other niceties, frequent professional entertainment for a large number of guests, and a generous gift budget. Housing is spacious, with a pleasant view, and in a safe location. Servants attend to every domestic need.

Private Residence

City Home, Common (1,000 gp): A typical small city home with three rooms has no decoration, merely functional chairs, a hard bed and a smoky stove. Curtains divide the rooms and the place is not very private. It could be an apartment or part of a row of similar homes, but it probably isn't freestanding. Its construction ranges from daub and wattle to mud brick to thin wood and thatch.

City Home, Good (5,000 gp): This home is a sturdy freestanding building of stone, brick, or wood. It has two or more private bedrooms, a separate kitchen and might have a distinct storage area, such as an attic or a basement. It might include a small exterior building as well -- a workshop, an outhouse, or both. The home contains more generous furnishings, but the space could still use a few hundred gold pieces' worth of customization.

City Home, Wealthy (25,000 gp or more): This home features multiple stories, spacious rooms, and comfortable furnishings. This treasure includes glass windows, padded chairs, thick rugs, and locking doors. Maintenance for this home requires that a character spend Extravagant upkeep (if this treasure includes that upkeep, add the two values together).

Tax Breaks

Toll Exemption (25 gp): Tolls are annoying and constant fees that characters face when they travel. They pay to use roads, they pay to use bridges, they pay to use ferries. If they ride mounts to hurry on their way, they pay extra for those. Although the cost of these tolls is minor in each case, their total is burdensome to the frequent traveler. A character with this benefit pays no tolls within its granting authority's lands.

One-time Exemption (variable value): A one-time exemption allows the character access to a certain right without paying for that right. The most common right that PCs desire is the right to carry weapons, although others include the right to operate a church, cast spells in public, or other rights the nobility don't want in the hands of commoners. A typical value ranges from 25 gp to 150 gp.

Tax Exemption (750 gp): The character is exempted from certain fees and taxes. One simple way to implement this benefit is to reduce the upkeep of Common, Good, or Extravagant lifestyles by 20 gold pieces per month. If you apply it to specific taxes as part of a detailed management of character finances, then the value of this reward varies.

Servants

Servant, household (150 gp): The services of a household servant are a mark of distinction in most societies. They remove the burden of household chores from a character and allow that character more time to pursue adventuring opportunities without worrying about mundane issues like cooking and cleaning. Specific servants include cooks, grooms, maids, butlers, porters, laborers, and messengers.

Hireling, skilled (500 gp): This servant might be a craftsman, a scribe, or other character with a useful skill. Instead of plying a trade for a livable wage, the NPC works for the character. Examples include armorers, hunters, tutors, blacksmiths, potters, weavers, musicians, or other bastions of society.

Hireling, expert (2,000 gp): The services of these hirelings are in high demand. While fully capable of working on their own and earning a comfortable living, they also pledge their services to prominent clerics, powerful nobles, or successful merchants. They include architects, spies, alchemists, cartographers, sages, stewards, and diplomats.

Lands & Rights

Farm Income (variable value): The character gains a plot of land. Additionally, serfs or slaves work the land and turn over the income. While the character must allow the workers a share of the crops, the land generates wealth for the character.

This benefit is not coins -- the farmers do not dig up gold coins out of the ground. This reward might be wheat, corn, rice, barley, or alfalfa. This treasure is not one that characters can carry around for the purpose of bribing monsters they find in dungeons. They can spend it locally in return for alchemical equipment, armor or weapons, mounts and other mundane gear (including spell components) and services.

The value of this right is 36 times the monthly income. Thus, if the monthly income is 50 gp, the value of the right is 1,800 gp. Unlike some other social rewards, the character might be able to trade this right in exchange for other goods or services.

Mining Rights (variable value): The character retains the right to keep a certain amount of the wealth to come out of a mine. The mine could be useful metals, precious metals, or some kind of gemstone. The character must turn over the bulk of the proceeds to the sovereign (who owns the land and, therefore, the minerals in it as well), and rulers do not care for deceit.

Mining rights yield returns in coin, not in product. The value of the mining right is 50 times the value of the monthly yield, so a mine that grants its owner 100 gp per month is worth 5,000 gp.

Tax Rights (variable value): Tolls for passage on a road or a stretch of river have vaulted some characters into stratospheric wealth. This gift includes a handful of armed guards whose duty extends only to collecting tolls. Misusing this armed servants could be a serious legal violation that could have this privilege revoked and could land the character in serious legal trouble.

Tax rights are worth 50 times their monthly yield.

Business Share (variable value): This reward describes partial ownership in a shipping company, a trading house, a bank, or some other commercial institution. The character is assumed to be a minority owner, capable of drawing an income but not actively involved in the business's operation.

A business share is worth 50 times its average monthly yield.

Titles

Low Official (150 gp for a one-year term or 1,500 gp for a life-long term): This general office encompasses tax collectors, bailiffs, aldermen, sheriffs, and other officials of various rank and prestige. Not restricted just to government, this category includes church officials such as curates and abbots, low-ranking military officers and lesser university positions as well.

Specific duties and privileges vary, but this treasure class assumes that the official draws a salary in coin and has a certain amount of perks such as servants, clothing, and room and board included. The position might be for a certain term, or it might be for life. For positions such as aldermen or bailiffs, the character is guaranteed the position for a year, and then must continue to earn it somehow (either by exercising ranks in an appropriate Profession or by earning more social treasures from the city's leaders).

A Low Official must maintain at least Common upkeep.

A Low Official gains a +1 circumstance bonus to Charisma checks made in the community in which he has authority. This bonus applies to Charisma checks and to Charisma-based skill checks such as Diplomacy and Bluff, but it only applies to people part of the community that celebrated the characters. Thus, it applies to Diplomacy checks made to

convince the councilman to allow a PC cleric to open up a local temple, but it doesn't apply to Bluff checks made to feint against a monster in the dungeon just outside of town.

High Official (3,000 gp): This position might include a member of a city council in a large city, or it might include a key position in a large town (such as a portmaster or a judge); comparable civil positions include university deans and guildmasters. High Officials can appoint other characters (including other PCs) to Low Official positions once per year.

All of these positions assume a lifelong posting. The character can still lose the position due to scandal or misdeed but need not fear loss due to competition or the advancement of underlings.

A High Official must maintain at least Good upkeep.

A High Official gains a +2 circumstance bonus to Charisma checks made in the community in which he has authority.

Town Mayor (7,500 gp): Obviously, the Town Mayor's power and prestige fluctuate with the government structure, the Town Mayor's personal competence, and the size of the town he oversees. This position assumes near-total control over the character's purview, subject only to review afterward. Town Mayors subject to strict supervision from a strong town council should be considered High Officials instead.

In addition to stipend and social benefits, the Town Mayor is immune to persecution for minor violations of the law. On the other hand, the Town Mayor is subject to very severe punishment for major violations. If the mayor assaults the noble who owns the land the town stands on, the town will soon have a new mayor -- whose first duty might be to preside over the funeral of the old mayor.

A Town Mayor must maintain at least Good upkeep.

A Town Mayor may appoint other characters (including other PCs) to Low Official positions once per month. The Town Mayor can appoint a High Official once per year.

A Town Mayor gains a +4 circumstance bonus to Charisma checks made in the community in which he has authority.

City Mayor (15,000 gp): A city mayor has the duties and privileges of a town mayor, but his income and influence reach further. Like a Town Mayor, the City Mayor may appoint other characters (including other PCs) to Low Official positions once per month. The City Mayor may appoint a High Official once per year.

A City Mayor gains a +4 circumstance bonus to Charisma checks made in the community in which he has authority.

A City Mayor must maintain at least Good upkeep.

Knighthood (5,000+ gp): A knighthood is a player favorite among social rewards. Should a character earn a knighthood, the situation calls for far more air time than simply writing the reward down on a character sheet. The reward should call for a high praise, the subservience of peasants, and a fair amount of description of the ceremony itself. It might be worth devoting an entire gaming session to the details surrounding this award.

The knight gains certain rights: namely, the right to travel freely, the right to bear arms and armor, the right to own land, the right of a title and formal form of address, and possible others depending on the campaign. In terms of other social treasures, the knight gains the services of a household servant, a skilled servant, at least Poor room and board (but usually Good), and toll exemption. A knight might or might not own land; if so, he gains farm income as a separate benefit. The ceremony celebrating the character's knighthood is considered a Holiday for the benefits it bestows.

The knight is also obligated to provide service to his lord by an oath of fealty. In addition to his own service, he might be required to provide a certain number of men-at-arms from the lands he controls.

A knighthood is not hereditary; the children of knights are freemen, not knights.

Noble titles beyond knighthood require detail beyond the scope of this article.

Guild Dues

Guild Dues, Minor (50 gp): This gift pays the character's guild dues for a year. The character is still responsible for meeting eligibility requirements, attending meetings, and following regulations. If the reward pays for lifetime membership, the value is 1,000 gp.

Guild Dues, Major (1,000 gp): This reward pays for annual guild dues for a guild that provides free character training as part of its services if the DM uses that option. If the reward pays for a lifetime membership, its value is 20,000 gp.

Fun Stuff

Holiday (250 gp): Holidays are not always formal scheduled events. The ruler and his lesser delegates have the authority to spontaneously order a holiday when the common people need a break. Holidays are good for cooling off tempers, slowing down the progress of internal rivals, and improving morale.

In the case of a holiday aimed at rewarding characters, the characters are praised by the town worthies, and stuffed with food and wine, plied with gifts, entertained with dancers and musicians, and otherwise treated like royalty. Activities might include feasts, parades, or decadent parties that last long into the night.

Characters treated to a holiday gain a +4 bonus to Charisma checks during the holiday (it might last longer than one day), and a +2 bonus to Charisma checks for another week.

Medal (750 gp): Quite different in tone from the holiday, the awarding of a medal is usually a solemn affair, reminding the principals of the often traumatic event through which they earned it.

The character gains a +1 bonus to Charisma checks among characters that know about the medal's importance.

Favor (variable value): Players love favors. With the fantasy world equivalent of a blank check, an NPC who says "I owe you one" usually comes to regret it. Instead of arbitrarily cutting the player characters off when they come back once too often, assign a value to the favor. For example, a favor worth 200 gp might mean that the character loans the party a horse without any expectation of its return. Providing a gold piece value to the reward ahead of time takes some of the mystery out of this player favorite, but subtlety can keep much of the feel. The players can make a Gather Information check to learn what the NPC is capable of and how great his gratitude has extended in the past. In this way, you can justify the out-of-character knowledge of the favor's value.

The Mmorn Commune

by Nick Grant

Just south of some ancient and honorable kingdom, in the heart of some green-forested and blue-laked continent, a dark territory is growing at an unsettling pace. The Mmorn Commune is incorporating bits and pieces of the surrounding nations and building itself up to be a major power. The undead which populate it aren't mindless shambling hordes or vampiric noblemen, but a rhetoric spilling race of intelligent communists, united under a mutual magical transformation.

History

Jacob Mmorn, a communist and a necromancer, had grown disgusted with the state of the world. Everywhere he looked, monarchies oppressed peasants, serfs starved while lords grew fat, and armies of the poor marched as meat-shields for elite, wealthy cavalry. From atop his tower Mmorn pondered the world's problems, postulating and meditating until he finally arrived at the inevitable conclusion: living sentients were not able to sustain a just government.

There were no power plays among the pigs, no elite cows. The sheep didn't slaughter each other over trivial matters and the wolves only killed for food. And, perhaps most importantly, the mindless human servants that roamed the halls of his laboratories and ritual chambers never spurned each other. Zombies represented humanity in its most perfect state -- a simple harmony seemed to saturate their society. This line of thinking inspired the necromancer and set him to working-modifying the zombie spells to create a more perfect beast. He was not, after all, so insane yet as to believe that the roving mindless undead could actually form a functional society, and even if they *were,* he had no desire to become one himself.

He began to recruit experimental subjects from the local populace. The original zombie formula was too mindless, too droning to actually conduct any of the higher aspects of humanity -- but he had to retain at the same time the simplicity which drove the need for the experiment in the first place. A few failed attempts, a few more household servants, and he finally saw a fantastic new possibility. Mmorn took a young, strong boy and removed his brain. Then, inscribing runic spells all over it, he covered it in an alchemically prepared paste and let it sit for a single month. After that time had elapsed, he took the brain and ate it himself.

The days that followed were pain-ridden. Intense internal restructuring and transformation through a death-like state took a serious toll on his body, but he was able to maintain his will and conviction throughout. After nearly eight days of delirium, everything snapped back into focus. Jacob Mmorn could feel his body as vibrantly as he ever had, but also felt an alien presence. The innocent and frightened voice of a fifteen year old boy gibbered in some corner of his mind. Much more intensely though, he felt a burning and obsessive lust for more brains.

Three more days passed while the necromancer battled the new wills in his head. The boy was easy to incorporate into his larger personality, but the hunger for brains battered his consciousness. He finally determined that it was impossible to fully resist, and began bringing others into his lab, only to be licking clean their cranial cavity an hour later.

With the new meals came new personalities. The rush of new wills to battle almost drowned the necromancer out entirely, but by utilizing the mental power that came with his magical training he was able to dominate the internal struggle. Another interesting development began to take place -- the brainless corpses he had discarded began to rise, clamoring for food of their own. After a month of the zombies feeding on new bodies and all undergoing an internal struggle of their own, Mmorn was left with a tower full of restless undead all on the edge of cannibalism (though some of the older ones had started to develop unique personalities of their own, all of them felt the same brain-lust that had plagued their progenitor). He did the only thing he felt he could do -- he opened his gates.

The following month was terrible for the town, but a golden age for the wave of zombies. The number of brainless

corpses (or hollow ones, as they would come to be known) started increasing exponentially, and the first cases of brain-starvation cropped up. The magician himself became more and more saturated with personalities and wills, and started to experience some psychic spill-over.

The society within the town quickly stratified. Those who had consumed the most brains, and who had started to manifest psychic powers, rose to the top while the hollow ones and those still struggling with streamlining a single persona sifted to the bottom. This social evolution set a precedent that would be repeated through the rise of the nation.

It wasn't long after the city was entirely consumed by the transforming disease that they realized the impending necessity of trade or war. Those competent enough to carry on conversation argued that, while slaves could bring in more brains, this wouldn't be nearly as quick as war. However, as slaves and war were not mutually exclusive options, both enterprises were embarked upon. The cannibal armies swept through the surrounding areas and established a a territory firmly in zombie control.

However, as the more powerful caste consumed more insight and power, they began to understand that they had no sustainable source of brains. A family of slaves might be able to produce new brains at a very slow rate (it took 13 years for a specimen to reach maturity), but a zombie needed at least one brain a day to stay healthy.

This led to the founding of the first free slave city. These glorified breeding grounds were considered a reward for loyal slaves -- though they were regularly pillaged for food, the living sentients there could live out their lives with a modicum of privacy and a thin hope to survive another day. The group of zombie cities and feeder slave cities formed a county, a unit that would be repeated several times over as the Commune expanded its territory.

Society

The social structure of the Mmorn Commune exemplifies the oppressive power structures its founder abhorred. The essential superiority of elders, the expendability of the lower class and a struggling middle class all typified the Commune's political thought.

It wasn't all bad though -- there was a relatively democratic ascension through the social classes, and a flurry of dialog around the topic of whether individual vessels ought even be considered when discussing how fairly an individual is treated. Certainly in the higher ranks a single complex individual was bound to a body, but the hollow and the mad were dominated by forces that no one person could take credit for. As the conservative element put it, the eventual fate of half the actual persons consumed was to end up in some ruler's head, helping to run the government itself.

The zombie society subsequently split into four classes.

The Slaves

These humans and humanoids were either bought or captured. Imported into deeper zombie territory and regularly slaughtered for their nutritional content, slaves have no rights, and are treated as animals. Zombies are never slaves themselves, and it is rare that a slave will be killed in such a way that the curse is transmitted to him (usually the brain is surgically removed, as opposed to being eaten straight out of the individual).

The Hollow and the Mad

The lowest of the three classes, the Hollow and the Mad are grouped together only by status -- they represent two distinct socio-magical groups. The Hollow are newly created undead. These creatures have just had their brains eaten by some other zombie and thus have no guiding will of their own. The will, personality, and direction that they had was consumed by whomever ate them, and they've become an empty vessel, carrying only the instructions of the disease which animates them -- *seek more brains.* These shambling beasts are incapable of serving any functions other than soldier, and really don't desire to.

This position is often referred to in the political rhetoric of the zombie philosophers as the ideal position for one of the Commune. They have no personal ambition except to devour, which is the uniting point for the Commune. They represent the ultimate equality, as they are a phase through which all (save Jacob) passed to gain fraternity with the rest of the Commune.

However, as the Commune evolves, the bureaucrats become less concerned with the plight of the lower classes -- and the rift between them and the upper class grows ever wider. Lately zombies who consumed as many as four or five brains are referred to as hollow, while previously it had been a technical term to refer to those totally without will.

While a zombie is consuming his first brains, an important mental battle takes place. The first of their kind, Jacob Mmorn, had passed this test with relative ease, being a magician of exceptional will. However, as the empty vessels fill themselves up with brains (often paying no attention to what brains they are getting), some of them succumb to a peculiar madness. It is very difficult for some people to get used to a new body . . . much less a new body that has a burning desire for cannibalism and is populated with several wills just as powerful as his own. The spell effect that incurs the brain-hunger does help the personalities mesh and reform into something greater, but some inevitably crack, and those are the mad.

Either because they can't stand the thought of sharing control of a body or they simply have too many personal hang-ups to be integrated into something larger, some elements of this zombie simply don't mesh. They grind and clank like unfitting gears, eventually bringing down the whole machine. These incoherent madmen are hunted by a few members of zombie society, and their brains and essences treated for re-entry into some stronger beings.

For both of these low status classes, existence is war-filled and trying. However, if they are able to survive with a modicum of sanity, they might be able to ascend to a middle class position.

Merchants and Artisans

The hefty middle class of the Mmorn Commune mostly concerns itself with the consumption of brains. Whereas in human, elven, or dwarven culture you find myriad diversions to satisfy the urges to eat, sleep, and procreate, zombie culture is dominated by dealing with the consumption of brains. Some zombies may indulge in the arts, but all that truly matters to the large majority is the ability to find a next meal. This can be especially difficult for zombies deep in zombie-controlled territory.

Zombie art is very disturbing to those outside the Commune. Grotesque masterpieces usually deal with the themes of losing ones humanity, incorporating smaller elements into a larger whole, or the triumph of power and will over an adverse universe. An appreciation for art is noted, by the philosophers and social commentators (who admittedly, usually have a snobbish love for art themselves) as being the first sign that a zombie is becoming transcendent.

The Transcendent

After incorporating a large number of brains, the zombie starts to act a little differently. If he's managed to retain his sanity, then by this point he's got a large reservoir of psychic energy which will bend to the command of the single emergent personality.

This begins to manifest as especially acute senses and an obsessive tendency to philosophize. The extra energy naturally flows to these channels -- interpreting smell more distinctly or bending the range of his eyes to give glimpses of new colors in the infrared spectrum. The implications and ramifications of political, metaphysical, or magical actions are all a little clearer, a little easier to deduce. The zombie undergoes a sort of enlightenment that allows him to understand how the world works more clearly with each brain he eats.

A few quirks have arisen out of this circumstance. Older zombies become more picky about the brains they incorporate, and will often grow disdainful of the lower classes eating so indiscriminately. Others however, lash out at this snobbishness, embracing the visceral pleasures of eating a fresh brain straight out of a head, and becoming very self-aware monsters. Others still take up the plight of the lower classes without overidentifying with them -- trying to

represent them to the local decision making bodies. On the upper end, the transcendent develop keen psychic powers, which will be outlined later.

Culture

It's rare that a young zombie, once he's developed a persona, will stay much longer in the military. There's a good chance there that he'll devour some stubborn brain, and a possibility that he'll be entirely ripped apart and destroyed. A number of jobs have sprung up among the true middle class that allow them to consume safer brains in a safer environment. The absolute bottom rung jobs are mostly physical labor -- mining mines, chopping down forests, etc. A few jobs deal directly with getting and preparing new brains to be eaten by non-military zombies.

Slave traders hold an important position in zombie society. They take the few exports the zombie commune naturally comes across and barters with conquering nations for slaves. Since the politics of the country don't allow for personal ownership, the imported slaves are usually shipped directly off to slave cities, there to reproduce and grow until it's time for them to be eaten. The slave traders need to be sharp, charismatic, and have a strong control over their brain-eating urges. For this reason, it's usually closer to the upper end of the middle class that can fulfill this position.

Governors of slave cities are also significant. They are responsible for keeping the slaves happy enough to continue to live and multiply, but keep them depressed enough to avoid rebellion (or, in rare cases, happy enough to not want to rebel). Furthermore, they recognize that the slaves will eventually be incorporated into their friends and equals, so they attempt to craft them into something more hopeful.

The chefs of the Commune specialize in preparing brains for consumption. Beyond being confectionery masters, they also need to have an aptitude for psychology. By meeting with the future meal beforehand, they have to be able to determine the "flavor" of its brain. Beyond this, they have to be skilled enough at surgery to be able to extract and prepare the brain while causing it minimal harm. Lastly, if for some reason they're handed off a brain that used to belong to a zombie, they must be able to distill the essences of whatever number of minds filled it, and be able to reincorporate those back into other host brains for more moderate consumption. The culinary arts are very important in the Mmorn Commune and the chefs stand among the most respected citizenry.

The harvesters have perhaps the most grim job of all in the Commune. It's their duty to seek out the mad, and extract their brains intact. They are the only zombies permitted to take up arms against their brothers. It's up to them to determine whether or not a particular host will be able to recuperate his losses and function effectively in zombie society, or if he's entirely gone. This is especially trying in borderline cases, in which multiple stable personalities have manifested and none can truly tell if or when one would finally emerge victorious.

The upper echelon of zombies have rarer jobs, and are generally expected to do less service to the Commune. These vocations will range from philosopher to artist to politician to more highly ranked military officers. The unique psychic powers of especially potent zombies allow them to command the troops very efficiently (and, some say, to control the Commune equally well). The philosophers and artists are generally the hungriest of the higher ranked zombies, but they have such strong psyches that they are able to keep their hunger in check with minimal brain consumption. By this point, most of those who do consume brains do so for the experience, or to gain new perspective. They are able to relate to normal sentients easily and will appear to the especially witty, graceful, and insightful. Occasionally zombies of this stature will strike out into the rest of the world, seducing individuals into private areas to consume "fresher" brains than the slaves and battles can provide. Whatever the actual activities that fill such a life are though, the zombies on the upper end of the Commune typically resemble aristocracy more than the peasant's leaders of the ideal Commune.

Populace

As zombies rise in power, they gain access to levels of psychic energy far exceeding normal sentients. While the first brains a zombie eats help to establish his identity, as he consumes more and more it takes a larger number of brains to affect a significant amount of change. The most advanced zombies seem to have hit a plateau beyond which their

powers only increase marginally over long expanses of time. The psychic spillover manifests in a few ways.

Expanded Senses: The zombies' sensory organs become more precise and complex as they advance. Several instances have cropped up in which a zombie's sight has expanded to allow him to see infrared or ultraviolet light, some claiming to see as many as six new colors. The auditory capacity of a zombie's ear can become astoundingly precise -- not only in the degree of sound it can perceive but also in the number of sounds it can digest. It's said that one zombie can tell the number of beans in a bag just by listening to them be poured over a grate. Similar permutations have been recorded for taste, touch, smell, balance, and psychic awareness.

Psychic Blasts: Perhaps the most uncontrolled expression of psi energy, some zombies are able to release their pent up power in a blanket blast of psychic power. The strength of this varies depending on how much psychic energy they store into it, but it has been known to drive weaker people mad on several occasions, literally obliterating their psyches.

Possession: A prized skill of many zombie generals is the ability to mentally dominate other creatures. By sending their consciousness out to take full command of another body the generals become able to orchestrate complex battlefield tactics on the spot. The ethical use of this gift is one of the most contested philosophical point in Mmorn society, but it's difficult to argue against the victories it brings. This skill can be used on multiple creatures at once, and can be used on sentients, but as the victim's psychic proficiency increases, so does the difficulty of the domination.

Politics

Politics are a hot issue among the more learned of the zombies. The state, originally conceived of as communist by Mmorn (and still rhetorically referred to as such by the idealists and the sarcastics) functions on a practical caste system. The only goods that actually completely require distribution are brains, and each individual zombie takes up a station that will bring him enough to suit his necessity. The least developed zombies are the most ravenous, and usually join warbands to sate their hunger. The middle class zombies have developed a more sophisticated pallet, and so take up merchant positions that allow them a steady income of reliable brains, building up specialized jobs in managing slave colonies. The most powerful zombies have less of a need for brains, and so generally devote more of their time to leisure.

There are few laws that are required, as scarcity isn't driving many to desperate actions. Mmorn maintains a small bureaucracy that meets in trial over cases usually dealing with harvesters getting out of line. Certain more conservative elements within the higher society have been pushing to formalize the military and make them pay brain tribute -- feeding a percentage of their spoils back into society, but it remains currently in the minority.

Overall, Mmorn's experiment was a mixed success. The state has become more and more of a burden to him as he suffers the growing tendency toward intrigue within the bureaucracy, and he has gradually been phasing himself out of running things, returning to the necromantic studies into which he once had such keen insight.

Adventure Seeds

Caught!: The most obvious adventure that incorporates the Commune involves the heroes somehow being imported into one of the slave cities. For a conspiratorial twist, you might want to have the governors of that city not be clear as to the intentions, and have the disappearances of fellow slaves shrouded in mystery. If the adventurers get out, they will have to fool the other zombies that they are one of them, and may be able to survive in zombie society a reasonably long time . . . given, of course, that they don't mind eating a few brains for show.

Intrigue!: A mysterious stranger has come into town, and begins hobnobbing with the nobility. A killer is also on the loose, leaving blood splatters but no corpses. Could the two be connected? And why does the stranger's household seem more busy with every slaughter?

War!: An alternate adventure pits the heroes against the Commune directly. The monstrous killings aside, the constant

fear of being turned into one of the fierce undead who assail their lines should provide some interesting roleplay opportunities, and could lead into the adventurers being . . .

Transformed!: Given the possibility that the adventurers lose the battle, they will either be captured and imported as slaves, or they'll be turned into hollow ones themselves. This provides the most open access to the Commune, and would allow the most intimate interaction with its culture. This opens up myriad new adventuring opportunities. It's also possible that only some in the band get transformed, and the others take the newly created undead with them to try and find some magical counter-curse (that could also, perhaps, turn the tide of the war).

Pyramid Review

The Secret of Zir'An Game Screen

Published by Paragon Games

Three-panel b&w screen with Empyriar Code Wheel insert; $5.99

No question, *The Secret of Zir'An RPG* would benefit from a few supplements that disseminate more information about the setting. While *The Secret of Zir'An Game Screen* may not cover much ground from a setting perspective, it's certainly a helpful item that condenses the charts spread throughout the core gamebook into a dandy pill.

First, the physics of the whole thing. It's a three-panel affair, with each panel clocking in at a fairly standard 8.5" × 11". The two side panels fold out from the middle, and the panels lie along their length, making it one of those half-as-high screens that obscure all the die roll fudges you're going to lie about while still allowing you to look your players in the eye as you do it.

The outside deserves only brief mention, since it's mostly decorative with the game's title in the middle (though more on that in a moment). That isn't to say it's not nice -- it's got an almost glossy look to it, the sort of cover that someone paid good money to make feel greasy to the touch when in fact it's just high quality.

Within, your charts. Central to the action, combat (since fights are usually, well . . . central. To the action). The middle bit is the finesse effects you can pull off with various combat skills and weapon types using the Finesse System. Admittedly it's a pretty simple system to recall, so putting these "feats" there is probably the best way to go. The combat formulae themselves are on the leftmost end, summing up how to land a blow. There's a table for how long various combat actions take, how fast you cover ground in a fight, and where you hit.

They follow that with a selection of handicaps from the book. These disadvantages aren't exactly out of place since the ones they list all bear some force on your effectiveness as a combatant. The one somewhat out of place piece on the first panel is the almanac, with the months and days of the year. With all the renaming conventions they use in the book, it might not hurt to have one of these guides handy to better familiarize oneself with those materials. It does hurt, however, not to include the common, standard skill-use formula (the one the core book focuses pointedly on).

A sad bit of layout: The feats in the middle take up just a little too much space, and spill over onto the top of the third panel. It's not awful, but without even a small "continued from previous panel" notation, it takes you a minute to figure out what these three orphaned table lines are doing hanging there. Then like too many screens, they panic and have to fill out some open space. The lists of standardized NPCs are good -- having some quick stats for the people you meet is good, whether you intend to bargain with them or just trade punches. But a random weather chart, compounded by a severe weather sub-table, and barely justified by a weather effects table? How about some more ranged weapon information instead of hiding it under one of the many finesse effects? Players have range prefigured on their character sheet, but a referee who forgoes having that form at hand now has no contingency. The final section is a perfectly appropriate list of common items (walls, trees, doors) and the protection they offer.

And of course, the burning question every time someone releases a GM's shield: What do you include inside? They went with something frugal, extraneous, and interesting . . . an Empyriar Code Wheel. Throughout the core gamebook, illustrations and designs (and even the players' side of this screen) sport the cryptic language of Zir'An. Looking like Mayan hieroglyphics, this two-piece cardboard cutout gets pinned together so you can turn the dial to find the right graphic, and see what the English equivalent is. Not that you can always tell which glyphs are which, but since too much of the core gamebook has these designs obscuring the actual game text, you may as well find out what's being said. Such a choice also probably kept this product's price tag in the single-digits.

The game doesn't use too many charts to begin with, so it's understandable some concessions might be made. ***The Secret of Zir'An Game Screen*** hits most of the important stuff, and it's a tribute to the system's simplicity that it can include as much as it does on three panels. It's inexpensive, and the wheel even manages in its own small way to shed light on Zir'An's secret . . . one of them, anyway.

Award Show

Published by Twilight Creations, Inc.

Designed by Todd A. Breitenstein with Kerry Breitenstein

Illustrated by Aaron Williams

100 full-color cards and b&w rules leaflet; $9.99

After battling zombies, visiting Hell and haunted houses, and dealing with other strange occurrences, the design team at Twilight Creations, Inc. tackle a more mundane subject, though one no less important to the American gaming hobby. *Award Show* claims to simulate the exciting, rewarding world of professional game design. Well, not quite . . . because as the title suggests, *Award Show* concentrates on the one night when you can gain peer recognition for your creation and win a statue as the proof.

The game consists of 100 attractively illustrated cards that each depicts a busy monkey, either counting or rigging the vote, or in ceremony best ready to accept an award. The cards come in several varieties. They start out with the six Company cards, each parodying an American publisher right down to the logo, such as A-Man Games, Paradise Studios, Inc., and Twilight Recreations, Inc. The 36 Company Award category cards are divided into six awards: Best Game, Best Game Art, Best Game Fiction, Best Graphic Design, Best Rules, and Fan's Choice. The six cards in each category correspond to the six Company Cards. The remainder and bulk of the cards are a mix of Vote cards numbered from -2 to +2, and Event cards, while the last card is the Ceremony Host, or rather Dealer card.

Designed for two to six players, they really take the roles of designers, artists, and writers of gaming materials rather any one publisher, as the publisher they represent changes from one round to the next. A Voting Round begins with the six cards in an Award Category being laid out on the table, each player receiving a Company card that is kept hidden, and a hand of eight Vote and Event cards. Then players take it in turn to place a Vote card face down next to one of the Company Award cards or play an Event card. A player's aim is to get as many positively valued Vote cards onto the Company Award that matches the Company card he is holding secret, and as many negatively valued Vote cards onto any other Company receiving votes.

Play continues until every player has run out of cards to vote with, or decides to pass. Then Award Presentation begins with the vote counting, the dealer deciding which stack of Vote cards to count. The process continues until every Vote card has been tallied, or until a total of eight positive votes have been counted for the Award Category. Once done, Company Cards are revealed and if one matches the highest number of votes received, its player wins the award and he receives all of the Company Award cards in the category that received any votes.

The only difference to this play is the Event cards, used during both phases of the game. Some allow a player to play a card out of turn or swap Company cards with another player during Voting. While in the Award Presentation phase, others can negate a Vote or prevent the next player from being the Dealer, and thus stop him controlling the order in which the Vote cards are counted. Essentially, Event cards are interrupts to normal play.

A new round begins with a new Award Category, and players receiving new Company and Vote cards. Once all six round have been played, the player with the most Company Award cards wins the game.

Playing Award Show is an under-whelming experience. It certainly looks good, and certainly proves that Aaron Williams should be drawing more monkeys. But the play is uninteresting, lacking both the substance and the bite

befitting the subject. Nor is helped by an underwritten set of rules that adds neither flavor nor feeling to the game. And because the whole game is essentially played blind, there is no reason for player interaction or the kind of table talk that might have added the missing element -- fun. On the plus side, Award Show does prove that an American publisher can properly package its small card games, but nevertheless this is disappointing. If all award shows are as uninteresting as *Award Show,* then my tuxedo remains unpurchased on the high street.

--Matthew Pook

Big Eyes, Archaic Smile: Reality Thaumata

"I have gazed on the walls of impregnable Babylon, along which chariots may race, and on the Zeus by the banks of the Alphaeus. I have seen the Hanging Gardens and the Colossus of Helios, the great man-made mountains of the lofty pyramids, and the gigantic tomb of Mausolus. But when I saw the sacred house of Artemis that towers to the clouds, the others were placed in the shade, for the sun himself has never looked upon its equal outside Olympus."
-- attributed to Antipater of Sidon (ca. 180 B.C.)

Sing, O Muse, of the four colors splashed across the world in the wake of the Divine Alexander! Sing of the cyan screens of the mausolikons! Sing of the magenta sails of the aetheremes! Sing of the yellow-bronze armor of the kolossi! Sing of the black dreams of kings and wonder-makers, who hold the key to power over all the world! Sing of Reality Thaumata, the world of wonders!

Like [Reality Futura](), which we visited some years back, this world also takes its shape from an artistic sensibility, which drives technology and history alike. This is the syncretic, utopian, sensual world of the Hellenistic Age, the age when the Seven Wonders -- both *thaumata,* or "magics," and *themata,* "marvels" -- of the World were completed and compiled. (All seven Wonders only co-existed for about 50 years, from the completion of the Lighthouse at Pharos, in 282 B.C., to the destruction of the Colossus of Rhodes in the earthquake of 226 B.C.) During the centuries after Alexander the Great's death, poets refashioned the old myths into new poetics. Apollonios of Rhodes assembled a league of extraordinary Argonauts in the last Greek epic, and artists painted the gods as beautiful yet fallible figures both sublime and earthy. In Reality Thaumata, the mood is one of high contrast and hyperkinetic action, erotic love and epic hubris. It's Yoshiyuki Tomino vs. David Drake in an anime-antique mashup for all the marbles!

"One praises another great structure built by a king of Egypt, namely the tower which stands on Pharos, the island commanding the harbor of Alexandria . . . We should not omit the great spirit shown by King Ptolemy, whereby he allowed the architect's name, Sostratus of Cnidus, to be inscribed on the creation. It helps when ships are moving at night . . . The continuous burning of the beacon is dangerous because it might be mistaken for a star, its appearance from far off being similar."
-- Pliny the Elder, *Natural History* (77 A.D.)

Under the brilliant, indolent rule of Ptolemy II, Neo-Aegypt crouches like the Sphinx, predatory and mysterious. The thauma of the Pyramids, harnessed by the geometer Euklides, flows through whirring insectile automata and eerily glowing pharoi all along the Nile. The Great Pharos stands ready, its fiery red beam lashing out thousands of stadia to destroy attacking fleets or burning straight up to drive the harmastres, the star-chariots that travel beyond the Moon. Ptolemy revels in luxury, plied with the finest wines by his harem of Bast-priestesses, but his lust for power is greater than any fleshly urge. Millions of fellahin sweat in the fields and factories of Neo-Aegypt, tracked by the ceaseless musings of the Great Bibliokephalon in Alexandria, a living library, a thaumatic brain tended by the greatest artificers in the world. Ptolemy's navy is the largest in the world as well, anchored by the battleship *Iamatos* constructed by Pyrgoteles. Its crew of 4,000 and marine complement of 2,800 is larger than some cities' whole navy; the *Iamatos* holds Crete and Cyprus and the southern coast of Anatolia in its grasp. The rest of the Neo-Aegyptian fleet presses Ptolemy's war with Antigonos II of Macedon deep into the Aegean. Only the Tower of the Winds, built in Athens by Andronikos of Kyrrhestos, keeps the Macedonian fleet alive.

"In the first place, the upper earth, when looked at from above, is . . . of divers colors, of which the colors which painters use on earth are only a sample. . . . And in this fair region everything that grows -- trees, and flowers, and fruits -- is in a like degree fairer than any here; and there are hills, and stones in them . . . And upon the upper earth are animals and men . . . dwelling about the air as we dwell about the sea; others in islands which the air flows round, near the continent: and in a word, the air is used by them as the water and the sea are by us, and the ether is to them what the air is to us."
-- Plato, *Phaidon* (360 B.C.)

But if Neo-Aegypt rules the waves, the Seleukids of the East command the skies. Antiochos II reigns from a moving castle in the sky, planted with mighty trees and flowers from the upper earth. These Hanging Gardens hover over

Babylon, and grow the liftwood to build Antiochos' aetheremes, the ships of the sky. With them, he presses his claims to the uttermost east and the northern wastes beyond Parthia. Here, his trained monster ranchers, recruited as youths from the farms and towns of his empire, harness griffins and other wondrous beasts, raising them from hatchlings warmed in the pockets of the ranchers' Parthian-style trousers. They train them to fight, pitting their beasts against each other in intricate combats. Full grown and well blooded, these flying predators carry Seleukid cavalry in waves against the armies of Neo-Aegypt in Coele-Syria and Palestine. Antiochos' writ runs from the Indus to the Aegean, although the people of Antioch and Sardis whisper that their emperor grows distant and inhuman from a diet of upper earth fruits and perfumes.

"[T]hey were prevented from making fast to the shore by Talos, a bronze giant, who broke off lumps of rock from the cliff to hurl at them. . . . His body and his limbs were brazen and invulnerable, except at one point . . . He terrified the Argonauts, and exhausted though they were they hastily backed water."
-- Apollonios of Rhodes, *Argonautika* (ca. 240 B.C.)

Only a few cities and islands on the Anatolian coast remain free of both Seleukid and Ptolemaic designs. Pergamum, in the north, has its own Bibliokephalon. Ouranopolis, the city of the Sky-Men founded on Mount Athos by Alexarchus in 300 B.C., has its strange overlords and their mystical disciplines to keep it hidden and safe. The rebel slave Drimakos holds out against the Seleukids on Chios with sheer daring, robbing from the rich and giving to the poor. Halicarnassus has its Mausoleum, covered with intricate carvings and paintings that seem virtually real, that move between the Otherworld and ours along a matrix designed by the four finest sculptors in all the Hellenic world. They carry knowledge and information from that world to this, and a bright blue mirror thaumatically ground from silica sand and silver-arsenic can reflect them no matter where it goes. These mausolikons are found in scholars' chambers and artisans' lodges, and carry messages between separated lovers who may never meet in the flesh.

These cities, and a handful of others, are protected by the merchant republic of Rhodes, the last free democracy in the world. Rhodes is defended by its kolossi, bronze giants piloted by the bravest of the brave. They walk, swim, leap, and fly everywhere that tyranny threatens or injustice is done to a free citizen. Of course, there are some bad seeds in every crop -- a number of kolossi pilots have long-lost brothers or romantic rivals who steal kolossi (or hire eccentric mechanics to build them) and turn to evil and piracy. The Great Kolossos, built by Chares to defeat a Macedonian siege fifty years ago, still stands astride the harbor, its eyes glowing with Archimedean puissance. Archimedes' city Syracuse, although ruled by the tyrant Hieron, is an ally of Rhodes against the cupidity of Macedon and Neo-Aegypt. Hieron pays Archimedes well and sponsors even his maddest researches.

"So having prepared a mass of all kinds of material, he constructed a machine called the City-Killer, which in size exceeded by far those that were before."
-- Diodorus Siculus, *Library of History* (ca. 35 B.C.)

These researches pay off in the form of mighty war machines from the Solar Mirror that defends Syracuse harbor to catapults that can fling iron spheres across seas to the City-Killer of Demetrios, which was lost after the siege of Rhodes and lurks in rumor in every unexplored corner of the world from the frozen Sarmatian plains to the fire-baked mountains of Ethiopia. Eccentric wonder-makers hole up in isolated caves or remote islands, preparing unknown dangers for the world. Occasionally they emerge and seize power somewhere, either behind a semi-barbarian kinglet in Pontus or Galatia, or in their own name as tyrants. Philo of Byzantium, who while at Alexandria harnessed the deadly "negative matter" known as the vacuum (contained in brass casks, it keeps Ptolemy's aetheremes aloft in lieu of liftwood), now rules his home city with madness and mechanisms, protected from seaborne invaders by his mighty Clashing Rocks. Roving gangs of youths race autoharmae, self-propelled chariots, in the Hippodrome and down the Mese while Philo perfects further unguessable devices.

"When the statue was completely finished, Phidias prayed to Zeus to show by a sign whether the work was to his liking. Immediately, so the story goes, a thunderbolt fell on the spot where to this day a bronze jar stands to cover the place."
-- Pausanias, *Description of Greece* (ca. 150 A.D.)

The Spartans, under King Agis IV, have retreated into a mythical past of warrior glory that now encompasses the entire

southern half of the Peloponnese. Here, the disciplined and ascetic spartiates can live simply and elegantly as their ancient forebears did, practicing their martial arts and bullying helots, though those who have offended their lords must wander the world and the waves seeking a living by the sword. Just north of Sparta is Arcadia, a pastoral country where the Olympic precinct and the living statue of Zeus remain inviolate on the banks of the sacred river Alph. Here, poets and singers seek inspiration, and those young Hellenes who would learn to harness unusual divine powers attend strict academies in starched uniform togas.

"To thee, Artemis, the Amazons, whose mind is set on war, in Ephesus beside the sea established an image beneath an oak trunk, and Hippolyta performed a holy rite for thee, and they themselves, O Artemis, around the image danced a war-dance -- first in shields and armor, and again in a circle arraying a spacious choir. . . . And afterwards around that image was raised a shrine of broad foundations. The sun shall behold nothing more divine, nothing richer."
-- Callimachus, Hymn to Artemis of Ephesus (ca. 260 B.C.)

Of course, some promising female sorceresses and wonder-workers seek sanctuary with the Amazons in the Temple of Artemis at Ephesus. Guarded not only by the Amazon warriors but by harpies, striges, sirens, and naiads, the matriarchy of Ephesus is the only city besides Rhodes that can hold its own against the great empires. The Ephesians are allied with the even more gynolatrous island of Lemnos, where only women dwell. Perforce, the Lemnians and their Ephesian allies must become experts at parthogenesis, the creation of life. Ephesian chimerae are developed -- designed, much like mechanical wonders in other cities -- and bred in the precincts of the temple, which holds a menagerie of uncanny beasts equaled only by the vast zoos of Antiochos, who can draw from all of Asia and the Upper Earth. (Some say the streams of [giant monsters](#) that attack the Pharos come from Ephesus, also.) Indeed, the Amazons of Ephesus can create life in anything from the walls of their temple to the clouds above their city. Many Ephesians are attended by small glowing balls of slime or flame, capable of speech and thought, which serve as pet and companion, watchdog and servant.

"Aristarchos of Samos produced a book based on certain hypotheses, in which it follows from the premises that the universe is many times greater than the universe now so called."
-- Archimedes, *The Sand-Reckoner* (ca. 225 B.C.)

For the curious connoisseur of **GURPS Infinite Worlds,** Reality Thaumata is a Quantum 3 world, possibly accessible from the Chronobahn somewhere in the deserts of Neo-Aegypt. (Because what's an anime setting without a potential Nazi invasion?) Potential triggers for this world's high "artistic charge" might include that thunderbolt in Olympia (a reality quake rolling back to 432 B.C.?), a spell cast by Medea over the Golden Fleece, or the whim of Ptah-Hephaistos. It hardly matters to the sleek, androgynous kolossi pilots or the magical Ephesian girls who live in it -- they just have to live fast, love well, and leave a good-looking mosaic.

Rocketmen: Axis of Evil

Published by WizKids, Inc.

Designed by Jordan Weisman, Jon Leitheusser, & Shane Small

Illustrated by Vic Bonilla, Sandra Garavito, Kim Goddard, Shane Hartley, Kian Chai Ng, Ethan Pasternack, Shane Small, Dustin Tucker, & Kelsey Wagner

Rocketmen: Axis of Evil Cartoon DVD with Two Pre-set Ship Cards, Microid Resource Card, Crew Resource Card, Asteroid Card, 2½'' × 3½'' b&w 16-Page Rulebook, & One Six-Sided Die; $12.99
Rocketmen: Axis of Evil Game Pack Containing Two Ship Cards, Microid Resource Card, Crew Resource Card, Asteroid Card, 2½'' times; 3½'' b&w 16-Page Rulebook, & One Six-Sided Die; $3.99

Genres come and go, sometimes in waves as multiple publishers jump aboard the latest trend. In 2001 it was World War II, and in 2003 it was pirates. Currently we seem to be between phases, and the only piratical survivor is WizKids' *Pirates of the Spanish Main.* This was the first CSG (or Constructible Strategy Game). Themed around the Golden Age of Sail with English and Spanish ships engaging with each other and pirates for the gold ashore the islands of the Caribbean, the constructible element were the ships themselves. Packaged as a pair of plastic styrene cards, the pieces snapped together as frigates, galleons and other ships, as well as forts in later expansion.

Matched with simple game play, *Pirates of the Spanish Main* managed to bridge the gap between collectible card game and the miniatures game, retaining the best features of both. Now WizKids have done it again, essentially mapping the rules, play, and design onto an all-new genre. *Rocketmen: Axis of Evil* is pulp science fiction, inspired by the feel and look of the cliff-hanger serials *Buck Rogers* and *Flash Gordon,* a sub-genre barely touched upon by the hobby.

The setting for *Rocketmen: Axis of Evil* is a future of the past in which the Legion of Terra under Lord Invictus has arisen to form an Axis of Evil with King Krillra of Mars. Arrayed against their plans to conquer the Solar System is the Alliance of Free Planets -- Mercury and Venus along with Earth's Rebels. These four factions vie for control of resource rich Asteroid Belt, and form the focus for both the game's DVD and the five-issue comic strip randomly inserted into the Game Packs. Future expansions will expand the background and add vessels for the outer worlds of Saturn, Ganymede, Io, and Neptune.

Each Game Pack contains a small but easy-to-understand rulebook, a tiny six-sided die, a full color one-page comic strip with faction information and ship listings on the reverse, plus six plastic styrene cards. These contain the pieces for either two ships or one ship and a squadron of fighters, a crew card, and a resource card. Each ship or squadron also comes with a data card. Both ships and fighters require construction, not always an easy task, but the results are bright, colorful vessels, though perhaps more fragile than the ships of *Pirates of the Spanish Main.*

Once put together, the spaceships come in four types, each with a special ability. Fighters have Evasive Maneuvers and can dodge attacks; Rocketships, the mainstay of each faction's fleet, have Extended Range and can increase their

attack range at the cost of accuracy; Cruisers have Armored Hulls; and Space Stations have Base Defense, making them difficult to damage. All have the equivalent of two, three, or four hard points, onto which slot the Pods from the resource card, either Arc Lasers or Shields.

Each has several values, all marked on its data card. This gives the ship's name, collector's number, faction affiliation, and point cost as well as its special ability and background information. More pertinent to the game are its AP or Atomic Engine Power Points, Weapon Rating or WR, cargo capacity, and both Movement and Weapon Increments. These last two are marked along the bottom long edge of the data card, and can be short, medium, or long range.

Optionally, crew can be added to the ship, each crew token slipped into one of the slots on a ship's base. The cheaper, generic crews, of which there are four per card, enable easier maneuvering, weapons targeting, boarding of enemy vessels, mining, or ship repair, while the personalities give better and multiple abilities. Crews are worth having, for they add and improve a player's options during play. For example, the Venusian Navigator allows a ship to rotate free of cost, making it more maneuverable.

At the game's heart is a battle for resources, which come in three types: Carbon-7, Newtonium, and Titanium. These come in the same resource card as the ship pods, and are scattered across the play area before the game's start on the central Rogue Asteroid or as free-floating Microids. Mined and returned in a ship's cargo hold, the resources can be expended to bring ships from a player's reserve fleet into active play.

Besides scattering resources, set-up involves the purchase of ships and crews for each player's active and reserve fleets. Once done, game play consists of players moving and attacking with all of their vessels, using AP to do both. Ship maneuvers include Move (in a straight line equal to its Movement Increment), Rotate (to face a new direction), Avoid (essentially fly around a large obstacle), and Dock. The latter enables a ship to latch onto an asteroid or microid to mine it, to unload cargo at its home base, or to conduct a boarding action. This is the game's most complex set of mechanics and involves lots of dice. After a successful boarding action, a captured ship can either be destroyed or towed back to home base and salvaged to give further resources.

Attacking also requires the expenditure of AP, one per Laser Arc fired. This can be in any direction and from one ship's base to another. To attack, two dice are rolled, and if the result equals, or is higher than the attacker's WR, it succeeds. The target's Shield Pods make it more difficult to hit and each successful hit destroys one of the target's pods. It is also possible to kill the crew aboard an unshielded ship, and when the ship has no pods left, any hit destroys it. Ships can also be damaged in collisions, and a canny player can bump and grind an unshielded ship with his shielded one! Play continues until one side is defeated or his asteroid base (or Space Station) is captured.

A few questions arose during play. For example, could a Tractor Beam Engineer use the tractor beam offensively, to pull or push a ship? And can crew be carried in the cargo hold for use in boarding actions or as prisoners? Could you transfer crew from one ship to another? With no FAQ available, our house rules answered these with a no (but we would like to), a no, and a yes. We also wanted a greater selection of weapons, such as missiles, grappling hooks, and more varied beam weapons, as well as an independent raider faction, so that you could have a faction of pirates that nobody liked.

With just the two coalitions available, *Rocketmen: Axis of Evil* is currently a two-player game, though more players could divide forces. Two Game Packs each are enough to gain a taste of the game, but many more are needed to freely build each player's active and reserve fleets -- I got a decent mix with eight. While the ships are highly attractive, many are quite fragile, and fiddling around with the crew tokens will neither ease this, nor speed set-up time. But play is quick and easy, with your ships soon zipping through the asteroid belt to strike at your opponent and mine the resources necessary to activate ships in the reserve fleet. The comic strip and each data card's descriptive text both provide the background to play against, while the crew tokens add character. And it is the use of these tokens that make up the game's customizable element, the enhancements they provide being too good to ignore, and are often vital to a ship's survival and effectiveness. Beyond the choice of crew tokens, the game offers little in the way of tactical subtlety, except perhaps keeping your ships together in squadrons, and using the large asteroids as occasional cover.

What really grabs you about *Rocketmen: Axis of Evil* is the ships, which just scream pulp sci-fi goodness. The background is also nicely done, and the more ships that you have, the easier it will be to design scenarios to fitting the

setting beyond the simple blast 'em up and resource raids. The simple mechanics, handled on two dice with simple modifiers, would also lend themselves to an easy RPG engine, and a ***Rocketmen: Axis of Evil RPG*** would be a terrific idea, not only filling an empty niche on the gaming shelves but also developing the setting. Yet that suggestion aside, ***Rocketmen: Axis of Evil*** is a clever adaptation of WizKids' CSG model to another genre, and the result is actually quite fun to collect because the ships are so damned cool. Even better, ***Rocketmen: Axis of Evil*** is just plain fun to play.

--Matthew Pook

Dungeons & Dragons: The Dragon Compendium, Volume 1 (for Dungeons & Dragons)

Published by Paizo Publishing

Edited by Erik Mona

Developed by Mike McArtor

256-page full-color hardcover; $39.95

Dragon Magazine has served as a source of new classes, rules, magic items and ideas for over three decades and multiple versions of *Dungeons & Dragons.* The *Dragon Compendium* is the beginning of Paizo Publishing's effort to mine this vast storehouse of information for today's players and Dungeon Masters. Paizo plans to issue a series of these volumes, with future ones possibly themed around specific settings or elements. Paizo clearly wanted to put their best foot forward with this first compilation. The list of authors whose articles were drawn on for this compilation reads like a who's who of *Dungeons & Dragons* history and RPG design, including Gary Gygax (co-creator of *Dungeons & Dragons*), Ed Greenwood (creator of the *Forgotten Realms Campaign Setting*), Monte Cook, and Skip Williams (both co-creators of *Dungeons & Dragons* *Third Edition*).

The first articles presented are the staples of *d20 System* supplements: new races, classes, prestige classes, and feats. The races presented are unique and interesting, without being too overpowered, although the Dvati, a race of identical twins both played by one character, will need some work by the DM to make sure they are not too unbalancing. The base classes offered are an eclectic selection, but may not fit perfectly into every campaign. The Jester would enliven a traditional medieval European milieu, but could be out of place in a world based on other eras and cultures. The Death Master, a servant of Orcus with divine and arcane powers may be better suited as an NPC class, unless an "evil" campaign is being run.

The prestige classes are similar in their variety and potential utility. The Arcanopath Monk is an anti-mage mystic warrior. His attacks and abilities do both physical damage as well as reflecting spells, stunning mages or even cause them to forget their spells, possibly permanent. There are both random feats as well as themed groups of feats. The themed groups include bloodlines, which give powers based on the characters ancestors (draconic bloodline, for example). Most of these grant extra spell powers, thereby favoring sorcerers, but could have a broader application. The other prevalent theme is martial arts, which are strongly represented.

The equipment section starts with weapons, mundane and magical. The mundane weapons selection is a good cross-section of weapons from different historical periods, such as the pilum, bardiche, and lochaber axe. Several pages are dedicated to Alchemical items, non-magical items with magical-equivalent effects. These are especially useful as a way to allow parties to have access to low-level magic benefits without putting too much magic in the campaign. The magic item selection is well-balanced between combat and utility items and most DMs should be able to find something useful.

The "Classics" section is a mix of articles which expand and supplement the basic game concepts. Spell Templates are an alternative to metamagic feats, similar in concept to monster templates such as the vampiric template, which modify various aspects of spells to create new types of spells with common themes or related effects which give spellcasters a tool for further customizing and personalizing their magic. These templates are a creation of designer Monte Cook's and a feature of many of his Malhavoc Press products such as Arcana Evolved. Their presence in the

Dragon Compendium is a good example of the potential of the OGL system to allow for the sharing of ideas. Other items include an expansion of the glyph spells and the theory and creation of tesseracts as terrain features. The piece on riddles is especially useful as it goes beyond a simple list, with ideas on how to use riddles in the adventure and campaign.

The monster section contains as many monster templates as it does actual monsters which is not necessarily a failing. While using templates does entail more work, it gives new life to existing creatures, in essence giving each one a number of variants which can be used in all sorts of situations. The magazine's namesake is also represented with the Orange, Purple, and Yellow Dragons, all of which will be an (un)pleasant surprise for players used to the traditional wyrms. An especially amusing twist on an old favorite is the Fire Troll, infused with the traditional bane of troll-kin.

The appendices are a potpourri of campaign and adventure ideas. Some of the more unusual items include a pronunciation guide for many game terms (always important for the purist), plus a guide to the chi square test and its game utility. Hearkening back to the first edition of the ***Dungeon Master's Guide*** is the solo dungeon generator which is useful for new players and players who find themselves without a group. Wrapping the book up is a cover gallery.

Compilations of this sort are hard to judge. On one hand, the ***Dragon Compendium*** does what it was intended to do, which is provide a selection of the best material published in *Dragon Magazine.* The chosen articles are of high quality, well written and accompanied by excellent art and good overall production values. Older material is converted to the latest rule set with minimal damage to the spirit of the original. The articles chosen are diverse in terms of the aspects of the game they enhance, power levels, and the age range of the magazine issues selected. And like the magazine it draws from, this book is a very good source of concentrated inspiration. While the specifics of a given piece may not be exactly what one needs, they can generate new ideas that will be useful for players and Dungeon Masters alike.

The problem is that the utility of any given piece -- and how much work it will take to integrate into an existing campaign -- will be different for each person; in other words, your mileage may vary. Some of the ideas presented may seem unbalanced, ill-conceived, or just odd, because we are unable to see them in the context of the campaign or game experience that inspired them. An example of this is the Sha'ir class. From the article one might simply see a variant magic user with a powerful familiar, improved spell flexibility, and some affinity towards geniekind. It is only by being familiar with the ***al-Qadim*** for ***Dungeons & Dragons*** *Second Edition* does one understand the Sha'ir as an individual spellcaster with a unique social role of interlocutor with the geniekind who are a powerful, almost essential force in the land. Without having this insight into the intent of the author, it is possible we will miss the full potential of the ideas presented in a given article.

This book is probably not a critical addition to your ***Dungeons & Dragons*** collection if you have already have a large *Dragon* collection or possess the out-of-print CD collection containing the first 250 issues. But if you are someone who is always hunting for new ideas, content, or new mechanics, then the ***Dragon Compendium, Volume 1*** may be an excellent choice for you. However it is strongly recommended that you browse through it, if at all possible. At $39.95, it is not inexpensive, and you will want to make sure that you will be able to get enough out of it to make it worthwhile.

--Michael Breen

The Gentleman Privateer

The Rough Trade Of Legitimate Piracy
for *GURPS*

by Nicholas Lovell

1561 A.D.

In the pre-dawn light, the war galley crept across the purple waters of the Aegean, the only evidence of its passage the ripples where forty blades broke the surface.

Frater Romegas stood on the prow. He strained his senses towards the warship anchored in the lee of the high-cliffed promontory. Six lengths to go, and no sound of alarm.

Behind Romegas, 60 fighting men stood in readiness. Fifteen knights in mail shirts, red crosses prominent on white tabards. Men-at-arms with crossbows and pikes.

A breath of wind stirred, carrying the creaks and groans of a ship riding at anchor. Four lengths.

The silence was shattered by the clatter of a pike across the deck. Romegas did not look round. "Now."

The drum spoke, and the slaves responded. Three lengths, two, one.

Romegas leapt forward as the vessels met with a crash. "Onward, my brethren! Onward, Knights of St John," he roared.

Battle was joined.

1804 A.D.

*"Prize crew away, hands to braces!" Captain Don Antonio Juan de Amaza gauged wind and tide. Call it skill or judgement, dawn had found the privateer **El Orely y Los Tres** in the heart of a British merchant fleet. It had captured two prizes already. The inshore squadron of the Royal Navy was over 10 miles away, and would take an hour to beat into range.*

Captain Don de Amaza assessed the remaining ships. Three were out of range, handy vessels with practised crews. A two-masted merchantman, barely a thousand yards away, was as good as captured, and the single-masted sloop was a potential.

"Prepare the long nines, aim for the masts," he called.

Tonight, four captured British ships would be at anchor in Cadiz. A good day's work.

> ### 3478 Exarch Calendar
>
> *Warden Niclo Crroe smiled. "Engage grapplions, ahead one quarter." The humming vibration of the sublight engine shifted down two tones as the **Endymion** slowed. On the viewscreen, a crippled freighter rotated about its central axis, fuel venting from the port engine in a cloud of superheated vapor. A micro-jump, barely four-tenths of a second long, had brought the **Endymion** to firing range. It took eight seconds to bring the **Endymion's** shields to operational status after a jump, and a well-prepared opponent could make short work of the privateer in that time. The calculated risk had borne fruit. This freighter had been ill-prepared for trouble.*
>
> *A siren sounded. "Viper interceptors launching, Your Excellence. ETA 17 minutes."*
>
> *"Understood." Seventeen minutes to grapple and board the freighter and then carry her through four pre-programmed jumps to safety. Crroe resisted the urge to rub his hands together. The annual trading venture of the harem of Aambula was in his hands. He brought honor to the kin of Crroe.*

* * *

For centuries, the landed aristocracy have wrestled with the challenge of what to do with their youngest sons. Large families brought prestige, and in an age of high infant mortality and low life expectancy, the surest way of ensuring that the wealth and estates stayed within a family was to have children. Lots of children.

The strategy succeeded if at least one of the male children survived to adulthood and inherited the estates, the wealth and the title. But success created its own new problems: the younger sons would be aristocrats, but without land or wealth. Families needed to find something for them to do. The Church was a popular route, since it offered power and influence. Joining the army or the navy was a route to glory, if not riches.

But many young aristocrats sought adventure, glory, fame, and riches. The life of the noble privateer offered all of this, and more.

The distinction between privateer and pirate was fine, but very important. Pirates were individuals working on their own initiative for their own gain; privateers were a recognised tool of war and had legitimacy with at least one nation.

The role of a privateer was to act as an extension of the official navy, with a focus on commerce-raiding. By granting individual captains the legal right to attack its enemies, the state was able to create a ready-made armed naval force at little or no cost. The state had no capital outlay, since the privateer's vessel was purchased, outfitted, and manned at his own expense, and the state could easily profit from the venture as between 25 and 75% of the value of the vessels, cargo, and ransoms captured or earned on the voyage were due as taxes. Different forms of legal rights existed. Examples include:

- **Papal patronage:** By the 16th century, the Knights Hospitaller -- founded during the Crusades -- had transformed themselves into the finest seaman and commerce raiders in the world, attacking Muslim shipping from their maritime headquarters on Rhodes, and later Malta, with the support and patronage of the Pope.
- **Letters of Marque:** A Letter of Marque and Reprisal empowered a privateer to make war on enemy shipping. The document gave the privateer legal protection from all warships of his own nation provided that he obeyed the terms of his Letter. This usually involved only attacking ships of a specified enemy nation, with stiff penalties for raiding vessels that were neutral or belonging to his own nation.
- **Exploring/colonisation:** While not a direct legal form, if there was no established diplomatic channel, there was little to prevent a privateer from taking goods, gold, and even slaves from newly discovered lands.

The advantages to the privateer were equally clear cut. At least one nation would provide him with safe harbors where he could re-supply and refit. He could gain significant riches legally, and if highly successful he could expect to be feted at court, rewarded for his success and potentially become a landowner or powerful noble in his own right.

A Privateer Without A Ship Is Just A Dreamer

A privateer's ship was very different from a naval vessel. A privateer was in the game for profit, with glory a distant second. A naval battle in which the enemy was sunk at great cost to the winner -- say, a butcher's bill of 50% dead or wounded -- might be glorious, but it would be disastrous for a privateer. Chasing down unarmed merchantmen, raiding a fishing port to cut out the cargo vessel that had taken refuge there, or encouraging ships to surrender . . . *these* were the preferred tactics of the privateer.

A privateer ship needed to be fast, well-armed and with a large crew.

Wherever possible, a fight would be won by an overwhelming display of force -- all guns run out, superior maneuvering, heavily armed boarders manning the rigging -- and without a single shot being fired. The ship also needed to be easy to maintain and repair, as privateers often operated a long way from secure harbors or sources of supply.

The vessel could come from many sources, depending on the character and the nature of the campaign. Likely routes might be:

- **Patron:** A guild, monarch, aristocrat, or wealthy collection of merchants. Typically, the benefit of the vessel would be offset by a duty: hunt ships belonging to an enemy nation, protect all vessels belonging to the guild, or something similar. It also might not belong to the privateer, but to his patron and the loss of the ship could be a source of disgrace, humiliation, a court martial and possibly even result in execution.
- **Borrowing:** A privateer could borrow the money to start his career. He would have a corresponding debt, and the lender would not be happy if his vessel was sunk or captured.
- **Signature gear:** This should require a good background story. For example: A player might create the *Pride of Spain,* which was stolen by an imprisoned English aristocrat during his escape from the fortified harbor of Cadiz. Now every Spanish warship is seeking the *Pride of Spain,* to gain honor and fame by capturing or sinking the symbol of Spain's humiliation.
- **Starting wealth:** The PC may be rich, but a significant amount of the wealth should be tied up in the vessel.

Costs can vary. A good rule of thumb is that a privateer ship would cost approximately ten times the starting wealth of the Tech Level of the campaign.

Characteristics

A gentleman privateer is a study in contrasts. Of privileged upbringing, he is viewed by many as nothing but a common pirate. A seeker of adventure, he must be able to fight, sail, and barter, but he must have the social graces required to secure his letter of marque and get the highest ransoms for his captives.

A gentleman privateer was rarely cruel. Although their victims viewed them as pirates, there was little of the wanton cruelty for which pirates were renowned. Ordinary seaman and passengers were often set free, perhaps in an open boat or on the nearest bit of deserted land. Wealthy captives or aristocrats were kept until a ransom could be paid, often as a guest of the privateer rather than a prisoner. Gentleman privateers sought to be cultured and refined, and worked hard to differentiate themselves from the rough-and-ready pirates that many assumed them to be.

The status and reputation of a noble privateer was varied. Although he was typically an aristocrat (Status 2), even his own countrymen would look down on him (Reputation -1, everyone except a large class). Among the enemies against which he fought his reputation was barely better than that of a common pirate (Reputation -4, among citizens of the

opposing state or nation, a large group of people).

The legal protections gave the privateer a patron of sorts. Ships of the same flag, whether other privateers or naval vessels, might come to the privateer's assistance. If the assistance was provided by another privateer, it was likely to be for monetary advantage, and could be extortionately expensive. Naval vessels would intercede since their duty was to sink enemy shipping -- they helped because it would be a dereliction of duty not to fight the enemy, not because they wished to help the privateer. (Patron, 6 or less). In return, a privateer had a duty to harass merchant shipping and disrupt the sea lanes. (Duty, 9 or less). It was not an extremely hazardous duty, since the privateer could pick the nature of the targets, but if a privateer consistently failed to capture anything (or was foolish or greedy enough to target vessels of his own nationality) the legal status could be withdrawn and, in the latter case, the privateer could find himself declared a pirate even by his own nation. Two of the most famous English privateers, Henry Morgan and William Kidd, were both eventually tried on charges of piracy by the English Crown, and Kidd was found guilty and hanged in 1701.

A privateer would also have many enemies. The navy of an entire nation, or possibly several, would be set against him, and it would be a feather in the cap of any ambitious captain to capture or sink a well-known privateer. Although privateer vessels were typically fast and well-armed, they could not hope to stand up to a well-equipped and manned naval frigate. (Enemy, utterly formidable group, 9 or less).

Skills

A noble privateer is a seaman/spacer, a fighter, and a courtier, all at once. His primary skills are focused on commanding a ship (Crewman, Navigation, Leadership, and Shiphandling) and fighting (Guns (Pistol or Rifle) and a melee weapon). Secondary skills add extra depth to his capabilities (Area Knowledge, perhaps of safe smugglers' havens or routes less well travelled by naval vessels, Astronomy and its pre-requisite Mathematics, Cartography and Gunner skill for using the ship-mounted weapons). Background skills are derived from his noble upbringing (Connoisseur, Savoir Faire).

Character Template

Gentleman Privateer   *120 points*

You are a nobleman with a licence to hunt down and capture enemy shipping for profit. A gentleman throughout, you walk the perilous course between legitimate warfare and the capital offence of piracy.

Attributes: **ST** 11 [10]; **DX** 12 [40]; **IQ** 12 [40]; **HT** 11 [10]

Secondary Characteristics: Dmg 1d-1/1d+1; BL 24; HP 11 [0]; Will 12 [0]; Per 12 [0]; FP 11 [0]; Basic Speed 5.75 [0]; Basic Move 5 [0].

Languages: Native language [0]; additional language (accented) [4].

Advantages: Status 2 [10]; Patron 4 (extremely powerful organisation/small nation; 6 or less) [13].

Disadvantages: Duty (raid enemy commerce; 9 or less) [-5]; Enemy (utterly formidable group; 6 or less) [-20]; Reputation -1 (Disdain by fellow countrymen for privateers, every one except a large class, all the time) [-4]; Reputation -4 (Viewed as pirate by enemies, large class, all the time) [-10]

Primary skills: Crewman (E) IQ+1 [2]-13; Pistol or Rifle both (E) DX+1 [2]-13; Leadership (A) IQ+1 [4]-13; Broadsword, Rapier or Sabre all (A) DX+1 [4]-13; Navigation (A) IQ+0 [2]-12; Shiphandling (H) IQ+1 [8]-13;

Secondary skills: Area Knowledge (Ports) (E) IQ+1 [2]-13; Astronomy (H) IQ-1 [2]-11; Cartography (A) IQ+0 [2]-

12; Gunner (E) DX+0 [1]-12; Mathematics (Applied) (H) IQ-2 [1]-10.

Background skills: Connoisseur (A) IQ-1 [1]-11; Savoir Faire (E) IQ+0 [1]-12

Additional Character Elements

To create a more detailed character, the options below allow improvements in skills, offset by a range of disadvantages. A gentleman privateer would benefit from being both an intelligent leader and a good fighter. Wealth, charisma, and fashion sense would increase the privateer's ability to blend in at court, while he could also be an expert in small boats, a diplomatic merchant or a streetwise smuggler.

Disadvantages should reflect a player's preferences. He might be impulsive, overconfident, gluttonous, or greedy. He might be a compulsive risk taker or addicted to opium, laudanum, alcohol, or spice. He might have lost a hand in a duel, had an eye gouged out by a metal shackle attached to a rope flailing in a storm, or have damaged hearing from many battles spent too close to the roar of the cannon. He might be held to a youthful and naïve code of honor, or he might have earned the enmity of any number of people whom he had captured or ruined, or whose relatives he had killed.

Add any number of points from the following, and an equivalent number from the disadvantages list (up to 30 is recommended):

Advantages/Extra Skills And Attributes

Choose from IQ/DX+1[20]; HT+1 [10]; HP + 5 [10]; Basic Speed 6 (also increases Basic Move to 6 [5]; Charisma 2 [10]; Fashion Sense [5]; Wealth (Wealthy) [20]; or for [10] points, choose either 2 primary and 1 secondary skill, or 1 primary skill and 3 secondary skills:

Primary skills [4]

Additional language (accented); Boating or Piloting (Aerospace) (A) DX+1 [4]-13; Diplomacy (H) IQ+0 [4]-12; Merchant (A) IQ+1 [4]-13; Streetwise (A) IQ+1 [4]-13.

Secondary skills [2]

Guns (E) DX+1 [2]-13; Any DX-average melee weapon (A) DX+0 [2]-12; Meteorology (A) IQ+0 [2]-12; Search (A) Per+0 [2]-12; Smuggling (A) IQ+0 [2]-12; Swimming (E) HT+1 [2]-12 or upgrade of Patron to Category 5 (large nation).

Disadvantages

Choose from Addiction [Varies]; Code of Honor (Gentleman's) [-10]; Compulsive Gambler [5*]; Debt (5-15% of starting wealth per month) [-5 to -15]; Enemy (equal in power to the PC) [-10*]; Gluttony [-5*]; Greed [-15*]; Hard of Hearing [-10]; Impulsiveness [-10*]; One Hand [-15]; One Eye [-15]; Overconfidence [-5*];

Adventure seeds

A noble privateer campaign can provide a very varied environment for gaming. A group of nobles could become privateers on the same vessel together -- perhaps boyhood friends or the younger sons of nobles from far-flung corners of an Empire brought together by their two years of apprenticeship at court. Alternatively, a gentleman privateer could build a coterie of experts around him: a grizzled sailing master, a bodyguard from a foreign culture, a youth abandoning a dull life on shore for adventure at sea, a courtier with diplomatic contacts fleeing the Royal Entourage following an ill-advised dalliance. Whatever the background of the characters, a number of campaign ideas can work

within the life of a gentleman privateer.

Dangerous Cargo: The capture of a merchant ship yields an unusual prize -- the sister of the ruler of a neighboring state and her commoner lover. The captive begs to be taken to a neutral state and set free in return for an enormous cash payment. Any privateer would know that this captive would be a valuable diplomatic bargaining chip to his own state. He might conclude that he could maximise his ransom, and perhaps secure a pardon for past crimes, by returning the eloping pair home.

Either way, there is likely to be intrigue, double-crossing, and high politics. The spy services of both the enemy nation and the privateer's home country are likely to be on their tail. Finding the right way to extract maximum value from the pair could be a challenge, as would protecting them from those (agents, other pirates, naval forces) who would like to control them.

As an alternative, the commoner lover might be a high-ranking noble in disguise, fleeing after a failed plot to overthrow the monarch and install himself as king after marrying the monarch's sister to secure legitimacy. This would significantly raise the stakes.

A matter of National Importance: The privateer is approached by a disdainful official of the appropriate ruler. An individual has stolen state secrets (or Crown Jewels, or something else of high value but small bulk) and fled the country by sea/spaceship. The government does not want to admit its loss and would like a fast, discreet, and armed ship to track down the thief. A handsome reward is offered.

A description of the ship is provided, and the information that it left harbor only an hour before, heading on a given course.

Navigation and seamanship rolls would be appropriate for determining where the ship was headed, and the GM can lead the players towards a sea-based chase with ship-to-ship action, ranged fire, and boarding, or towards a pursuit through the centre of an enemy land, perhaps where the characters have a price on their heads.

Catching the thief may be only the start of the adventure as returning the loot, potentially through hostile territory, will provide further significant challenges.

Outpost: Intelligence suggests that a foreign outpost (fort, harbor, island, or moon base) has been stripped of defenders to mount an attack elsewhere. The crew has the opportunity to capture and pillage the town against a tiny force. The attacking force returns prematurely, leaving the privateer and his crew with the option of defending or fleeing.

If the scenario was timed to coincide with a need to refit following a previous battle, the option of fleeing may no longer be available, forcing the characters down the path of military heroes.

Colonization: A rival state has discovered a new land (continent, planet, wormhole to a new region in space, whatever). The ruler puts forth a call for adventurers to explore the new world, to forge alliances with native rulers, to secure new colonies, and to harm the rival in every way possible. This is a campaign rather than an adventure, and is likely to include diplomacy, encounters with new civilizations, shipwrecks, and probably new flora and fauna.

Sample Characters

Romegas

Frater (Brother) Mathurin Lescaut Romegas was a member of the Knights of St John of Malta, the Hospitallers. Founded in the 11th century as one of the great Crusading orders, their fortunes waned as they failed to retain their lands throughout the Holy Land. By the mid sixteenth century, they had been beaten back to the island state of Malta, and had refocused their activities into becoming the finest fighting seamen in Europe. In 1565, they endured the Great Siege of Malta, when fewer than 10,000 defenders, only 800 of which were knights, held Malta against the might of

the Ottoman Empire, which sent almost 50,000 troops to capture this barren island in the centre of the Mediterranean.

Romegas was the pinnacle of their talent and renowned as the greatest seamen the Hospitallers ever had. He was one of the most experienced sailors and fighting men in the Order. He had been shipwrecked on several occasions, and once spent an entire night in the upturned hull of a galley capsized in a storm, together with the corpses of his drowned crew. He had also been captured and forced to serve in the galleys of the Turkish fleet until he was ransomed.

He was a natural linguist, speaking Turkish, Arabic, French, Spanish, and Latin, and his experience and wisdom meant that his advice was sought by every Grand Master under which he served.

By the time of the Great Siege, he had demonstrated a hardy toughness in an era of high mortality rates, and was already in his 60s.

Romegas had a very powerful patron in the form of the Hospitallers, accompanied by an extremely hazardous duty to seek out and destroy Muslim vessels, forts and towns, or die trying. Romegas did not possess his own ship. It was the property of the Order, and more than one captain was executed for surviving the loss of his ship. Despite an official vow of poverty, many captains were able to retain some of the wealth from their captured vessels, but the majority was retained by the Order to fund its religious wars.

Romegas represents a man at the peak of his career as a noble privateer, although his focus was on glory more than profit.

Brother Romegas, Knight of St. John   *200 points*

Attributes: **ST** 11 [10]; **DX** 13 [60]; **IQ** 14 [80], **HT** 15 [50]

Secondary Characteristics: Dmg 1d-1/1d+1 [0]; BL 24 [0]; HP 11 [0]; Will 14 [0]; Per 14 [0]; FP 15 [0]; Basic Speed 5.5 [-30]; Basic Move 5 [0].

Languages: French (native language) [0]; Latin (accented) [4]; Spanish (accented) [4]; Turkish (accented) [4]; Arabic (broken) [2].

Cultural Familiarity: Islamic [1]

Advantages: Patron (Knights Hospitaller, powerful, with extensive political power, 6 or less) [15]; Rank 5 (Admiral of the Hospitaller fleet) [25]; Reputation 2 (Protector of Christendom, all the time, amongst all Christians living on the Mediterranean shore) [5]; Status 4 (including 2 from Rank) [10]

Disadvantages: Duty (extremely hazardous, almost all of the time, 15 or less) [-20]; Enemy (All Islamic forces, utterly formidable group, 9 or less) [-40]; Reputation -4 (Scourge of Islam amongst all Muslims, large class) [-10]; Vow (Poverty, Chastity, Obedience) [-15]; Hates enclosed spaces [-1]; Obsession (Free as many Christian galley slaves as possible) [-1].

Skills: Area Knowledge (Mediterranean Ports)-15 [2]; Area Knowledge (The Maltese Archipelago)-15 [2]; Astronomy (Observational)-13 [2]; Boating (Unpowered)-14 [4]; Broadsword-14 [4]; Cartography-14 [2]; First Aid-14 [1]; Gunner (Cannon)-13 [1]; Guns (Arquebus)-15 [4]; Leadership-15 [4]; Meteorology-13[1]; Navigation-14 [2]; Polearm (boarding pike)-13 [2]; Savoir Faire (High Society)-14 [1]; Seamanship-15 [2]; Search-13 [1]; Shield-14 [2]; Shiphandling-15 [8]; Swimming-15 [1]; Theology (Christianity)-12 [1].

Captain Don Antonio Juan de Amazas

Don Antonio was born the fourth son of Don Luis de Amazas, a Spanish nobleman from Toledo. As the youngest son, he felt little sense of responsibility, and was always the first to suggest an adventurous activity, whether rafting across the Tagus or exploring the caves in the hills. His charm and intelligence enabled him to escape punishment for his

foolhardiness on many occasions.

At age 16, he was presented at court, and spent the next three years on the fringes of the Royal circle, learning the fine arts of diplomacy and etiquette. His charisma and dress sense made him a popular young man, and many noble daughters were flattered by his attentions. The intrigues of court fostered a rivalry between Don Antonio and another young courtier, Don Alvaro Rodriguez. With a lady's honor at risk, Don Antonio challenged Don Alvaro to a duel. Don Antonio won, leaving his rival with a scarred cheek and an implacable enmity. A Spanish proverb says that revenge is a dish best eaten cold, and Don Alvaro is a patient man.

When Don Antonio was 19, his father died, and while his eldest brother inherited all the estates, Don Antonio received a sizeable legacy. Bored with the courtly life, he sought a letter of marque from the Crown to pursue the war against the British at sea. He paid for and equipped a fast privateer, hired hands and an experienced sailing master and set out to his new life of adventure.

Within four years, Don Antonio had become a successful privateer and knowledgeable sailor in his own right. His manners and sense of honor meant that even those who he captured had few bad words to say about the courtly and entertaining captain of *El Orely y Las Tres.*

Don Antonio Juan de Amazas   *150 points*

Attributes: **ST** 11 [10]; **DX** 12 [40]; **IQ** 12 [40]; **HT** 11 [10].

Secondary Characteristics: Dmg 1d-1/1d+1 [0]; BL 24 [0]; HP 11 [0]; Will 12 [0]; Per 12 [0]; FP 11 [0]; Basic Speed 5.75 [0]; Basic Move 5 [0].

Languages: Spanish (native language) [0]; English (accented) [4]; French (accented) [4]; Portuguese (accented) [4].

Advantages: Charisma 2 [10]; Fashion Sense [5]; Patron 5 (Kingdom of Spain, 6 or less) [15]; Status 3 (including 1 from Wealth) [10]; Wealthy [20].

Disadvantages: Code of Honor (Gentleman's) [-10]; Duty (9 or less) [-5]; Enemy (The English, utterly formidable group, 6 or less) [-20]; Enemy (Don Alvaro, individual equal in power to Don, 9 or less) [-10]; Overconfidence (12 or less) [-5]; Reputation -4 (amongst English, a large class, all the time) [-10]; Reputation -1 (amongst everyone except the English, almost everyone except a large class, all the time) [-4].

Skills: Area Knowledge (West and North coasts of the Iberian peninsula)-13 [2]; Astronomy-11 [2]; Boating (small sailing vessels)-13 [4]; Broadsword (Cutlass)-13 [4]; Cartography-12 [2], Connoisseur (Music)-11 [1]; Diplomacy-12 [4]; Gunner (Cannon)-12 [1]; Guns (Pistol)-13 [2]; Leadership-15 (including +2 from Charisma) [4]; Mathematics (Applied)-10 [1]; Navigation-12 [2]; Savoir Faire (High Society)-12 [1]; Savoir Faire (Seafarers)-12 [1]; Seamanship-13 [2]; Shiphandling-13 [8]; Swimming-11 [1]

Niclo Crroe

Niclo Crroe is the fifth son of the Crroe kinship. By tradition, Jonlo, the eldest brother, trained in the arts of politics and diplomacy, while Siman, the second joined the Exarchate Navy. The third son, Annol, was entered into the Church on his seventh birthday. Tradition did not dictate what later sons should do, but by the time he was 17, Niclo knew. Siman's success in the Navy had inspired him, but he knew that he would never amount to anything in the Crroe kinship. He had to secure his own wealth and fame to found a new dynasty: the Niclo kin.

He persuaded a collection of merchants to refit a freighter to his own specification in return for a share of spoils. Niclo achieved significant successes, capturing a number of merchantmen as well as earning the approval of the Exarch through destroying a fleet of Aambulian sunriders on the third moon of Gena. A disastrous encounter with a naval blockading squadron almost destroyed the *Endymion,* and the refit cost almost all the wealth he had earned.

Niclo's ambition is to petition the Exarch for the right to establish a new kinship. He will need to demonstrate wealth, courage, and a clear understanding of the responsibilities of the nobility. The process will take at least six years, and until then, Niclo will continue to fight to bring glory to both his kinships -- the old and the new.

Niclo Crroe   *130 points*

Attributes: **ST** 11 [10]; **DX** 12 [40]; **IQ** 13 [60], **HT** 11 [10]

Secondary Characteristics: Dmg 1d-1/1d+1 [0]; BL 24 [0]; HP 11 [0]; Will 13 [0]; Per 13 [0]; FP 11 [0]; Basic Speed 5.75 [0]; Basic Move 5 [0].

Languages: Standard Exarchian (Native language) [0]; Aambulian (Accented) [4]

Advantages: Patron 4 (The Exarchate, 6 or less) [13], Status 2 [10]

Disadvantages: Debt (10% of starting wealth per month) [-10]; Duty (raid shipping, 9 or less) [-5]; Enemy (The Aambulia Regime, utterly formidable, 6 or less) [-20]; Obsession (Found a new kinship, long-term goal, 12 or less) [-10]; Reputation -1 (Disdain for privateers from fellow citizens of the Exarchate, all the time, everyone except a large class) [-4]; Reputation -4 (Hatred of pirates by the Aambulia Regime, all the time, large class) [-10]

Skills: Area Knowledge (Home planet)-14 [2]; Astronomy-12 [2]; Beam Weapons (Pistol)-14 [4]; Cartography-13 [2]; Computer Operation-13 [1]; Connoisseur (Gourmet)-12 [1]; Force Sword-13 [4]; Gunner (Beams)-13 [2]; Leadership-14 [4]; Mathematics (Applied)-11 [1]; Navigation [Hyperspace]-12 [1]; Navigation [Space]-13 [2]; Savoir Faire (High Society)-13 [1]; Savoir Faire (Spacers)-13 [1]; Shiphandling (Starship)-14 [8]; Smuggling-12 [1]; Spacer-14 [2]; Streetwise -12 [1].

Anthropological Roleplaying

by Paul Cardwell

Steve Jackson Games, has a line of game figures called **Cardboard Heroes.** These are strips of light cardboard with the front and rear views of game characters; the strips are folded and weighted. They have the advantage of low cost and light weight, but the disadvantage of being hard to recognize from the side, and -- as with all commercial figures of any kind -- limited in subject matter.

However, it often seems that rather than the figures representing the characters, a lot of roleplayer's characters tend to resemble those figures. They are easy to generate, even when mini-maxing, but they still turn out to be the same old two-dimensional rehash of bad Tolkein, Roddenberry, Lovecraft, and so on.

Some game systems try to force a little variety by having charts of advantages and disadvantages to chose, but even if one takes care to avoid contradictions in those choices, characters can still come out as a collection of statistics, rather than living individuals.

There is a fairly easy way to avoid this problem -- base your characters on real cultures in history. This automatically brings in distinctive features in weapons, armor, trades, view of life, physical size, religion, hobbies, diet, musical instruments, and all the other features that make one character distinctive from another.

As with anything else to achieve this, it is no magic formula. The player pursuing this method may have to spend a little time in the library to get the finer points of the culture. I found this out myself when my northern plains Indian PC advanced to the point of becoming a shaman. Even though I had fairly recently had a graduate course in that field taught by a professor whose specialty was the Lakota religion, I still took a few days working out how this occupation would affect the character *in game terms*. Ultimately, it was no great inconvenience -- all that work was saved and became the basis for the temporal plane shaman data.

Anthropological roleplaying not only provides a source of playing characters, but NPCs and plot hooks as well. How would the band of adventurers react upon seeing some NPC from that culture? More importantly, how would they react about coming on a whole village of this culture? Would they try to conform, or remain aloof? Would they make faux pas according to the etiquette of that culture, and what would be the repercussions? What if there were no common language; how would they communicate? What about trade? The possibilities are endless.

While this list looks ridiculously exhaustive and practically exhausting, it is not. Make a hardcopy, increasing the spaces between lines if you don't want to write small. Go to the library; an academic library of a university offering anthropology is ideal, but it will work with even a rural county library . . . they at least have an encyclopedia. Get their books of the subject and start filling in the blanks. In the academic library, you should be able to get 90% filled in one afternoon; the small public library will take longer, but you can still get there. *Osprey Men-At-Arms, Elite,* and *Warrior* series are excellent because they are a quick read, written by historians, and illustrated based on museum artifacts.

While most of this data relates directly to probable game situations, much of the rest (clothing, weapons, packs, and so on) will enable the gamer to have the proper miniature figures for the character (by conversion or scratch-building), as well as give an additional "feel" to properly design and play this type of character in the game. The research alone will provide a realistic and internally consistent character and enable one to roleplay an in-depth character rather than roll-play a vague, flat stereotype.

To cover these cultures adequately for really in-depth roleplaying, one should fill in the blanks in the following outline as completely as possible. This will be harder with extinct, pre-literate cultures, as most of the evidence will be from archeology, with the rare and often distorted from literate people who came in contact with them (note Herodicas' sometimes fanciful descriptions of the Scythians and others). Even literate ones rarely discussed some of these details, assuming everyone knew about that, and even fewer of these records survived outside desert cultures because the

writing media decayed. Still, the more complete, the more interesting your character will be.

General Features

Correct the Stereotypes

What was the culture really like? Where is it different from the usual concepts of what it was like? In most cases, it is better for game purposes to play the real one, warped slightly to fit the game system you are playing (particularly in regards to magic, but in some cases in regards to clothing where outside the original environment or the like). For example, Arnhem clothing from tropical Australia doesn't work in the Alps, nor Inuit in the Kalahari.

Problems Adapting To The Game

Can someone from this culture even be a playable character? If not, what changes must be made to permit this? If too much adaptation is required, you may be better off to keep the culture as intact as possible and use it strictly for NPCs. Some cultures simply wouldn't adventure under any circumstance; others might have some individual do so, such as Bilbo Baggins, but would be considered just as daft for it.

Place Of PC Groups In NPC Society

If only part of the culture can be suited for gaming, how does that subculture differ and still fit in? A good example of this is using a Japanese character. Most gamers choose either a samurai or a ninja. However, ninja were strictly contract workers hired though several layers of intermediaries and rarely worked in groups. Samurai were bound to a specific warlord and had no chance of independent work unless the lord and heirs were destroyed. These ronin might pick up any job offered, but mainly wanted to find a new lord to serve. Only the musashugyo, a ronin not looking for another lord, but improving martial skills as a religious discipline, would qualify, and they were quite rare.

Social Structure

Form Of Family

Is the family structure:

- nuclear (only parental couple and their children]
- extended (aunts, uncles, and cousins also considered part of the family and live in essentially the same place)
- multigenerational (generally three-generations -- children, parents, and surviving grandparents)
- ainga (all descendents of a common living ancestor)
- or something different?

Is the "head of the family":

- patriarchal
- matriarchal
- both but with clearly defined roles
- or totally egalitarian (which was very rare)?

As an example, with the Polynesian ainga, the head (matai) was literally elected by the family and represented them on the village council.

Marriage And Divorce

Is monogamy or polygamy the common form? If the latter, is it polygyny (multiple wives) or polyandry (multiple husbands, which is rarer)? Is divorce easy or difficult? What are the attitudes toward adultery? (In late-19th-century upper-class Europe, adultery was virtually expected, by both; in others it was a capital offense; most are somewhere in between.) Was there concubinage (which were granted legal status, but children -- while legitimate -- usually did not inherit)?

How Infants Were Carried

Are children carried in the arms, cradleboards, slings, or something else? If not in the arms, are they carried in front or back, upright (facing forward or back) or horizontal, etc.? This is of critical importance if adventuring with infants, and useful in the case of NPCs.

Women As Adventurers

Are female adventurers feasible or not under that culture's attitudes? If possible, would it be permitted with infants? Look beyond the obvious: Sacagawea's main value, beyond adding a couple more languages to the group (ignoring the incredible encounter with her long lost brother just when they needed horses) was that in encounters, Jean Baptiste Charboneau in the cradleboard was considered proof it was a peaceful group.

Social Rank

What is the class structure? There are no truly classless human societies, although in fantasy games a sapient nonhuman species might have one. How much mobility is possible between classes? Does this include downward mobility as well as upward (is there such a thing as a poor noble or is the status lost with the money)?

How Are The Leaders Are Selected?

Is it by heredity, election, ritual combat, merit, examination, or something more exotic? Is it from a limited aristocracy or can anyone with the other qualifications be a leader?

Governmental Size

Is the government decentralized into semi-autonomous subdivisions (tribes, districts, or the like) but still a part of a larger group; centralized with a local bureaucracy under relatively distant control; or small enough for all members to be acquainted?

Economics

What is the basis for economic exchange (coin, metal, rare materials such as shells or pipestone, barter, or something else)? How are inequities adjusted (taxes; giving to others as the main means of social status; other than clothing, most goods are held in common; something different)?

Etiquette And Enforcement

How elaborate are social behavior codes (rigid and a major feature of the culture, informal and flexible, a different set for different situations and/or levels of society)? How are they enforced? Are they part of the legal code, is there loss of status, ostracism, or ridicule? Aer these codes self-enforced through accident or disease? And the like.

Crime and Punishment

Is there a formal legal code (written, recited at public events, oral tradition, etc.)? What is the range of punishments

(fine, exile, imprisonment, death, something else)? How is guilt determined (magic, jury, judge, common belief, a more exotic system)?

Slavery

What is the extent of slavery, and the proportion of slave to free? How are slave obtained (capture, purchase from other cultures, home grown, temporary for payment of debt, or the like)? How oppressive is a slave's life? Is it just another class of society indistinct except for freedom and usually wealth, or are they subhuman or considered a consumable resource? Is there a possibility of freedom, and if so, what is the procedure?

Religion

Cosmology And Pantheon

What is the perception of the gods? Are they remote and only contact their creatures through spirits, departmental (with each deity has jurisdiction over a certain species, occupation, or aspect of life), personal, or something else? Is the culture polytheistic, henotheistic (where they primarily worship one, but acknowledge the existence of -- and occasionally worship -- others)? Monotheistic?

If acknowledged, is the nature of spirits good or bad? What is their relation to creatures and to gods; are they approachable only by shamans or by anyone?

Liturgical Form

What is the nature of their worship (prayer, sacrifice, dance, trance, ritual)? Is it public or private? Is it in consecrated structures, home altars, remote natural places, someplace else? Is pilgrimage practiced?

Magic

Was there a concept of magic and how restricted was its use? Did they have wizards or shamans, and if so, how did they fit into society as a whole (were they respected leaders, just another occupation, or feared outcasts)?

Funeral Custom

How did they dispose of dead?

- Burial (in what position: extended, arms at side or across chest; fetal, on their side or upright; other)?
- Cremation?
- Exposure?
- Excarnation?

Are grave goods (items interred with the body) used?

This information is useful to know if the PC is killed, since most people want to be laid to rest according to their custom.

Art

Graphic And Sculpture

What is the nature of paintings, carvings, decorated pottery and/or basketry? Are there purposes other than/in addition

to aesthetics (religious, ceremonial, educational, something more)?

Music And Dance

What types of instruments are used? Do they accompany singing and/or dancing, or are strictly solo or ensemble? Are dances religious, secular, either, both? Is participation restricted to certain individuals?

Sports And Games

What types of recreation are there, other than those related to work? What is the nature of work-related sports (strictly competitive like rodeo or lightening work like harvest games or barn raising)? Are there professional athletes? Is everyone expected to participate? Are there games of chance? Are there board games? Is storytelling a competitive sport?

Tattoo And Scarification

Is it done, prohibited, or restricted to subgroups? What is the significance? What are the patterns (representational, geometric, or something strange)?

Other

Of course, they could have any form of art that does not fit the above.

Equipment

Housing

What is the architecture? What materials are used? Are such structures considered permanent, temporary, or portable? What are the sleeping facilities (bed, hammock, pallet, on the ground, something else)? Is cooking done inside or outside the main living quarters? What is the bathing tradition (never bathed, steam or dry sweating, stream or lake, something else)? If bathing is done, what's the frequency (several times a day, daily, weekly, for special occasions, only after death)? What are the toilet facilities? (This information can be really difficult to find!)

Public Buildings

Do they have public structures? What kind? What purposes do these building serve -- governmental, religious, recreational, or other? How does the architecture differ from that of other purpose buildings? Is use restricted to certain groups?

Clothing

What types are worn? What materials are used? How are fabrics made (on a type of loom, knitted, felt)? How was skin prepared (rawhide, brain-tanned buckskin, tannic acid, etc.)? What are the differences in clothing by sex and season? Are there sumptuary restrictions (where certain types are worn only by certain classes)? How are they decorated -- with dye, quill, beadwork, or ornaments (metal, fur, shell, feathers, appliqué)?

Food

What foods did they eat? How did they get it: foraging (hunting/gathering), growing (agriculture/herding), trade with other cultures, and so on? How did they preserve food (drying, salting, freezing, smoking, spices, something else)? What is the nature of farms or gardens -- did they use neat rows or haphazard arrangement; plow, dibble stick, or

scattered on the surface; and so on)? What is the distribution system (everyone grows their own, farmers are a separate occupation, grocers, government distribution, something more exotic)?

Packs And Containers

How did they pack things for transport (carried loose, bags, backpack, animal packs, vehicles, etc.)? How did they store items to protect from spoilage or pillage by insects or rodents (pits, jars, baskets, suspended, granaries, or the like)?

Fire-making

How did they make fire: flint sparking, firebow, fire plow, spindle, constantly burning fire (lamp, candle, smoldering punk), etc.? What did they burn: wood, grass, a type of oil, dung, some other fuel type?

Land Transport And Types Of Mounts

How did they cover distance on land: foot, animal mounts, travoix, sleds, wheeled vehicles (type), or some other means? What powered it: members of that culture, dog, horse, ox, reindeer, camel, elephant, or more exotic animals?

Boats

How did they cover distance on water: swim (perhaps assisted by inflated skins, logs, or the like), coracle, canoe/kayak, dugout, constructed boat, ship? What powered it: paddle, oar, sail, or something else?

Weapons

Main Missile Weapon

Type? How made? How used?

Other Missile Weapons

Type? How made? How used?

Main Melee Weapon (Mounted)

Type? How made? How used?

Other Melee Weapons (Mounted)

Type? How made? How used?

Main Melee Weapon (Dismounted)

Type? How made? How used?

Other Melee Weapons (Dismounted)

Type? How made? How used?

Weaponless Combat

What did they do when unarmed and attacked? Did everyone always carried a knife? Did they use fist, grapple, a formally developed martial art (type), or some other means of defense?

Shields

Type? How made? How used?

Armor

Type? How made? How used?

Tactics

Military

How did organized groups use weapons: did they prefer fixed formations or display of individual skill and bravery? Did they use stealth to surround before combat or announce before engagement and try for single combat? And so on. How was mass combat coordinated: drum or bugle signals, flags, some other means?

Individual

How did individuals or a small group (hunting party or raiders) use weapons: stalking, driving over cliff or pre-set enclosure (natural or constructed), concentrating on one target at a time, traps (type), something else? How was it coordinated: hand signals, bird calls, etc.?

Character Stats

Modification to Rolls

What changes (usually in size) are needed to conform primary rolls to physique?

Availability Of Magic

Could everyone use magic or just shamans/wizards? How did one become a shaman or wizard?

Tribal Skills

Are there any particular abilities unique to that culture, such as the ability to domesticate monkeys (southern Asia), use of celestial navigation (Polynesia), shrink heads (Shuar), find water in a featureless desert (Australian aborigine and San), or the like?

Fabulous Beasts

What mythical animals did they believe were real? What ones were acknowledged to be mythical, but were of cultural significance anyway?

References

What books did you use in designing this culture? Sometimes it helps to go back and check on some detail; having your bibliography on hand makes this easier.

Glossary

Aside from the sheer pomposity of the name, the biggest problem with anthropological RPG is that the average gamer is not an anthropologist. Like most fields, it has a language all its own mostly to avoid using a paragraph of definition where a word or two will do.

To remind one of the meaning of unusual words, the same thing would apply to that culture's unique items, concepts, ways of using items, and so on, such as the names of the parts of armor, or metaphysical concepts. For instance, the Scythians did not use stirrups, but trained their horses to kneel in sort of a show-horse bow, and mounted, leg over the withers -- very useful if heavily armored or wounded. They also carried their sword on the right, pointing forward and drew it by swinging the arm back; the left side held the bow and arrows in a gorytos. Thus the sword rested on the thigh when mounting and nothing got tangled up.

It is strongly encouraged that the reader examine as many of these books and articles as possible. This will guard against errors in one source. While not as frequent or severe as in modern times, there were changes in style during the periods described, just as in our own time, the difference being more due to our rapid communication than anything else.

For a character designed with a long-running campaign in mind, the quality of the characters produced by this method will more than compensate for the time spent on the research.

The City in the Storm

by Martin Jenner

A chill wind howled across the plains, baring winter's teeth. Frojac shivered atop his mount, glancing uneasy at the sky. The sun was bright and clouds skimmed lazily across the empty blue, except in the west where they piled high like water behind a dam. He stared, a frown creasing his sunburned face. Something wasn't right. The herd were scattered around him, great horned heads lowered to munch contentedly at the grass before winter buried it in snow. The other herders were distant, watching for the telltale signs of a grassdog pack nearby. Frojac turned his gaze skywards once more, the wind whipping his hair across his face. The cloudbank seemed closer, looming large and dark.

"Frojac!" The young herder flinched, turning to see Herdmaster Runthia's baleful glare. Beyond him the settlement sat squat and gleaming against the green plains, remote and fragile. "Quit daydreaming, boy!"

"Yes herdmaster," Frojac mumbled obediently. "Only . . ."

"What?" Runthia snapped.

"That cloud . . ."

The herdmaster peered up as though seeing the sky for the first time. Frojac followed his gaze, missed seeing the old man's leathery skin pale. The cloud was thick and black, boiling overhead. Actinic flashes lit the depths, the rumble of thunder like stampeding cattle a second later. The herders were all looking and pointing now, their cries lost in the rising gale.

"Herdmaster, I don't understand," Frojac said, pushing his mount close to Runthia's. "How can a storm move against the wind?"

Thunder roared. The world was dark now, as though the sun had never been. Lightning tore the sky asunder. Runthia turned.

"Ride," he said. Something broke through the cloud's leading edge, dark and angular. Frojac watched, open-mouthed. "Ride." The mass above grew, clouds pouring from its tortured stone. The herdmaster yanked on Frojac's reins, wheeling his mount about, and slapped the beast's flank. The horse screeched and leapt into a gallop, slipping easily through the long grass. "Warn them!" Frojac heard through the thunder. "Tell them Stormrider comes!"

Lying flat against the body of his mount, the wind screaming in his ears, Frojac raced the storm for home.

The Legend

Some 50 years after the end of the world, the city of Reno was destroyed. Reports from traders spoke of buildings leveled, parks uprooted and bodies littering the streets. The few survivors spun described a terrible storm that descended and hung over the city like a shroud while monstrous, inhuman raiders scoured the streets, looting and murdering. Where these bandits came from, none knew.

Time passed and more stories came in. Tales of towns and cities ruined and their people dead or stolen away, and always those lucky few spoke of the great dark storm that swept over the settlement, a harbinger of doom. Years would pass and the Storm would fade, forgotten, then a traveler would bring news of another isolated settlement razed to ash and bone and people would remember, would begin to fear again. Mothers threatened their children, "go to bed or the Storm Riders will get you," and for the last three centuries the people of this shattered Earth have kept one wary eye on the skies above. Most believe the tales little more than fables, something to thrill the children and excuse the actions of humanity's dregs. Perhaps they are correct, those ravaged settlements simply the unlucky target of desperate

men and women, yet still the legend lives on. Only the dead know the truth of the matter and they keep their secrets well.

The Reality

The dead are not alone in holding the secrets of the Storm Riders, but those who know are in no position to share their knowledge. Stolen away under cover of rain and battle, they are bound and blindfolded, abused and beaten. While most are left as corpses, some are taken alive when the raiders leave.

At the heart of the great storm there is a city, a place known simply as the Rock. Thunder rolls across its stones and lightning crackles from tower to tower, seeking release; it is here those taken by the raiders are brought. The kidnapped see for the first time that their devilish captors are only human, the residents of this strange place.

How the city remains airborne few ever learn, for their role is to play slave to the raiders who call this home. Each raid brings back only a handful of captives, but they are sorely needed for dangerous works and few survive for long. But it is not the need for fresh slaves that drives the city's inhabitants to plunder and destroy, rather the simple need for food and water. So it goes that the raiders must strike again, scouring another settlement from the Earth to feed their hunger.

Some slaves, should they live long enough, manage to become raiders themselves, issued an antique firearm far more sophisticated than anything remaining on the surface. They see for the first time the ancient helicopters that first carried them away from their homes in chains. How the raiders came into possession of such aged marvels the ex-captives may never know.

Some among the Rock's inhabitants know the truth, quiet men and women in smart uniforms. They serve in the Vault, deep in the heart of the Rock. Here the tunnel walls are smoother, the floors flat and the doors fashioned from solid steel. From within these well-worked tunnels the storm is controlled, but to ask of the Vault is to invite brutal punishment, a lesson few slaves need to experience more than once.

The Place

The Rock is more than just a base for the raiders it is a city in its own right, with parks and markets and civilian residents. The tunnels that honeycomb the dark stone are home to nearly three thousand people, and space is the greatest luxury. Large, open hangers house the Rock's ancient helicopters and their support staff, while nearby wells hold the precious fuel they need to function. While much of the cave system is taken up with storerooms, primitive factories and the sprawling secrets of the Vault, the vast majority of the Rock's internal labyrinth consists of living quarters. The mass of people inside the Rock is growing steadily and most captured slaves find themselves put to work carving ever-narrower tunnels and quarters from the hard black stone in order to make room.

On the upper surface of the Rock, in the heart of the eternal storm where lightning blasts great jagged splinters from the stone and thunder roars load enough to deafen, ugly towers rise into the clouds. The tallest is a dozen stories high, its walls shattered and burned by lightning strikes, but most are far lower. It is here that the majority of the raiders' captives are housed. Even the rough underside is not wasted, slaves inhabiting inverted towers that hang down towards the earth. Every building is streaked with copper lightning conductors in an effort to deflect the storm's fury, yet a handful of buildings are ruined each year by lightning and both above and below the Rock the surface swarms with construction crews. Surface duty is essentially a death sentence; those slaves assigned to it the troublesome and the useless. In a similar fashion the roles of supervisor and foreman are often given as punishments to citizens or raiders who defy the Rock's rough justice.

Back within the Rock itself the population live in cramped discomfort, each person receiving an allocation of space according to rank, wealth and status. Only the richest and most powerful have the luxury of separate living and sleeping areas, while the poorest families share single rooms no larger than three square meters. Slaves are even more unfortunate. Crammed by the hundred into large caverns they sleep pressed tight against one another and yet are thankful, because even such crowded halls are better than the flimsy slave-towers on the surface.

At the center of it all lies the Vault. Those privileged few who enter learn the true way of things, the history forgotten by raiders and citizens alike. They alone know that the Vault is what remains of a military installation from the old world, built to hold scientists and technicians as they worked at secret, hidden projects. The people of the Rock are the descendants of scientists who worked on those projects and the soldiers who guarded them though little evidence remains to prove it, even in the Vault.

Regardless of its origins the Vault is critical to the Rock's existence. Within its maze of smooth-cut passages colossal generators work ceaselessly, powering everything from the dim lights that make subterranean life possible to factories and hydroponics labs. The massive fans that drive fresh air out into the tunnels and caverns of the Rock are here too, breathing life into the city.

Vital as these systems are, they are nothing compared to the real secret of the Vault: the technology that keeps millions of tons of rock and metal from crashing back to earth where it rightfully belongs. In the midst of all the tunnels and administrative departments that keep the city running smoothly, between the raiders' headquarters and the assembly room of the city's ruling council, there is the Helmsman's chamber.

Here men and women scurry back and forth, cursing their own ignorance. The room is packed with instruments and the Rock's last remaining computer. The walls are white, the floor and ceiling the same, and the busy scientists are pristine in white coats and gloves. Yet for all this activity, for all the wonders of the old world gathered here, it is neither the white-coats nor their equipment that draws the eye. It is the bare rock of the fourth wall, bare rock from which something blue and silver protrudes. A single figure kneels before it as though in prayer, his hands pressed against its molten, ever-shifting form. He appears young. His eyes are closed and his lips move constantly, silently mouthing words in an unknown tongue. Long ago an attempt was made to move him, to excavate more of the strange device that binds him. It nearly ended in disaster, sending the young man into a thrashing fit and the Rock plummeting. The young man's identity, his name or station, are long forgotten, for in three hundred years he has neither aged a day nor spoken anything but gibberish. Yet that he still understands is clear, for through commands whispered in his ear the rulers of the Rock can steer their misshapen chariot. He is called Helmsman, and he is a mystery.

The People

The city in the storm's inhabitants can be divided into three groups: raiders, citizens and slaves. The raiders are the most respected and the oldest, present long before there were slaves to serve them or citizens to support them. The citizenry are the largest group, comprised of support staff, merchants, entertainers and a hundred other professions a city needs. While the Rock is still officially under the control of the military and the "citizens" themselves born into the armed forces, their military connections are for the most part quietly ignored.

The raiders would like to believe themselves something better, having little respect for the merchants and technicians who keep life running smoothly about them. Clashes between raiders and citizens are commonplace and while the Rock's rulers frown upon such quarrels, they tend to overlook their troops' aggressive behavior. While the raiders might consider themselves heirs to a fine military tradition they are but poor shadows, leeched of their principles by time and necessity. The Rock's selection and training methods are aimed at producing hard, ruthless killers who obey orders without question, so a certain amount of casual violence is accepted as inevitable. Only the most serious transgressors are ever punished, sent out to supervise slaves in the building and rebuilding of the lightning-shattered towers that cover the Rock's blasted shell. What is certain is that conflict between raiders and citizens would be far more common were it not for the slaves within the Rock. Without any rights at all a slave is an easy target for torment or abuse, despite complaints from the more moral citizens. Those voices are lost, however, overwhelmed by the weight of apathy among their peers who have never known life without slaves to serve them. Most of the Rock's inhabitants give little thought as to what their lives must have been like before their capture. Slaves have always been there, somewhat less than human.

Among the Rock's rulers, uncertainty is rife. Some have begun to question the institution of slavery, as well as the necessity of plundering weaker settlements for the sake of improving their own. Others care little for such concerns, concentrating instead on planning and carrying out raids to the exclusion of all else. A turning point has been reached,

one that could see the Rock take the first step towards restoring the world that was, or see it squander that promise and descend into savagery. The factions are evenly matched, and things are coming to a head. One way or another, the city in the storm will never be the same again.

The Truth

Back when the world was whole there was a rumor that never seemed to fade. It spoke of a military base out in the desert, a place where scientists poked and prodded strange artifacts of unknown origin, hoping to understand their mysteries. Despite all the denials, that little base beneath the Nevada desert actually existed. In the dark rock beneath the sand the American military guarded their blackest secret, for long before something bright and shining had fallen to Earth. The base grew up around it and generation after generation of America's brightest minds studied that half-buried thing. All failed, yet still they tried. Even while the world collapsed around them the scientists worked to no avail. Isolated, deniable, self-sufficient, the base lived on. Years passed and younger men and women, the children on the original personnel, took their parents' place. None expected the riddle to be solved, but one day the ground began to shake.

Rushing to the lab those young scientists found one of their number bowed before the device, his hands pressed against it and strange words pouring from his mouth. As the base tore free of the ground, pulling a great mass of stone up with it, the Helmsman's eyes closed and his voice faded to silence. He has never moved again.

As that colossal bulk rose into the sky above the ruined desert the storm clouds began to gather. From nothing they appeared, swirling around the mass of the base as if to hide its unreality from the eye. Thunder rolled and lightning flashed; Stormrider was born.

The Adventures

Stormrider is designed to slide easily into any modern Earth-based post-apocalyptic campaign, but with a few minor alterations it can be used in any setting. Transplanting the city from Earth to another world is as simple as changing a few names, while it could be converted to suit a fantasy campaign by replacing the mysterious technology which drives it with some ancient and forgotten magic. The ex-military raiders could be swapped for a cult or organization looking to change the world for the better no matter what the cost.

The floating city could be used in a variety of different ways. The legend could be mentioned in the hearing of the PCs to give the setting flavor or the tale could be foreshadowing, setting the scene for a later encounter. Alternatively Stormrider could be the center of the campaign, with PCs living aboard the Rock or captured during a raid and enslaved. Finally, the PCs might be what passes for the law in their area or the lucky survivors of a raid, determined to stamp out the bloodthirsty murderers who have brought misery and death to so many over the centuries.

How you use the Rock and its Stormriders is up to you, but here are some adventure hooks that might fire the imagination.

From The Outside, Looking In

Fuel is a problem. The helicopters and generators that keep Stormrider functioning and its soldiers raiding require gasoline, and the Rock's supplies are dwindling. In desperate need of fuel, the city's rulers turn their attentions on a half-functioning refinery run by an ally of the PCs. With so much refined gasoline lying around an attack in the usual fashion would be risky, so the Stormriders try a different tactic subterfuge.

When the world ended the crust was torn and battered, opening great fissures leading deep inside the Earth. While exploring one such fracture, the PCs discover something strange. Something . . . alien. And aboard the Rock, hundreds of miles away, the Helmsman opens his eyes and screams . . .

The PCs arrive in a town to find it a barren husk, stripped of valuables and living settlers. Are the legendary Storm

Riders responsible, or has some other threat risen to menace the area? The PCs must investigate the carnage and discover whether surrounding settlements are at risk.

From Within The Storm

Aboard the Rock, things are not well. The storms that ravage its outer crust are growing stronger and more brutal and a rumor prevails that these environmental effects are not even deliberate, rather that they are a result of damage to whatever keeps the city flying. Tensions are high and many of the citizens call for the city to be grounded until the problem can be rectified.

Space within the Rock is rapidly becoming all used up. The community is thriving and if such growth continues people will soon be forced to sleep in the hangars, storerooms and narrow tunnels. Many are calling for a reduction in slave numbers to make room, while others say it is time to begin changing the world for the better. The Rock is split in too, and conflicts between the two sides are increasing in regularity and violence.

Someone is preaching rebellion to the slaves, calling on them to rise against their oppressors and claim the Rock for their own. Who is this hidden leader, and does he have the slaves' welfare at heart?

Murphy's Rules

Things I Hate as a GM

This isn't one of my single-thought columns, nor is it quite one of my column-loaf installments (made from real column pieces chunked and formed into a column shape). Rather, it's a collection of some top-of-the-head musings as to Things I Hate As a GM. Besides direct sequels to this column, it immediately suggests three other related sequels.

Anyway, these aren't necessarily my biggest pet peeves (although, having sprung to mind relatively quickly, they're probably near the top), nor are they arranged in any particular order of dislike (although, with three entries in this installment, there's a one-in-six chance that they are).

And now, without further ado . . .

* * *

Any type of ability to detect lies. I cannot express how much I, as a GM, despise the ability to detect lies. This one ability cuts down entire swaths of adventure potential; the more foolproof the method is, the more whole *genres* of adventures are eliminated. Practically every mystery, cop show, diplomatic tale, thriller, and romance story revolves around deceit or lies at some point. And the way this ability is structured in most games, there isn't any disincentive to detect lies on every statement made by someone else.

PLAYER: Sooo . . . we suspect you might have had something to do with the murder of Dr. Suerte. Did you have anything to do with his murder?

GM (AS SUSPECT): No.

PLAYER: Detect lies.

GM (rolling and sighing): You suspect he's lying.

PLAYER: Ah HAH!

GM: Yeah, listen. I'm going to the kitchen to get a Mountain Dew.

PLAYER: Detect lies.

GM: All right. *And* some Chex Mix.

Some games go even further; I remember feeling my heart sink as the fledgling GM of an ***In Nomine*** game when the full power of the truth-detecting Seraphim became known. Not only was there not much real protection from their supernatural means of detecting lies (especially from mortals), there were few restrictions keeping such characters from using their abilities constantly, *and* there was a 1-in-6 chance that they would learn what the truth was (presuming the character knew the truth). In other words, you ask your prime suspect six times "What did you do with the body?" and -- if he knows -- then you've got a 66% chance of knowing that cadaver's exact fate.

The ability to detect lies means that, to run the kind of mystery games I like (and that my players seem to enjoy), I need to rely on more and more contrivances. ("Ah-ha! He *was* telling the truth . . . but he'd been hypnotized into believing he saw that!")

Games present and future, hear my warning: Detect lies is to gaming as DNA is to mystery stories; if you include it, then half the GM/writer's time will be spent trying to figure out how it *doesn't* apply.

* * *

Settings that don't tell me something crucial I need to know to run the darn thing. (This one bugs me as a player,

too.) When gaming in others' RPG universes, I'm amazed at how often a future book will contain some piece of information that was somehow left out of the core book. Sometimes these are mere errata oversights (such as the Second Edition of *Wraith: The Oblivion,* which [forgot to mention](#) how to regain the Pathos points so essential to power and fuel certain effects). And the supers game *Brave New World* contained enough metaplot that I would've been terrified to run anything there for the first few months, lest some introduced fact I believe to be trivial turns out to be vitally important and game disruptively wrong.

I'm trying to remember any amusing or annoying anecdotes that stem from this, but failing; the only anecdotes I'm coming up with involve characters I've made (which, I suppose affected my GM from the other way). I seem to recall that the First Edition of *Fading Suns* didn't give a good idea for how big the jumpgates that connect the stars were; I knew they were big enough for spaceships to pass through, but assumed them to be akin to, say, the size of a space station. As a result, my character's origin, had a basis, an unlikely collision between two ships around the jumpgate. But it wasn't until a later book that I realized *how* unlikely it was; it turns out they're about half the size of a moon . . . meaning that the odds of two ships colliding around the sparsely used gates was about the same as finding a specific person at random in [Canada](#). Whoops.

Another time, when I made a character for our *Vampire: The Dark Ages* game, I learned in a sourcebook that all vampires part of one bloodline were only turned into vampires if offered a choice. Whoops . . . turns out it was *almost* all in our campaign.

Perhaps in a complex and interlocked enough universe it's unavoidable that such facts will come to light during a game . . . especially if it's evolving and being added to. But that doesn't mean that I don't dislike it, and it's probably one of the reasons that I'm drawn to [canceled game lines](#).

* * *

Any rule mechanic that interferes with my "Roll the dice and see how pretty they look" system. I confess that I don't always have time to make NPCs or determine exact difficulty numbers or any of the things that a "real" GM is supposed to do. And I suspect that I'm not alone in this regard.

Fortunately, I learned early on that -- in most games -- I don't need to do know exactly what I'm doing. For example, in a game such as the ***D6 System,*** it doesn't really matter if the exact difficulty number is 16 or 19 if the player rolls a 26. And games such as ***GURPS*** are even better, with their "roll low" task resolution system; if the player rolls a 4 on that 3d6, I know he almost certainly succeeded.

I've abstracted this philosophy into the "Roll the dice and see how pretty they look" system. Basically, if I don't necessarily know the difficulty number, I'll usually ask the player to roll anyway; the better the roll, the greater the chance of success. Only if the roll isn't clear (they didn't roll obviously well or obviously poorly) do I actually devote my precious brain CPU cycles to determining if they succeeded or not.

Unfortunately, some game systems seem to mess with this seemingly simple concept. One of the difficulties I've had in running the ***d20 System,*** for example, is the relative graininess of the system coupled with many player's expectations of mathematical precision in the game. Since it's a linear die roll directly affected by a modifier or an opposed roll, the odds of rolling a 9, 12, or 14 are all the same; if the difficulty number and the roll both fall somewhere in that range -- which is most of the time -- then I need to figure out exactly whether or not it succeeded.

But by far the RPG I've had the worst time using my RtD&SHPTL system is the original ***Fading Suns.*** In this game, all success rolls are made using a d20 against a difficulty number. At this point it's like the *Price Is Right:* The closer the die roll is to the target number without going over, the more successes. So if the difficulty number is an 11, a roll of 10 is good while a roll of 12 is a failure. Oh, and an exact roll is a critical success, where the number of successes are doubled. And these difficulty numbers are directly affected by modifiers. So, for example, let's say a player tries to shoot a bad guy with a blaster; let's say his normal difficulty a 12, and he rolls a 14. Now, I find myself needing to ask, "Are there any modifiers that would change that result and make it easier with a modifier of +2? Because if so, it goes from being a missed shot to being one the best possible outcome he can have. Even worse, the number of successes is important, so even if a roll is obvious -- for example, a 1 always succeeds -- the result still isn't (since a

roll of 1 always results in one success, which often isn't enough to get results). More often than not the entire system was a colossal headache for me.

Nowadays a game would have to be *really* interesting for me to overlook this fundamental deficit in my style of play . . . and even then, I'd probably be more inclined to convert the setting to another game line instead.

* * *

Of course, if these spark any related thoughts or personal peeves, feel free to mention to me via [e-mail](#) or over on the [message boards](#); I'll be happy to steal the best ideas for a future easy column.

--Steven Marsh

Jincheng

by Paul Drye

After a disastrous invasion by the Mongols in the 14th century, the Chinese Empire carries on from the West Coast of North America. Jincheng is the greatest of its cities, on the site of Homeline's San Francisco. It's also been the home of both a lucrative White Star Trading outpost and a Paralabs facility for the last 15 years. Unfortunately, the reason for the lab is coming to the fore: in Jincheng it's late March of 1906, and the Great Earthquake is due in a few weeks. Infinity is working to get all its personnel out of the city with 48 hours, but the project is complicated.

The Setup

It's been more than six centuries since Sartaq Khan swept out of the northern steppes and conquered northern China. As far as Infinity has been able to determine, the change point on this timeline came several decades earlier in the convoluted succession crises that followed Genghis Khan's death. Different leaders led the campaigns in East Asia, and the wars ran somewhat differently. In the end, the important change was that Southern China stayed independent longer, and the more adventurous and trade-oriented Cantonese had more room to develop their own Chinese culture. Offshoot kingdoms were founded in the Philippines and Hawaii, and eventually North America was discovered by an unknown sailor. When the Empire finally collapsed under Mongol assault, there were several hundred thousand Chinese in the New World, from Baja California to Vancouver Island. Cut off from the wellspring of Chinese civilization, they drifted into independence. By the dawn of the 20th century, there were more than 20 million of them.

Jincheng is the capital of Dankuo, the "Dawn Country," a teeming pre-industrial metropolis of some 300,000 people. As well as being large and politically important, it is also the main trade entrepot on the east side of the Pacific, with contacts spreading north to the Native American country of Haida Gwaii and south to the Chimu inheritor kingdoms in Peru. Between the sophisticated technology the Chinese brought to the Americas and the gold fields to the east of Jincheng, the city is the center of two continents.

This is the sort of thing that interests White Star Trading, and since the timeline was discovered 15 years ago, they've built up a lucrative business trading luxuries like pepper and tropical fruits for various products of the Empire.

The other major Homeline presence is scientific. On Homeline, California was hit with numerous earthquakes from 1850 to 1906, all a prelude to the Great Earthquake. For the last few years, the University of Nevada has been running an earthquake research project in conjunction with Paralabs, studying the impending quake here and on other timelines approaching 1906. By observing the same event multiple times, they're hoping to get an understanding of these disasters beyond anything known even on more advanced (but non-parachronic) timelines.

The quake is going to be so intense, though, that both the project and White Star have been ordered to close up operations no later than 48 hours before the Homeline date for the quake: April 16th. Unfortunately, there's a lot of

resistance to the order. On a few timelines, the quake never happened, and some of White Star's people are concerned that closing down even for a short period of time will be costly; they think it's better to just get out of the city, and don't worry about not being able to get back to Homeline easily for the few weeks it takes until Jincheng is back under control and this side of the conveyor can open again. Similarly, several scientists want to stay so they can monitor the quake as it occurs. They're of the opinion that, since they know it's coming, they can prepare and ride out the worst of the disaster. The data they could obtain by not running their equipment on auto-pilot would make it worthwhile.

Meanwhile, back on Homeline there is agitation from Miracle Workers to do something about the disaster. It's generally agreed that they'll be involved once the quake hits, but some are arguing that they need to take pre-emptive action. A little preparation could save quite a few lives. The difficulty is how to go about doing it. Unless they're careful, outtime personnel might attract unwanted questions in the days following the disaster if someone remembers them doing unusual things beforehand.

There is every chance that someone will be left behind, either by chance or deliberate resistance to Infinity's evacuation order. The GM is left to arrange that the group plays some of the unlucky ones.

The City

Jincheng was once a ramshackle affair, but as it grew in importance it was rebuilt each time it burned down (as pre-industrial cities are wont to do). Now it's laid out on a classic Chinese square grid, in a rectangle about 2.5 miles by 1.5 miles bounded approximately by the Homeline locations of Van Ness Avenue and 16th Street.

The more north and west one goes in Jincheng, the better off the citizens. The northern reaches of the city, along the channel between the bay and the Pacific, are the site of various Imperial residences and those of his family. This includes the large Three Hares Palace (named after the symbol of the current dynasty, who built it) on Telegraph Hill, which is the seat of government. The palaces are surrounded by gardens and the whole system is enclosed in a large wall -- the closest thing to Beijing's Forbidden City that one will find on this timeline, though it's become more open in recent centuries.

The city's richest non-noble citizens cluster to the west, outside the city walls where the land starts to rise in a series of hills and ridges. It's been 200 years since Jincheng was seriously threatened by an invader, and in that time the protection of the walls has become unnecessary to some; still, small private armed forces are quite common in the estates.

The hills to the southwest of the city are largely empty and devoted to religious buildings of amazing diversity, mostly Buddhist and Taoist temples, and a few mosques. The Ji Jingjiao ("Jade Christian") Temple is also here, and is the home to a small, unusual offshoot of Nestorian Christianity. It's not important in the grand scheme of things, but it's become known to outtimers because of its unusual, high quality architecture and sacred art.

Docks and markets dominate the eastern shore of the city, inside the bay. They are as busy as any in the world between a large fishing fleet and an immense amount of trade going along the coast and as far out as Hawaii and even the Philippines. There are dozens of ships docked on any given day, and an uncounted number of small vessels. The lower half of the city feeds off this business, and contains 80% of the city's population. Other major market places are strung along the southern edge of the city and sell rice and produce from the farms the stretch the rest of the way down the peninsula. The net effect is to make the portion of the city where foreigners (and so also outtimers) live very busy, dusty, and stifling. Fortunately Jincheng was rebuilt along a strict grid after the last great fire ninety years ago and the regulations introduced at the time haven't let the poorer neighborhoods become warrens, not yet anyway.

The quarter of the city between the poor districts and the Imperial city to the north is the home of Jincheng's small middle class. It consists entirely of government officials and middling merchants on their way up to living in the west of the city. Actual industry, no matter how enriching, is restricted to the poor districts.

The Disaster

The morning of April 16th is unseasonably foggy, and about 15 minutes before dawn -- while the night is apparently still dark -- the quake will begin. The cooking and heating fires of early risers will start numerous small fires in damaged and destroyed buildings, causing a major problem in the primarily wooden city. Jincheng has a very elaborate firefighting system in place, with the 2,000 soldiers of the garrison under standing order to pitch in. Signal flags and runners are assigned to coordinate the response. Unfortunately the Imperial Palace is in one of the less-stable areas, and the minister in charge of running everything is severely injured when one of the outbuildings collapses.

There is then a major aftershock at 8:14 AM; many buildings damaged by the earlier shifting collapse completely. Within a few hours a few fires that were not caught have expanded into infernos, and it becomes obvious that much of the town is going to be destroyed. The fire brigades start to get their efforts together under the command of Imperial Prince Wai-Keung, and they start building firebreaks by destroying buildings along several major streets.

Despite their efforts, serious fires will continue for three days and more than a third of the city -- primarily in the poorest blocks to the south and east -- will burn down. Most of this area was flattened or severely damaged first, and another quarter of the city will have been destroyed by the quake but escape the fire. The rest of Jincheng will escape relatively unscathed, though there's hardly a building that doesn't have something cracked or broken in its structure.

From the end of the first day, the ongoing problem will be the people of Jincheng. About 20,000 people will be killed if events continue without major outtime intervention spurred by the players' characters. Unless that unlikely event comes to pass, the city will be dealing with homelessness, disease, and lack of food and water for several weeks. Temperatures at night will drop to under 50°F. Social chaos will break out if basic needs aren't met; fortunately the Imperial Army will be ordered to send as many troops as they can into the city from the surrounding region, so there will be some authority for outtimers to fall back on.

Most serious for Infinity personnel left behind, the quake was so severe as to disrupt crosstime travel into the region. Any scientists left behind will be beside themselves with excitement, as this is the first good observation of even a small reality quake being hooked to real-world events, but the practical issue is that Jincheng will be cut off from the rest of the multiverse until the afternoon of April 19th. The GM should feel free to alter this time for dramatic purposes if need be, and should remember that the players should have no idea if the connection will come back.

People

Qhispi: A traveler from Taypikala, a large South American kingdom in the approximate location of Southern Peru. Qhispi is the de facto ambassador to the emperor of Dankuo. Relations between the two states are good, so he doesn't actually spend much time at the court, instead running a large trading concern that ships goods back and forth along the Pacific coast.

Taypikalans don't generally use full names unless they're necessary, and in Jincheng there are sufficiently few of them that personal names are all that are needed. Qhispi has a particular reason to obscure his, however: it is Qhispi Inti Vilca, or "Qhispi, Prince of the Blood." He is the sixteenth son of the current emperor through one of his lesser wives and, while Ohispi will likely never inherit, he is going to be a powerful man some day. He's in Jincheng at the order of his royal father in order to learn practical administration and politics before he's given some town to administer. Only the Imperials, some of their assistants, and a few other Taypikalans in Jincheng know who he is.

Qhispi's role in any adventure is to be a fellow outsider to Dankuo who has already got used to their ways and can supply GM's exposition as needed. Later, he can be a bridge to the Imperial family in Jincheng if the players decide they should contact the upper reaches of the city's government.

He is a short Native American man in his early twenties, with an angular face, high rounded cheekbones, and short black hair parted in the middle. He is the altruistic type, but in a basic "noblesse oblige" way related to his mission rather than out of true conviction. His first instinct is towards conservatism -- a common failing among his people -- but he has a fatal weakness for the opposite sex; away from the court for the first time, he's getting his chance to really indulge and hasn't got bored of it yet. Luckily for him, it always seems to work out despite his not being able to

leverage his noble blood without blowing his cover. He's managed to dodge vengeful husbands and unfortunate pregnancies with remarkable ability.

Qhispi Inti Vilca   *140 points*

Human; 5'5"; 160

Attributes: **ST** 10 [0]; **DX** 11 [20]; **IQ** 12 [40]; **HT** 10 [0].

Mui Kailun: Inspector Mui is one of many tax inspectors devoted to watching imports into Jincheng. He is small and rumpled, but also very observant and incorruptible, two characteristics that make him a good inspector but keep him from rising very far in the service. He is also seemingly unable to close a case, though he often stirs up a lot of trouble before the object of his attention somehow wriggles away from justice.

If Qhispi is a help to outtimer adventurers, Kailun is a hindrance. His role is to be the intelligent, overly curious native who threatens The Secret. He will already be wondering about the Infinity outpost because they're likely physically unique in Jincheng -- Europe is no more advanced than Dankuo on this timeline, and he's never met an African. If the outtimers start to act strangely, he may be inspired to dig more deeply, and can cause severe problems for the characters even if they are merely trying to help. The reckoning may be delayed until the crisis is over, but the attention they're trying to avoid will eventually come. GMs looking to add an extra moral quandary to adventures in ruined Jincheng may want to make the Inspector a personal friend of one character, or at least sufficiently likable that the group will want to avoid his being kidnapped and sent to Coventry.

Inspector Mui is a male East Asian with particularly dark skin (hinting at some ancestor from perhaps Indonesia), and neck-length hair; he has a small braid hanging down on either side of his eyes in the current style for civil servants. He tends to watch and stay silent for some time, then once he starts to speak it is nearly impossible to get him to shut up -- a personality quirk of which he is profoundly aware and constantly apologizing for as he continues to talk.

Mui Kailun   *125 points*

Human; 5'3"; 130

Using Jincheng In Other Settings

When moving Jincheng out of *Infinite Worlds,* the key concept that needs to be translated is the limited knowledge of the impending disaster. The players know about it, and so do a few others related to their characters, but no one else.

Keeping it this way this requires some motivation on the characters' part, which probably stems from the nature of the

background. In *Infinite Worlds,* it's The Secret. In fantasy settings, the knowledge will be magical in some way, so exploring the source will suggest solutions. If the revelation of impending events stems from the gods, it may be that the characters should not tell anyone else ("Sobeshu is sending the earthquake to punish the city, and only his mercy has informed the righteous so that they may be saved."). If the GM's tastes run toward classical tragedy, the characters may be cursed so that they physically cannot tell anyone due to divine injunction, or they may be literal Cassandras -- no one will believe them when they do give warning.

An interesting alternative is that those in the know could tell but don't want to. With a bit of effort Jincheng can transform into the capital of any evil empire based on Asian or Middle-Eastern-flavored oriental despotism. The adventurers could be one of a select group with prophecy or precognitive magic working in their favor, with the quake being the signal for an insurrection against the dead Emperor and his new successor.

In a science fiction setting, the magic knowledge can be brought out by Clarke's Law about sufficiently advanced technology. The characters are visitors from the advanced technical civilization of the Stellar Commonwealth, which knows from tectonic science technobabble that a disaster is looming, while Jincheng is a city on some backslid world stuck in a new dark ages. Here the restriction on telling may be a law against interference, or more prosaic concerns like knowing they'll never get their own citizens away to safety if there's general panic. In campaigns with gray morals, the adventurers may be taking advantage of their knowledge to press home a caper during the chaos -- perhaps rescuing slaves, or just out-and-out theft.

Dark Champions (for the [Hero System](#))

Published by [HERO Games](#)

Written by Steven S. Long

Cover by Storn Cook

Illustrated by Nate Barnes, Warren Beckford, Storn Cook, Robert Cram, Andrew Cremeans, Keith Curtis, Eric Lofgren, Roberto Marchesi, Eric Radamaker, Scott Ruggles, Dan Smith, Greg Smith, Chris Stevens, Derrick Thomas, Erich Von Haus, & Dean Yuen

372-page b&w softcover; $31.99

Just over a decade ago author Steven Long had published his first RPG sourcebook. 1993's **Dark Champions** explored the anti-heroes of the superhero genre, the vigilantes like Batman and the Punisher who fought crime on their own terms. Armed with superior skills, knowledge, and training, and often with an array of equipment and armaments they took on not the brash supervillains of the four-color genre, but the muggers, burglars, pimps, pushers, and rapists as well as organized crime in the harsh realities of the underworld. As the title suggests, this was written with the *[Champions](#)* universe in mind.

Now at the helm of Hero Games, Mr. Long is able to revisit his original work, and in doing so make it not an updated vigilante sourcebook, but a guide to gaming in the modern-day action-adventure genre in a gaming version of the real world. Thus **Dark Champions** takes in spies, cops, soldiers and mercenaries, weird conspiracies, the criminal caper, monster hunting urban fantasy, and the techno-thriller as well as vigilante crime fighting and the new addition of *Dark Champions: The Animated Series.* In this, **Dark Champions** is as much heir to **Danger International** and **Espionage** as it is to the original 1993 book. And if the discussion of those genres is not enough, then the book also tells you how to mix them up with comedy, horror, mystery, romance, and tragedy, and indeed with other **Hero System** game supplements such as *[Fantasy Hero](#)* and *[Star Hero](#)*.

Just as it starts out with the basics for the genre, **Dark Champions** does the same for characters. Before buying skills and abilities players are asked to consider their character's background, suggesting several like Intelligence Training and (reformed) Criminal, which can be combined with the given personality types (each with suggested disadvantages), genre archetypes, and the 20 or so skill packages to form a firm foundation for any character. The skill packages are neatly divided into the criminal, including a terrorist package; espionage, with a cinematic spy package that lets you do kiss-kiss-bang-bang style along with the realistic; law enforcement, and military categories. The packages are very American, so a GM will have to adapt them if he wants packages for other nationalities. Plus the selection seems a little too black and white.; split between the good and the bad and little in between, a better range is needed to fit the book's genres, particularly the monster hunting and the weird conspiracies.

In turn, attributes, skills, powers and disadvantages, and super skills are put under the **Dark Champions** spotlight, adjusting and explaining how they work in the modern adventure genre. Perks and talents get the same treatment, with perks expanded to encompass those associated with rank and position, whether business, government, or military. The new talents, such as Deadly Blow and Hotshot Pilot are mostly drawn from other **Hero System** books, but are

appropriate nevertheless. Powers are applied in several different ways, rather than in the slam-blam fashion of the four-color genre. The primary use is in the creation of weapons and equipment, but others include enhanced physical abilities and super skills for cinematic-style games. The latter might be better termed advantages in other games, and if a GM cannot find a suitable one from the 114 listed (including Favorite Gun, Cinematic Safety, and It's Somewhere In These Files), then they also serve as examples to work with.

To represent characters going through their vehicles, gear, and equipment during the course of an adventure, *Dark Champions* introduces the concept of Resource Points. Although optional, their use allows a player to buy guns, gain vehicles, and contacts without spending character points, and a GM to regulate what a player character has access to. Granted as series of pools, each differentiates between a character's personal kit and what he keeps in his armory. Admittedly this all adds another degree or two of bookkeeping to the game, but if it involves guns, gear, and cars, there are some players who are going to get a kick out of it.

Two large chapters support equipment use, the largest given over to guns. The claim that the weapons chapter is a gun bunny's dream is both true and a problem. It's true in that a lot of ammunition types and guns are listed along with accessories aplenty. A sidebar even covers fictional bullets such as the Anti-Vampire and Silver Ammunition, and all of the equipment is priced in terms of character points, resource points, and actual prices. The problem is that as comprehensive as the tables of weaponry actually are, you need to be a gun nut to know what each of the entries is. Few are illustrated and even fewer are described, resulting in the need for the non-bunny to have to refer to the list of references in the bibliography.

Actual combat in *Dark Champions* is more tightly focused and personal and is accompanied by a side note to role- as well as roll-play it. Despite the more realistic aspects of the modern adventure genre, with new options for damage, hit locations, and healing, the emphasis is still on the dramatic. This is not to say that *Dark Champions* cannot and does not handle either realistic or cinematic combat. Included realistic rules allow for blow through, grace under pressure (in a gunfight), and recoil while the cinematic allows various tricks and unlimited ammunition. One new realistic rule is for Mystery Damage, which lets a player character know that he has taken damage and some idea of its effect, but not necessarily the numbers lost.

Other support for a *Dark Champions* game comes in the form of a chapter devoted to forensics -- useful for not just the *C.S.I.*-style game -- and then another on potential adversaries. Included are organized crime, gangs, cinematic masterminds, costumed criminals, serial killers, and terrorists. The information on organized crime is decent enough and should be at least adequate for most games. A GM will need to do more research on any of the terrorist groups described if he wants to use them in any more than a superficial manner.

Used in conjunction with opening chapter on the genres of *Dark Champions,* the advice on running a *Dark Champions* game is excellent. It addresses character creation and its problems, adding paranormal abilities to a game, and also campaign type, theme, and tone. It's all sound advice, as is that on running the game, including a section on the differences between fiction and RPG play. Termed "disconnects," these are aspects that work well in the former, but make for a poor experience in the latter. For example, a player character's caution in combat versus the daring action hero, villain death versus the recurring villain, and, really, why not just send in the cavalry . . . err, marines? This is short, sweet, and very, *very* useful for almost any game.

Dark Champions is rounded out with a short rogue's gallery of vigilantes and villains. Useful as NPCs or player characters, the vigilantes are heirs apparent to the Harbinger of Justice, the very character whose creation lead the author to write the original 1993 book. The villains originally appeared in that book, but here have been updated and redone to make use of the new book's rules. For example, one makes use of the new resource points rules, while another uses Talents to become murderous with a knife. Finally, the book comes with a brief bibliography that feels a little too short and unexplained.

Physically *Dark Champions* is up to Hero Games' usual standard of presentation. It's nothing exciting to look at then, but nevertheless both readable and accessible. In updating and expanding *Dark Champions,* Steve Long takes it away from the original vigilante comic book genre and on to a broader stage that encompasses the whole of modern-set gaming. It certainly provides everything necessary to handle such a campaign, but it still leaves the GM wanting more

in each specific genre, particularly those of mercenaries, spies, and weird conspiracies. The GM will need to look at other supplements for such specifics, though Hero Games have released a source book for one of them in the form of *Dark Champions: The Animated Series.* Hopefully they will publish further supplements, perhaps one covering modern weaponry in more and better detail. Despite this problem and the lack of specifics for some genres, *Dark Champions* is everything a GM will need to turn his *Champions* campaign down a notch to run grittier, darker games.

Pyramid Review

Amazonas

Published by [Mayfair Games](#)

Designed by Stephan Dorra

Full-color boxed set with board, 48 wooden tents in four colors, 58 playing cards, 64 research tokens, 28 gold counters, 16 silver counters, four value chips, rule booklet; ; $49

Mayfair Games, purveyor of several versions of *Settlers of Catan,* has taken a somewhat loftier stance with *Amazonas.* In the Catan series you're trying to hew a living from the rough, untouched lands, but here you're just a scientific sightseer. You've been tasked to look for new and rare species of plants and animals, and you've got a reputation to maintain (and the grant money doesn't hurt either).

The object of this game -- designed for three or four players -- is to score the most points for your research by the end of the last round.

The board depicts a chunk of the Amazon River, with areas for small settlements on either side. Each site is connected to some of the others through overland trails in the jungle or passages over the water. Players get a hand of bidding cards, some traveling money, and a map of locations for their secret mission.

Each turn, an event card gets flipped over from the deck. These determine the special effect for that turn. Sometimes it's a brushfire, eating into everyone's profit. It could be an animal attack, cutting off access to neighboring villages. And it might be a chance to make extra money through your sponsors or find new specimens with the helpful natives.

Everyone bids on player order. All players get a deck that lets them bid zero to six -- the highest number goes first *and* gets that amount of silver. Going last isn't ideal because buying campsites costs more the later you arrive at the location. Once you've established a base, you can only connect to adjacent sites. Each little village is associated with one of the five bits of flora and fauna for which everyone is searching, and pitching your tent there gets you a counter of that type. This assumes there are enough spaces to accommodate you -- if there aren't, you can't camp there at all. Each player's secret mission card tells them which villages they must claim for their patron; if you're shut out of one or more of them, you lose points.

As you pick up specimens, you're trying to build a collection as wide and deep as possible. If you go wide, you want one of each of the five research counter types. The first to reach this level of diversity gets the best "value chip"; successive chips are worth progressively less. If you go deep, you have to have three or more of the same research counter to make any points off them, but you make better money, too. Playing your highest value card gets you more silver, but you have to play through your deck before you can shuffle and reuse them. Each bid card is associated with one kind of research, and you get money for matching the symbol. If you think you can pitch tents at another "flower" village or two, holding onto the flower-related bid card until then may make it your most profitable. Once the event cards run out, the game is over. Everyone counts up the points for going wide and/or deep, and the high score is hailed as the 19th century's greatest explorer.

The game components have the right materials, with a colorful mounted mapboard, good cards, thick counters, and wooden huts for your researchers to huddle in. The byways on the map seem well defined, but you have to be wary -- they can be tricky, like optical illusions for the inattentive. The real graphic trouble is the villages and their costs. There's a square for each tent it can take, and the gold nuggets in each (three silver equals one gold) tell you how much a build costs, but pawns and squares are the exact same size and…well, it's a lot happening in a tiny space, and it can

get easily shifted if you're not careful.

None of this should stop someone with the right intrepid spirit from picking up the game. (Mind you, the price might do that -- it's an awful lot of money for something that's got some fancy kit but isn't all that intricate compared to its brethren.) While it shares this general category with a number of other games, this one is a quick pickup. The rules are easy, you're not overwhelmed by the counter mix, and best of all you can play it quickly. By your second go-round you won't take an hour to finish a full game. *Amazonas* offers challenge without overload, strategy sans the needless complexity, and fun without a full evening's obligation.

--Andy Vetromile

Advantage-Based Magic for *GURPS*

by Kevin J. Chase

There is a sidebar on p. B114 that shows how Innate Attacks and Afflictions can be combined to create effects ranging from a dragon's breath to a 9mm submachinegun. But **GURPS** advantages can do much more. By combining advantages and modifiers, a GM can replace the long prerequisite chains of the standard **GURPS** skill-based magic system with a few self-contained advantages.

These spells are not limited to attacks. With nothing more than a name change, Telekinesis 10 becomes "Garret's Invisible Hand" and Invisibility becomes, well, "Invisibility." Add the right modifiers, and you can reproduce most dungeon-crawling magic.

Problems Substituting Advantages for Spells

Advantages alone don't feel like *spells* -- they feel more like super-powers. (One of the **GURPS Supers** sample characters, Necron, is a perfect example.) For starters, most advantages are always on. The whole idea of casting a spell goes out the window when a mage's augmented strength and magic force field are never off to begin with.

More importantly, one doesn't learn advantages -- one is born with them. So not only does advantage-based magic replace your beared old wizard with a bearded old superhero, but the musty old tomes in his research lab are gone too, as are the lab itself and all his apprentices -- there's nothing to learn, nothing to teach, and nothing to research.

Finally, advantages are all-or-nothing. One wizard's fireball has exactly the same range as the next's, his invisibility is no better or worse than another's, and he won't be improving his healing magic until he somehow raises his IQ.

Solutions

To keep the old wizard and his magic library in the campaign, advantage-based spells must allow:

Learning: With proper training, an apprentice who can't cast a lightning bolt should learn to do so. That training could come from a master or from a book, but it's important that he is *learning* a spell, rather than somehow having power bestowed upon him.

Training: More training should result in better control of magic. A mage who's practiced chucking fireballs all his life should find them more reliable, easier to cast, and generally more powerful than someone who just learned how.

Evolving: Training and research should improve spells not just by increasing their damage or range, but by adding new capabilities and eliminating drawbacks. With enough experimentation, a wizard should go from healing humans only to healing any humanoid, and his improved lightning bolts should home in on his foes rather than flying in a straight line.

Learning Spells

Making advantages learnable is easy on the face of it: Simply allow your players to buy spell advantages during play.

While that solves the immediate problem, it reveals another. Now your wizard's player can look forward to learning that Mind Control spell in . . . 15 or 20 weeks. After all, 50 points is a huge expenditure, and many campaigns won't last long enough for him to save that much. What the spellcaster needs is a way to buy just part of an advantage at a time.

Some advantages can already be bought piece by piece. For instance, any spell based on a leveled advantage like Innate Attack lets you pay in installments -- just buy one level at a time. Most attacks cost only a few points per die of damage, so after a year's apprenticeship a novice will throw a lightning bolt that does one die of damage, while his master dishes out six or eight at a shot.

Likewise, Afflictions can be "leveled up" by increasing the HT check penalty, and a magic force field by increasing its DR. But this still doesn't help the non-leveled advantages that are the basis for most non-combat spells.

Adventure Seed: Seeking the Master

The party's patron wizard (or the PC mage himself) wants to take his force field, lightning bolt, or telekinesis to the next level. He's already the most skilled in the kingdom, so the PCs must convince a superior master from some other nation to tutor him. Or if they're the naturally-devious sort, a covert mission to steal that other master's notes might suffice . . .

Training Spells

Closely tied to the huge up-front cost of the big spells based on Invisibility, Mind Control, and Morph is another problem: There is no sense of development over time. Immediately after paying the points, the character can cast his magic just as well as an old master. By modifying the base advantage with some hefty drawbacks, a novice spellcaster can learn an affordable (if unreliable) version of his master's favorite magic.

Costs Fatigue, Extra Time, Nuisance Effect, and Unreliable all suit a novice spellcaster well, and they also reduce the cost to an affordable level. Likewise, a few perks like Accurate, Extra Range, or Cyclic let a master wizard show his stuff. That requires some fiddling around with percentages, but like most math in *GURPS,* it's all done before play.

Even better, groups of modifiers can be wrapped up in standard packages like "apprentice" and "master" to provide a one-word adjustment to each advantage. There is a table of suggested spells and their costs at each rating of mastery at the end of this article.

Adventure Seed: Open Season on Healers

There is only one master healer in the entire kingdom. There used to be five, but the rest have died under suspicious circumstances. Someone is systematically eliminating the nation's ability not only to heal its wounded, but to train new healers. Morale among the soldiers, accustomed to magical first aid on the battlefield, is dropping fast. The heroes have to figure out who is undermining their country while simultaneously keeping the last master healer alive.

Researching Spells

Just as advantage modifiers can represent different skill levels, they can also represent variations of the spell itself. Enough of these little additions can create a whole family of magic based on improving a single spell: If a standard-issue fireball is good, then surely a fireball with an explosive area effect is better, and one that lets you choose explosive or not as you throw it is better still.

This leads to a system where wizards will seek to learn from other wizards, not to get an extra +1 skill level, but to pick up new variants of spells they already know. If you learn a teleport spell that lets you warp to places you've never been (Warp + Blind) from Lucien the Lucky, and another version that lets a friend tag along with you (Warp + Extra Carrying Capacity) from Konrad the Conveyor, then you've just invented a spell that lets you warp other people to places you've never been (Warp + Blind + Extra Carrying Capacity). Expect the world to beat a path to your door . . . if they can find you.

That old wizard and his school of magic are not only back in your campaign, but other wizards are asking to borrow

his notes.

Adventure Seed: No Place for Demons

The demon-spawn hordes of Evilopolis are about to overrun the peaceful nomads of Pastoria, and the PCs are there to save them. The nomad shamans have no trouble dealing with malevolent spirits, but they all learned their Bind and Banish spells with the limitation: "Spirits Only [-50%]". Their primitive cosmology has no place for demons, so their magic won't affect them.

While the PC knight is teaching their warriors how to fight an organized army and the rogue is learning the terrain from their scouts, the wizard should be instructing their shamans in demonology, so they can reduce their accessibility limitations to "Extra-Planar Beings". Cultural Familiarity might be the key to survival for everyone involved.

Example Spells

All spells require mana, which is a -10% Accessibility penalty simply called "Magic" below.

The other modifiers are negotiable; there's no reason a spellcaster's clothes *have* to turn invisible along with the rest of him, just as there's no reason a healer can't heal a golem. The player just has to find the character points to pay for it.

Disguise: Shapeshifting (Morph) [100] (Magic, -10%; Cosmetic, -50%; Retains Shape, -20%) [20].

Flight: Flight [40] (Magic, -10%) [36]. (See also the skills Aerobatics (p. B174) and Flight (p. B195).

Heal: Heal [30] (Magic, -10%; Xenohealing (All Earthly Life), +40%) [39].

Invisibility: Invisibility [40] (Magic, -10%; Can Carry Objects (No Encumbrance), +10%; Switchable, +10%) [40].

Mind Control: Mind Control [50] (Magic, -10%) [45].

Passwall: Permeation (Very Common Materials) [40] (Magic, -10%; Can Carry Objects (No Encumbrance), +10%) [40].

Probe Memories: Mind Probe [20] (Magic, -10%) [18].

Read Thoughts: Mind Reading [30] (Magic, -10%) [27].

Send Thoughts: Telecommunications (Telesend) [30] (Magic, -10%) [27].

True Sight: Hyperspectral Vision + See Invisible [25 + 15] (Magic, -10%; Link, +10%) [40].

Leveled Spells

Costs below are for a single level of each advantage. To figure the cost of a higher level, multiply the base cost of the advantage by the level you want, *then* add the modifiers.

Resist the temptation to multiply the final cost of a 1d Fireball by 8 to get an 8d Fireball. Due to the rounding involved, you'll usually be off by several points.

Banish: Affliction 1 [10] (Magic, -10%; Accessibility: Extra-Planar Beings, -40%; Based On Will, +20%; Disadvantage: Weakness: Natural World, 1d/minute, +60%; Malediction: -1/yd, +100%) [23].

Bind: Binding [2] (Magic, -10%; Accessibility: Extra-Planar Beings, -40%; Engulfing, +60%; Malediction: -1/yd, +100%) [5].

Evil Eye: Affliction 1 [10] (Magic, -10%; Heart Attack, Secondary, +60%; Malediction, +100%; Sense-Based, Vision, -20%) [23].

Fear Aura: Affliction 1 [10] (Magic, -10%; Disadvantage: Combat Paralysis and Cowardice (6 or less), +35%; Area Effect, 2 Yards, +50%; Emanation, -20%) [16].

Fireball: Burning Attack 1d [5] (Magic, -10%; Area Effect, 4 Yards, +100%; Variable, +5%; Dissipation, -50%) [8].

Frost Spray: Burning Attack 1d [5] (Magic, -10%; Cone, 3 Yard Width, +80%; Hazard, Freezing, +20%; Variable, +5%; Reduced Range, 1/5, -20%; No Incendiary Effect, -10%) [9].

Lightning Bolt: Burning Attack 1d [5] (Magic, -10%; Side Effect, Stunning, +50%; Surge, +20%; Variable, +5%) [9].

Movement: Telekinesis 1 [5] (Magic, -10%.) [5]

Paralyze: Affliction 1 [10] (Magic, -10%; Paralysis, +150%) [24].

Shield: Damage Resistance 8 [40] (Magic, -10%; Force Field, +20%; Physical Attacks Only, -20%) [36].

Stone Rain: Crushing Attack [5] (Magic, -10%; Area Effect, 2 Yards, +50%; Bombardment, Skill 14, -5%; Overhead, +30%; Persistent, 10 Seconds, +40%; Variable, +5%; Dissipation, -50%) [8].

Truthteller: Affliction 1 [10] (Magic, -10%; Disadvantage, Truthfulness (6 or less), +10%; Based On Will, +20%; Melee Attack, Range C, -30%) [9].

Example Skill Levels

These are collections of minor drawbacks that reduce a spell's utility for beginning casters. Journeymen and Masters more or less break even, and Grandmasters get bonuses.

Novice: Costs Fatigue (2/min), -10%; Nuisance Effect (Obvious), -5%; Takes Extra Time 2, -20%; Takes Recharge (5 sec), -10%; Unreliable (14 or less), -10%.

Apprentice: Costs Fatigue (2/min), -10%; Nuisance Effect (Obvious), -5%; Takes Extra Time 1, -10%.

Journeyman: Costs Fatigue (1/min), -5%.

Master: Costs Fatigue (1/min), -5%; Low Signature, +10%.

Grandmaster: Costs Fatigue (1/min), -5%; Delay (Variable), +10%; No Signature, +20%.

While none of these modifiers are required, think carefully before removing the fatigue requirement. Without it, magi will walk around with their Shield and True Sight spells on all the time. There's nothing wrong with that, but it makes them feel less like cast spells and more like innate powers.

To keep this list generic, modifiers that affect only missile spells are not included here. Feel free to give an old master's combat spells enhancements like Accuracy, Homing, Increased Range, and even Rapid Fire in addition to the above.

Keeping Track

Bookkeeping is easiest if a player saves character points to advance his spell advantage from one rating to the next, say from Journeyman to Master. It also makes for a more compact character sheet:

Fireball 3d (Master) [23]
Flight (Novice) [14]
Invisibility (Journeyman) [42]

But if a player is willing to keep track of all the modifiers individually, there's no reason he can't buy them one by one.

Table of Spells

Spells marked with an asterisk cost more than the math would indicate, due to the -80% limit on advantage modifiers.

Spell	Mods	Novice	Apprentice	Journeyman	Master	Grandmaster
Disguise	-80%	*20	*20	*20	25	45
Flight	-10%	14	26	34	38	46
Heal	+30%	23	32	38	41	47
Invisibility	+10%	22	34	42	46	54
Mind Control	-10%	18	33	43	48	58
Passwall	+0%	18	30	38	42	50
Probe Memories	-10%	7	13	17	19	23
Read Thoughts	-10%	11	20	26	29	35
Send Thoughts	-10%	11	20	26	29	35
True Sight	+0%	18	30	38	42	50

Table of Leveled Spells

Spell	Mods	Novice	Apprentice	Journeyman	Master	Grandmaster
Banish 1	+130%	18	21	23	24	26

Appendix Z

Crash Site Recovery

For Any Conspiracy-Minded Game

by Davide Amato

Your F-16 jocks have grounded one of these pesky UFOs. Now it's time to send those expendable soldiers and recover a shiny plasma cannon. This article details what these soldiers can discover in the crash site, depending on the damage suffered by the UFO; they also provide a lingo that is usable in missions ("We have a C3 downed in Roswell . . ."). There are five categories of wreckage:

State A: Intact
State B: Nearly intact
State C1: Damaged (Crew seriously damaged)
State C2: Damaged (Crew lightly damaged but ship is a wreck)
State C3: Damaged (Power plant destroyed)
State D: Wreck

The "C" categories are roughly equivalent, representing a UFO too damaged to take off. The type of damage suffered makes the difference.

The damage suffered by the UFO can be evaluated with by someone at the scene, at a significant penalty if the observer has never evaluated UFOs before. A state-of-the-art artillery strike might be able to further damage a UFO and bring it down one state. A critical failure during the investigative or retaliatory stage destroys the crash site or gives the UFO enough time to fly away.

State A: Intact UFO

A real prize! The UFO was forced to land but damage is negligible. Fast action is required; all that's necessary for the ship's crew to do is reboot the systems or make other minor adjustments and the aliens will depart.

UFO: Nearly intact. A good scientist could even get into it and start driving.

Crew: Bad news . . . The crew is 100% intact, armed, and ready to defend the ship. All soldiers are fully armed, uninjured, and tactically deployed.

Priorities: The ship's engineer will jumpstart the engine after half an hour. The ship's captain will blow the ship if an opposing force enters it and defeats the soldiers, unless communications is jammed or ship systems are hacked.

Protocol: These are the best prizes, but usually they end blowing up with many good soldiers inside. It's not unusual for the UFO to be reduced to State C2 with a long range artillery strike before recovery!

If an assault is ordered (very unlikely) it would include the best of the best commandos escorting some excellent scientist, but it is quite difficult to deploy such a team in half an hour . . .

State B: Nearly Intact

The UFO has crashed, but damage is minor and fixable. Some grunts are injured but all the officers are well.

UFO: Damaged. Some damage overcame the ship's armor and one vital component is not working. The cargo is slightly ruined, and some fragile components are dead.

Crew: There have been some casualties amongst the grunts (about 10%). Soldiers are fully armed, uninjured, and tactically deployed, but with reduced number and morale.

Priorities: If an engineer (either alien or human) makes an appropriate skill roll, the ship will fly again, albeit damaged. The ship's captain is still likely to blow the ship.

Protocol: For humanity, this isn't as suicidally risky as the State A, but still too risky for recovery. At least there is enough time to bombard it from afar!

State C1: Damaged (Crew Seriously Damaged)

The UFO has crashed bad, killing and injuring many of its crew but not destroying the ship. This is the standard state for UFOs downed by biological weapons, psionic strikes, or other crew-killing devices.

UFO: Typically, this type of vessel has been seriously damaged. Half of the armor plating has been blown off, half of the vital systems are scrap metal, and all fragile components are dead. The UFO is usually embedded in the ground, many corridors are strewn with rubble, and the lighting is poor. Interior walls are holed, sirens howls, and bodies are aplenty. Half of cargo destroyed. A cloud of smoke will surround the UFO, blocking line of sight.

Crew: There are typically 75% casualties, and the remaining crew will be wounded and with low morale. Even noncombatants aboard the ship will take arms in the desperate defense of their lives.

Priorities: Somebody aboard the ship will radio a S.O.S., if possible, and the crew will just try to stay alive until help arrives. A friendly UFO can land to save the survivors or strafe the wreckage until nothing remains.

Protocol: This is a "standard" recovery mission. It's not too risky and has a decent reward. The team just needs to make sure it can pull the mission off in time!

State C2: Damaged (Crew Lightly Damaged But Ship Is A Wreck)

The UFO has crashed bad, but ultra-tech-safety systems have kept the crew alive. This is the standard state for UFOs damaged by standard combat or artillery strikes while landed.

UFO: It's almost destroyed, and all systems are dead. The UFO is embedded in the ground, with no lighting nor interior walls. The cargo has been totally destroyed, although some random component can be salvaged. A thick cloud of smoke will surround the UFO and soar high into the sky.

Crew: 40% casualties, and the remaining crew will be with low morale and few weapons, armor, and equipment. Everyone will grab a makeshift weapon and fight.

Priorities: As for C1.

Protocol: Another standard recovery mission, especially for capturing live aliens. Some of them can be pretty dangerous even while unarmed.

State C3: Damaged (Power Plant Destroyed)

Typically in this situation, the UFO landed to restart its power plant, but it blew up! This is the standard state for UFOs downed by sabotage or engine killing weapons.

UFO: This UFO will never move again. The entire power plant failed catastrophically and it is now scrap metal. It has no internal power or lighting, with all systems shut down or in emergency power. The cargo is half-destroyed.

Some other components are damaged but serviceable, and could be scavenged easily. The entire area is contaminated by radioactive fuels and toxic coolants.

Crew: Usually all engineers and technicians aboard the ship have been deep fried. A third of the crew is dead, and the survivors will suffer from low morale, wounds, and poisoning.

Priorities: As for C1, but there is a slim chance of rescue. If there are any fellow UFOs in the area, they are likely to just strafe it from far away.

Protocol: This usually isn't worth the risk. Sending a team in a compromised battlefield just to recover a wreck is not a good choice. A team would have to include a combat expert with good skill and equipment.

State D: Wreck

The UFO has crashed very bad, with few survivors.

UFO: A total wreck. There's no usable component, just a pile of metallic junk strewn over a wide area. Area may be contaminated with radioactive or poisonous materials.

Crew: There are less than 10% survivors, all severely wounded and with no equipment. Some of the ship's soldiers will go berserk, while many other will be slowly dying from wounds.

Priorities: As for C1, but help is unlikely to arrive.

Protocol: This is a good mission for a group of rookie investigators, but usually it's not worth the risk. A medic with some knowledge of alien biology (or luck) can stabilize a dying alien and take him alive.

Things I Love As A GM

[Last week's](#) column generated some interesting buzz in my inbox, and so I thought I'd dip back into the well for a second week, this time listing off some random things I love out of a game as as GM. Again, this isn't a definitive list, but rather just some things that sprang to mind.

* * *

A Good Index. One of the things that first attracted me to *GURPS* was that crazy *Wild Cards* cover; I didn't know what *GURPS* or even *Wild Cards* was, but if an obviously supers RPG setting could look that cool, how bad could either be?

But that's a digression. The *second* thing that attracted me to *GURPS* was realizing that it was actually indexed . . . not just the core books, but even the supplements.

Alas, though *GURPS* was one of the earliest RPGs I discovered in my fledgling branching out from non-TSR games, I was saddened to learn that the other games I branched out into didn't have them either. (Of course, neither did most TSR games. Stoopid *Adventures of Indiana Jones.* Stoopid *Marvel Super-Heroes.*)

Now, my love of indices might end if and when the electronic book ever comes fully into its own. For example, when I'm searching PDFs, I love the feature that does a global search for a phrase, and offers some context words around that search. But until then, I'd gladly give up the 2-5% of a book's page count that is required for a good index.

* * *

Game Worlds That Separate Information Everyone Knows From Information Only the GM Knows. I think the first game I encountered that did this amazingly well was the *Deadlands* line, which were each divided into sections of general player knowledge ("Posse Territory"), intermediate secrets ("No Man's Land"), and GM-only information ("The Marshal's Handbook"). Since so much of a good horror game is not knowing exactly what's possible (or even exactly what's going on), this technique made it very easy to keep sensitive material from the information while still allowing them to read the sourcebooks and understand the setting.

Unfortunately, too many games reveal too much. This either forces the GM to be a screen for every sourcebook ("Don't read the left half of page 2, the middle of page 7, the first six paragraphs on page 9..."), potentially spoils a lot of fun for players by requiring them to place a barrier between player and character knowledge, or requires the GM to make up enough interesting "new" stuff to keep the campaign from being entirely known before the first die is thrown. (I suspect, for *Dungeons & Dragons/d20 System,* this is one of the reasons why monsters are such perpetual favorites for magazine articles and books; since so much of that game is known to its players, one of the only ways to interject surprise into the game is the introduction of new critters.)

Anyway, good games are like toolboxes, and good tools allow me to customize their usage according to my need. As another curious example, I once ran a game of White Wolf's *Aberrant;* now, one of the curious aspects of this setting is that the opening storyline of the game was a murder mystery of a character beloved by the game world. And so, this was a really juicy whodunnit. Unfortunately, the problems were two-fold. First, I wanted to set the campaign a month or two *before* the murder; I thought it would give the demise a lot more impact if I could have the PCs team up with that character first. So I didn't want the players to know about the murder ahead of time.

[ABERRANT SPOILER ALERT!]

The second problem was that the mystery is built up as a phenomenal enigma, but the most likely possibility they offered within the main book turned out to be exactly correct. It's like a surreal trailer for a bad thriller movie: "You won't know what to believe when everything is *exactly* as it seems . . ."

*[END **ABERRANT** SPOILER ALERT]*

Fortunately, both of these problems were easily solved by the book itself. As I've mentioned [before,](#) **Aberrant** presents almost all of its background and setting information in the form of in-game material: website articles, television broadcasts, and so on. As a result, it was trivial to excise the material I didn't want them to see; all the information relating to the murder, for example, was revealed in just a few pages. And then, once the murder *did* happen, I was able to show the information from those pages as a new in-game handout. Boss!

* * *

Games with some kind of player-enabled "fate points." Whether it's called Karma Points, Fate Points, Character Points, Possibilities, or the like, I always love games that give the players more control over their fates, since it means I don't need to work as hard to achieve balance. (As I revealed [last week,](#) making up characters or full-fledged encounters isn't one of my strong suits as a GM . . . of course, neither is actually doing any work.) One of the great things about these points is that players use them to create their *own* balance. After all, if an adventure is too easy, they won't use the points at all. If it's just right, they'll use points to ensure they win. And if it's too hard, they'll use points to *survive.* And the beauty is that this balance is entirely in the hands of the players; as one player put it, "If you die with [game-affecting points], you're stupid."

In addition, when I'm learning a system, I can be generous or stingy with the points depending on how many they used that session, allowing me to further tweak the difficulty level of the campaign. It's a win-win!

More interestingly, some games allow these points to modify the setting; the example from *DC Heroes* is a fight in a lab, where the hero wants to reach out for a handy beaker of acid to throw at his attacker. In my experience, players are generally reluctant to use this ability, but done right it can allow for a lot more of the cinematic give-and-take seen in most media. And it also makes it a more collaborative effort.

* * *

Speaking of collaborative efforts, feel free to offer up your own ideas for things you love as a GM over on the [message boards](#) or by [e-mail](#). Because everyone deserves to know about happiness.

--Steven Marsh

The Library of Libraries

by Conan W. Purves

At the end of every world, its hidden access known only to a few, is the Library. It is the ultimate reference institution. It contains all recorded information from every world, every time, every dimension -- an incalculable treasure for the researcher, indeed. The only trouble is getting there, finding what you are looking for, and getting a library card.

Location

Every world, be it a land, a time, or a galaxy (in other words, basically any game setting) has a single access to the Library. Though the entrance is extremely well-hidden, difficult, and dangerous to reach, it is always in the material form of the species it serves. Oxygen-breathing, standard-gravity creatures will find that the portal has the air and pressure they are used to. Water-based life forms will be able to swim to the Library. Currently, on our planet and timeline, the entrance is rumored to be buried somewhere in the Arctic Circle; those few who know its exact location are extremely worried about global warming.

The Lobby

Once the entrance has been discovered and passed through, a visitor to the Library will discover himself in a vast circle, divided in half by the Welcome Desk. This is the Lobby. Behind them is a curved wall with an infinite number of portals, each leading to a different world, dimension, or timeline. Through these doorways come and go every possible being from every possible location and time: white-robed and bearded Greek philosophers, tribal shaman, greys, fire demons, financial analysts, leopardmen, etc. Visitors, though from diverse worlds, do tend to represent the studying classes of their respective societies. There are many reasons to come to the Library, and more than a few have tried (and failed) to take it for its wealth.

The Lobby, as a crossroads and the only part of the Library where any kind of discussion is allowed, is a meeting place for many. However, interaction between strangers is frowned upon. Unless one has a specific appointment or is following up on a posting on the Bulletin Board, most people direct themselves briskly to their business at hand. This reticence toward social interaction is a fundamental part of the culture here and is founded on a general ignorance of what the consequences would be if two individuals from disparate worlds were to communicate. Nobody knows what would happen and nobody wants to find out.

However, there are some who ignore these concerns and make their living hanging around the Lobby, selling maps, information, reference materials, and prayers for guidance to the visitors. Most of these individuals are hucksters and con artists, though there may be a few who actually have something useful to sell. There are also some pilgrims who consider the Library or something in the Library to be a central element in their religion. These types are generally discouraged from entering the internal rooms after the Librarians have ascertained their purpose and thus remain in the Lobby, either pleading their case or holding prayer vigils.

Opposite the wall of portals, on the other side of the open space, is the Welcome Desk. It is a long wooden barrier that divides the circle of the Lobby in half. One can pass to either side of it and access the entrances to the various sections in the back wall of the Lobby. Behind the Welcome desk, any kind of communication, verbal, visual or psychic -- unless it is a request to a Librarian -- is impossible. It is unknown if it is magic, technology, or some other force that prevents communication, but so far nobody has been able to bypass it. Though these restrictions may seem overly severe to a human being, the passage of thoughts or sign language are just as disturbing to certain other species as someone yelling out loud.

The Librarians working the Welcome Desk are very friendly but not very informative. They will indicate the appropriate section and help one get a library card, but they are in constant demand and cannot spend more than a

minute or so with each client before they have to move on to the next. They will direct the visitor to the appropriate section, pointing to the doors behind them. If asked for any more detailed information, such as the specific location of a volume, they will refer the visitor to a Librarian in that section.

The Welcome Desk opens up in a semi-circle kiosk that is the Security Booth. The bored-looking individuals that work here manage the Lost & Found and any threats to the Library or to peace and good manners in the Lobby itself. Otherwise, they are not very helpful.

Past the Welcome Desk, the other side of the circle houses entrances to the various wings of the Library. These doorways change from time to time, depending on the intellectual trend of the time and the whims of the Library's Board of Directors. Currently, there are only four wings: The Tower of Story, The Dismal Science, The Thought Bubble, and How Things Work. Each of these sections is divided into many sub-sections whose organization is open to the GM.

Inside The Library

Once a visitor has passed through a portal into one of the four sections, he is on his own. There are a bewildering number of choices with very little guidance. Because the question of language is so complex, signs and printed directions are very limited. However, as one probes deeper, and enters rooms with documents constrained to a specific subject, culture, or world, one finds the organization and labelling improves. Librarians have bailiwicks and their control over them is almost absolute. Each section has a unique organization system, usually linked to the subject matter of the section.

The interior of the Library can be quite dangerous. Though any kind of attack is forbidden (even the intention of attack will bring security to the scene immediately), the manifold environments themselves pose a threat. Though most sections of uncommon atmosphere post warnings, death by drowning, burning, rapid pressure change, or the like occurs often enough to keep the custodial staff quite busy. A more common danger is just getting lost. Some of the documents themselves can be hazardous as well. At times it is almost impossible to get to the far end of the Elder Gods section because the floor is so cluttered with gibbering madmen, writhing in the fetal position. There are spellbooks that burn, data disks that wipe minds, and tomes that simply eat people. It is strongly recommended that the visitor of the Library know what they are looking for and go directly to it.

The Tower Of Story

This section deals entirely with fictional accounts. It is believed to be in the form of an infinitely high and low cylinder, though nobody has ever measured it from the inside or seen the outside. Generally, the lower one goes, the more "primitive" the documents become. The bottom floors contain rooms of storytellers. Slightly above them are cave paintings, walls of hieroglyphs, crop circles, the Nazca lines, and other pictographic forms (though, interestingly, comic books can be found much higher up). The middle sections are made up of books. Some of these rooms are dangerously seductive and should not be entered without the appropriate magical or technological protections. The Romance room is famous for its soft divans, endless boxes of chocolates, and opiatic stories that never let go once they have the weak-willed in their clutches.

The higher levels of the tower are dedicated to stories in media other than print. DVDs, holographs, virtual reality disks, and other incomprehensible means of presenting narrative contain the stories of infinite cultures. One long-running and bitter feud among the Librarians is whether or not the roleplaying games should be kept in the Tower of Story or elsewhere.

The Dismal Science

Given money's current vogue in the universe, the Board decided to dedicate an entire section to it and the people who worry about it. This wing is extremely boring, sometimes fatally so. Only those who know what they are doing should enter here. It is in the form of a gigantic rectangular room with linoleum floors and steel-gray shelves.

The Thought Bubble

This wing is dedicated to intellectual and academic pursuits. Documents concerning all the social sciences from every world can be found here. The first room through the portal is a giant glass sphere (thus, bubble), the floor of which is lined with massive tables of dark wood. One can borrow periodicals here (subject to the temporal restrictions noted below) and read them at the tables. The outside of the bubble is constantly changing. It may be a starry night, an argon sky, a jungle, flowing lava, patterns of fractals, and so on. Ringing the base of the sphere are passages leading to the myriad sub-sections of the Thought Bubble. There is an extensive language and linguistics section here as well, with a translation center where a visitor can hire "memory-runners." These are couriers who will follow the visitor to a given document, memorize it, and return to the translation center where they will communicate it to the translators.

How Things Work

This is considered the "practical" wing of the Library and looked down upon by some of the more academic-minded Librarians. The materials for research of any kind, as long as it has some sort of application, can be found here. Mechanical drawings, lists of spell components, FTL drive theories, woodworking books, and software training CD-ROMs are all available here.

This is one of the most difficult wings to navigate. It is basically a labyrinth. Fortunately, the Librarians here tend to be the most helpful (although many note that "most helpful Librarian" is faint praise indeed).

Policies

Egress

A visitor can only exit through the portal they entered.

Access

A visitor has access to every section of the Library with one exception: They cannot enter rooms whose documents came into existence during the visitor's future, unless the visitor has already traveled to that future. Access can be taken away at any Librarian's discretion at any time.

Rules

No communication of any kind is allowed behind the Welcome Desk, unless it is with a Librarian. It is almost impossible to break this rule thanks to the powerful force that keeps the whole place silent, though some high-level wizards and ultra-tech individuals have been able to get around it. Eye contact is possible, but frowned upon. Staring will bring security running.

Destruction of material or visitors is also expressly forbidden. Individuals should be conscious of their physical form and its effects on their surroundings at all times. This holds particularly true for fire and water-based creatures (there are, of course, sections in flame and underwater).

Borrowing Books

Though the Library is primarily a reference library, it does have a lending policy. Visitors with a valid and current library card may borrow a document with the two following restrictions:

- the document must exist in the visitor's home world
- the document cannot be unique

So in our world you could find and borrow yesterday's newspaper but not tomorrow's; the text of the Declaration of Independence but not the original; a map of Thikombia Island in Fiji but not Captain Tasman's map to the location of the golden skeleton his first mate buried there in 1643. All of the items you can't borrow are available for reference, of course . . . if you can find them.

The amount of time documents can be borrowed is relative to the time-scale of the visitor's world. Generally speaking it is three weeks.

Getting A Library Card

The Library has significant experience in dealing with theft, fraud, and false identity, and therefore has an extremely rigorous and restrictive set of requirements to get a library card. Though the "Proof of Existence" requirement has now been waived (some of the more conservative Board members are pushing for it to be reinstated), the "Proof of Identity" and "Proof of Residency" requirements are almost as burdensome. You must prove you are who you say you are and you must prove that you have a fixed address. Itinerant adventurers need not apply. Proof of identity can be as simple as a valid birth certificate or as complex as DNA samples going back four generations, each with signed, stamped, notarized, and holographed legal documents testifying to their validity. One poor soul had to bring his hypnotized parents and elementary school teacher to verbally confirm his identity.

Proof of Residency is often more onerous. The Library frowns upon uncommon existences and requires a deed of property or lease, two separate sets of bills with the address printed on them from a legitimate public utility or financial institution (the Library decides what constitutes "legitimate"), and hand-written personal correspondence, also with the address, with some details that can prove that the correspondent actually knows the applicant. A spaceship can count as a permanent residence.

The application process can be one of great frustration and there are some who come and hang out at the desk just to watch the many and entertaining forms of outburst and temper displayed by unsuccessful applicants.

Overdue Books

The penalty for delinquent borrowers is, in the following order, a fine, three written requests for return of the item, three verbal requests for payment of the fine and return of the item, and finally a personal visit from a Book Collector. If all that fails, the Library will send out their in-house Collector, usually a senior Librarian.

The Fine Structure

The fine begins modestly enough, but can grow to vast proportions. In modern, *GURPS* terms, the fine is $1 a week for the first 10 weeks, at which point the delinquent borrower will receive a written warning. The fine then grows to $2 a week for the next 10 weeks and the second written warning is sent. This process continues through 60 weeks, at which point the borrower owes the library $210 and will have received three written warnings and three verbal warnings (by whatever means of mass-distance communcation is common -- or, barring that, possible -- in the borrower's world: telephone, videophone, hologram, Whisper spell, oracle, or the like).

The Library's board considers this an appropriately generous policy, taking into consideration its public role and the varying income levels of its clientele. It is at this point that the fine is frozen and the Collectors are sent out. If the first Collector fails in his mission (and failure is rather loosely defined by the Library) and has to be replaced, the fine starts to grow again, starting again at the rate of $1 every 10 weeks, but now doubling at the beginning of each 10-week cycle. The exponential fine rate, though it has its detractors on the Board, exists as a preventive measure rather than a mechanism for gathering revenue. Still, empires have been ruined because of an overdue library book and there are individuals on the run today, barely one step ahead of the Library.

What happens if a book is lost, stolen, damaged, or destroyed while in a borrower's possession is likewise something of a mystery. All the usual penalties that apply to "late" books -- fines, warnings, etc. -- are still the same. However

many of those who told a Book Collector they longer had a book were "encouraged" by them to try more diligently to find it. Those informing a Librarian of the same event were usually last seen being escorted by the Librarian . . . presumably back to the Library, but never to be seen again. Regardless, about the only option a patron has for handling a missing or destroyed book is to try recovering it, or acquiring another copy of that volume. (A damaged copy -- either the original volume or a lesser-conditioned version of the same volume -- will usually be accepted, presuming all the information is still intact.)

The Book Collectors

The Book Collectors are an outside contract service hired by the Library to retrieve overdue books and the fines associated with them. It is an easy job to get, if you know the right people. There are several agencies that provide collectors for the Library and many freelance collectors as well. Like most contract jobs, there are benefits and drawbacks to either working under an agency or working freelance. Most collectors prefer the security of a good agency, especially the ones that provide backup on difficult jobs. The Library shares all of the delinquent borrower's personal information with the collectors, so they usually come prepared.

The Librarians

Little is known about the Librarians. Their ranks are not limited to any specific species and there are only rumors as to the Library's hiring practice. It is suspected that the Librarians exist in a rigid and complex hierarchy, made dynamic by internal politicking. Whatever their background, many believe them to be incredibly powerful creatures. This reputation is primarily based on accounts of Senior Librarians' overdue book missions, missions that currently have a 100% success rate. (The little old lady with the black clutch purse and horn-rimmed glasses stood at the massive stone doors of Deathsmoor Castle and spoke to the guard: "Excuse me, I'm hear to see General Gralkstooth about an overdue book . . .") Their only distinguishing element is that all Librarians wear or carry a pair of horn-rimmed glasses on a chain, whether or not they have eyes. Some suspect that these glasses may actually be very powerful items in and of themselves. Some say that they can read your mind, others that they shoot death rays, still others that they give the wearer immediate visual access to the Library's entire contents. Even as a trophy, they would be considered of immense value.

Librarians vary in personality and temperament. They are all professional and unbending in their loyalty to the Library and its rules. However, some may be brusque and unhelpful, while others may be exceedingly friendly, leading a user directly to the document requested, all the while having a rich conversation on its contents. A regular visitor may make an acquaintance with a Librarian (though never a friend), while some may never see the same Librarian twice. The hucksters in the Lobby will be glad to sell a new visitor information that leads to the location of a helpful Librarian. Some visitors come equipped with specific prayers for this result as well.

The Library In The Campaign

The Library has been designed as a modular component for any campaign that is comfortable not being too tied to "reality." Its use can range from a quick side trip, to a complete adventure, to an epic journey spanning several sessions. It can also be used repeatedly, as a regular resource for a party, with new obstacles each time. Access to information can be incredibly powerful, with the potential to unbalance the campaign. The Library is a vast resource, but its rewards should be complemented by appropriate challenges. Getting a library card, finding the right document, and surviving the internal rooms of the Library are all structured so that the GM can scale their difficulties depending on the value of the document in question and the power levels of the campaign.

If party members actually borrow a book, getting the book back (or trying not to give it back, as the case may be) can be an adventure in and of itself. A specific document could be necessary for the completion of a quest, but the quest takes just slightly longer than the point where the Library sends out the Collectors, so the party is caught between completing their quest and staying one step ahead of the Library.

As A Campaign

An entire campaign can take place within the Library. Characters could play junior Librarians, struggling to work their way up the Byzantine hierarchy of the Library, though the details of such a campaign would be up to the GM. Players could play Collectors, perhaps all working for the same agency. A Collector game is open to all kinds of world-jumping adventure, as overdue books could be found anywhere and may require a rich combination of stealth, intrigue and force to retrieve.

Demonic Rituals for *Unknown Armies*

by Bevan Thomas

The figure crouched in the pentagram, preparing his offerings of pornography, money, fried chicken, and pillows. As the sun set, he lay down and spread his limbs, yelling out, "I call to thee, spirits from beyond the Veil!" Then the figure began to shake, as if victim of some strange fit. When the shaking ended, his eyes appeared brighter and more energetic, and his face was likewise transformed in style. He laughed with a feeling of pure, crazed joy, and reached towards one of the offerings. "I really missed chicken," said the figure as he picked up a drumstick and bit.

Demons and revenants are some of the most prominent unnatural beings in *Unknown Armies,* spirits of the dead that have been pulled back to the world of the flesh by mortal magick or the power of their own obsessions. Though these unnatural beings are often an excellent source for information, they are also usually lying, selfish bastards who are obsessed with recovered their lost sensations, and anyone who deals with demons does so at his own peril.

Though certain magick schools such as Dipsomancy and Entropomancy -- as well as the occasional avatar (for example, the Merchant) -- incorporate the summoning and binding of demons, most adepts and avatars prefer to keep the demonic world at arm's length. Through their seductive pacts, demons often lead their associates into taboo-breaking (not to mention amoral) situations, and there is always the worry that too much interaction with the dearly departed will attract the attention of the enigmatic Cruel Ones (a force that no adept is ready to deal with).

However, Thaumaturges generally lack the luxury of avatars and adepts to dismiss demonic assistance out of hand. Rituals are few and far between, and their uses are usually very specific. Frankly, there is only so much unnatural stuff a proud possessor of Back Money, Plague of Hiccups, and Angel of the Animals can pull off. If he doesn't want to mess with his opponents or watch for any magick placed upon him, then he has to rely on natural means to get things done. However, demons are often useful sources of information on the occult, can serve as astral spies, and may have other useful skills or abilities. With regards to demons, one simple ritual can open the door to a lot of possibilities (and a lot of danger, but many Thaumaturges don't really understand this until it is much too late). Furthermore, rituals that summon demons are much more common than most other rituals, because demons actively spread them around to increase the demons' potential access to the physical plane. This means that many of the rituals that Thaumaturges are likely to find are demonic summonings. Conversely, rituals that banish or bind demons are very rare, since demons do their best to destroy or distort them (demons enjoy people using distorted binding rituals, since it makes the Thaumaturges believe that they have far more control over the demons than they actually do).

Thaumaturges that involve themselves a lot with demons are commonly known as diabolists. Diabolists are an eccentric and idiosyncratic group even by occult underground standards. Though not bound by taboos, they are often directed by the whims and needs of their demons and need to fulfill all sorts of bizarre pacts unless the diabolists have the good fortune of knowing the Command Demon ritual. They often spend a lot of their time reading the obituaries and investigating graveyards, getting information on potential demons. Particularly ambitious and amoral diabolists will sometimes have people killed in particularly traumatic ways in the hopes of transforming them into demons. Naturally, the diabolist in question will do his best to make the demon unaware that he was involved in its demise, as demons are generally unwilling to help their killers. The more magickally experienced a diabolist becomes, the more demons and the less humans he generally associates with. Particularly potent diabolists are often isolated from normal human contact, feeling a stronger connection to the dead than the living. Because they focus so much on obsessive, driven demonic personalities, they become unused to the subtleties of human interaction, and often become blunt and insensitive as a result.

Occasionally people are able to conjure demons without resorting to rituals, spells, or anything else that extravagant,

instead using special Soul skills. An example of this is Rebecca DeGhoule and her Summon Demons & Send 'Em Away skill from the *Unknown Armies* core rulebook. These individuals have often developed these skills through contact with demons or pure focus of their will. The skill will often duplicate a demonic ritual, its advantage being that the skill does not require charges nor time. However, the skill is less versatile than a magick school or even Authentic Thaumaturgy would be. Those who rely on a special skill to summon demons are often disdained by the ritual diabolists for lacking intellectual rigor and a true understanding of the Statosphere, and are often called "hobbyists" or "hedge conjurers" by those who are unnaturally "in the know."

The following rituals are a sample of various demonic rituals that can be included in a campaign. It is suggested that the Game Master customize them for his campaign to help keep the players guessing. Particularly in the case of summoning rituals, it is likely that there are many different kinds in existence with their own particular ritual actions.

Attract Demons

Power: minor
Cost: 2 minor charges
Effect: Attracts all demons within a five-mile radius to the skull and they must remain within five feet of it for one hour. If the skull moves, the demons must follow it. Though the demons must follow the skull, they are not restricted in any way from affecting the person holding it, or even killing him.
Ritual Action: Dig up the skull of a woman who died while pregnant and cover it with honey. Hold the skull towards the setting sun while making the sound of a whippoorwill. After the spell ends, the skull becomes worthless for this ritual, and a new skull would need to be found if the ritual was going to be repeated.

Banish Demon

Power: significant
Cost: 1 significant charge
Effect: Sends a demon or revenant back to whatever passes for the afterlife, unable to return for six months. Some spirits give up their rebellious ways, and decide to pass on, but most are even hungrier to return and gain vengeance on whoever banished them.
Ritual Action: Collect a decent amount of material from the place that the demon's body is (so a handful of its grave-dirt if it was buried, or a some water if it was dropped into the ocean). Toss the material into the spirit's face while calling out, "You are dead and no longer welcome on this world! Go back into the eternal night!"

Command Demon

Power: significant
Cost: 2 significant charges
Effect: You can control a summoned demon.
Ritual Action: Grow a tree, constantly watering it with your own semen (or menstrual blood) and urine. When it has become old enough to grow strong branches, cut off a branch that's at least one foot long and sharpen the end to a point. With the point, prick your left index finger enough to draw blood. This branch is now able to be used as a "command wand." It can be used as many times for this ritual as desired (and can even be used by other people), though if it is broken then it becomes permanently useless and a new one must be fashioned.

When performing this ritual, point the command wand at the demon and call out "By my will and by this wand, obey!"

Determine Demon

Power: minor
Cost: 1 minor charge
Effect: Reveals if a dead person has become a demon, revenant, or simply passed to his or her final reward.
Ritual Action: Cut up a photograph or picture of your target and drop the remains into a glass of milk. Drink the milk

and all the pieces of the picture.

Exorcism

Power: minor
Cost: 2 minor charges
Effect: Forces an unnatural being to disconnect itself from its victim. Examples include ending a demonic possession, removing an entropic, or unlatching an astral parasite. The unnatural being is able to directly affect its former victim for 24 hours.
Ritual Action: Tie the victim's hands and feet together with thin rope and place them within a circle drawn with chalk. Splash the victim with water from a mountain spring and then whip him for thirty-three minutes and three seconds while demanding that the spirit leave the body. The spirit's nature must be named (such as "be gone, demon," or "be gone, astral parasite").

Summon Random Demon

Power: minor
Cost: 2 minor charges
Effect: Summons a random demon that speaks to you telepathically. This ritual does not grant you any special control over the demon.
Ritual Action: On the second Sunday of the month, draw a pentagram on the ground in white chalk without the chalk ever leaving the ground or the line being broken. Then at four of the five points, place a symbol that represents a pleasure of the flesh (which demons long so much to experience). Place a sexual image (such as a pornographic magazine) on the bottom left point to symbolize lust, a large amount of money (such as a $100 bill) on the right for avarice, an incredibly unhealthy yet enjoyable piece of food (like a greasy hamburger with all the trimmings) on the top left point for gluttony, and a pillow on the top right for sloth.

After all the preparations are complete, walk counter-clockwise around the pentagram three times and spit on all four the objects placed with it. Then lie down inside the pentagram so that each limp is at a point, and touching the relevant object and your head is at the pentagram's highest point. The moment the sun sets, say "I call to thee, spirit from beyond the Veil."

Summon Specific Demon

Power: minor
Cost: 5 minor charges
Effect: Summons a specific demon that speaks to you telepathically. Many of the dead have gone on to whatever final reward awaits them, and have not become demons. Any attempt to summon one of these people automatically fails. This ritual does not grant you any special control over the demon.
Ritual Action: On the desired demon's birthday, draw a pentagram on the ground of a place where the person slept at least three times in life. The pentagram must be drawn in white chalk with the chalk ever leaving the ground or the line being broken. Then at four of the five points, place a symbol that represents something precious to the person in question (examples include photographs of loved ones, favorite book, treasured mementos, etc.). At the minute corresponding to when the person was born, burn a picture or photograph of him and eat the ashes. Then lie in the pentagram with your limbs and head each at the appropriate point and call out the desired demon's name three times.

Ward Against Demons

Power: minor
Cost: 3 minor charges
Effect: No demons or revenants can cross the circle for 333 minutes, even while possessing someone else. Therefore if they are inside the circle, they cannot get out and if they are outside the circle, they cannot get in.
Ritual Action: Mix the flesh from a three-day old corpse with 33 drops of your own blood and the juice from

overripe green grapes. Use a brush with bristles made from a dead donkey to paint the circle with the mixture.

Take Me To Your Leader

for *GURPS*

by Stephen Dedman

"Some men are born great, some achieve greatness, and some have greatness thrust upon them."
--Clown, *Twelfth Night*

Dennis: "What I object to is, you automatically treat me as an inferior."
Arthur: "Well, I am King."
--*Monty Python and the Holy Grail*

With the possible exception of Monty Python's anarcho-syndicalist commune, every human society known has had some form of hierarchy. Methods of reaching the top of the heap have varied from time to time and place to place, but in any campaign, there will be someone with higher status than the PCs -- and the power to make their lives easier, more difficult, or considerably shorter.

Here is a collection of high-status NPCs designed for use as contacts, enemies, allies, and patrons. Wise or foolish, benign or malevolent, all-powerful or ineffectual, all have one thing in common -- they are the most important individual in their community. They are designed with a particular cultural background in mind, but require only minor changes to adapt for almost any setting from the Paleolithic to the post-apocalyptic.

Judge Roy Bean, "The Law West of the Pecos"   *86 points*

Ht 5'8", Wt 290 lbs, Size Modifier 0, Age 60.

Appearance: Fat and unkempt, with gray hair and untidy beard. Wears shirt and unbuttoned vest (both stained), frayed straw hat or bandana, golden watch chain.

Languages: English (Native). TL: 5. Cultural Familiarity: Homeline.

Attributes: ST 11 [10]; DX 10 [0]; IQ 11 [20]; HT 9 [-10]. [20 points]

Secondary Characteristics: Dmg 1d-1/1d+1; BL 24; HP 11 [0]; Will 13 [10]; Per 11 [0]; FP 9 [0]; Basic Speed 4.75 [0]; Basic Move 4 [0]. [10 points]

Advantages and Perks: Allies (Regular customers, Present on 15-, group of 6-10, 50% point total) [36], Charisma/2 [10], Status +3 [10; +1 Status free with Wealth], Wealth (Wealthy) [20] [76 points]

Disadvantages and Quirks: Alcoholism [-15], Bloodlust (15) [-5], Congenial [-1], Fat [-3], Greed (9) [-22], Intolerance, Total [-10], Proud [-1], Unattractive [-4]. [-61 points]

[39 points]

* +2 for Charisma

Gear: Revolver, .36.

Roy Bean (1825-1903) fought on the Confederate side during the Civil War as leader of the New Mexico Territory's Free Rovers, a guerilla group better known to locals as the Forty Thieves. In 1882, he was appointed Justice of the Peace for Pecos County, Texas, after posting a thousand-dollar bond: he held onto that position for 14 years by using his isolated saloon as a polling place, until authorities noted he was receiving more votes than there were eligible voters. His knowledge of the law was gleaned from a copy of the 1879 Revised Statutes of Texas; he used other law books sent to him as firelighters or toilet paper. A sign on Bean's saloon in Langtry, The Jersey Lilly, boasted that he was the "Law West of the Pecos," which made him the highest authority for 400 miles around.

Bean mostly held court sitting on a beer barrel outside his saloon, with his regular customers serving as jury and sometimes as executioners. He used his power primarily to make money, fleecing both defendants and accusers, and fining travelers who complained of being overcharged or short-changed for disturbing the peace. He received $5 for officiating at inquests, $2 for marriages, and $5 for (illegally) granting divorces. Called to investigate a man who fell from a nearby railroad bridge, he discovered $40 and a six-shooter in the corpse's pocket, and fined the dead man $40 for wrongfully carrying a concealed weapon. Bean was also a bigot with a nasty sense of humor, lenient to ex-Confederates and Irishmen, but murderous when sentencing non-whites. He once acquitted an Irishman accused of murdering a Chinese railroad worker, on the condition that he pay for his burial, declaring that his law book didn't specify that it was "illegal to kill a Chinaman." Suspected rustlers and horse thieves, however, could be executed on the flimsiest of evidence.

For more details of Bean's antics, see *GURPS Old West.*

Campaign uses: Bean may seem like a harmless buffoon, but if he takes a dislike to the PCs while they are in his jurisdiction, he is very likely to try to strip them of everything they're carrying -- and he has a lynch mob handy if the party tries to resist.

Other settings: Bean is a colorful but hardly unique example of a corrupt lawman given sole authority over a large but remote area. Similar characters might be found in other unsupervised frontier outposts or governing far-flung colonies in almost any era.

Ula Chandra   *235 points*

Ht 5'9", Wt 120 lbs, Size Modifier 0, Age 44.

Appearance: Pale complexion, waist-length braided black hair, grey eyes; an attractive woman in a white self-cleaning robe.

Languages: Tibetan (Native); English (Accented); Mandarin (Accented). [8 points] TL: 11. Cultural Familiarity: Homeline.

Attributes: ST 10 [0]; DX 12 [40]; IQ 13 [60]; HT 12 [20]. [120 points]

Secondary Characteristics: Dmg 1d-2/1d; BL 24; HP 11 [0]; Will 14 [5]; Per 13 [0]; FP 12 [0]; Basic Speed 6 [0]; Basic Move 6 [0]. [5 points]

Advantages and Perks: Attractive [4], Charisma/1 [5], Enhanced Dodge [15], Honest Face [1], Status +3 [15], Trained by a Master [30]. [70 points].

Disadvantages and Quirks: Attentive [-1], Disciplines of Faith (Monasticism) [-10], Honesty [-10], Pacifism (Self-Defense Only) [-15], Responsive [-1], Sense of Duty (Willendorfers; large group) [-10]. [-47 points]

[79 points]

* +1 for Charisma

Ula Chandra is the administrator of the colony on New Willendorf, and never uses any other title -- not "Abbess," or "Reverend Mother," or even "Sifu" (teacher). She publicly maintains that the colony exists purely as a refuge for women seeking peace, solitude, and harmony with the tao: she emphatically denies that it is a school teaching esoteric martial arts or psionic skills.

Many of the women living on the small habitable area of New Willendorf are artists of some sort, and most are only temporary residents. Some attend Chandra's meditation and philosophy classes, but few are selected for more intensive training. Most of these live or work in situations where psionics are a potential threat; Chandra teaches them how to protect themselves from mind probes and mind control, and how to use body language skill to guess what telepaths are thinking. Her former students include a large number of successful female politicians, diplomats, and spies.

Chandra controls who can and cannot stay on New Willendorf, and where they are housed. The only place in the colony where a large spaceship can land is fenced off, and men are not permitted through its gates. The modified cargo mule robots are fitted with non-lethal weapons, and all of the colony's buildings are so well camouflaged that they effectively disappear if they close the shutters. On rare occasions when the colony has been attacked, Chandra has let the raiders blunder around in the swamp and jungle until they are immobilized by the robots, tangler mines, defense globes, quicksand and stunflowers. The tiny startown boasts a small hotel, staffed mostly by robots, though some Willendorfers will mingle with male visitors there. Chandra makes a point of meeting all visitors at least briefly, and is unusually approachable for an autocrat.

Campaign uses: Chandra grants exclusive one-year contracts to independent traders for the passenger and mail run between New Willendorf and the nearest worlds. These are sufficiently lucrative for a small ship and crew that competition is fierce: if the PCs manage to impress Chandra, they may have a year or more of guaranteed income with the opportunity to meet some very interesting women, and possibly even have the chance to be Trained by a Master. If Chandra becomes an enemy, she may be able to persuade some of her former students to target the PCs; she will not have them killed, but may well have them banned from several worlds, deprived of important licenses, or even jailed.

Other settings: Chandra is a benevolent dictator who really is "beloved of the people" -- those who object to her rule are not only free to leave her domain, but sometimes actively encouraged to do so. A colony like hers might exist in isolated areas in earlier eras, but in lower-tech settings, it would probably need something more robust in the way of defenses, such as gun turrets or Amazonian warriors.

Deersinger, Tribal Shaman and Chief   *85 points*

Ht 5'10", Wt 160 lbs, Size Modifier 0, Age 34.

Appearance: A well-fed Cro-Magnon man with a weatherbeaten complexion, shaggy grizzled hair and beard, right eye brown, left eye green, broken nose, scarred arms and hands.

Languages: Tribal (Native). TL: 0. Cultural Familiarity: Homeline.

Attributes: ST 12 [20]; DX 10 [0]; IQ 11 [20]; HT 11 [10]. [50 points]

Secondary Characteristics: Dmg 1d-1/1d+2; BL 29; HP 12 [0]; Will 11 [0]; Per 13 [10]; FP 11 [0]; Basic Speed 5.25 [0]; Basic Move 5 [0]. [10 points]

Advantages and Perks: Animal Empathy [5], Penetrating Voice [1], Reputation (Powerful Shaman, +4 to reaction rolls, known to all neighboring tribes, recognized on 7 or less) [3], Status +3 [15], Talent (Outdoorsman)/2 [20], Temperature Tolerance/2 [2], Voice [10], Wealth (Comfortable) [10]. [55 points].

Disadvantages and Quirks: Dependents (Children, 50% points, appear on 15-) [-60], Lecherousness (12) [-15], Lunacy [-10], Proud [-1], Sense of Duty (Tribe, small group) [-5], Short Lifespan [-10], Stubbornness [-5]. [-106 points]

Skills and Techniques: Acting (A) IQ+1 [4]-12; Brawling (E) DX [1]-10; Fast-Talk (A) IQ+2 [2]-13 *; Fishing (E) Per+1 [1]-14 †; First Aid/TL0 (E) IQ [2]-12; Leadership (A) IQ-1 [1]-10; Melee Weapon (Spear) (A) DX+1 [4]-11; Mimicry (Animal Sounds) (H) IQ+5 [8]-16 *†; Mimicry (Speech) (H) IQ+2 [4]-13 *; Naturalist (H) IQ+2 [4]-13 †; Pharmacy/TL0 (Herbal) (H) IQ [8]-12; Public Speaking (A) IQ+1 [4]-14 *; Sex Appeal (A) HT+1 [1]-12 *; Singing (E) HT+2 [1]-13 *; Spear Thrower (A) DX+1 [4]-11; Stealth (A) DX+1 [4]-11; Survival (A) Per+2 [2]-13 †; Teaching (A) IQ-1 [1]-9; Thrown Weapon (Spear) (E) DX [1]-10; Tracking (A) Per+1 [4]-14 †. [61 points]

Spells: Beast-Soother (H) IQ+1 [2]-12; Beast-Summoning (H) IQ+3 [8]-14. [10 points]

* +2 from Voice
† +2 from Talent (Outdoorsman)

Gear: Stone-tipped spear; Spear Thrower; Fur Tunic, Leggings, and Boots; Fur mask (worn during rituals); First Aid kit in pouch.

Deersinger has risen to the leadership of his tribe mostly because of his proven ability to find animals or bring them to him to be slaughtered. His three wives and seven surviving children are the best-fed in the tribe, and don't mind flaunting their good fortune. Deersinger is also the tribe's most skilled healer, though this owes more to his knowledge of medicinal herbs than to his chanted prayers. At most times, Deersinger is a competent leader, able to keep the tribe well-fed and happy while still indulging his own weaknesses.

When things turn sour, though, Deersinger tends to think of himself and his family first, and others later. He hates taking advice unless it's sweetened with flattery. He will be very reluctant to yield power to anyone else, even in a situation where he is totally out of his depth, such as a war with another tribe. He's not above a little deliberate fraud, occasionally using his ability to mimic voices to add credibility to séances in which the tribe's dead former chiefs apparently make suggestions that benefit Deersinger. He's also caused younger men who refuse to share their wives with him (he prefers plump brunettes) to be humiliated, injured or killed in hunting "accidents".

Campaign uses: In a Paleolithic campaign, Deersinger may be the chief of the PCs tribe, or of a tribe competing for the same hunting grounds. In a Time Travel or Lost World campaign, he may offer the PCs hospitality and much needed food -- though possibly at a price female PCs are not willing to pay -- or lead his tribe into battle against them.

Other settings: Deersinger would fit into any low-tech tribe -- Native Americans in the Old West, Africans in a Victorian-era or Cliffhangers campaign, or primitives (human or alien) on a distant planet. With a little tweaking, he might also be an explorer or time-traveler secretly using ultra-tech medicine and devices to win the trust of the tribe for his own reasons.

Lucia Diaz, President of Tlalocan   *490 points*

Ht 5'11", Wt 155 lbs, Size Modifier 0, Age 37.

Appearance: Tanned complexion, golden blond hair, brown eyes; a beautiful woman in expensive clothes.

Languages: Spanish (Native); English (Native); French (Accented). [10 points] TL: 8. Cultural Familiarity: Homeline.

Attributes: ST 17 [70]; DX 14 [80]; IQ 13 [60]; HT 14 [40]. [250 points]

Secondary Characteristics: Dmg 1d+2/3d-1; BL 58; HP 17 [0]; Will 16 [15]; Per 14 [5]; FP 14 [0]; Basic Speed 7 [0]; Basic Move 7 [0]. [20 points]

Advantages and Perks: Beautiful [12], Charisma/3 [15], Combat Reflexes [15], Empathy [15], Fashion Sense [5], Flexibility [5], Night Vision/5 [5], Status +6 [20; 2 levels free with Wealth], Talent: Smooth Operator/1 [15], Voice [10], Wealth (Multimillionaire/1) [75]. [167 points].

Disadvantages and Quirks: Bully (12) [-10], Chauvinistic [-1], Greed (12) [-15], Megalomania [-10], Overconfidence (12) [-5], Sadism (9) [-22], Selfish (15) [-2]. [-55 points]

Skills and Techniques: Acrobatics (H) DX [2]-13; Acting (A) IQ [3]-15 ª; Administration (A) IQ [1]-12; Area Knowledge (Tlalocan, Small Nation) (E) IQ+2 [4]-15; Climbing (A) DX+2 [1]-16 ‡; Current Affairs/TL8 (Politics) (E) IQ+2 [4]-15; Dancing (A) DX [2]-14; Detect Lies (H) Per+3 [2]-17 ‡ª; Diplomacy (H) IQ [4]-16 *ª; Economics (H) IQ [2]-12; Erotic Art (A) DX+3 [2]-17 ‡; Escape (H) DX+1 [1]-15 ‡; Fast-Talk (A) IQ+3 [2]-16 *ª; Geography (Political) (H) IQ [4]-13; Guns/TL8 (Pistol) (E) DX+1 [2]-15; Intimidation (A) Will+1 [2]-17 ª; Karate (H) DX+1 [8]-15; Leadership (A) IQ+4 [2]-17 §ª; Make-up/TL8 (E) IQ+2 [4]-15; Performance (A) IQ+3 [4]-16 *; Politics (A) IQ+5 [8]-18 *ª; Propaganda (A) IQ [4]-14; Psychology (Applied) (H) IQ+2 [2]-15 †; Public Speaking (A) IQ+6 [2]-19 *§ª; Savoir-Faire (E) IQ [2]-16 *; Sex Appeal (A) HT+4 [4]-18 *ª; Singing (E) HT+2 [1]-16 *; Stealth (A) DX-1 [1]-13; Streetwise (A) IQ+1 [2]-14 ª. [83 points]

* +2 for Voice

† +3 for Empathy

‡ +3 for Flexibility

§ +3 for Charisma

ª +1 for Smooth Operator

Variants: Powers version: add Mind Control [50], Regeneration (Fast) [50].

Lucia Corona was a minor actress and singer and part-time dominatrix until Tlalocan's president Julio Diaz saw her in a chop-sockey action film and invited her to perform in his national casino. Lucia became his mistress, his wife, and his widow in the space of less than a year, and is widely suspected to be the reason he died of a heart attack. After inheriting Diaz's lands, fortune, and taste for power, Lucia decided to stay on the tiny island and campaign for the presidency herself. Nine years later, she has consolidated her grasp on power, and some of her opponents joke that they hope she's only president-for-life. Some superstitious types on the island, where voodoo is still widely practiced, suspect that she's either a powerful houngan or a Cat Person (see *GURPS Voodoo*). Whether or not this is true is up to the GM, but Lucia Diaz is undeniably a monster.

Julio Diaz enjoyed watching the torture of political prisoners; Lucia preferred to be an active participant. Julio sometimes filmed her beating and humiliating her victims (always wearing a full-face mask), and a few of these films were exported. After Julio's death, Lucia continued to indulge her sadism: she prefers not to kill her victims, but never releases them.

Tlalocan, a tiny Caribbean island close to Cuba, has few legal exports apart from tobacco, cheap rum, and pornography. Cocaine and marijuana are also grown there, but the economy is mostly based on its status as a tax haven and its lack of extradition treaties: a large number of wealthy criminals have retired there. (In a *Powers* campaign, the island will also be a sanctuary for metavillains, black magicians and mad gadgeteers.) These criminals have worked with the island's secret police to keep any political opposition weak, ensuring Lucia Diaz's continued grip on power.

Campaign uses: PCs who visit Tlalocan for any reason had better hope not to be arrested. On Tlalocan, Lucia and her agents appear almost all the time (see p. B36), making her a very dangerous Enemy. Fortunately, though she dreams of

conquering neighboring islands, Lucia has very little influence beyond the shores of Tlalocan.

Other settings: Lucia Diaz is designed as a Master Villain for a cinematic Espionage or Supers campaign -- but murderous and sadistic female rulers are a staple of fiction, and not unknown in history (Elizabeth Bathory being an extreme example). With a little tweaking, a version of Lucia Diaz could rule anywhere from ancient Egypt to a Galactic Empire.

Captain Richard King RAF, Commander of the Tower   *275 points*

Ht 5'11", Wt 170 lbs, Size Modifier 0, Age 48.

Appearance: Pale complexion, short dark brown hair, blue eyes; a healthy-looking man in patched leathers.

Languages: English (Native); French (Accented); German (Broken). [6 points] TL: 6. Cultural Familiarity: Ariane.

Attributes: ST 11 [10]; DX 12 [40]; IQ 12 [40]; HT 12 [20]. [110 points]

Secondary Characteristics: Dmg 1d-1/1d+1; BL 24; HP 11 [0]; Will 13 [5]; Per 13 [5]; FP 12 [0]; Basic Speed 6 [0]; Basic Move 3 [0]. [15 points]

Advantages and Perks: Allies (War Council, Present on 15-, group of 6-10, 50% point total) [36], Combat Reflexes [15], Fit [5], Military Rank/4 [20], Night Vision/1 [1], Status +3 [15], Temperature Tolerance/1 [1]. [92 points].

Disadvantages and Quirks: Chauvinistic [-1], Chronic Pain (Severe, 1 hour interval, 12-) [-10], Code of Honor (Soldier's) [-10], Dislikes being called "King Richard" [-1], Lame (Crippled Leg) [-10], Responsive [-1], Sense of Duty (Tower community) [-10]; Stubborn when in pain [-1]. [-44 points]

Skills and Techniques: Administration (A) IQ+1 [4]-13; Area Knowledge (London) (E) IQ+1 [2]-13; Brawling (E) DX [1]-12; Detect Lies (H) IQ [4]-12; Diplomacy (H) IQ-1 [2]-11; Driving/TL6 (Automobile) (A) DX [2]-12; Fast-Talk (A) IQ-1 [1]-11; First Aid/TL6 (E) IQ+1 [2]-13; Fishing (E) Per+1 [1]-14; Gunner/TL6 (Machine Gun) (E) DX+2 [4]-14; Guns/TL6 (Rifle) (E) DX+2 [4]-14; History (England) (H) IQ-1 [2]-11; Leadership (A) IQ+2 [8]-14; Melee Weapon (Spear) (A) DX+1 [4]-13; Meteorology/TL6 (A) IQ [2]-12; Navigation (Air) (A) IQ+1 [4]-13; Piloting/TL6 (Light Airplane) (A) DX+2 [8]-14; Psychology (Applied) (H) IQ-1 [2]-11; Public Speaking (A) IQ+1 [4]-13; Riding (Horse) (A) DX [1]-11; Savoir-Faire (E) IQ [1]-12; Savoir-Faire (Military) (E) IQ+1 [2]-13; Scrounging (E) Per+1 [2]-14; Search (A) Per+1 [4]-14; Soldier (A) IQ+2 [8]-14; Strategy (Land) (H) IQ+1 [8]-13; Streetwise (A) IQ-1 [1]-11; Survival (Woodlands) (A) Per [2]-13; Swimming (E) DX [1]-12; Tactics (H) IQ [4]-12; Thrown Weapon (Grenade) (E) DX+1 [2]-13; Urban Survival (A) Per+1 [4]-14. [103 points]

Gear: Auto Pistol, .45 (TL6) in belt holster with woven steel lanyard; small folding knife; large knife; leather jacket with sleeves; leather cap; shoes. When expecting trouble, add Bolt-Action Rifle, 7.62mm, with bayonet (treat as spear); steel pot.

Before the Plague, Captain Richard King was a Royal Air Force fighter ace -- twice decorated for valor, but not expected to rise any higher in the ranks. When the Plague broke out, he was reassigned to transporting much-needed medical supplies. Stranded in London when there was no more fuel, he decided to stay and defend the wounded, the hospital, and what remained of the city. Eventually, he and his new-found followers abandoned the hospital in favor of the fortified Tower of London, which he began turning into a fortress.

Twenty-one years after the Plague, Richard King is undisputed leader of the Tower and its community. He has turned nearby parks into farms, and the Tower now houses a school, a small hospital, a smithy and a variety of workshops, and a garrison of the best-trained and best-equipped soldiers in post-war England.

As commander of the Tower's forces, King is the single most powerful person in London, but he knows the limits of his expertise, and always listens to his mostly civilian Council -- especially Dr. Becky Crowe, an 81-year-old Quaker

immunologist and lecturer who he refers to as his Minister of Health, Science, and Education, and who is able to have him declared unfit. With the Council's help, King's struggle to maintain tech level 6 and a recognizable version of the British way of life in London has been largely successful, and he is slowly and cautiously civilizing outlying areas.

Campaign uses: Richard King is intended as a Patron in a Survivors campaign, but he could also become an Enemy.

Other settings: Richard King is meant as the leader of a post-holocaust community, but with minor tweaking he might also be military governor of a frontier outpost, or a soldier-turned-politician in charge of a small country or planet.

King Ryons of Northgalis, Ireland, and Many Isles   *285 points*

7'3", Wt 310 lbs, Size Modifier +1, Age 39.

Appearance: Ruddy complexion, receding red hair, blue eyes; a huge powerfully-built man with a full beard.

Languages: English (Native), Latin (Broken), Gaelic (Broken). [4 points] TL: 3. Cultural Familiarity: "Camelot" Myth Parallel.

Attributes: ST 13 [30]; DX 11 [20]; IQ 11 [20]; HT 13 [30]. [100 points]

Secondary Characteristics: Dmg 1d/2d-1; BL 34; HP 13 [0]; Will 13 [10]; Per 11 [0]; FP 12 [0]; Basic Speed 6 [0]; Basic Move 7 [0]. [5 points]

Advantages and Perks: Allies (Knights, Present on 15-, group of 21-50, 50% point total) [60], Combat Reflexes [15], Fearlessness +3 [6], High Pain Threshold [10], Status +7 [30; 1 level free from Wealth], Wealth (Wealthy) [20]. [141 points].

Disadvantages and Quirks: Bully (6) [-20]*; Chauvinistic [-1]; Gigantism [0]; Ironic sense of humor [-1]; Lecherousness (9) [-22] *; Overconfidence (12) [-5]*; Megalomania [-10]; Sense of Duty (Knights) [-10]; Trims his cloak with the beards of kings he's defeated [-1]. [-70 points]

Skills and Techniques: Acting (A) IQ [2]-11; Administration (A) IQ-1 [1]-10; Area Knowledge (British Isles) (E) IQ+1 [2]-12; Brawling (E) DX+1 [2]-12; Carousing (E) HT+1 [2]-14; Detect Lies (H) IQ [4]-11; Fast-Talk (A) IQ [2]-11; Heraldry (A) IQ [2]-11; Interrogation (A) IQ+1 [4]-12; Intimidation (A) Will [4]-14; Knife (E) DX+1 [1]-11; Lance (A) DX+3 [8]-14; Leadership (A) IQ+2 [8]-13; Melee Weapon (Broadsword) (A) DX+3 [12]-15; Melee Weapon (Spear) (A) DX+1 [2]-12; Navigation (Ground) (A) IQ [2]-11; Psychology (Applied) (H) IQ-1 [2]-10; Riding (Horse) (A) DX+3 [8]-14; Savoir-Faire (E) IQ [1]-11; Sex Appeal (A) HT [2]-11; Shield (E) DX+3 [8]-14; Strategy (Land) (H) IQ+1 [8]-12; Streetwise (A) IQ+1 [4]-12; Survival (Woodlands) (A) Per [1]-11; Tactics (H) IQ+1 [8]-12; Thrown Weapon (Knife) (E) DX [1]-11; Thrown Weapon (Spear) (E) DX+1 [2]-12. [105 points]

Gear: Fine Bastard Sword; Lance; Large Knife; Heavy Steel Corselet with heavy plate arms and legs; Greathelm; Heavy Gauntlets; Sollerets; Medium Shield; Heavy Warhorse with plate barding, face mask and head/neck armor.

In the years after the death of Uther Pendragon, inheriting a kingdom didn't guarantee that you could keep it. By the time Arthur drew the sword from the stone, Ryons, who claimed descent from the Greek hero Herakles, had already defeated 11 kings and forced them to shave off their beards as a sign of their tribute to him. He didn't join the 11 kings who fought against Arthur at the battle of Bedegraine, but took advantage of the chaos to attack Leodegrance of Cameliard, Arthur's future father-in-law.

Ryons had decorated his cloak with the beards of the kings he'd defeated, and he demanded that the young Arthur shave his so that he'd have an even dozen. With the aid of Merlin, Arthur's knights Balin and Balan ambushed Ryons while he was on the way to visit the Lady de Vance, slew more than 40 of his men, and brought him to Arthur. Ryons yielded to Arthur rather than be slain, forfeiting his lands, but later met him in single combat and was decapitated with

one blow from Excalibur.

Vicious as Ryons was, he was also a successful leader, and his men remained loyal to him until his capture.

Campaign uses: With his undisputed courage and cunning, his ironic sense of humor and streak of cruelty, King Ryons would be make excellent villain for an adventure set in the early days of Arthur's reign. The PCs might be knights or mercenaries the service of a king who Ryons is attacking (or who he has already defeated, if you want to re-enact the story of the forty-seven ronin in Arthurian Britain), or villagers in the path of Ryons' army who find themselves having to defend themselves from looters. Ryons might also become a Patron for a less ethical group.

Other settings: With very minor changes, Ryons could be an ambitious warlord in almost any feudal or fantasy setting.

Adventure Seeds

A Mammoth Undertaking *(Time Travel):* The heroes accompany a nature film crew traveling to the Pleistocene, and persuade Deersinger to summon the animals they want to shoot. However, Deersinger is better at summoning dangerous animals than he is at controlling them, and the film crew flees in panic when mammoth come stampeding towards them. Deersinger, his hunters, and the PCs go looking for the scattered crew -- but can they trust the shaman, or does he have an ulterior motive?

By the Book *(Fantasy):* The adventurers learn that the tribute King Ryons has collected from the kings he's defeated includes a powerful grimoire. Knowing that Ryons is frequently away from his castle, they hatch a plan to break in and steal it. Unfortunately, they're trapped in the castle when the king and his knights return earlier than expected -- and Ryons is not known for his forgiving nature.

Habeas Corpus *(Deadlands):* The party is passing through Langtry on election day, when the saloon is suddenly besieged by walkin' dead from Boot Hill. The dead are led by the victims of Judge Roy Bean's rough brand of justice, and all are determined to vote Bean out of office. Bean and his cronies start firing when they recognize some of the corpses, and the dead counterattack. The PCs can join in the fight on either side, or try using Acting, Fast-Talk or Stealth to get out of the saloon unharmed.

Vulture Culture *(Powers):* Tlalocan has become a haven for unethical scientists, and the heroes hear a rumor that one of these has created an bioweapon that can kill, cripple or sterilize men, but has no effect on women. Unfortunately, the only person who knows the whereabouts of the scientist, his lab or the culture (if it exists) is Lucia Diaz. At the very least, the PCs will have to break into her presidential palace and search through her papers; more probably, they'll have to interrogate or mind probe Diaz herself.

Battle Beneath the Earth *(Survivors):* Someone has been hijacking wagonloads of fertilizer, and Richard King suspects that his enemies are planning to turn it into explosives to undermine the Tower. He calls for volunteers to explore the London Underground: the job pays better than guard duty or farming, and there's the potential to salvage some valuable items, but the tunnels are also rumored to be full of dangerous mutant strains of everything from viruses to wolves, as well as feral humans.

Lady Bountiful *(Space):* A telepath seeking refuge on New Willendorf realizes that her neighbor is Tia Breton, wanted for manufacturing and selling counterfeit medications that have cost dozens of lives. Breton shows no sign of leaving the colony; if the PCs want to bring her to justice (or collect the $100,000 bounty), they'll have to find a way to get past Ula Chandra.

Pyramid Review

Dungeons & Zombies (for [All Flesh Must Be Eaten](#))

Published by [Eden Studios, Inc.](#)

Written by Jason Vey with Ross A. Isaacs

Cover by Jon Hodgson

Illustrated by C. Brent Ferguson, Travis Ingram, Jonathon Kirtz, Dan Oropallo, Cary Polkovitz, Gregory Price, George Vasilakos, & Kiran Yanner

160-page 7¼"×9¼" b&w softcover; $24

After a whirlwind ride into the [past](#) and though a gamut of [genres](#), and even a step into the [post-post apocalypse](#) when the zombies have won, the RPG of surviving the corpse cortege, *All Flesh Must Be Eaten,* takes us back to the original roleplaying genre -- fantasy. Yet worry not, dear reader, for *Dungeons & Zombies* is not a book about filling an evil overlord's underground demesne with extra members of the cadaver cavalcade. Well . . . actually it is, but you get more than that. Quite a bit more.

Dungeons & Zombies is the game's sourcebook for the fantasy genre, which right from the start acknowledges its inspiration with Jon Hodgson's tribute to that most parodied of covers. So the question is, how does the supplement handle the genre? First it introduces two new character types that let you do heroic fantasy. While the Norm type handles the likes of mere townsfolk and peasantry, and the Inspired type will happily handle clerics, most *other* characters can be created using the Survivor character type. Mages and sorcerors though will need to take the new Adept Hero type and also purchase the Gift quality to power their spells. For more "heroic" characters, the Talented Hero is the character type of choice.

But this is just the starting block, because to simulate a certain game with all of its races and classes, *Dungeons & Zombies* goes on a ransacking spree through several other UniSystem supplements and RPGs. And once it returns with its trophies from *[Enter the Zombie,](#) [Terra Primate,](#)* and both the *[Buffy the Vampire Slayer](#)* and the *[Angel](#)* RPGs, it uses them to construct fantasy races -- Dwarf, Elf, Gnome, and so on, and Profession Qualities to closely model those classes of an *oh so* familiar game. Thus you can play a cleric, paladin, ranger, or swashbuckler from those given, and constructing others is hardly a challenge. Wizards and psychics do not receive Profession Qualities, but they are just as easy to create, as are other fantasy races.

To reflect the genre, magic has also been expanded, with the Gifted channeling Essence in the mode of the cleric or druid, and the mage employing Invocations, rituals, and formulae to weave Essence into the desired result. An Invocation involves the summoning, focusing, and dismissal of Essence, and once summoned, has an intoxicating effect until dismissed. If not dismissed, then this effect can become adverse. Invocations come in a variety of flavors, but primarily those of the four elements. They are purchased as a skill with five ranks available. Also included are rules for Necromancy, itself available in four flavors -- Death Lordship, Death Mastery, Death Speech, and Death Raising. Mostly employed by the average Dark Lord, in *Dungeons & Zombies* the art of Necromancy is not necessarily evil. Rather, it is evil by intent and use. These rules are in fact a lighter adaptation of those found in the publisher's post-apocalyptic RPG, *Armageddon,* and a Zombie Master wanting more detail is directed to that game or *WitchCraft.*

After a quick and dirty guide to creating magical items designed to emulate the swords & sorcery sub-genre, *Dungeons & Zombies* discusses the process of world creation. This is equally quick and dirty, but the four pages do an excellent job, and the process is easily aided by the application of these guidelines to one of the book's four Deadworlds.

The first of these Deadworlds is "Dead Gods and Demon Lands," a setting evoking the writings of Fritz Leiber and Robert Howard. In this pulp fantasy, the land of Iurth has become the battleboard of the gods. With a convoluted cosmology, the various deities of Light and Darkness, Order and Chaos, all war over a land in which access to the Afterlife has been denied, forcing the dead to rise again as hungry zombies. Besides these Restless Dead, other zombies are the creation of the gods, Kali and Ahriman. This is a Deadworld in which to adventure rather than go on an epic quest, the characters undertaking relatively small-scale tasks and threats.

"Dawn of a Dead Age" is more typical fare, being Epic Fantasy and thus on a much grander scale. In the medieval land of Domhain, shards of the Apocalypse Blade have been found and the Dark Lord Adramalech has awakened after a millennia long slumber. With a heavy Celtic feel, Dawn of a Dead age is intended to model Joseph Campbell's Hero's Journey as the discovery of part of a sword marks the beginning of a great quest that will finish with the player cast facing a great evil. Again there is more than one type of zombie, the risen dead forced to do the Dark Lord's bidding, and the Shedim, the bodies of the Sidhe now occupied by demons. Of course, they are also one more parallel with a certain very popular book.

As the title suggests, "Death of the Round Table" is an Arthurian-inspired Deadworld, set in the last years of the king's reign when his despair darkened the land. Galahad's quest to find the grail and restore the kingdom has failed, enabling Morgan le Fey and Mordred to take power and taint the land with their evil. Worse still, the Grail has been put to perverse ends, helping to raise an army of zombies that includes many former members of the Round Table. This is another Deadworld involving a quest, this time to regain the Grail and restore the kingdom.

The last Deadworld goes East, "The Eastern Dead" being an Asian fantasy with ninja, samurai, and fox spirits replacing assassins, knights, and elves. Set in the Three Kingdoms of Samguk -- a mixture of Chinese, Japanese, Korean, and Vietnamese cultures -- this Deadworld is beset by demons from Jigoku, the Land of the Dead. The demons are of course, supported by a growing army of undead. This all bears resemblance to a certain Oriental RPG, but this is not to say that this Deadworld is derivative. Finally, there is "The Tomb of Doom," probably the very first dungeon bash for the UniSystem. Not a Deadworld in the conventional sense, this adventure even starts in a tavern!

Dungeons & Zombies does exactly what you have to expect for a supplement for *All Flesh Must Be Eaten* -- explore a genre and present suitable Deadworlds ready to play in. Yet it does something more than others of its ilk, serving to showcase how a particular type of game can be run using the UniSystem. In this way, and in its Deadworlds, *Dungeons & Zombies* is actually the most accessible of all the *All Flesh Must Be Eaten* supplements, because at its heart, its genre is the most familiar.

Miskatonic University: A Handbook to the Pride of Arkham

Published by [Chaosium Inc.](#)

Written by Sam Johnson with Sandy Antunes, Richard Watts, Keith Herber, Alan Matthews, Chris Tutt, Doyle Tavener, Lynn Willis, and dyvers hands

Illustrated by Philip R. Rogers (cover painting), David Grilla, Alex Thomas, Paul Carrick, and Tom Kalichack, with maps by David Conyers

256-page b&w softcover; $29.95

Miskatonic University is one of the key elements in H. P. Lovecraft's fiction. Many of his protagonists are scholars or scientists, and Miskatonic University is the academic institution they're most likely to have been involved with, as students, faculty members, or recipients of funding. *Miskatonic University,* recently released book from Chaosium, provides a guide to the university and its setting, and is designed to meet the needs of GMs running campaigns based on the Cthulhu Mythos. In the process, the authors have produced some material that GMs might want to borrow for other sorts of campaigns as well.

Usefulness to GMs is a major emphasis of this book. The introduction explores different functions Miskatonic can play in a campaign and suggests ways of using the book to serve each of them. Johnson rightly emphasizes that the GM, or "Keeper," is the ultimate author of the campaign and needs to make his own creative decisions about how to set it up. This book provides raw materials that can be used for that purpose.

The opening chapter focuses on the history of the university, from the days of the Salem witch trials to the "modern day" of the 1920s, H. P. Lovecraft's own era. It includes a street map of the campus and a building-by-building guide to its layout. There's as much attention to everyday life in the university community as there is to horrors and secrets; a campaign set here could be well grounded in daily life. Two buildings in particular -- the Orne Library and the Exhibit Museum -- get detailed descriptions, including maps, lists of books, and character sheets for people who can be met there; the library is especially well realized and could be very useful as a continuing location for research scenes.

The second chapter is titled "People on Campus" and does actually contain a large number of biographical sketches, with 28 character writeups. But there's more to the chapter than that. It's a guide to the life of a university, as seen by students, graduate students, and faculty; it covers the daily routine, costs of living, departmental politics, and fraternities, sororities, and clubs. Some of the character descriptions hint at involvement with the Cthulhu Mythos or other sorts of alien or supernatural horror, but that's not the main theme of this chapter. Both the Recent Expeditions Map and Chronology and the character sheet for William Moore (a member of the geology faculty) provide links to another supplement, *Beyond the Mountains of Madness,* which describes an expedition to Antarctica supported by Miskatonic University.

The third chapter is the heart of the book as far as game mechanics is concerned. It provides rules for actually being a student and getting an education. These are organized around the concept of the Semester Check, a commitment of time to some activity over the course of a semester. Each student gets six Semester Checks, which are typically committed to four courses, a sport or hobby, and daily life and social contacts. Semester Checks can be divided into half units, and invested in up to eight different activities; there are penalties for shorting an activity and rewards for

putting extra effort into it, making this an entertaining resource management game, one that could profitably be borrowed for campaigns in other academic settings from Hogwarts to the University of California Sunnydale. In the process, students choose courses (the book's approach steers neatly between the tedium of an actual course catalog and the vagueness of handwaving everything) and determine grades earned, so that after four years a character will have not only a list of skills acquired but also a transcript.

The fourth chapter presents a variety of secret places and organizations to be found at Miskatonic University. Some of these could provide aid and support to PCs; some would be deadly threats; some could go either way. Lovecraftian characters such as Nathaniel Wingate Peaslee and Asenath Waite put in appearances. Naturally, the university has a tunnel complex that adventurous students can explore, and where they may encounter ghouls, sinister little people from Irish folklore (one of the book's least successful ideas, to my taste), or both. The various secretive organizations look a lot like real academic factions, and would be useful to a conspiratorial campaign about hidden mystical cabals in the modern world. One way to use this book would be as a setting for a non-Mythos campaign about Hermetic sorcerers, parapsychological researchers, or other people studying Things Man Was Not Meant to Know; this chapter would be a big help.

The fifth chapter is the obligatory brief scenario. Discussing it would give away things that GMs would need to keep secret; but it looks well planned, with horrific events, multiple layers of clues, more character examples, and links to other parts of the occult world of Miskatonic University.

Finally, an appendix provides useful information on several topics, along with blank diplomas and degree plan worksheets that can be photocopied. The rules for studying Mythos tomes carry on the theme of resource management and might better have been placed in the main text, perhaps in chapter three.

As a whole, this book is a bit hard to describe; it has a sensible organizational scheme, but it reads more like a collection of documents than like a comprehensive treatise on a subject. It's not a packaged campaign, but a resource that can be used to create a campaign. Most GMs will want to use it selectively. Fortunately, it's well suited to that kind of use; the quality of its various parts is high, and several sections, such as the Semester Check mechanic in chapter three and the material in chapters one and four on the Orne Library and the head librarian, Henry Armitage, are brilliant. This book will especially reward the GM who, like a proper Lovecraftian scholar, loves reading books closely looking for hints of deeper meanings.

Sam Johnson's version of Miskatonic University could be the setting for a Mythos campaign, focused either on faculty or on students; it would be especially useful for a student campaign, following a cast of characters from admission as freshman to graduation, or even on into graduate school. Or, if it followed the book's suggestion to start in fall of 1928, it could lead up to a band of new graduates signing onto the Starkweather-Moore Expedition already described in *Beyond the Mountains of Madness. Miskatonic University* volume could also be a resource for a GM whose campaign was set elsewhere, but needed a scholarly institution for investigators to consult. Finally, any GM running a campaign set on a university, or any sort of school, could find inspiration in this book's treatment of student life and choices.

Murphy's Rules

Things I Hate As A Player

I'm riding the pet peeve money train for all it's worth, and this week the pooh-pooh choo-choo is taking us through the things that tick me off as a player.

Standard disclaimers apply . . . these may not be the biggest things, but they're up there.

* * *

RPGs that don't let me make the concept I want. I have a philosophy of character design: An RPG should permit me to make *any* character I can conceive, even if it's required to be a watered-down version of that concept. For example, if I want a character who's a millionaire diplomat, then the game should enable me to buy up levels of wealth and diplomacy. If I have a character who believes he's divinely empowered to do great deeds, then the game should let me at least get close to that idea (such as by taking some type of Luck power, which I can chalk up to my character's empowerment). And if I'm playing a Supers game and I want to make a mild-mannered reporter with flight, heat vision, and strength, I should be able to do that.

Now, as far as I'm concerned, the *magnitude* of the adherence isn't crucial. In other words, it's not as essential that I be able to make a character who's one of the 10 wealthiest in the world, so much as I have significantly above-average wealth that I can use in certain situations. Likewise, my mild-mannered reporter doesn't need to be able to fly fast enough to turn the Earth back in time, so long as he's able to fly at all. In this way it's usually possible to (for example) make Superhombre with (in *GURPS* terms) 200 points, 500 points, or 2,000 points; it's only the magnitude that is different.

Unfortunately, too many games don't permit this. The number one offender -- in quantity, if not egregiousness -- are the original *(Advanced) Dungeons & Dragons* games (including most flavors of the *d20 System*). Without GM fiat, there wasn't any way to start a character as (say) a wealthy merchant, or a cursed magician, or an incognito prince, or any of a jillion other fantasy concepts I could concoct. Nope; you were stuck with being that first-level cleric, with a mace and one casting of *cure light wounds.* Wake me when you're dying.

This was especially true of games where there was no real character-creation system so much as a character-generation system. The original TSR *Marvel Super-Heroes* RPG, for example, didn't have any type of means of giving player guidance toward character creation, relying instead on an entirely on random creation. By far, this reached new levels of existential goofiness with the release of the *Ultimate Powers Handbook,* where eleventy-jillion different powers were all but guaranteed to collide on the charts in mad-whack ways. ("Okay, so my new mutant has plant growth, acute sense of smell, and probability manipulation? Terrific . . . Ummm . . . call me 'Lucky Green-Thumb Big-Nose.' Whee.")

Hey, games: I play RPGs so I can be a different person . . . a different person I *want* to be! Don't make that any more difficult for me than it has to be.

* * *

Games that don't tell me what "average" is. There is a surprisingly common affliction that many skill-based games have (among others): they don't tell you what people typically have, or (if they do provide some guidance) how normal competent people do their jobs.

I cannot stress how important this information is in trying to design a character, especially in an unfamiliar system. Is someone with a doctorate in a skill rolling 3D, 5D, or 8D? Does a world-renowned expert in that field of knowledge have a skill of 15, 18, or 21? And so on. Knowing what the designers of a game had in mind is important, especially if they're assuming that additional rules will be used by people fairly often. For example, the *D6 System* (among many other games) provides a bonus for taking extra time; so, for example, by taking twice as long as the default at a task, you can gain an extra die -- rolling, say, 5D instead of 4D. Now, it's entirely possible to assume that most professional

people are normally "taking extra time"; in this way, all professionals could have 4D in a skill while competent PC heros have 5D . . . and heroes, being heroic, are able to perform their acts at the same level of competence as a professional, albeit in a much faster time frame.

Unfortunately, not all games give this information, and the difficulty it presents is two-fold: I don't know what level my characters are performing at, and I don't know what level others are performing at. So, for example, when I designed a character for *Fading Suns,* I gave a level of competence that I had assumed would be comparable to a reasonable swordsman (since I was designing within the parameters of the game system). Sadly, this was not to be, and having gotten smoked in my first outings by low-powered opposition, I cursed the game for not informing me of what I needed. (And let's not forget the Big Laffs that awaited me after actually believing *In Nomine's* character creation rules that said an average celestial or excellent human had a characteristic roll of 6; do you know how often you'll fail if you're rolling for a 6 or less on 2d6?)

For me, the games that always did this the best were those that had "caps" along with logical structures. For example, White Wolf's Storyteller system had a five-point scale for all skills and attributes (not counting zero). If I wanted a novice, I could give one point; if I wanted a doctorate-level, I could give four points; if I wanted the best human potential, I could give five points; and so on. And, mercifully, most players as well as most source material interpreted the levels in the same way, resulting in a lot less of the "Well, gee, I thought 14 in a skill was a doctorate, but I keep looking really dumb in comparison with these other NPCs" situations.

* * *

Games with poorly designed character sheets. In my mind, there's nothing quite as amazing as a good character sheet. At their best, character sheets should be simultaneously evocative, informative, and well-organized; with a good character sheet and a simple enough system, I can explain the entire game to a new player using nothing but that character sheet. The *D6 System* pre-made templates are good example of this (especially the old *Star Wars* system), since these sheets are friendly, big-fonted, and usually contain an image that is evocative of the character's abilities -- it's a lot easier to tell a newbie that their character is big and strong when you show them a huge-muscled dude with an axe on their character sheet.

Unfortunately, too many games have character sheets that were created as an afterthought, designed as a slap-dash assortment of stats, abilities, and (if you're lucky) charts. And some of these sheets seemed to be made as if they were actually antagonistic, and *not* designed by gamers for gamers. In my mind, by far the most egregious example of this was the original *Advanced Dungeons & Dragons* Character Sheets from their supplement of (I believe) the same name. Sure, the character sheet itself was not much to write home about . . . uninspiring and fairly dull. However, its crimes went beyond mediocrity. To thwart photocopying -- since, y'know, six bucks for 32 pages of heavy-use character aids might inspire such -- they made them a garish gold color. This color, in addition to being useful in color-matching marine rescue equipment, caused headaches for me in any situation where I was forced to stare at it for longer than an hour at a time . . . which is to say, every time I would have actual need of it.

Too many character sheets fall into a "what were they thinking" category . . . for example, listing attributes on one side of a sheet and skills on the other, despite the fact that you need both to do any roll. (In-game sound effects: <flip> <flip> <flip> <flip> <flip> . . .) Others have an intrinsic flaw that indicates to me the designers weren't thinking like gamers. One of the big class of offenders was around the late 1990s, where full-color hardcover RPGs were just starting to come into their own as a concept, but we weren't quite at the level of omnipresent support material PDFs from the companies. As a result, many of these games had beautiful full-color character sheets that were incredibly painful to try to use, since they photocopied awfully. (Last Unicorn's *Star Trek* line: I'm looking at you.)

One of my good gamer friends' test of *any* new RPG was to crack open the book to the back and see what the character sheet looked like. While I'm not that persnickety about them, they're still high on my list of things that drive me up a wall when it comes to a new game.

* * *

Well, now that I've the raised hackles back in "hack 'n' slash," feel free to offer up your own ideas for things that tick

you off as a player over on the [message boards](#) or by [e-mail](#). Because anger is the gift that keeps on giving.

--Steven Marsh

Icosahedron Adventures

Refuge Part Three -- Arches and Shingletown
Organizations and Neighborhoods of a Steel Age Fantasy d20 City

by Owen K.C. Stephens

In this final installment -- which we've visited twice before, we look at the middle class and merchant sections of Refuge.

Arches

Arches is the main merchant section of the city, and is characterized by wide, straight streets (big enough for a cart pulled by eight oxen to turn around) connected by narrow, meandering alleyways. The borough's name comes from the large stone arches found throughout the region, connected by rope systems and short, gated walls. These were originally supposed to support a system of catwalks for the Refuge Guard to patrol the area, but the engineering of the project was unsound. A previous Domant opted to connect the arches with much more reasonable walls, supporting them with ropes and pulleys to ensure they wouldn't collapse. Of course, if oxen were hooked to the ropes the arches could be brought down, allowing the city to throw numerous stone barricades in front on an invading army (though this has never been put to the test).

Arches is patrolled chiefly by the City Militia, though their primary duty is to ensure the wide streets don't get crowded by bender stalls and tents (though this is allowed on festival days, when residents often come out to sell a few crafts they've constructed since the last festival). Anyone found selling out of a wagon or trying to set up a temporary stall is fined and ejected. There are no such restrictions on wandering salesmen, resulting in a wide array of items carried on poles or portable racks and offered for sale by Criers.

Any reasonably common material can be found at a shop in Arches. Uncommon material may also be available at places such as Rat's Bits and Pieces (detailed below).

Criers

The Criers are common throughout Arches, both as simply announcers (of special offers, job opportunities, new laws, and even public threats between wealthy houses) and as wandering sellers of good kept on the body rather than in a wagon or stall. A Crier can be bought for a gp a day, though most must be hired at a Crier Stage, one of the many small platforms at which members of the Crier's Association gather when looking for work. Young men and women can become members of the Association for a small fee and, if their voices are loud and clear, make fair money for little labor.

They officially operate outside the Guild League system, and use that exclusion to act as fences, door-to-door salesmen, and deal brokers. The people of Refuge are used to seeing Criers everywhere, and thus give no thought to one being near a robbery or spotted after a break-in. Criers are next to invisible, and use that fact to run numerous minor scams. Those who do so successfully are brought in to the "inner circle" of the association, where they discover the Criers are part of the larger thieves' guild in refuge. They can carry goods anywhere without arousing suspicion, and are the most ignored when they draw attention to themselves by hollering about new tax laws, cheap meals at the Red Turnip Inn, or how Lord Thunsey plans to thrash Lord Mickles for an argument over someone's daughter. The very best are eventually brought into the inner circle of the criminal element, and learn the Criers are actually spies for the Domant, his eyes and ears among the common folk of Refuge.

Of course, not every Crier that is shown the secrets of the Association proves trustworthy. A newly enlightened

member is assured if he is unhappy with this turn of event, he can take a payment for his silence and leave Refuge in peace. The member is then followed and watched by those stealthier than himself; at the first hint of willingness to talk or run, the former member is killed. The Criers can brook no traitors, and consider their secret duties too important to let a threat live. The Domant does not use them as assassins, but many train in such skills to police their own numbers. Once the secret of the Criers is revealed to a member, the only escape from the group is death, though many are said to have "retired overseas" to deflect suspicions.

The Criers are ruled by Cedric Baker, an overweight and aging man whose voice can still be heard over nine blocks if he bellows at full force. Baker is a loyal agent of the Domant, and seeking a replacement he trusts to be just as loyal. He lives simply in a small office behind one of the Crier's Stages, satisfied in the security of knowing the Domant needs him rather than any material reward. Baker is also a sorcerer who focuses on spells of divination, a secret he keeps even from other trusted Criers. As a result, he has convinced most of the spies under him that there exists another organization that does nothing but watch over the Criers and report to Baker. This misdirection has saved Baker's life many times, as foes who penetrate the Criers waste time seeking this nonexistent group, giving Baker time to find them with divination magics.

Rat's Bits and Pieces

Found on the northern edge of Arches, Rat's Bits and Pieces is a ramshackle, stale-smelling, sprawling warehouse stuffed to the rafters with, well, junk. The walls, ceiling, shelves, and counters are stuffed with broken weapons, one-foot sections of rope, half-burned candles, desiccated spider corpses, perforated waterskins, ripped clothing, broken pottery, untanned hides, cracked barrels, rotting books, small animal skeletons, and scraps of paper with incomplete recipes and poems. For most people, it's all valueless.

For Rat, a short and balding man well past his prime, it's home.

Rat was a street urchin 25 years ago, when he happened to overhear a plot to poison the Domant. Being naturally stealthy, he managed to sneak into the Domant's palace and worn the sovereign. Surprised, but wary, the Domant held rat until he could ascertain the truth of the vagrant's claim. When the plot materialized, and was foiled, the Domant offered rat a boon. Having always desired a shop of his own, like those of the fat and happy merchant who drove him from their shops, Rat asked for a business in Arches. The Domant agreed, and gave him a property free of rent.

Rat, of course, had no business experience. He quickly went broke. So the Domant bailed him out. Many times. Eventually, the Domant just asked Rat to limit the speed at which he lost money, which Rat did by only buying things cheap. Very, very cheap. Soon, the B&P was the premiere place in Refuge to sell useless junk. Indeed, Rat buys almost anything, at one cp per ten pounds.

However, one man's trash is another's treasure. Craftsmen soon learned they could find raw materials in the B&P. Seamstresses got trim, buttons, and needles. A few spellcasters learned that any material component without a gp cost was likely on some shelf, somewhere. Slowly, Rat built up enough of a clientele he actually turned a profit, as his rent was free. Now two to three people can be found during any daylight hour, searching through the piles of refuse for some item too small for other businesses to worry about. (Anything with a price of 10 gp can be found in an hour with a DC 20 Search check. Such items are second-hand, with half the hardness and hit points of a new version and requiring an appropriate DC 10 Craft check to function properly.) Rat sells his junk for 1 sp per 5 pounds, and makes a tidy profit at that.

Rat is also a source of gossip and local information. Anyone buying from him more than once in a week gains a +4 circumstance bonus to any gather Information or Knowledge (local) check regarding Refuge. The sole exception is information clearly harmful to the Domant. The city's ruler can do no wrong in rat's eyes, and the shopkeeper has nothing to do with any question that seems designed to make trouble for Domant.

Shingletown

Located west of the Arches merchant district, Shingletown is home to the city's small, but growing, middle class. This is where smiths, merchants who own more than one shop, scribes, and master craftsmen live in relative peace and safety. The name of the area comes from the fact that while the buildings here are wood or a combination of wood-and-stone, their owners can afford to keep clay- or tile-shingled roofs above their heads. Shingled roofs are much better at keeping rain out of a building than the thatch common on lower-class homes in Refuge, but are significantly costlier to build and maintain. Tile shingles are common for shops throughout town, as the additional cost is justified by the protection it gives wares and working areas, but most commoners can't afford such a luxury for their homes. Conversely the very wealthy live in all-stone buildings with stone roofs, which is beyond the reach of the middle-class Shingletown dwellers.

The community of Shingletown is surprisingly tight-knit. Many of the residents have nothing in common but their economic status and physical proximity, but that's enough to encourage them to stand together on many political issues. The aldermen of Shingletown have lead the debate opposing sumptuary laws, inheritance dues, property taxes, trial-by-combat, and any restriction on what occupations young freeman may enter. While their successes have been modest, the fact the aldermen have been allowed to speak out against the existing system, and even occasionally get a law changed, is itself a sign of their growing influence.

Information Checks

- **DC 13:** The Refuge Guard never patrols here. Since it is funded by the nobility of the city, who see the freemen of Shingletown as dangerous upstarts, the Guard does nothing to stifle crime here. The Guard only enters Shingletown to arrest someone.
- **DC 15:** The City Militia has a very strong presence in Shingletown. Many of its senior watchmen are younger sons of Shingletown merchants, more loyal to their families and the neighborhood in general than the second-rate knights who officially command them.
- **DC 18:** The residents of Shingletown see the City Militia as their protectors, and thus are unwilling to act against them. Any excesses the Militia commits in Shingletown against nonresidents (either lower-class citizens from other neighborhoods or foreigners) is actively covered up by most of the residents of Shingletown. Any crime committed by the Militia against a noble or the agent of a noble is covered up if there is no evidence, but a watchman who gets himself in trouble with the nobles and leaves witnesses loyal to them around will be turned out by Shingletown (for the good of the community).
- **DC 25:** Only one thieves' guild, the Golden Mules, has any influence over Shingletown. They pose as a simple porter's guild, and gain the support of Shingletown residents by preventing other criminal organizations from moving in.

City Militia

The City Militia is a relatively recent addition to the military forces of Refuge. It was originally assembled over a generation ago by a small band of knights in the Refuge Guard through conscription, to bolster the city's forces in the face of impending pirate attack. The feared assault never came (many believe exactly because the Militia had been formed), but having a group of armed men who neither answered to the nobles of the Lower Court nor took the long training of a Refuge Guard knight turned out to be popular and useful.

The Militia Guard are seen by the common folk of Refuge as more evenhanded and honest than the refuge Guard, and seen by the Domant as less likely to back a major noble in a coup attempt. When the Lower Court refused to pay for the Militia after the pirate threat passed, the Guild League volunteered to do so. As a result, the City Militia became the primary patrolling force within the merchant districts of refuge, and has grown in numbers and power for 50 years.

To prevent the Lower Court from rebelling at the perceived loss of power, the Militia was assigned knights of the Guard as commanders early in its formation. This duty was seen by the knights as a form of punishment, and those connected to the richest and most powerful houses worked to avoid such assignment. Many knights from minor noble houses have come to prefer duty with the Militia, as it keeps them from dealing with the more stuck up members of the Refuge Guard, and the Militia has developed a tradition of loyalty to those who befriend them. More than one minor

noble family has been saved from hard times through beneficial contacts with merchant houses related to members of the Militia. While a few knights still try to get out of Militia command duty as quickly as possible, an increasing number see the Militia as the "true" military force of Refuge and are proud to serve in it.

The Militia is headquartered in a large building known as the Grand Barracks, or just the Grand, near the center of Shingletown. The Grand is among the biggest buildings in Refuge, but unlike the Domant's palace or the cathedrals, it is constructed primarily of wood. It serves as housing for active members of the Militia, storehouse for emergency food for the city, and training facility for the Militia and any citizen that wishes to learn how to operate the city's siege engines to aid in its defense. The training of personal combat is restricted to Militia members and their families, to discourage brawlers from training to be more effective troublemakers.

The City Militia is currently commanded by Sir Roland Fletcher, a senior knight who has served the organization for 20 years. Sir Roland has worked tirelessly to improve the quality of the Militia members, secure their status within the city, and weed slackers and malcontents from their ranks. In his efforts he has thrown out several less-than-enthusiastic knights belong to noble families more influential than his, embarrassing those families. This has increased tension between the Militia and the Refuge Guard. Sir Roland sees this an acceptable consequence, and secretly hopes the Guard push the rivalry far enough for the Domant to disband them. So far his loyal service to the city has earned Sir Roland the Domant's trust and protection, but when the current Domant dies the Lower Court may be emboldened to eliminate Sir Roland, and eventually the whole Militia.

The Golden Mules

The Golden Mules are the unquestioned, and unchallenged, lords of organized crime within Shingletown. Though they have tendrils in the lower-class boroughs as well, Shingletown is the bread and butter of the Mules, and they act quickly to crush any perceived threat to their control of the region, or threat to their income from it.

The Mules restrict their activities to actions taken against nonresidents, and charging outrageous fees for the transportation of anything into and out of the borough (starting at one gold piece, and going up by a silver per pound, per stop, though distance is ignored). The Mules allow residents to carry what they can by hand, but anyone trying to use an animal or cart to move things in and out of the borough is cornered and beaten. Since the Mules also guard against other criminal organizations working in Shingletown, the residents pay the Golden Mules' fees without complaint.

While residents of Shingletown are safe from the Mules' criminal actions, visitors to the area are not. Mules happily rob, blackmail, and even kill outsiders that happen to travel to Shingletown. They don't victimize outsiders without restriction -- after all, if Shingletown became an unpopular destination less money would flow in -- but they do act boldly when a major profit seems within reach. Newcomers to the city may be beaten and robbed at the edge of Shingletown, residents from elsewhere threatened for extortion money, and Refuge nobles lured into honeytraps or kidnapped for ransom. Wherever possible the Mules don't do their dirty work near the center of Shingletown, which helps deflect suspicion to other groups, but even so their presence and actions are well known to the various guards of the city.

For the most part, the Golden Mules also ignore members of the City Militia, which helps convince the militia to overlook some Mule operations, such as unlicensed brothels, dice games, usury, and the occasional mild beating of people behind in their payments. The Mules don't roll over for the Militia, however, and the Militia doesn't give the Mules a pass for major crimes. Even so, it's not unusual for an older brother to join the City Militia and a younger brother the Golden Mules.

The Golden Mules are currently led by Sharia Fess, the first woman to hold the position of guildmaster. She rose through the ranks of madams when younger, and moved into extortion and armed robbery when she realized she had to inspire both respect and fear within the guild to gain any more power. She became a member of the old guildmaster's inner circle, then rose to power when the Golden Mules suffered a major backlash from the Red Hawks and Refuge Guard over the unwise slaying of a Refuge knight. Fess managed to cement her hold over the Mules by promising the Red Hawks to reign in their excesses, a promise she intends to keep as long as she's publicly known. Fess also hopes

to fake her death some time in the next few years, and set up a shadow leader of the Mules. Then she would be free to engage the Mules in any activity that seemed profitable, and if the authorities became too upset Fess could sacrifice a figurehead leader to appease them.

Cities In Fog: Well-Walled Troy

"Of the true and famous Troy there have been no traces for ages: not a stone is left to certify where it stood. It was looked for to little purpose as long back as the time of Strabo: and Lucan, having mentioned that it had been in vain searched for in the time of Julius Caesar, concludes his narrative with this melancholy observation upon the fate of this celebrated city, that its very ruins were annihilated."
-- Robert Wood, *An Esssay on the Original Genius and Writings of Homer* (1769)

It's the first city of Western literature; the tale of Troy has quite possibly been around longer than any scripture in the world. Its descendants built Rome and London, and their scions fight their heroic wars in the Rose Bowl every winter. But for all that, what do we know of Troy? We think we see its topless towers clearly in the mind's eye, or their foundations firmly pinpointed on the chart of History -- but do we? Let's go looking, then, for Troy.

"And so great names are nothing more than nominal,
And love of glory's but an airy lust,
Too often in its fury overcoming all
Who would as 'twere identify their dust
From out the wide destruction, which, entombing all,
Leaves nothing till 'the coming of the just' --
Save change: I've stood upon Achilles' tomb,
And heard Troy doubted; time will doubt of Rome."
-- Lord Byron, *Don Juan* Canto IV, 101 (1820)

One begins, of course, with Homer, who would rather call the city "Ilios" than "Troia" -- he uses the former name exactly twice as often. Hence, the *Iliad* rather than the *Troiad.* Interestingly, Homer differentiates between Troy and Ilios -- only Ilios is "holy," for example, while only Troy is "deep-soiled." This has led some scholars to speculate that originally, the country was Troy and the city was Ilios. Or, actually, Wilios, since it originally took the digamma, as clever linguists can tell by examining the Homeric text. (This, by the way, is powerful evidence that the *Iliad* is at least partially based on a genuine Mycenaean epic -- the digamma was common in Mycenaean Greek, but obsolete by the time Homer sang, around 700 B.C., give or take a century.) So you can imagine the excitement when a deciphered Hittite treaty from 1270 B.C. or thereabouts mentions the "districts" of Wilusa and Taruisa, which pretty much have to be our holy Wilios and broad Troy. (Egyptian records list the "Drdny" as Hittite allies around 1300 B.C. -- Homer's Trojan "Dardanoi"?) As a bonus, a Linear B inscription from the ruins of the Mycenaean citadel at Pylos -- Nestor's city -- mentions "Toroja," in the context of a captive woman.

So we have something like Homer's names, carved into clay records right around the time of Homer's Trojan War, which Herodotos dates to 1250 B.C. (Other classical historians run the gamut from 1346 B.C. to 1127 B.C. When do modern historians date the Trojan War? Modern historians make little gulping noises and change the subject.) Where do those names come from? Quite literally, your guess is as good as mine. The Greek mythographers, of course, said that the names came from Ilos, the son of Tros, which solves precisely nothing. "Ilos" might be cognate with Greek *ilê,* "troop," or with *ili-,* the Illyrian root for "mud" (from the mud-brick buildings?), or with something entirely different. "Troia" could be cognate with *tri-,* since Troy's deepest (and hence earliest) layer features a [triple-branched](#) passage that once supplied water to the town from an [underground spring](#) cave. Other possibilities include the Hittite *taru* which means "timber" or "trees," or the Indo-European root **toru,* which means "churn-handle," but has connotations of something winding or twisted, such as the current through the Hellespont or the mazy alleys of Troy. Or the intestines, which are coincidentally *ileos* in Greek. (*Eileo-* connotes "twisted" or "winding".) And we might as well mention, to close the circle (*redan**truare,** in Latin), that a Babylonian term for entrails -- or for mazes, or both -- is *tirani.*

"Egypt? Woe is me! to think that hither I have sailed! . . . Can there be a man that hath the name of Zeus by the banks of Nile? The Zeus of heaven is only one, at any rate. Where is there a Sparta in the world save where Eurotas glides between his reedy banks? The name of Tyndareus is the name of one alone. Is there any land of the same name as

Lacedaemon or Troy? I know not what to say; for naturally there are many in the wide world that have the same names, cities and women too; there is nothing, then, to marvel at."
-- Menelaos, in *Helen* by Euripides (412 B.C.)

Now that we've gotten ourselves thoroughly twisted around linguistically, what can we do geographically? By the time Herodotos (if not Homer) wrote, there was no real question where Troy was -- it was at Ilion, the Aeolian colony planted at the Asiatic entrance to the Hellespont around 700 B.C. (For awhile, scholars thought the name "Ilios" might have come from "Aeolis," but the digamma seemingly disproved that notion.) Conquerors, pilgrims, and bards who visited the site all agreed, from Alexander the Great to the Emperor Constantine to Lord Byron. We have evidence that for at least nine centuries in the classical era women from Locris, to wipe out the stain of Ajax of Locris' blasphemy during the Trojan War (he dragged Cassandra out of the temple of Athena and raped her), traveled to Ilion to serve as scullery maids. Although most authorities believed that Ilion was the original Troy, a few mavericks (such as Strabo) placed it elsewhere on the plain, usually on a different hill, now called Bali Dagh. Slowly, however, they somehow convinced themselves that it was lost, all the same.

To be sure, Ilion (and to a lesser extent Bali Dagh) matched Homer's poem -- but that might have been because Homer (a local boy, from neighboring Ionia) might have matched his words to the site rather than the other way around. The "actual" Trojan War might have been fought, suggest a few scholars, at Teuthrania, well to the south of Ilion, where the pre-Homeric *Kypria* records a different contest of Achilles. (This, as it happens, coincides with a Hittite document complaining about the depredations of the "Ahhiwiya," quite likely the "Achaeans" of Homer.) Teuthrania is also convenient to the very large and impressive ancient city of Pergamon, which is intriguingly Homer's name for the citadel of Troy. Some scholars suspect that Homer put together a "greatest hits" epic, combining sieges and stories from all up and down the Anatolian coast into one ideal type. Another scholar claims that the "Troes" were actually a tribe in Thessaly near Aeolis, and the Aeolians (them again) took the names with them when they colonized Asia. The folklorist Rhys Carpenter went so far as to identify the historical Trojan War with the attack of the "Sea Peoples" on Egypt in 1200 B.C., an argument that founders somewhat on the fact that Egypt, unlike Troy, won that round.

But why let puling historical plausibility stop you? Theophile Cailleux identified Homer's "Danaoi" with the "Danaan," or Celts, and placed Troy in England, specifically atop the [Gogmagog Hills](#) near Cambridge. One Roberto Salinas Price discovered Ilium in Illyria (makes sense, no?), specifically in the town of Gabela on the Yugoslavian coast. Perhaps best of all, in *The Baltic Origins of Homer's Epic Tales,* nuclear engineer Felice Vinci notes that the battle over Achilles' armor spans two days, through the "dimly-lit night." Where do you have dim light at night? Why, in Scandinavia! (More specifically, in the evocatively named Toija, Finland -- the "r" having apparently vanished over the millennia.) After all, the Mycenaean warriors sure act all Viking-y, and it must be admitted that there's a lot of rain, wind, and snow in the *Iliad* for a war that's supposed to be happening in the sunny Aegean.

"The fragment of the Critias has given birth to a world-famous fiction, second only in importance to the tale of Troy and the legend of Arthur; and is said as a fact to have inspired some of the early navigators of the sixteenth century. This mythical tale, of which the subject was a history of the wars of the Athenians against the Island of Atlantis, is supposed to be founded upon an unfinished poem of Solon, to which it would have stood in the same relation as the writings of the logographers to the poems of Homer."
-- Benjamin Jowett, "Introduction to *The Republic* of Plato" (1892)

Of course, once you've gone that far, you might as well go whole hog -- why can't Troy be Sri Lanka? The *Ramayana,* which tells of Rama's war to recapture Sita from the king of Lanka, is full of no-doubt eerie parallels to the Helen legend, and the Vedic tribes who wrote it were just as obsessed with bulls and chariots as any of Homer's heroes. And if you, like some folks, think that "Lanka" sounds a lot like "[Atlantis,](#)" then it ties in nicely with Eberhard Zangger's theory -- Troy was Atlantis!

There are, it must be admitted, some attractive aspects to Zangger's notion. In *The Flood From Heaven,* he points out that both Troy and Atlantis are citadels holy to Poseidon, situated on well-watered plains with deep harbors. Both have mountains behind them. Both sit at the entrances to straits. We get around the vexed name question, since Tros and Ilos were descendants of the Titan Atlas -- which is to say, they were Atlantean. Better yet, both Troy and Atlantis have hot-and-cold twin springs, the only two such places in all the corpus of Greek lore. Both Troy and Atlantis

fought Hellenic confederacies, and lost. Intriguingly, Plato's history of Atlantis breaks off right where the Trojan War epic starts -- with Zeus calling a council of the gods to determine the fate of the city. And, of course, both Troy and Atlantis vanished.

"I am extremely disappointed at being obliged to give so small a plan of Troy; nay, I had wished to be able to make it a thousand times larger, but I value truth above everything."
-- Heinrich Schliemann, *Troy and Its Remains* (1875)

But hold on a second, I can hear you cry. Didn't Heinrich Schliemann quite noisily "discover" Troy, right where the ancients said it was, buried under the Greek city of Ilion? Well, yes and no. Absolutely, Schliemann dug up a Bronze Age fortress -- or, technically, seven Bronze Age fortresses and two Classical-era towns -- from the hill of Hisarlik in northwestern Turkey, right where Ilion had been. Most archaeologists, or at least those of a romantic bent, are willing to identify "Homeric Troy" with either Troy Vih, a powerful citadel damaged by an earthquake, and maybe a fire, around 1280 B.C., or Troy VIIa, a much poorer city, definitely burnt around 1190 B.C. But it's worth reiterating that there is absolutely no hard evidence for a siege of either, and not a shard of proof that Hisarlik's hill forts were Troy, or even Wilusa. And even Schliemann (who thought Homer's Troy was Troy II, burnt in 2200 B.C. by other people entirely) recognized that all his Hisarliks were too small to be "wide-wayed Ilios," supporting populations in the hundreds at best, although he did his best to bury that truth in persiflage and flamboyance. Schliemann's most recent inheritor and defender, Manfred Korfmann, maintained that he had discovered a defensive wall around the "lower town" that vastly increases Troy VIh's size. Other archaeologists note dryly that this "wall" more resembles a drainage ditch, and was discovered already anyway by Carl Blegen in 1938.

"They said Achilles in the darkness stirred . . .
And Priam and his fifty sons
Wake all amazed, and hear the guns,
And shake for Troy again."
-- fragmentary poem by Rupert Brooke, written while sailing to Gallipoli, shortly before his death (1915)

So even Schliemann's Troy, the Troy of the archaeologists, is bisociated. Possible dates for Troy VI and Troy VII overlap by as much as fifty years either way; potsherds that clearly belong in the 9th century turn up *under* undisturbed buildings in Troy VIIb, dated closer to 1200 B.C. Homer's Troy is allied with the Phrygians, who don't appear in history until four centuries later, and the word of Homer himself has been dated anywhere from 950 B.C. (well before the Phrygians, as it happens) to four hundred years later. The *Iliad* may not have taken final form for another two centuries, or even longer -- the oldest text of Homer we have only goes back to the 10th century A.D. This kind of thing gives off eerie echoes of A.T. Fomenko's theory that the Trojan War is merely a recension of medieval events like the Fourth Crusade (when, as it happened, the Venetians looted that manuscript of Homer), or vice versa. Suddenly we're back in the twisting, winding entrails of time, wrapped around the hollow history touched off by the burning of Ilios' topless towers and the breaching of its god-built walls.

Troy could only be taken by guile, never by force. By oracular decree, Odysseus must first steal the Palladium, Troy's sacred goddess-stone, a baetyl that fell from heaven; and then he must devise the ruse of the Trojan Horse. In other versions of the myth, it's Ajax of Locris who steals the Palladium, and this is the blasphemy that enslaves the daughters of Locris. Ajax, you'll be interested to know, is the son of Oileos -- Wilios? Again, we're twisted around to where we started. Troy cannot even be approached directly; in the *Kypria,* the Greeks accidentally besiege Teuthrania at first and cannot find the way to Ilion. Finally an oracle reveals that only Telephos -- a wounded captive from Teuthrania -- can guide the fleet to Ilion, but Achilles must solve a riddle and heal Telephos with his spear. (Shades of the Fisher King!) The Achaean heroes have just as much trouble extricating themselves from Troy -- Menelaos winds up in Egypt, and Odysseus wanders for 20 years. Little wonder that "Troy-town" was also used in the Renaissance as a synonym for the Labyrinth of Crete, which as we've seen was guarded by yet another enigmatic goddess, with her own eccentric archaeologist-hierophant. Schliemann planned to excavate Knossos himself, but died before he could buy the land.

"Schliemann had a morbid fascination with graveyards; in his diaries are repeated references to corpses and burial sites."

-- Caroline Moorhead, *Lost and Found: The 9,000 Treasures of Troy* (1994)

In other words, Schliemann (and his successors) found what he was already looking for. In that spirit, we can excavate Schliemann's life for all sorts of weirdness. To begin with, he's simply lousy with Sophies and Sophias -- his stepmother, his father's maid (and lover), and his cousin, whom he pursued romantically. He attempted to court yet another Sophie in Russia in 1846, and finally married the beautiful, naïve niece of a Greek Archbishop, Sophia Engastromenos, in 1869. (He was patronized by Queen Sophie of the Netherlands, to boot.) All of this calls to mind the legend of Simon Magus, who discovers the reincarnated Helen of Troy -- the avatar of *Sophia,* the principle of Wisdom -- in a brothel, and marries her.

As a youth, Schliemann also had what sounds very much like tuberculosis, spitting blood so badly that he could not work in shops. In desperation, he took passage on the ship *Dorothea* (his mother's name) for Colombia. The ship was wrecked in a storm, and Schliemann (shades of Odysseus) was the only survivor. Weirdly, his tuberculosis was miraculously cured. Also unusually (for a shipwreck survivor, at any rate) Schliemann became a sudden addict of seawater baths, and kept up the habit for the rest of his life. He did have another brush with tuberculosis; he took his consumptive servant Pelops to Egypt with him in 1887. Pelops (named by Schliemann for the son of Tantalus, sacrificed to the gods) died, unfortunately. When Schliemann himself died, on the day after Christmas 1890, his wife Sophia used much of his vast fortune to endow tuberculosis sanitariums.

We can draw the threads together -- Schliemann somehow attracts a Lamia, a [vampire spirit](). He shakes it off in the wreck of the *Dorothea,* and like Byron communes less dangerously with it at sea. But he has the thirst now -- he searches for the avatar of Sophia, and haunts graveyards. He is drawn to Homeric Greece, as if by the song of the [Sirens](). (Does he hear them while bathing at sea? Is that why he has life-long pains in his ears?) In his first Greek dig, on Odysseus' Ithaka in July 1868, he illegally excavates a palace and "accidentally" destroys fifteen burial urns, covering himself with the potent dust of ages. He also finds a bust of Helen of Troy; he redoubles his search for Sophia. He finds her in 1869, and at Hisarlik in April 1870 he again finds a vase with "human ashes." He has his new patroness, not Lamia but Athene Glauxopis, "[Owl-Eyed Athene]()," as he translates Homer. Suddenly, Schliemann "discovers" Troy, digging it up in plain sight, piercing clouds of seemingly willful blindness. He pulls out the "Treasure of Priam," and photographs Sophia in the golden regalia, which has no clear provenance. Perhaps this offends, or perhaps his excavations have exposed too much. He begins hanging pictures of Jesus on the walls of Troy "to discourage looters" -- and in 1887, he buys more time from the Lamia by sacrificing Pelops in the Egyptian desert. He digs up weird [owl-woman]() hybrid statues in the wasteland ("I shall make of them," saith the Lord in Isaiah 34, "a court for owls.") and by 1889 is openly admitting to visions of Athene. He plans to dig out the goddess at Knossos, or to excavate Atlantis on the Canary Islands, but dies he dies on Yule, his ears choked with anomalous bony growths, having opened -- but far from resolved -- the conundrum of Troy.

Fun Shui

for *GURPS*

by Peter V. Dell'Orto

"the more ridiculous the stunt, the more likely it is to succeed; the more mundane the task, the more likely it is to fail. Jackie Chan's characters can happily ride a 200-foot banner down to earth safely, but will set fire to a friend's house while making a pot of tea."
--Kyle "JimBob" Schuant, on *forums.sjgames.com*

In certain genres, usually action-comedy movies, dangerous stunts like jumping a motorcycle onto a moving train *never* fail, but mundane circumstances with potentially comic outcomes often fail. A fighter will get beaten up by an old woman with an umbrella, but parry every single blow from the evil master's henchmen with ease. Yet the old woman is no match for even one henchman. Why does this happen? Simply put, because the consequences of one fight -- losing to the old woman with her umbrella -- are humorous. They may advance the plot by having the hero kicked out his school because of the humiliation, or look silly in front of the girl he wants to impress, or whatever! The consequences of the other fight, losing to the evil master's henchmen, is disastrous -- evil wins the day *and* the hero looks foolish and weak in the face of opponents he should roundly trounce. This applies to trivial situations as well -- when the kung fu student has to clean his master's room, he will trip over every object and send priceless artifacts tumbling. But that same student will flawlessly pull off the Seven Steps of the Serpent to hop from fence post to fence post to save a falling heroine!

There are two broad categories of ridiculous actions -- cinematic stunts and silly stunts. Cinematic stunts are crazy stunts unlikely to succeed in reality -- not without multiple out-takes and handy safety crews -- yet which succeed in the movies because the hero (or sometimes villain) is cool enough to pull them off. Silly stunts are exactly that -- silly. These stunts shouldn't succeed, yet do because they make the scene funny either through their ridiculous success or ridiculous failure.

Some games solve this problem with Hero Points -- they give the characters a pool of points to spend to influence the results of tasks. PCs will expend these to succeed in difficult stunts. But even the best hero point systems can encourage hoarding, and force the player to guess which tasks are the "big ones" worth blowing a wad of hero points on. No one wants to spend their whole stash only to find out this was the tune-up stunt, not the climactic battle! One additional problem for comedic games is that there is no corresponding negative hero points which make mundane tasks -- ones with potentially comedic or plot-advancing results from failing -- more difficult.

The focus of this article is on *GURPS Fourth Edition,* but GMs of other systems or of earlier editions can use its ideas to transform their own game's bonus/penalty situations. The goal of these suggestions is a fun game -- not a difficult challenge. Massive bonuses for ridiculous stunts will mean they will usually succeed. Thus, the challenge is not succeeding at a hard task, it's coming up with a way to find the most difficult tasks and execute them. GMs rewarding character points based on the challenge should instead reward it based on using the most appropriate genre methods to succeed. Merely succeeding or failing is not the point -- you've got to do it with style!

Reversed Penalties

Pages 345 & 346 of the *GURPS Basic Set* list bonuses and penalties appropriate to situations based on their difficulty. For these types of games, reverse the penalties; in other words, multiply the listed penalty by -1. So a 10 penalty (disastrously bad circumstances, like clearing a jammed gun while dangling upside down from a rope from a helicopter by your ankle in the rain) becomes (-1 × -10)=+10, making even a default Guns roll work at DX+6!

Consequences of failure is the determining factor in whether a "difficult" situation should warrant a bonus, or if an

"easy" situation should warrant a bonus. If the possible failure is *comedic* or *plot-advancing,* but otherwise doesn't cause significant harm to the character, what would normally be a bonus will be a penalty.

Actions do not have to be physical -- this explains the "sudden insight" that allows breaking a code without any access to computers (or even the code!) or how movie hackers can spend hours tweaking their computers but only seconds to crack the security of top-secret establishments. This also explains why characters can solve complex riddles while overlooking the fact that their suspiciously helpful new ally's name is an anagram of their enemy's -- deciphering Cretan Linear B to find out where the McGuffin is buried is at +10, but turning "Recnam Ecron" into "Necromancer" is at -10!

If the consequences are "Do this complex task or you die!" you get a massive bonus, encouraging people to swing on chandeliers or toss poor Maggie Cheung Man-Yuk out the window to slide down a cloth to the ground. Truly insane stuff should cap out near the +10 you'd get in a realistic game for utterly trivial activities done in ideal circumstances. So jumping a motorcycle onto a moving train is *easier* than riding down the street on a clear day with no traffic.

If the consequences are "Do this trivial task or you fail with humorous consequences!" you get a massive penalty to the roll. You'll likely fail. The -10 you'd get for disastrous circumstances is appropriate for the easiest activities, done in circumstances where failing can be much more entertaining than succeeding. *Every* trivial task is not subject to this penalty -- that would rapidly derail a game and remove any semblance of humor. Only tasks with humorous plot-significant consequences will get this. Walking down the street isn't penalized. Walking down the street with Master's antique teapot might be. Walking down the street with Master's antique teapot, which he doesn't know you've borrowed, when the Master is watching you, *is.*

Reward both appropriately in-game and out of game (bonus character points, spotlight time, in-game benefits) and you shouldn't have too many problems getting people to go along. Ideally, if you reward appropriately, you'll get PCs who are far more likely to try crazy stuff in combat or during adventures, but who get more silly goofiness outside of dangerous circumstances.

There are two ways to implement this.

GM Control

Under this system, the GM simply sets penalties and bonuses for tasks. Players may take extra risks to ensure a better chance of success, but generally the GM makes the determination. There is no accumulation of penalties or bonuses -- especially hard actions get a bonus, especially easy ones get a penalty, depending on how the GM sees the consequences and the difficulty. The reward for attempting dangerous stunts is a bonus, and you look cool if you succeed! Consistently attempting cool and appropriate stunts during a game is *definitely* good roleplaying. GMs should look at page 498 of the ***Basic Set*** for appropriate rewards.

Pros: The upside to this approach is that it is simple, easy to implement, and minimizes attempts by players at working the system by making their own task more difficult -- thus making them more likely to succeed.

Cons: The downside is that the weight of deciding what is appropriate falls squarely on the GM. Another downside is that the players do not get input on what would make a scene especially interesting or a stunt particularly impressive.

Bonus Pool Bidding

An alternative to GM control is a Bonus Pool Bidding System. Instead of the GM assigning penalties to actions based simply on their relative difficulty and potential consequences, the player bids up difficulty on mundane situations, in order to build up bonus points to later take penalties. This is essentially a hero point system, but where hero points are *only* accumulated by making other situations harder!

Players *bid* up the difficult on situations. The GM will state the base penalties or bonuses for a situation, reversed as

above. Then the PC can attempt to bid up the penalty on situations by describing possible bad consequences for their actions. For example, Jackie is riding his two-seater bike with his NPC girlfriend Maggie when they suddenly turn the corner and down a steep flight of stairs! In a dangerous action sequence, this would be worth a bonus. In a non-combat situation, it's a penalty. Jackie's player says "I bump down the stairs terrifically fast, and I may lose control and send Maggie flying over my head into a pillow-maker's big feather pile, mussing up her new dress!" The GM thinks it over and says "Okay, that's fine -- it's worth a -4 on your Bicycling roll. Roll for it." Succeed or fail, Jackie has earned 4 points for this action.

For each -1 taken by a player, he gets a +1 that can be used later that session (or in later sessions) in a difficult situation. These points accumulate and are separable. A PC who takes a -4 on one action, a -5 on another, and three -2s will have 4+5+2+2+2=15 points in his Bonus Pool to use for bonuses later. They can be used for a single +15 to a roll (!) or 15 +1s, or any combination totaling 15. As points are used, mark them off -- totals may go up and down rapidly in a game session.

When a situation arises, the PC will describe the extra difficulties (for bonuses) or potentially plot- or genre-friendly consequences for failure. These *must* be roleplayed. "I take a +5 to my Climbing roll and +2 on my ST roll" is *not* acceptable, while "I hop from flaming ladder rung to flaming ladder rung with both feet and one hand, while my other hand holds onto my Dependent! I take a +5 to climbing and a +2 to ST." The GM can veto or modify a bonus or penalty to fit the circumstances. A task may be too trivial or the justification by the PC too thin to be worth a big bonus.

Pros: One positive benefit of this approach is it makes players work to fit their actions into the genre. Another is that the GM is not the sole arbiter of difficulty -- the PCs will actively try to make their own mundane life more complicated to earn points, and pour in exciting details in dangerous situations to justify spending their points.

Cons: One downside is that it gives more rewards to good roleplayers, and may leave inexperienced or hesitant players in the dust. Those who "get it" will reap lots of rewards (and many pratfalls) while those who do not will have to depend on the luck of the dice. Another downside is that players may still seek to "game" the system, by ensuring as many goofy problems as they can imagine occur so they can get lots of points to win the big fights. This may or may not suit the genre -- for kung-fu comedies this is ideal, but for more serious games or pseudo-gritty action movies, it may make the game too silly and lose its edge.

Variants

The above methods can be tuned to fit a particular campaign. These are only a few starting suggestions. GMs are strongly encouraged to make up more to fit the genre they are playing in.

Restriction: Skilled Only: You *must* have the skill to get these benefits. Default use doesn't count, but even a single point (or half point under the *Third Edition*) is enough to activate these rules.

Restriction: Heroes & Villains Only: Only PCs and plot-critical NPCs -- often major villains, allies of the PCs, and comic foils of no allegiance -- get the benefit of these rules. Flunkies and bystanders use the normal system. The hero gets a +5 for jumping over the rack of sharp knives, but the pursuing henchmen get the normal -5 . . . making it very likely he'll succeed and his pursuers will crash into the rack, losing ground in the chase.

Restriction: Non-combat skills Only: Only non-combat skills get the benefit of these rules. Combat skills are unaffected. This encourages high-skilled fighters to fight like they would under realistic conditions, while still allowing for crazy stunts both in and out of combat. PCs won't be able to get a bonus for eye shots and massive Deceptive Attacks, but they *will* be able to slide down banisters or run across a pool by stepping on a series of swimmer's heads with relative ease.

Two Heads Are Better Than One: If two or more characters are affected, the penalties or bonuses are *additive.* Apply the highest penalty or bonus, and for each additional character, add half again (round *down*). For example, Jackie throws Maggie out the window for Sammo to catch her. Jackie has a +4, Maggie also a +4, while Sammo's task is

trivial (and failure to catch her would be very funny!) so he is at -6. Jackie throws at a +6 (+4, half of +4) and Sammo catches at a -6 + 6 or a 0. Because his friends had such a hard task, his is easier!

Double or Nothing: If a PC takes a penalty on a trivial task, he can *choose to fail* instead of rolling. The task automatically fails, with the most comic results the GM or players can think off. Treat this as a critical failure, but without actual serious consequences. Any Bonus Pool points earned from this action are *doubled.* However, as a balance, if the PC takes a penalty and succeeds in his task, no Bonus Pool points are earned.

Important Notes

In the movies, the characters are usually unaware they are *in* a movie. They do not know that it is safer to slide down a 200-foot banner or swing from chandelier than it is to ride a bike to work or start a campfire. Players in an RPG are extremely aware of the game rules. The players in an RPG are like the actors in a movie -- while Jackie Chan's character doesn't know the modifiers are reversed, while Jackie Chan the *actor* does. Because the *characters* do not know how the universe works, they believe that more dangerous tasks will be harder and more trivial tasks easier. Players who can separate their player knowledge from character knowledge will mesh well with this system. Players who have difficulty may do better with the Bonus Point Bidding Pool, where their out-of-game knowledge of the rules must be parleyed into in-game benefits with agreement from the GM, not just abused for bonuses or penalties.

GMs should take care PCs aren't working the system instead of using it to make the game more fun. If the player says "I'm on fire and they're shooting at me? Well, I'll do cartwheels across the floor, grab the rope with one hand in mid-wheel, and swing across the room through the window and into the water to put it out!" he gets a +8 to +10 to the appropriate rolls. If he says "I'm trying to make tea in a totally unimportant scene? I'll do cartwheels around while making it!" he gets a -10, because he's being needlessly silly and there is no serious consequences. He's probably only going to get a flat roll (if that) if there are no possibilities of humor or actual injury. And if there *are* . . . that -10 may ensure he gets it.

Natasha Fatale: Boris, is Moose you said you killed in previous episode?
Boris Badenov: Look, it's his show. If he wants to be hard to kill, let him.
--The Bullwinkle Show

Of course, in some movies and television shows -- such as *Last Action Hero* or *The Adventures of Rocky & Bullwinkle* -- one or more characters are aware of some of the rules of the universe. The villains may know they're the villains and must lose. This "fourth wall" breaking is useful for certain games -- generally ones with comic overtones, although the scenario is possible in other games as well. PCs forced into a "artificial reality" setting may realize the rules have changed and be able to take advantage -- this makes a good "change of pace" for games with normal, non-reversed modifiers.

This type of system requires good GM control and emphasis on consequences. Simply reversing penalties for situations means players will never do anything the easy way. No one will simply drive to work or make a pot of tea; they'll drive to work backwards blindfolded or make tea while standing on their heads on the counter. This will rapidly lead to a *very* silly game. This may be exactly what the GM and Players are looking for!

Way of the Exploding Grid

A Mystic Order for the *Diana, Warrior Princess* RPG

By Marcus L. Rowland

"Look at the chest," said frontier law-woman and medic Billie 'Doc' Holliday, "the placement of the wounds is accurate to a fraction of an inch. A perfect nine by nine grid, made by a weapon with a narrow curved tip about three inches long."

"Couldn't he have fallen on something that had a lot of spikes sticking out?" asked Diana.

"The wounds weren't made simultaneously," said Billie. "If you look at the holes in his shirt, it's obvious that he moved between one blow and the next. I'd have to say that all 81 wounds were made one after another, with a sharpened finger-nail."

"That can only mean one thing," said Diana, staring at the corpse. "He was killed by a Sudoku master . . ."

Sudoku (more properly Su-Doku, the "way of the exploding grid") is an ancient philosophy from the Mysterious East (Boston). It includes elements of meditation and numerology, and a martial arts tradition based on precise finger thrusts and blows to nerve clusters. Backing everything is a belief that events follow laws which can be understood and predicted . . . essentially, the triumph of law over chaos.

The most important element of Sudoku is an arcane numerological fortune-telling system. This involves entering a meditative trance, then putting numbered tiles onto a nine-by-nine grid, typically a board made of wood or marble, although the same techniques can be applied to a grid that's ruled on paper or drawn in the dust with a stick; the sequence in which the numbers fit, the order in which they are added to the board, and their location on the grid can somehow be used to generate insights into the future. The techniques of Sudoku meditation are a secret, revealed only to initiates, who refer cryptically to things like "the paradox of the excluded number," "the garden of forking paths," and "eliminating the extraneous," but never actually explain things in a way that an outsider will understand. Even the most basic Sudoku training requires several months of study. Successful meditation can give an insight into the past or future, and possibly a vision of things that would otherwise be unknown. It takes considerable time, from a few minutes to several days depending on the nature of the prediction and the psychic talent of the initiate, and is usually accompanied by tea-drinking, chanting, and the like.

One of the methods used to achieve the trance state is a form of ritual exercise in which the initiate moves through a series of 81 steps and bodily positions of increasing difficulty, on a floor mat ruled out in a nine-by-nine grid. Somehow this has evolved into a martial arts style, combining deadly finger-thrusts and blows to pressure points and intricate dance-like maneuvers. Initiates can often be recognized by their elongated fingernails. Even a relative beginner will usually have at least one long nail, usually the index finger of their dominant hand; masters may have several elongated nails. The length and number of long nails can be a clue to the ability of the initiate; a single nail a half-inch or so long is the sign of a novice or a relatively inexperienced initiate, while several

three or four inch talons suggest a master. Anything much longer is generally considered to be counter-productive ostentation. These signs can be deceptive, of course; a master might trim her nails as a disguise, accepting that her blows will do less damage in order to go unrecognized, or a novice (or imposter) might use false nails to pose as a master, assuming that nobody will dare to call his bluff and fight him. Some initiates also learn to use Sudoku boards and tiles as weapons, but a real weapon is more likely to be effective.

Members of the order are typically known by their rank and surname. At higher levels a particularly auspicious combination of numbers may also be used. For example, "Novice Goldberg," "Student Chang," "Initiate Singh," "Five-nail Master 4578 Jenkins."

Initiates of the martial art train in dojos whose floors are marked out with the traditional nine-by-nine grid and (apparently) random numbers chalked on some of the squares, and shout the numbers as they leap from square to square, performing martial arts maneuvers appropriate to the numerology of the sequence of squares, each maneuver adding another number to the square. This technique can be used as another way to generate the number sequences used for Sudoku prediction, though it requires someone to take notes. One consequence of this form of training is that initiates often shout out numbers and the names of combat maneuvers as they fight; for example "14 -- crouching weasel! 692 -- rabid coypu!" It's a hard habit to break, and means that when initiates fight they often seem to predict each other's moves by extrapolating the next numbers of the sequence.

It's important to realize that not all Sudoku initiates are martial artists; some of the most renowned seers of the order are infirm, or have no interest in combat techniques, and limit themselves to the "pure" numerological method. They are most likely to be encountered in or near the order's schools. They are the order's main source of revenue, selling their predictive services to anyone who can afford a steep hourly fee. Initiates found elsewhere are nearly always martial artists, if only for self-defense.

One interesting and rarely-mentioned use for Sudoku training is in cryptography; once even a few numbers and their positions are known the entire grid can be completed, and the rules of Sudoku prediction guarantee that there will be only one outcome. If you know the key to decoding the resulting grid you can send incomplete grids, or the information needed to create them, as a very compact code message which in turn creates a larger message. Such grids are useless for genuine prediction, of course, since the results are predetermined by their creators. This method is mainly used to send messages between the order's schools, but could have wider applications.

Game Stuff

For **Diana, Warrior Princess,** Sudoku training is a major event in a character's life, and must be included in his back story. Sudoku masters can't easily have any other occupation; the mental exercises, meditation, and martial arts training required to maintain mastery are a full-time job. Less committed initiates might combine the training with other forms of mysticism or martial art, or have some other way of earning a living.

"Pure" Sudoku prediction is a use of Mystic Power, and all initiates must have at least one point in this attribute. It can be combined with Thinking (and possibly other attributes such as Luck) but more successes will be required for any prediction. The greater the number of successes, the more accurate the prediction is likely to be, but ultimately the outcome is always determined by the referee.

The ritual exercises and combat prediction techniques again require the use of Mystic Power, but it can be combined with attributes such as Athlete or Speed and (of course) Martial Arts.

The martial art uses attacks to pressure points, usually delivered by a sharp prod of an extended finger. All attacks require the use of the Martial Arts attribute, which can be combined with Strength, Speed, or Mystic Power. Initiates keep at least one finger nail abnormally long. The length of the longest nail (in inches) or the number of extra-long nails is the number of extra dice added to an otherwise unarmed Martial Arts attack, to a maximum of +4 or Martial Arts, whichever is *lower*. For example, if an initiate has Martial Arts [3] and grows a 3" fingernail or three 1" fingernails there is a +3 bonus; growing longer nails, or more long nails, does not give a further bonus. Even if Martial Arts exceeds 4 the maximum bonus is +4. Unkind referees may occasionally wish to impose penalties on attributes

requiring precision hand work, such as Art or Thief, if a character has extra-long nails. They also make disguise very difficult.

Use Marksmanship to throw a sudoku board; it acts like a Frisbee with sharp corners, no bonus for a wooden board, +1 for a marble board. The tiles can be thrown or dropped as a tripping hazard, but give no bonuses to Marksmanship or Martial Arts.

Sudoku cryptography uses Thinking and/or the Computers attribute; Mystic Power cannot be used to decode messages. Computers cannot be used for normal Sudoku predictions.

Roleplaying Suggestions

- A Sudoku initiate makes some predictions about one of the characters, describing a series of unlikely events culminating in his or her death. After the first incident the character goes to great lengths to evade fate, but seems to be unable to shake off destiny. Is death really certain, or is someone giving fate and the prediction a helping hand?
- After years of study one of the adventurers is considered ready to graduate from the rank of "novice" to "initiate," if he can pass a few simple tests; nothing too arduous, and it's years since someone was actually killed by them. However, for some reason the Master of the local school has taken a particular dislike to the student, has only grudgingly agreed to administer the tests, and seems determined to find reasons to fail him. Can the other adventurers lend a hand without accusations of cheating?
- While visiting a Sudoku school the adventurers stumble into a secluded hall where a group of extremely old masters, all with several four-inch fingernails, are practicing martial arts on a large grid, much bigger than nine-by-nine, using hitherto-unseen moves such as "C3B -- Leaping lizard!" while a younger initiate scuttles after them and chalks numbers and letters into the squares. Before the adventurers can interrupt or ask questions their guide catches up with them and steers them back into the main temple. Once they are out of earshot the guide explains that they are "dancing the 16-fold path to enlightenment," an extremely advanced exercise. He makes it sound almost routine... but there is an echo of fear in his voice, and it's obvious that he's hiding something. If they're using the ritual to predict something, why isn't the usual nine-by-nine grid sufficient? And why is the guide so scared?
- The Sudoko board and tiles belonging to the legendary Nine-Nail Master 7162534 Cohen were lost several hundred years ago, but an antiques dealer in the legendary desert Bazaar of E'Bai claims to have found them, and is offering them for sale at what promises to be an exorbitantly high price. The auction is to take place in less than a week; the adventurers are hired to undertake the perilous journey to E'Bai, and recover these relicts at all costs if they are genuine. Of course "at all costs" doesn't actually mean that they're being given much money to play with. But there may be other, less legal means to recover them. Naturally there are problems, not least the sorcerer lords of E'Bai who control the market and take a hard line on theft.
- A famous Sudoku Master meets the adventurers and decides to join them, whether they want him or not. He's strong, full of ancient wisdom, and a combat monster . . . but he's senile and just a little absent-minded, to the point where he sometimes has trouble remembering who he's supposed to be fighting. As for predictions, forget it; he can't stay focused long enough to complete even the simplest grid. But he can undoubtedly beat any of the other adventurers in an instant; how are they going to tell him that he's unwelcome? Or are they prepared to keep him around and accept the collateral damage, which may eventually include friendly casualties?

End Notes

If you were wondering, the word Sudoku actually means "numbers singly" in Japanese. The name is a registered trademark of puzzle publisher Nikoli Co. Ltd in Japan. This type of puzzle was actually invented by Howard Garns, an American freelance puzzle constructor, in 1979. Source [Wikipedia](#).

Special thanks to Robert Prior and Michael J. Lowrey for some excellent suggestions.

Istvan Roja, Vampire Vampire Hunter Hunter

for *GURPS*

by James L. Cambias

Istvan Roja has been a vampire for more than 400 years, and is perfectly content with his condition. As far as he is concerned, it is perfectly natural and right that he and other vampires prey on humans. But there are some humans who just won't accept that arrangement. They go after vampires with fire, sharpened stakes, and holy water. The very idea of humans perverting the natural order this way angers Istvan, and he has taken up a personal campaign of extermination aimed at vampire-hunters.

Roja was a Transylvanian baron who lived in the 16th century. He was killed by a vampire while out hunting in the deep forests of his land, and struggled back home a few days later as a vampire himself. Roja had no immediate family, and his servants were either loyal or terrified of him, so for several years he was able to hide his condition and retain his lands and wealth.

But rumors of an "unliving lord" reached the ears of a wandering vampire-hunting priest who sought out Roja and tried to expose him. The vampire lord laughed off the accusations at first, but as pressure from other nobles mounted, he finally had to flee his castle and go into hiding with as much treasure as he could carry. When the vampire-hunter tried to track him down, Roja killed him.

Since then, Roja has done his best to destroy all those who would hunt vampires. He studied sorcery at the dreaded Scholomance in the Carpathian mountains above Herrenstadt. He learned to change identity and adapt (grudgingly) to a changing world. And he learned to hunt vampire hunters very effectively.

Istvan Roja   *560 points*

A handsome, regal-looking man with very pale skin and very sharp teeth. He wears his dark hair long, and dresses in very expensive black suits.

Equipment

Istvan wears a blood-red opal on a gold chain around his neck; the stone is a 10-point Powerstone. He usually carries a silver-headed walking-stick containing a hidden rapier, although he prefers his old cavalry saber in a real fight.

During the 20th century Istvan favors a "broomhandle" Mauser pistol; earlier than that he carries a black-powder Colt revolver or a single-shot cavalry pistol. After 1990 he wears a Kevlar vest if he knows he's going into battle. Before World War II, Roja rides a coal-black stallion; after that he gets around in cabs and rented cars (he can drive, but doesn't enjoy it).

Istvan Roja is built on the standard 150-point Vampire template, as described on page 262 of the Basic Set. He dislikes industrial-era and later technology -- he'll use advanced tech if he needs to, and certainly understands it, but given a choice he'll go low-tech. This also means that he particularly despises high-tech vampire hunters.

As a feudal lord in Transylvania, Roja was a fierce defender of his people. Since becoming a vampire he has retained that fierceness, but "his people" are now his fellow vampires. When dealing with other bloodsuckers, even those who are his rivals or personal enemies, Istvan is courteous and honorable. Any vampire in distress can appeal to him for help and be certain of getting it.

To mortals he is much less polite. To him they are domestic animals. Their lives are his to take or spare as he chooses, and he certainly doesn't have any use for their opinions. However, the flip side of this attitude is that when hunting vampire hunters, Istvan has no desire to torment them or gloat over their defeat. He is as coldly efficient as any pest exterminator.

Istvan has a well-crafted modern identity (the name of his modern alias is left to GMs to determine), as a wealthy chess aficionado with Swiss citizenship. His fortune is simply the accumulated assets of four centuries, transformed into capital and shrewdly invested. When he is not hunting vampire hunters, Istvan shuttles among the larger cities of Europe, with occasional vacations in Transylvania. He is very careful not to betray himself with his feeding -- he typically preys on single tourists or business travelers, then uses magic to erase any memories of the attack. If time is short and his hunger is great, he attacks outcasts like streetwalkers or beggars, confident that nobody will investigate their deaths too carefully.

Encountered

When planning a hunt, Istvan always uses Gastromancy plus hired private investigators and researchers in order to learn as much as possible about his targets. His methods vary depending on the quality and resources of his prey. Against ordinary humans who got lucky and killed a vampire, Istvan generally strikes fast and hard, trying to catch them outdoors and put them to the sword.

When dealing with professional-caliber hunters, Istvan may lay a cunning trap -- committing several sloppy, public attacks and leaving obvious clues which draw the hunters into a prepared ambush. A favorite trick is to prepare a "hidden vampire coffin" which contains a keg of gunpowder and nails triggered when the lid opens. Because he himself has both magical and mundane resources, he can target the weaknesses of a group. Against magicians he uses mundane weapons, hired goons, and cold steel. When dealing with combat-ready foes he calls upon spirits and uses spells (especially Fascinate, Sleep, and Terror).

The default setting for Istvan Roja is modern, but he can fit into almost any period from the age of revolutions to the cyberpunk future. In 19th-century settings, adjust the tech level of his Pistol skill down (he is typically one TL behind the state of the art) and possibly give him a band of loyal servants. During the Cliffhangers and World War II era,

Roja probably lies low to avoid getting caught in Europe's political upheavals, but he just might join forces with the Allies if there are Nazi vampire-hunters to fight. (Istvan knows who the Master Race are, and it isn't a bunch of Germans.)

In a *GURPS Cabal* campaign, Istvan is undoubtedly a top agent of the secret masters, the one who gets called in when other Ultors have failed. His rank in the Cabal is Theorist or better, so in a Cabal campaign add 4 levels of Rank in the organization, worth 20 points. He should also have the Secret True Name advantage at the 8-point level (he was confirmed as a Catholic, but that was centuries ago in a part of the world which has been ravaged by numerous wars and invasions since then). A Cabalist Istvan would grudgingly accept non-vampire members of the conspiracy as equals.

In a futuristic setting, his loathing for computers may be enough to qualify him for the Primitive disadvantage. On the plus side, he is probably Zeroed since he's been around since before computer databases. Gamemasters should decide if his vampiric non-reflectivity translates into Invisibility to machines. In the new century he will reluctantly upgrade from his Mauser to a reliable 20th-century European-made pistol like a Glock or Walther.

Campaign Uses

Istvan is a major villain, best used to throw at players who have beaten their share of supernatural perils and may be getting cocky. The realization that they are once again the hunted should scare even the most jaded characters.

If he isn't hunting the PCs, they may hear about the suspicious deaths of some NPC occult investigators and gradually learn the truth about how and why they were killed. But the deeper the heroes dig, the more likely they are to attract Roja's attention to themselves.

Roja can act as a Patron or a powerful Ally for a group of vampire PCs. He can help them if they're in need, but will also expect them to return the favor by assisting him in any current hunts. If they are "ethical" vampires friendly to humans -- such as the Iconic character Baron Janos Telkozep -- Roja will consider them traitors, although he will still treat them honorably. If a vampire manages to beat Roja once or twice, he is likely to become a personal Enemy.

However, in campaign settings where humans and vampires are trying to live together peacefully, Roja can be a respected fighter for mutual tolerance, battling bigoted stake-happy mortals. In that kind of setting, replace his Intolerance with Code of Honor (Gentleman's), and turn his Secret into the appropriate Social Stigma for being a vampire.

Roja's natural habitat is Horror campaigns, but he can be used elsewhere. His wealth and status make him a potential player in any vast secret conspiracy. Against capes-and-spandex superheroes he probably can't win in a stand-up fight, but could be quite effective working from the shadows to strike at dependent NPCs or vulnerable Secret Identity forms. In a fantasy campaign Roja can retain his castle and authority as the "Vampire Lord" of a minor fief which is a sanctuary for creatures of the night. Obviously his Pistol skill should be switched for Lance or possibly Axe/Mace, and his Language Talent and most of his languages should be cashed in for Shield skill.

Peter Rigby: Idea Thief

for *Over The Edge*

by Shane Cubis

"I saw it. This guy had an idea, and I saw it. It popped out on top of his head -- a light bulb! I grabbed the bulb and his face went blank".

When he is not sitting around at home or wandering the streets of his hometown, Peter Rigby works as a casual laborer. He gets up every morning and waits for a phone call that tells him he is needed to help clean a warehouse, shovel refuse, or perform some other mindless and menial task. If there is no work that day, the middle-aged slob will usually watch a bit of TV or head out into the crowds of the city to pilfer a few ideas from passersby.

Peter Rigby spontaneously developed the ability to steal ideas. He was on a crowded train one evening after work when he saw a cartoonish lightbulb go on over the head of one of his fellow passengers. He instinctively snatched the bulb and stuffed it into his pocket. In return he received a few odd looks, but no one else appeared to have seen the floating light. Since that fateful day Peter has stolen hundreds of ideas, but unfortunately cannot use them.

Peter has a form of ADHD (Attention Deficit Hyperactive Disorder) that prevents him from concentrating on one subject for any length of time. This stops him from making anything of the ideas he has taken, and even from focusing on the bulbs long enough to understand the full ramifications of those strokes of genius he possesses. He hoards them jealously, unable to use them but damned if he will let anyone else gain their benefit.

Obviously, many power groups would love to get their hands on Rigby and his bulbs. Once he has plucked it from above the head of an unsuspecting victim, the bulb becomes visible and useable to anyone. An interested party could make use of the large backlog of ideas Peter has lying around his dingy apartment, and use him as an agent to steal the flashes of afflatus from rival groups.

Peter keeps all the bulbs in his laundry, which he rarely uses. From the outside, the room seems to be permanently aglow with powerful lighting, throwing bright beams underneath the closed door and around the edges of the permanently closed curtains. A person would have to wear sunglasses or shield his eyes in the room, as the power of a hundred differently watted light bulbs assault the senses upon entry. Most are clear, but a rare few throw off red, blue, or green light. Rigby has no idea how these ideas are different to the others. The careful explorer will also find that some of the bulbs no longer glow, having somehow burned out.

Once the party -- no doubt more curious and experimental than Peter Rigby has been -- gets their hands on a bulb or two, they will probably be looking for answers to the following questions:

- **What happens if you put one in a socket?** A bulb will provide a minor Intelligence bonus (in *Over The Edge,* an extra die to any action involving brain power) to anyone within its radiance for 1d6-2 hours. This uses up the idea inside forever.
- **What if you smash one?** When a bulb is smashed, the idea inside dissipates into the ether. It may linger on the edge of consciousness like a dream, but rapidly fades.
- **What happens if you put one in your mouth like Uncle Fester?** You get a cheap laugh from your comrades, and may singe your lips slightly. The bulbs are hot!
- **How do you get ideas out of the bulbs?** Peter has no idea and, quite frankly, neither do we. Looks like the characters will have to experiment.

Game Uses

The party may be chasing Peter for another reason, or simply stumble into his home. If something should happen to Peter, the group would have a large, weird cache of ever-glowing light bulbs. Even if they did not figure out the nature of the bulbs, they may be able to sell them as oddities. Anyone who knows the true power of them would attempt to buy the whole lot, taking advantage of the party's ignorance. Of course, if they did figure out the secret of the ideas hidden within the bulbs, the party should be able to command a far higher price, assuming they can protect the ideas and survive.

Perhaps Rigby stole an idea from a character or their patron, and they want it back. Otherwise, the PCs see a man snatch at the air above a person's head, and wonder he is doing. They may even see the flicker of a bulb themselves after Peter steals it, as it becomes visible to the world, and follow him back to his apartment.

Peter's prize idea, the one he will often stare at before becoming distracted or fidgety, is encased in a light bulb that requires two hands to hold. Multifaceted colors swirl within its depths, promising the secret knowledge of the world. He stole this bulb from an ordinary looking exterminator from downtown. The idea within the bulb represents a paradigm shift, along the lines of heliocentric cosmology, dada or the addition of a third actor in Ancient Greek theatre. If it can be somehow removed from the bulb, the idea would reshape the world. Obviously, many groups would be interested in exploiting this idea, and others would probably do their best to shatter the giant light bulb.

Peter's Stats for *Over the Edge*

Central Trait (Primary): *Idea Thief* -- 2 Dice. Peter can not only see people's ideas, he can steal them. (Surrounded by the uninspired, always has lit light bulbs in pockets).

Side Trait: *Avoids Notice* -- 3 Dice. Peter slips beneath the radar. He is unassuming, and most people pay no attention to him. He can easily evade pursuers, and witnesses to any of his actions are hard-pressed to pinpoint any details. (Looks like every other working class, middle-aged man, hard to pick out of a line up).

Side Trait: *Quick-Fingered Klepto* -- 3 Dice. Peter is surprisingly adept at sleight-of-hand. If he had the patience to practice, he could be an excellent magician or pickpocket. As it is, he has never been spotted stealing an idea -- as far as he is aware. (Long, twitching fingers, can flick cards into a hat.)

Flaw: *Attention Deficit Hyperactive Disorder.* Peter cannot focus on anything for longer than a few minutes. (Looks bored and fidgety all the time.)

Motivation: To steal as many ideas as possible, and hoard them away from the world.

Secret: Peter can't read, and would be terribly embarrassed and angry if someone found out. He can sign his name, but that is about it.

Languages: English

Important Person: The man he stole his first idea from. Peter has never spoken to him, but still sees him around town, looking depressed and deflated. He gave Rigby his first ever feeling of superiority.

Age: 38

HP: 21 (lots of hyperactive energy)

Pyramid Review

Around the World in 80 Days

Published by [Rio Grande Games](#)

Written by Michael Rieneck

Illustrated by Bernd Wagenfeld

Full-color boxed set with mounted fold-out map board, 24 gold coin counters, 18 bonus chips, starting player piece, 15 event cards, 60 travel cards, six pawns, six time markers, six betting slips, & rules; $37.95

It may seem like an outdated property, but if you want to secure family fun, it's not a bad idea to dip into some older franchises that come from a more innocent time. *Around the World in 80 Days* may be a relic of the early 1870s, but it continues to be remade into movies, so why not a board game of the sort Rio Grande Games excels at?

The object of the game is to circumnavigate the globe in the fewest days.

Everyone starts their journey in London. They have a handful of travel cards, a pawn, and a gold coin for expenses (read: dice rerolls and buying additional cards). Their itinerary is on the map board, which shows a series of major cities like Paris, Calcutta, and San Francisco. Between each pair of locations on the trip are symbols showing what you need to cover that leg. Usually this is a combination of trains or ships.

The travel cards are all railway or water travel, and the numerical values are added together. For example, going from Suez to Bombay takes two ship cards, so if you have cards with a two and a seven, you make the trip in nine days. If the numbers match, the trip only takes as many days as one of them; play two "six" ships, and the trip is six days, not 12. Getting the quicker fare depends on which cards you can secure, but waiting too long for just the right selection allows everyone else to get ahead of you.

Your stash of money and cards won't carry you the whole journey, so along the way you'll pick up more resources. Each round, a new set of cards is laid face-up beside the board next to a set of symbols. The first player for this round (an honor that rotates or switches every turn) takes the card he wants and adds it to his hand. The symbol next to that card provides an additional effect or bonus, like gold coins, a balloon ride, or a chance to move the detective (who can add days to the tally of anyone unfortunate enough to be subjected to his questioning).

The balloon is one of a few alternate methods of travel sprinkled lightly throughout the game. Things like the submarine allow you to knock a few days off certain forms of transportation, or make specific legs easier to accomplish. These can be found in the event deck, among other goodies. Switch face-up cards before selecting them, travel to two cities in a single turn, or manipulate the detective. Storms and delays also lurk within, though, waiting to ruin everyone's travel plans.

The first person to arrive at a city gets a bonus marker, and these are good for more gold, event and travel cards, and time added to your opponents' time tracks. You also get a bonus marker if you're the last person to arrive, adding a little strategy (people in the middle get nothing). If a traveler makes it back to the Reform Club, the time markers for the remaining players suffer additional days of travel as a penalty. When a certain number of players circle the globe and end up back in London, everyone else has one more round to do the same; only those who make it to London may claim victory. Whoever makes it in the fewest days is the winner.

This game is a little cheaper, and this may be because it's lighter on the components. You're mercifully unburdened by piles of cards and counters (the plastic bin in the box has plenty of space for pieces even though they all fit in the ziplock baggie provided), though what you have is good quality. The cards are the most annoying bit; they're the tiny kind, only an inch or three on a side, so it's good you don't have to shuffle them more than you do (the bonus counters are on the small end as well).

Though they advertise it otherwise, the game does have rules for two players; these go a little faster and are less forgiving of those who lag behind. To be fair, even in a multiplayer game it's not hard to be left behind and never be able to catch back up. But **Around the World in 80 Days** does an impressive job of giving players the tools they need to get the job done, and clever play and planning are consistently rewarded. There are a lot of elements to balance, perhaps a few too many, but finding how to use the rules to your advantage is half the fun. It's a bright, clean game, easy and short, and good entertainment for the whole family.

Kobolds Ate My Baby! The Beer and Pretzels Roleplaying Game - Super Deluxx Edition

Designed by [9th Level Games](#)

Published by [Dork Storm Press](#)

Written by Chris O'Neill & Dan Landis

Cover & Illustrations by John Kovalic

48-page b&w hardcover; $14.99

In a year when the majority of the big roleplaying releases have been new editions of old games, along comes something much, much smaller, all about the nastiest of little things. After appearing in three previous editions, *Kobolds Ate My Baby!* returns not as the expected fourth edition, but as the surprising *Super Deluxx Edition.* To support all of that "Super Deluxx-ness," the new edition gets a load of new material, which, in the scheme of things, is not all that important. What *is* important is the upgrade from a saddlestitched booklet to a hardcover in the same format as the *Munchkin RPG,* and in particular, the fact that the *Super Deluxx Edition* is illustrated with the fine pen and inks of John Kovalic. Fans of previous editions should know that it is still designed by 9th Level Games, but is now published by Dork Storm Press, and that it is backwards compatible.

To be up front, *Kobolds Ate My Baby!* is a nasty, horrible little game. But it is fun, and that is what counts. Kobolds are just as nasty and horrible, and full of teeth, and have just the one thing on their teeny, weeny, tiny little walnut sized noodles. Food. And the fact that King Torg -- ALL HAIL KING TORG!™ -- is hungrier than any other Kobold. Plus he is bored with being served with Orcloaf Surprise for dinner. Which is more than one thing, but when King Torg -- ALL HAIL KING TORG!™ -- wants fresh baby flesh of young human on his platter that very night, another thought is necessary. So King Torg -- ALL HAIL KING TORG!™ -- sends the Kobolds out of the Cave baby hunting, and any Kobold returning with succulent baby meat is in line for a hoard of Victory Points. Or at least survives another night without finding himself skewered on a spit and slowly revolving as King Torg's -- ALL HAIL KING TORG!™ -- next snack. Kobold flesh you see, tastes like chicken. There is only one thing that tastes better than Kobold, and that is Chicken. And there is only one thing that tastes better than Chicken, and that is Baby.

Then again, there is the clever Kobold, a rare and much endangered species. The problem is, getting fresh baby back to the Cave in time to give King Torg -- ALL HAIL KING TORG!™ -- his tea, just might require some cleverness. Signs of such cleverness include not possessing "Everykobold" skills, possessing Dangerous skills like Sage or Trade, attempting to figure out Pi beyond two decimal places, rebelling against King Torg -- ALL HAIL KING TORG!™, casting a spell, mishandling fresh baby, and so forth. All of which irks the proverbial out of Vor, the Big Red God, who was so irked by Kobold antics that he became the God of Anger as well as the God of Kobolds. At such moments of irksiness, Vor is likely to strike, having a host of horrible deaths to bestow upon clever Kobolds, like being doused in baby oil (thus becoming attractive to *every* Kobold), a sudden hail of arrows, and an Eldritch tentacular attack. This can also occur when a Kobold fails a skill roll, which all makes for a short -- but hopefully interesting and entertaining -- life for the average Kobold.

Creating a Kobold is an easy task. Roll 2d6 each for four statistics -- Brawn, Ego, Extraneous, and Reflexes, with Extraneous covering both Luck and anything else not falling under the other three stats. Each attribute has an

associated secondary statistic, equal to a third of its value. These are Meat, Cunning, Luck, and Agility. He selects six skills, one of which should be the Everykobold skill (essentially Cook), the rest such that he has a minimum of one skill associated with the four statistics. Equipment is rolled for, consisting of one weapon, one bit of armor, and one bit of gear, all stolen or salvaged and available from the Cave Bazaar.

A Kobold also has three Edges (advantages) and three Bogies. Two of each are given, the remaining two are determined randomly. The innate Edges are Bark Like A Dog and Kobold Senses, the Bogies being Fearless and Taste Like Chicken. Random Edges include Troll Blood and Winning Smile, while random Bogies include In Heat and Taste Like Baby.

Every Kobold has The Horrible Death Record. This tracks the number of Cheques received whenever a Kobold is clever (as above) or at the Mayor's (as the GM is known) whim. Gain a Cheque, and a Kobold's total is the modifier for a Horrible Death roll on 2d6. Roll 14 and one occurs, selected randomly from the Kobold Horrible Death Chart.

If a Kobold has the Lackey skill, then he has worked for a mage, perhaps even the Evil Arch Warlock Tabriz. This was an opportunity to learn something, in particular, a magic spell. Kobold magic is, of course, dangerous and clever. And in keeping with the silliness of it all, the spells parody those of a certain famous game, like *Bail's Floating Frying Pan* (useful for cooking *and* hitting), *Wall of Beer,* and *Pimpy's Slapping Hand.*

Mechanically, ***Kobolds Ate My Baby!*** employs the same ***BEER Engine System*** found in 9th Level Games' ***[Ninja Burger: The Roleplaying Game.](#)*** To do anything, a Kobold rolls a number of six-sided dice aiming to get under the appropriate statistic. Easy tasks require fewer dice, harder or multiple tasks need more. For an opposed roll the number of dice is determined by the target's secondary stat. For example, when hitting another Kobold, his Agility is the number of dice rolled. Combat, or just smacking things, is simple. Weapons or teeth and claws do damage, armor is smashed and falls off, and once a Kobold has lost his Hits (equal to his Brawn), he takes a Dirt Nap. Kobolds do not understand the concept of dodging.

A successful Kobold, though rare, can earn Victory Points. These can buy him a visit to the Bazaar for new and better gear, or an Outfit. Although expensive -- 12 versus the 2 for the shopping trip -- an Outfit bestows both benefits and a little class on the Kobold. They include Kobold Veteran, Short Order Cook, Cutpurse, Rules Lawyer, Evil Apprentice, and Bootlicker. It is possible to obtain more than one Outfit, but this is invariably beyond a Kobold's lifespan.

Kobolds Ate My Baby! is played in a particular way. The players sit in decreasing Extraneous order to the left of the Mayor, with Kobold actions taken not in the free-for-all of a normal RPG, but in that order with the Mayor going last. The game almost has a boardgame-like feel, but less so than in previous editions or ***Ninja Burger: The Roleplaying Game.*** There is also the element of acting out, as some in-game effects cannot happen without a player's actual input. For example, the Winning Smile Edge only works when the player is actually smiling, and Bark Like A Dog needs the player to, yes, bark. This goes up a notch in the House Rules! Mention King Torg and everyone must yell, "ALL HAIL KING TORG!™" When a Kobold dies, then his player can deliver a hopefully moving soliloquy to keep all of his Victory Points for the new character. As such, these are not really House Rules! Rather they could not find a home elsewhere in the book, and their use should be near mandatory as they add much flavor and fun.

For the Mayor, there is a quick and dirty guide to running ***Kobolds Ate My Baby!*** In plain terms, keep it simple, keep it silly, and have fun. In addition to The Kobold Horrible Death Charts and The Baby Horrible Death Charts (for when an unfortunate Kobold has an accident), there are rules for creating a town to home to fresh baby flesh, and a sample adventure, "What's For Lunch?"

Physically, ***Kobolds Ate My Baby!*** is nicely put together, greatly benefiting from John Kovalic's stalwart illustrations. Even though Matt and Igor of *Dork Tower* fame make an appearance, it is a pity that the interior is black and white. It would have looked so good in color. That aside, the game itself is amusingly written, and of course, it includes opportunities aplenty for the Mayor to be rotten to his Kobold players. Just as they will be rotten to each other in the scramble to gain Victory Points. In this, it shares some similarity with ***[Paranoia,](#)*** the GM being allowed to have as much fun as his players.

Of course, games like this should played infrequently, or the humor value is quickly lost. After all, a Kobold can

progress only so far. Easy to set-up, easy to run, ***Kobolds Ate My Baby! The Beer and Pretzels Roleplaying Game -- Super Deluxx Edition*** is raucous, rambunctious, and best suited to an evening's silliness.

--Matthew Pook

Official Rules, and Other of Oxymorons

Back when I was an undergraduate in college -- a great five-year period of my life -- I used to spend hours in the lobby of the honors dormitory, playing cards with others. Sure, I vaguely remember the background chatter of something called "classes" or some-such, but playing cards was a lot more interesting. Anyway, although we played perennials such as Spades and Hearts, our game of choice was one introduced to us a Minnesotan (who's also a *Pyramid* subscriber and was part of my long-suffering Supers group) called "500." He taught us the rules and the lingo, and all my knowledge of the game stemmed from the collective experience.

Anyway, sometime around my second or third year of college, I was in a Barnes & Noble and decided to crack open a copy of *Hoyle's Rules of Games* to see what it said about my beloved game. In perusing the rules, I discovered two things: first, that the *Hoyle's* book had all the warmth, charm, and approachability of a turn-of-the-20th-century calculus textbook; and second, that the rules we'd been playing under didn't seem to bear much resemblance to the actual rules there.

Now, thanks to the wonders of Wikipedia, I reacquainted myself with an authoritative accounting of the rules of 500, and discovered that 1) Wikipedia is written by human beings, and 2) the rules are actually a fair bit closer than I'd remembered seeing in that old book. However, I curiously noted that there were still major game-affecting discrepancies between our rules and the rules written there. (For those curious, some of the differences include: Only one round of bidding; able to bid any number of tricks, including less than six; no Misère or Open Misère bids; and being able to win by taking enough non-bid tricks to reach 500.)

That grinding noise you hear is the sound of shifting gears. Anyway, I was running a classic *Torg* adventure at a convention a year or so ago, and one of the players happened to be the current owner of the *Torg* license as well as my boss. The short of it is, this guy knew his *Torg,* whereas I had barely managed to skim the core rulebook an hour before. (I note that "skimming the rulebook" is more prep than I've done for many a game.) Anyway, one of the things I introduced to make the game go faster was the idea of a "passive" or "reflexive" observation roll; many games assume that the PCs aren't walking around with laundry sacks over their heads, utterly devoid of all stimulus unless they specifically state, "I'm looking for clues." So I'd routinely call for random "Find" rolls (or whatever skill it is with *Torg* . . . darned if I remember), and, if successful, make a comment like, "You hear an odd digging noise coming from below."

Anyway, after the game was over, the *Torg* grand poobah informed me that the game didn't really have a mechanism such as I was using, and he told me the correct way that the rules allow for such information (which, if I recall, involves using the default numbers of people's abilities *without* a roll). Nevertheless, he said that the rule I was using worked fine, and it helped keep the game going at a brisk pace.

Now, here's the interesting thing . . . and this paragraph can be copy/pasted to the end of both anecdotes: Even though we weren't playing by "official" rules, we still had a great time. More importantly, I don't think it matters in the slightest that we weren't playing "correctly"; if the old gang got together and wanted to play a game of *500/Torg,* I'd probably play by the rules I'd been using all along, even if I knew they weren't "right."

This year is a relatively low-key April Fool's issue; I'm still running some lighter fare than "typical" issues, but it's not a tightly knit theme as in times past. But even so, I always appreciate the holiday for the way the usual rules don't apply. And, applied to gaming, I think that it's not necessary for all the rules to apply, just so long as everyone has fun. (Of course, some gamers are only happy if all the rules *are* being applied; so long as all the players agree and are having fun, there's nothing wrong with that, either.) Perhaps, even more so, I think that some players like figuring out how the rules are different, or playing with variant rules. For example, one of the reasons I enjoy running a game like *Torg* is that the heroes can end up anywhere, and the rules don't necessarily apply. This is also a common technique in many Supers games, where it's common to end up in an alternate dimension where (say) everyone can fly or everyone is one-tenth as powerful. (And I could also mention the *Dungeons & Dragons* rules for alternate planes, where nothing works quite as it was expected.)

Anyway, I love being kept on my toes as a player, and I like keeping players on their toes. And as long as the rules are (more or less) fair to everyone, and folks have fun, who cares? Accept the spirit of April Fool's, and don't worry about playing "by the book" . . . even if your games wouldn't be sanctioned by the Intergalactic Correct Game-Playing Guild.

--Steven Marsh

Dork Tower!

Previous installments of the Brief History of Gaming series:

The Many Faces of Evil

for the *d20 System*

by Michael Tresca

Paladins have a multitude of divine powers, from turning the living dead to healing the wounded, from calling upon the divine grace of the gods to summoning a holy mount. And yet the least of the paladin's abilities, the ability to detect evil, is often overlooked.

With the power to know a person's soul comes great responsibility. What does a paladin do when he detects evil in someone who has yet to exhibit any evil actions? Does he draw a sword and kill the man, thereby committing murderer in the eyes of the law? For that matter, what's considered evil, exactly? This article explores the consequences peering into another person's soul.

Detect evil, at a glance, is a visual response. Like a smudge of dirt, it appears on people and things that bear its taint. But what is evil? Your paladin might specialize in a particular form of evil detection, depending on his deity's background.

Types of Evil

Guilt: The target doesn't have to actually commit an evil act; he just has to feel guilty about it. Guilty targets are victims of their own conscience. This form of detection might make a psychotic murderer completely immune to the paladin's power, as the madman doesn't feel guilt over his crime. Guilt over failing to finish a chore gives off a dim aura; guilt over murdering one's wife is an overwhelming aura.

Example: A paladin detects evil on the mayor, a good-aligned pillar of the community. The mayor detects as evil because he cheated on his wife and feels guilt over it.

Sin: The target actually must commit a sin to be detected as evil. The sins are outlined by the paladin's (not the target's) religion. There are two types of sins: venial (minor) and mortal (major) sins. The GM provides the framework, but whatever the case, the paladin views each target through his deity's uncompromising gaze. Venial sins give off a faint aura; mortal sins give off a strong aura.

Example: A paladin of a particularly frugal deity detects evil on a wealthy merchant. The rich merchant detects as evil. Even though the merchant doesn't consider hording cash to be a sin, the paladin's deity does.

Violence: The only sin that shows up is when violence is the root cause. The violence does not necessarily have to end in murder, but only the psychic shock leaves behind traces the paladin can detect. Spanking a child gives off a dim aura; murdering a child gives off an overwhelming aura.

Example: The paladin detects evil on an elderly woman, because she recently beat her young son for not fetching a pail quickly enough.

Reputation: The majority judges the target. This majority can be the other people in the room, the town where the target lives, or the target's family and friends. Regardless, if they think the target is evil, it detects as evil. An individual that is disliked gives off a dim aura; a heinous villain that everyone despises gives off an overwhelming aura.

Example: The paladin detects evil on a leper. The leper is loathed because he is believed to spread the plague. Whether or not this is true, he detects as evil.

Taint: Evil is as evil does. This form of detect evil only detects supernatural evil or evil so heinous it must be diabolically influenced. More often, a demonic or devilish taint is left behind after the fiend has moved on. The evil power is dependent on the creature's hit dice or caster level, as indicated in the spell's description.

Example: The paladin detects evil on an inn. A demon passed through disguised as a courtier. The paladin sees evil on every footstep, the mug it drank from, and the barmaid it danced with.

Falsehood: Evil is anyone who knowingly conceals the truth about anything. Bald-faced lies and little white lies are all detected by this power. The lie must have been committed within (paladin's level in rounds). Little white lies give off dim auras; bald-faced lies gives off moderate auras.

Example: The paladin detects evil on a barmaid, because she lied about her last tip.

Skills

Once the nature of the paladin's detection ability is determined, it can be used to bolster the paladin's skills. The bonuses the paladin can receive by using his detect evil power in conjunction with a skill cannot exceed a certain amount, depending on the strength of the evil in question. An aura strength of dim can only provide a +1 bonus, faint +2, moderate +3, strong +4, and overwhelming +5. All bonuses are considered sacred bonuses.

Below are some suggestions for how skills should be modified in conjunction with detect evil.

Appraise (taint, reputation, violence): The paladin can use his detect evil ability to confirm the nature of the item being appraised. The paladin using detect evil can make an Appraise check (DC 20) to determine if the item has an evil reputation or was used in an evil act.

Craft, Alchemy (taint): A paladin using detect evil can make a Craft check (DC 20) just as if he were detecting poison. This will identify if any evil components were used in the substance's creation, such as demon ichor or a mass murderer's powdered bones.

Decipher Script (taint, reputation): By making a Decipher Script check (DC 30), the paladin can use his detect evil ability to get the gist of any script written in Abyssal, Giant, Gnoll, Goblin, Infernal, Orc, or Undercommon. He is not able to read it word for word but comprehends the general intent of the script.

Diplomacy (guilt, sin): By knowing the nature of a person's soul, the paladin can boost diplomatic relations in his favor. He knows who to trust and who to avoid. He receives a +1 sacred bonus on Diplomacy checks for every 4 levels in paladin.

Forgery (taint, falsehood): The paladin can use his detect evil ability to detect forgeries. He receives his Wisdom bonus to his opposed Forgery check.

Gather Information (reputation): By knowing the reputation of a particular person, the paladin can use his detect evil to zero in on information about him or her. The paladin finds out more on a successful Gather Information check (DC 25).

Heal (taint): The paladin can detect evil in a person's body. The taint is considered to be inherently evil, but it must be more than just a common wound -- poisons, diseases, and festering wounds. The paladin receives his paladin level/4 as a sacred bonus to treat poison or disease while using the detect evil power.

Intimidate (all): The paladin can reveal things about his target, terrifying him as the victim's most intimate nature is revealed. This isn't necessarily a good act in itself, but the paladin can use it as leverage. The paladin receives his Wisdom bonus to the Intimidate check while using his detect evil power.

Knowledge (reputation): The paladin is divinely guided about all things religious or extraplanar. While attempting to

research how to defeat an evil thing, he receives his paladin level/4 as a sacred bonus while using his detect evil power.

Search (taint): The paladin can discover traps with evil magical spells or set by particularly evil beings as a rogue can.

Sense Motive (guilt, sin, falsehood): The paladin can detect evil motives in his target. He receives his paladin level/4 as a sacred bonus while using his detect evil power.

Spellcraft (taint, violence): The paladin can detect and identify spells of an evil nature. The paladin receives his Wisdom bonus to the roll against DC 20 + the spell's level while using his detect evil power.

Spot (sin, falsehood, violence, reputation): The paladin's chances of detecting an evil being are increased while using this skill. He receives his paladin level/4 as a sacred bonus while using the detect evil power against evil targets. If the paladin's specialty is in detecting falsehood, this sacred bonus applies to detecting disguises.

Survival (taint): The paladin can track tainted beings on a successful check (DC 25) regardless of terrain type while using his detect evil power. The paladin can sense the direction of an evil person or thing. The paladin receives his paladin level/4 as a sacred bonus to the check while using his detect evil power.

Detect Evil Advantages and Disadvantages

For players who want their detect evil abilities to be truly unique to their paladin, below are a list of advantages and disadvantages. As a general guideline, a paladin can have one major advantage or two minor advantages at the cost of one disadvantage. The manifestation of these side effects should be derived from the deity or ethos the paladin worships.

As another option, paladins can gain a minor advantage for one feat and a major advantage at the cost of two feats. To determine an advantage or disadvantage randomly, roll 1d6.

Disadvantages

1. **Ability Loss:** The effort to detect evil strains the paladin. By peering into the heart of evil, he is exhausted in some way, either physically or mentally. The paladin must make a Fort save (DC level of target) or suffer a temporary ability drain to Constitution or Wisdom of 1 point per 2 levels of the target.
2. **Insanity:** The paladin's mind is subjected to the incredible strain of evil. The paladin must make a Will save (DC level of target) or go temporarily insane for 1d20 rounds. The paladin suffers the effects of the confusion spell during this time. Alternately, he can suffer from an insanity specific to the nature of evil he was detecting.
3. **Empathy:** The paladin actually feels the effects of the sins committed by the target. If there is a victim that most recently suffered from that evil, such as a wound, the paladin suffers that same damage as nonlethal damage. If the victim died, the paladin takes the same amount of hit point damage suffered -- it's possible the paladin can be knocked unconscious by detecting an act of murder in this fashion.
4. **Impious Evil:** If the paladin fails a Will save (DC target's level) he inadvertently manifests a form of evil as a quasit, imp, or neutral evil fire mephit, as appropriate to the target's form of evil. The evil that is part of the target is erased completely -- guilt is relieved, crimes are forgotten, lies become truths in the victim's mind. For that particular form of evil, it cannot be detected again as the victim is absolved of the past. The outsider will do its best to tempt the target to more evil, however, and may not immediately reveal itself.
5. **Deep Trance:** While using his power the paladin can do nothing -- he is unaware of his own surroundings on the activities around him while in the trance, frozen in the same position. He is defenseless, both physically and mentally.
6. **Righteous Rage:** The paladin must make a Will save (DC target's level) when detecting evil or be overcome with righteous rage. He gains a +2 morale sacred bonus to Strength and Constitution, a +1 morale sacred bonus on Will saves, a 1 sacred penalty to AC and immediately attacks the evil target, striking to kill until the paladin

or the target is dead.

Minor Advantages

1. **Pangs of Guilt:** The target envisions the most recent act of evil he committed, clearly and vividly. Even if the subject would not normally feel guilty, he must make a Will save (DC level of paladin) or suffer a 1 morale sacred penalty per 4 levels of the paladin to future Will saves for the rest of the day.
2. **Flashbacks:** The paladin witnesses the evil as if its were playing out before his very eyes. He can identify faces, voices, and locations, giving a +1 sacred bonus per 4 levels of paladin to Listen, Spot, and Search checks when encountering the same people or situation.
3. **Good Beacon:** When the paladin detects evil, good outsiders are immediately attracted to the paladin's location, as per the sympathy spell as if cast by the paladin for the duration of the detection.
4. **Comfort:** While the paladin is detecting evil, the target feels at peace. The target must make a Will save (DC paladin's level) or be calmed as per the calm emotions spell.
5. **Circle of Detection:** The paladin can choose to detect evil as a full circle (rather than a quarter circle) at half the range (30 feet). The paladin can switch between the two area types of detection each round.
6. **Sounds of Devilry:** While detecting evil, the paladin can detect falsehoods related to his particular brand of detection as per the discern lies spell. The lies manifest themselves as roaring, demonic voices that require the paladin to make a Listen check (DC target's level) to comprehend. Otherwise, he only knows that the target lied.

Major Advantages

1. **Reform:** The paladin's ability to detect evil becomes so powerful that a victim who regrets his sins can seek to atone for his ways. By making a successful Will save (DC the victim's own level) he can benefit from the effects of an atonement spell (redemption) as if cast by the paladin.
2. **Transposed Agony:** The target envisions the most recent act of evil he committed, clearly and vividly. He is wracked with pain as he feels the suffering the victim of his evil suffered. The target must make a Will save (DC paladin's level) or he collapses to the ground as if knocked down. Thereafter, he suffers a 2 morale sacred penalty per give levels of paladin to all saves for the rest of the day.
3. **Malignant Guise:** The paladin's detect evil ability shows everyone for a moment what the target's true nature is in graphic, visual detail. A bloodthirsty murderer appears dripping in blood; a sadistic torturer stands cackling with an instrument of torture in his hands, an unfaithful lover appears seductively dressed, etc. Everyone who witnesses the event is aware of the evil and, at the DM's option, the victim suffers a 1 sacred penalty per four levels of paladin to all Charisma based rolls with the witnesses.
4. **Mind Read:** The target must make a Will save (DC paladin's level) or the paladin temporarily inhabits the target's mind. The paladin cannot exert control over the target but is privy to his thoughts as a detect thoughts spell.
5. **Second Sight:** The target must make a Will save (DC paladin's level) or the paladin temporarily taps into the target's senses. The paladin cannot exert control over the target but is privy to everything he sees and hears as a clairaudience/clairvoyance spell.
6. **Mark of Judgment:** If the paladin detects evil on a target, it must make a Will save (DC paladin's level) or be marked with a mark of justice in the shape of the paladin's sacred symbol. This mark usually appears over the target's left breast (over its heart, if it has one).

New Spells

Detect Falsehood

Divination
Level: Clr 5, Pal 4
Components: V, S, DF
Casting Time: 1 action

Range: Close (25 ft. + 5 ft./2 levels)
Target: One creature
Duration: Concentration, up to 1 round/level
Saving Throw: Will negates
Spell Resistance: Yes

When casting this spell, the caster perceives one sentient creature's level of falsehood as a yellow aura. The deeper the shade of yellow, the more egregious the target's lies.

Evil is anyone who knowingly conceals the truth about anything. Bald-faced lies and little white lies are all detected by this power. The lie must have been committed within one minute of the spell's casting per level of the caster. Unintentional lies are lies that are said without the target's knowledge that he was speaking an untruth. White lies are "harmless" lies that are false, but cause little impact. A lie of omission deliberately leaves out relevant information. A lie of commission is a deliberate falsehood. A bald faced lie is a blatant, egregious lie, usually to cover up an even more sinister deed.

Severity of Lie	Aura Strength
Unintentional lie	Pale Yellow
White lie	Light Yellow
Lie of Omission	Yellow
Lie of Commission	Dark Yellow
Bald faced lie	Dun

So long as he continues to concentrate on the subject, any lie spoken by the target is immediately detected as his aura changes to match the level of deceit.

Detect Reputation

Divination
Level: Clr 1, Pal 1
Components: V, S, DF
Casting Time: 1 action
Range: Close (25 ft. + 5 ft./2 levels)
Target: One creature
Duration: Concentration, up to 1 round/level
Saving Throw: Will negates
Spell Resistance: Yes

When casting this spell, the caster perceives one sentient creature's level of reputation as a green aura. The deeper the shade of green, the lower the target's reputation with the majority of the target's peers. The target's peers can be the other people in the room, the town where the target lives, or the target's family and friends. The general target's reputation is based on the Attitude of the community towards the target. A hunted murderer glows dark green while an admired king glows pale green.

Reputation Level	Aura Strength
Friendly	Pale Green
Indifferent	Light Green
Unfriendly	Green
Hostile	Dark Green

If an NPC casts this spell on a PC, the NPC may change his attitude as a result.

Detect Taint

Divination
Level: Clr 1, Pal 1, Rgr 1
Components: V, S, DF
Casting Time: 1 action
Range: 60 ft.
Area: Quarter circle emanating from the character to the extreme of the range
Duration: Concentration, up to 10 minutes/level (D)
Saving Throw: None
Spell Resistance: No

This spell works in a similar fashion to the *detect evil* spell but is another variant that removes the easy means of determining the alignment of "normal" sentient beings. It only detects supernatural evil or evil so heinous it must be diabolically influenced. More often, a demonic or devilish taint is left behind after the fiend has moved on. The caster sees all that the fiend has touched as a black aura.

Creature/Object	Evil Power
Undead creature	HD/2
Evil elemental	HD/2
Evil magic item or spell	Caster level/2
Evil outsider	HD
Cleric of an evil deity	Level
Item touched by evil	Owner's evil power - # of rounds last touched

Evil Power	Aura Strength
Lingering	Dim
1 or less	Faint
24	Moderate
510	Strong
11+	Overwhelming

Original Strength	Duration of Aura
Faint	1d6 minutes
Moderate	1d6×10 minutes
Strong	1d6 hours
Overwhelming	1d6 days

If the caster has the ability to track footprints, he receives a +10 bonus to track supernatural evil creatures with this spell for the duration. The caster also receives a +4 sacred bonus to Spot and Search checks involving the supernatural evil.

If an aura falls into more than one strength category, the spell indicates the stronger of the two. Each round, the character can turn to detect things in a new area. The spell can penetrate barriers, but one foot of stone, one inch of common metal, a thin sheet of lead, or three feet of wood or dirt blocks it.

Detect Evil Feats

In campaigns where detect evil is much more common, paladins, clerics, and rangers might have access to much more refined abilities to sniff out evil and corruption. At the GM's discretion, these feats allow a greater range of results in detecting evil.

Circle of Detection [Metamagic]

Prerequisite: Ability to cast *detect evil* spell or variant.

Benefit: The caster can choose to detect evil with an area of a 30-ft. full circle, centered on the caster. The caster can switch between the two area types of detection each round. The detection spell uses up a spell slot one level higher than the spell's actual level.

Comfort [Metamagic]

While the caster is detecting evil, the target feels at peace.

Prerequisite: Ability to cast *detect evil* spell or variant.

Benefit: The target must make a Will save (DC caster's level) or be calmed as per the *calm emotions* spell. The detection spell uses up a spell slot one level higher than the spell's actual level.

Flashbacks [Metamagic]

The caster witnesses the evil as if its were playing out before his very eyes.

Prerequisite: Ability to cast *detect evil* spell or variant.

Benefit: He can identify faces, voices, and locations, giving a +1 sacred bonus per 4 levels of caster to Listen, Spot, and Search checks when encountering the same people or situation. The detection spell uses up a spell slot one level higher than the spell's actual level.

Good Beacon [Metamagic]

Prerequisite: Ability to cast *detect evil* spell or variant; Charisma 13+.

Benefit: When the caster detects evil, good outsiders are immediately attracted to the caster's location, as per the *sympathy* spell as if cast by the caster for the duration of the detection. The detection spell uses up a spell slot one level higher than the spell's actual level.

Malignant Guise [Metamagic]

The caster's *detect evil* spell shows everyone for a moment what the target's true nature is in graphic, visual detail.

Prerequisite: Ability to cast *detect evil* spell or variant; Charisma 13+.

Benefit: A bloodthirsty murderer appears dripping in blood; a sadistic torturer stands cackling with an instrument of torture in his hands, an unfaithful lover appears seductively dressed, etc. Everyone who witnesses the event is aware of the evil and, at the DM's option, the victim suffers a 1 sacred penalty per four levels of caster to all Charisma based rolls with the witnesses. The detection spell uses up a spell slot two levels higher than the spell's actual level.

Mind Read [Metamagic]

The caster violates the mind of the person who committed the evil, opening his thoughts to the caster.

Prerequisite: Ability to cast *detect evil* spell or variant; Intelligence 13+.

Benefit: The target must make a Will save (DC caster's level) or the caster temporarily inhabits the target's mind. The caster cannot exert control over the target but is privy to his thoughts as a *detect thoughts* spell. The detection spell uses up a spell slot two levels higher than the spell's actual level.

Reform [Metamagic]

The caster's *detect evil* spell becomes so powerful that a victim who regrets his sins can seek to atone for his ways.

Prerequisite: Ability to cast *detect evil* spell or variant.

Benefit: By making a successful Will save (DC the victim's own level) he can benefit from the effects of an atonement spell (redemption) as if cast by the caster. The detection spell uses up a spell slot two levels higher than the spell's actual level.

Second Sight [Metamagic]

The caster can see and hear everything the target committed through the detection spell, from the point of view of the target.

Prerequisite: Ability to cast *detect evil* spell or variant; Wisdom 13+.

Benefit: The target must make a Will save (DC caster's level) or the caster temporarily taps into the target's senses. The caster cannot exert control over the target but is privy to everything he sees and hears as a *clairaudience/clairvoyance* spell. The detection spell uses up a spell slot two levels higher than the spell's actual level.

The paladin's detect evil ability can be a blessing or a curse, a powerful tool to investigate a murder or a terrifying means of revealing the evil that lurks in the hearts of men. Use it wisely.

Ritual Magic for *GURPS Fourth Edition*

by Bevan Thomas

Magic gives detailed information on a magic system appropriate for high fantasy campaigns where wizards throw fireballs and shatter castle walls, performing miracles by saying a couple of words of power and making a few cryptic gestures. It mentions "ritual magic," though only in describing how "ritual wizards" learn their spells in a different manner than normal wizards, not going into any detail about how performing these rituals is different from high fantasy wizardry.

This article explores the principles and techniques of the ritual spell-caster (who is called an "adept" in order to differentiate him from the wizard of the core magic rules). It was inspired by the ritual magic rules from *Spirits,* but treats ritual magic as a modification to the system in the *Basic Set* and *Magic* instead of as a completely new set of rules.

The Principles of Ritual Magic

This section discusses all the changes between Ritual Magic and the "wizardry" of the normal *GURPS* magic system. Any magic rule not discussed here functions as described in *Magic* (such as how distraction affects spell-casting).

Mana and Ritual Magic

The default assumption in this article is that ritual magic derives from mana just as wizardry does. It is affected by mana levels, as well as advantages such as Magic Resistance, Mana Damper, and Mana Enhancer. As with wizardry, no one who possesses Magic Resistance or Mana Damper may perform ritual magic.

It is up to the GM to decide if wizardry and ritual magic exist together in his campaign. If they do, then they are learned completely independently of each other, so, for example, normal Magery does not add to path scores, and levels in ritual spells cannot be used as prerequisites for wizardry spells. However, both are considered magic for the purpose of spells and other effects, so a Pentagram inscribed by an adept would guard against a demon summoned by a wizard, and a wizard could use Remove Curse to restore someone turned to ice by an adept.

Learning Ritual Magic

Ritual magic is dependent upon a single "core skill." This skill must be Very Hard, and is usually Ritual Magic (p. B128) or Thaumatology (p. B225). However, depending upon how the GM wishes to use ritual magic in his campaign, other VH skills are possible. Alchemy or Herb Lore are obvious alternatives, as they already produce supernatural effects, as is Musical Influence for bardic magic (in the case, the spells' rituals will probably be musically orientated). Computer Hacking or Weird Science might be appropriate for technomancers and cybershamans, whereas "chi skills" such as Body Control or Invisibility Art would be logical choices for magic that derives from martial arts. Even science skills such as Physics and Biology could be employed in a campaign where magic is actually fringe science.

Each college of magic is an IQ/Very Hard "college skill" or "path" that defaults to the core skill at 6. Each college skill may not be higher than the core skill. Each spell is a Hard technique that defaults to the relevant college skill. The default's penalty is equal to the spell's prerequisite count (p. M6), and in order to raise a spell above this level, the adept must have at least one point in the path. However, he is able to ignore all of the spell's normal prerequisites. Spells cannot be higher than the associated path.

Unlike wizardry, ritual magic derives from knowledge and not from inborn power. Because of this, Ritual Magery is not needed to perform rituals; it simply makes the spellcasting easier. Ritual Magery adds to the core skill, paths, and spells. It is entirely separate from normal Magery. As Ritual Magery is talent, not magical power, Aspected Ritual

Magery cannot generally be taken. Another important difference is that it cannot be used to detect magical items (there is no "Ritual Magery 0"), and so Ritual Magery 1 only costs 10 points (Ritual Magery 2 costs 20, RM 3 costs 30, and so forth).

Time Required and Energy Cost

Ritual magic spells do not usually drain FP or HP (except in the way that FP is normally lost through sustained activity and lack of sleep). Instead, they take a far greater time to cast than normal spells. Most ritual spells take 10 minutes to cast per point of its normal casting cost. For example, Seek Pass costs 3 points, and so if cast with ritual magic, takes 30 minutes, whereas Plane Shift costs 20 points, and so it takes three hours and 20 minutes (200 minutes).

As with wizardry, if your base skill with a spell is 15 or more, reduce the cost by 1 point; if you have skill 20 or more, reduce it by 2; and continue to decrease the cost by 1 for every five levels above skill 20. For example, if you have Plane Shift at skill 25, it would only take 150 minutes to cast. All ritual spells take at least ten minutes to cast. This replaces the rules for reducing casting time for spells found on page 8 of *Magic.*

Maintaining Spells

If a spell can be maintained in the normal rules, it can also be maintained through ritual magic. As long as the adept continues to chant, wave his wands, and perform the rest of his magic ritual, the spell will be maintained. If his concentration is broken or the spell otherwise ends prematurely, he must start the whole process all over again. This means that while maintaining a spell, an adept can do nothing else.

Alternately, an adept can take longer to cast the initial spell in order to extend its duration without needed to maintain it afterward. Simply add the cost to maintain to the normal point total and determine how long it takes from there. For example, Earthquake requires 2 energy to cast, and the same to maintain, and has a duration of one minute. Therefore, it takes 20 minutes to cast the spell if it is to last one minute, 40 minutes if it going to last two minutes, one hour if it is going to last three minutes, and so forth. As this increased casting time takes place before the spell is cast, it cannot be combined with the previous method of maintaining spells. The adept must choose to make use of one or the other.

Enchantments

Adepts can use "slow and sure" enchanting (p. 18 of *Magic*), with only a few minor differences from the wizard version. Anyone who possesses the necessary spell at level 15+ (if the default level of the relevant path is high enough, it qualifies) counts as a mage for the purpose of putting in "mage-days," and only a loss of the primary mage ends the project. They do not normally have a "quick and dirty" version (page 17), though ritual charms somewhat compensate for it.

Even magical items created by adepts drain energy when used, and powerstones may be dedicated to them as normal. In fact, the only time that adepts may make use of a powerstone's energy is if it is dedicated or exclusive to a magical item. This means that manastones are of no use to them.

Charms

A ritual charm (as opposed to an alchemical one) is an object charged with a spell in a manner similar to a scroll. In order to bind a spell into a charm, the spell takes a third again as long to cast. So if the spell normally takes three hours to cast, than it takes four hours if the end result is a charm. The adept can extend the charm's duration by taking longer to cast it as with normal ritual magic (this time is calculated before the spell is multiplied by one and a third).

When the charm is made, the caster must determine the result of the spell (for example, using Lightning against Lord Marcus or walking through the wall of Redraven Keep). He then may carry the charm with him, and when in the right position, he may active it. The charm will only work if it is being used exactly in the way that the spell was described while being cast. So the aforementioned Lightning charm would only spew out its energy if pointed at Lord Marcus

and no other. Other people may be affected by the spell, but they cannot be the main target (so a fireball would burn everyone caught in its radius, but it would only activate if centered around the prescribed person or place). Activating the charm takes the spell's normal time to cast (one to three seconds in the case of Lightning) and has the normal range, but it costs no energy.

Once a charm is activated, it crumbles to dust. All charms are delicate things, often bags filled with relevant objects or small objects tied together with string or rope. If they are damaged or altered in any way (such as the objects being removed from the bag or untied from the string), then they become useless, the magic within them dispelling harmlessly.

The Ritual

It is up to the Game Masters and the players to determine exactly what form the magic rituals take. It could be intense dancing, long chants accompanied by complicated gestures made with a wand, or even silent meditation. In some settings, each adept will have his own unique method, and in others it will be determined by his magic tradition or there might even be only one style that everyone follows.

Depending upon the magic style, the words of the spell could either be the adept's own language or an archaic or "sacred" one such as Ancient Egyptian, Hebrew, Latin, or Sanskrit. It may even be spoken in a non-human language such the speech of angels or dragons or a special language that is used only for casting spells. A spell cast in a language that you have at Accented is at 4, and cannot be cast at all with only a Broken understanding. A spell would be written down in the same language that it is spoken, and so would require the adept to be fully literate in the language in question.

Unlike wizardry, ritual magic often makes extensive use of material components, with symbols drawn on the ground, objects burned in a large fire or tossed into the wind, offerings made to various spirits, etc. A list of common components and the spell collages they relate to is located on page 222 of *Magic.* A more complete listing of various components and arcane modifiers is found within *Cabal.*

The Adept's Grimoire

As befits a more subtle breed of spell-caster, the adept is often thought to focus on different spells than the wizard, favoring the summoning of spirits and divining the future over elemental mastery and flashy magic duels. Here are presented various ideas on the spells that an adept would have access to.

Blatant Will-Working

Ritual charms are included in this article to allow spell-casters to perform rituals akin to those of classic folklore, but still be able to throw fire and lightning and perform other extreme acts of power that are so common in modern fantasy. GMs who prefer magic to be more low-key can easily remove ritual charms without it impacting the rest of the rules.

Another possibility is to restrict the spell selection of adepts, forbidding them from learning some of the more extravagant spells, such as Flaming Missiles, Enlarge, and Weather Dome. Attacking their victims with cunning curses and malevolent spirits is more in keeping with the ritual magic genre than unleashing a rain of fire and stone.

Spirit Mastery

Ritual magic is often identified with the summoning and mastering of spirits. GMs may wish to combine all spirit related spells into a "Path of Spirits." The spells most appropriate for such a path are: Affect Spirits, Animate Shadow, Animation, Astral Block, Astral Vision, Awaken Craft Spirit, Banish, Bind Spirit, Command Spirit, Control Elemental, Control Gate, Create Elemental, Create Gate, Entrap Spirit, Materialize, Pentagram, Planar Summons, Planar Visit,

Plane Shift, Plane Shift Other, Repel Spirits, Resurrection, Scry Gate, Sense Spirit, Skull-Spirit, Solidify, Soul Jar, Summon Demon, Summon Elemental, Summon Spirit, and Turn Spirit.

In a world where all magic derives from the spirits, spirit-spells might be the only ones adepts could cast, relying upon various spirits to perform the actions that on other worlds wizards perform themselves (such as healing or summoning rain). In such a setting, the Path of Spirits would probably be split up into various paths that relate to the kinds of spirits invoked, so that, for example, there might be the general Path of Spirits with multipurpose spells such as Astral Vision and Banish, the Path of Elemental Air, which has Control, Create, and Summon Air Elemental, the Path of Ghosts which includes such spells as Skull-Spirit and Command Spirit (ghost), and the Path of Demons which has Summon Demon, Planar Visit (Hell), etc.

Ritual Magic in the Campaign

As a more subtle and toned-down form of magic, ritual magic is appropriate for a low-magic setting where spell-casters are more likely to manipulate from the shadows than fight in the forefront with fireballs and lightning bolts. The length of time it takes to perform rituals makes many combat spells impractical, forcing mages to direct their talents in other areas, such as knowledge acquisition and mental domination.

It also brings magic more inline with how it is presented in horror, swords & sorcery, and similar genres, not to mention real-world beliefs. It makes magic more difficult to perform and more mysterious, and thus makes it more potent by comparison. It is difficult to remain impressed by the supernatural if it becomes released at every opportunity, often taking the role of heavy artillery. It is far easier if the power of magic is felt more rarely and quietly, when each ritual is an important event, its results become even more important.

Moving Performances

Sensies for *GURPS Fourth Edition*

by Paul Stefko

Melissa wiped her hands on her skirt. She always got nervous before a performance, and this would be her most important show ever. Live sensie performance was a dying art; few bothered to develop the skill necessary to create memory in real-time. The audience was dwindling, but Melissa still managed to draw several thousand people to the outdoor stadium.

She peeked out from behind the curtain to look at the crowd sprawled on blankets up the slope of the hill. They looked young and eager; hopefully, at least some of them would remember what she had to show them today.

The music began, and the announcer's voice rumbled from the conduction strips below the stage. The computer sewn into her blouse began scanning crowd response, reading the audience's excitement. "Ready to go, boss," it whispered through her interface.

"Ladies and gentlemen, I give you . . . Mnemosyne!"

Melissa stepped out onto the stage, smiling weakly and waving to the crowd. At center stage, a large padded seat had been placed, and Melissa gratefully settled into it. She cleared her mind and drew forth the first images of her set: 13 human forms, floating in a dark purple liquid, connected one to the next by thick tubes.

As she shut down her own senses in preparation for her broadcast, she felt the rifle shot like a bee sting on her right breast. Even with her last breath, she knew she had enough life left for a burst transmission. Someone out there had to understand; someone had to remember . . .

Powers gives us the Sensie enhancement for the Telecommunication advantage, turning a communication medium into a potential artistic medium. This article explores the possibilities of sensie production, including an artistic skill and options for generating, transmitting, and receiving sensies.

New Skill

Artist (Sensie)
IQ/Hard
Default: IQ-6, Artist (Illusion)-4, or Artist (other)-6
Prerequisite: Telecommunication with the Sensie enhancement, or reliable access to equipment that replicates the effects of the advantage

You are trained in the creation of sensory recordings, or "sensies." This is an intensive process requiring all five senses. This requires about 10 times the length of the sensie ie, a six-minute sensie would require an hour of work. You can roll at -4 to halve this time or -8 to create in "real time."

Modifiers: Equipment modifiers (page 345 of the ***Basic Set,*** if your ability to transmit is based on technology); physiology modifiers (p. 181 of the ***Basic Set,*** halved if your ability to transmit has the Universal enhancement); +2 if you possess Eidetic Memory (+4 on a successful IQ roll); +6 if you possess Photographic Memory.

The Halls of Memory

A sensie could be an entirely original creation, but as with all art, the best product is built on the artist's personal

experience. The problem with sensies is that the average person cannot recall their own experiences so thoroughly as to make them suitable for sensie transmission. Typically, a sensie will not feel more "real" if the artist incorporates authentic experience than it would if he had developed it from scratch.

But the Eidetic Memory and Photographic Memory advantages can grant a sensie artist the edge in creating sensies "based on actual events." GMs should consider allowing the following special enhancement for Eidetic Memory and Photographic Memory:

Sensory: You can recall events with the sensory clarity necessary for sensie transmission. This allows you to transmit memories via Telecommunication with the Sensie enhancement, not just real time experience. In addition, you get a bonus (+2 for Eidetic Memory or +4 with a successful IQ roll; +6 for Photographic Memory) to the following skills: Acting, when using a method that calls for drawing performance from personal experience; Writing or Poetry when integrating personal experience into your narrative or poem; and Artist (Sensie) when integrating your own memory into an original work. +20%.

If your memory only stores experience, you may take the following special limitation. This can represent digital media that can store sensie data or other means of recalling experience.

Sensory Only: Your memory can easily recall experiences, but not learned knowledge. For some reason, your mind does not capture time spent studying, so you cannot recall moments spent, for instance, reading a book. This limitation includes the effects of the Sensory enhancement, but none of the effects of the normal advantage. -40%.

Seeing Through Another's Eyes

A sensie artist may want to use another person's memory as a basis for his art. Assuming the subject does not possess Sensie Telecommunication, this requires the Mind Probe advantage with the Sensory enhancement. If the subject is willing, the GM should wave any Quick Contest and allow the exchange to occur freely.

A less scrupulous sensie artist may try to steal another's memory. This is a more traditional use of Mind Probe. The length of the memory extracted is dependent on the margin of success, at a rate set by the GM; a good default is 30 seconds per point.

If you can only draw out experiences, apply the Sensory Only limitation given above for Eidetic Memory to Mind Probe, rather than the Sensory enhancement.

Picking up The Signal

None of the variants of Telecommunication with the exception of Telesend can receive and interpret sensie signals unaided. The following enhancement can be applied to any form of Telecommunication except Telesend:

Sensie Receiver: You can receive and interpret sensory transmissions. While experiencing such a transmission, your natural senses are suppressed, with the exception of any force that deals damage. You can turn off the sensie and return to your normal senses at will. +40%.

If your Telecommunication can only transmit sensies, add the following limitation instead of the Sensie enhancement:

Sensie Only: You can only transmit sensory experience. This still allows verbal communication, but all messages must be spoken clearly aloud. -10%.

The Pleasure and the Pain

Some sensie artists can unlock the emotional core of extreme experiences. This allows the artist to transmit a feeling of euphoria (or agony) with their sensies. This can be modeled by an Affliction with the Agony or Ecstasy enhancements.

If the artist's sensies are addictive, the Affliction should have a Disadvantage (Addiction) enhancement as well.

Sensie Packages

The following perks and metatraits provide packaged advantages for various systems of sensie production and use:

Cybernetic: You transmit and receive sensies via a radio implant. You also possess "headware memory" that can store sensie information, including automatic recording of your own sensory data. Telecommunction (Radio; Sensie, +80%; Sensie Receiver +40%) [22], Photographic Memory (Sensory Only, -40%) [6]. 28 points.

Memory Thief: Your sensies are actually stolen memories. You do not possess Mind Reading and therefore must touch your subject to activate Mind Probe. If your subject is unwilling, you must restrain him or knock him unconscious. Once you have stolen a memory, you can transmit it again by touch, along with an addictive euphoria. Mind Probe (Sensory Only, -40%) [12], Photographic Memory (Sensory Only, -40%) [6], Telecommunication (Telesend; Burst, x10, +30%; Link, +10%; Sensie Only, -10%; Sense-Based, Touch, -20%) [33], Affliction 1 (Based on Will, +20%; Ecstasy, +100%; Link, +10%; Contact Agent, -30%) [20], Affliction 1 (Based on Will, +20%; Disadvantage, Addiction, +20%; Extended Duration, Permanent, +150%; Link, +10%; Contact Agent, -30%) [27]. 98 points.

Sensehead: You have a slot in your head that allows you to process pre-recorded sensie chips. If you possess a Modular Ability (Chip Slots) that allows mental traits, a sensie chip can occupy one of your slots and can hold a number of sensie recordings equal to the number of points available in that slot. If you do not have Chip Slots, you can slot a sensie chip containing a single recording. 1 point.

Sense Memory: You can identify an individual based on the specific "feel" in sensies of his experiences. This also allows you to determine a specific sensie artist responsible for an original creation. Whenever encountering a new source or artist, make an IQ roll to memorize their sensie "signature." 1 point.

Using Sensies in the Campaign

Science Fiction: Sensies originated in cyberpunk and post-cyberpunk literature. Usually in these settings, sensies are cheap and addictive but legal (Sensie Addiction would be worth -15 points). For more ideas, see *Cyberworld* and the *Transhuman Space* line.

Horror/Psionics: A sensie "artist" using the Memory Thief package above could make for a terrifying villain in a horror game with exotic abilities. This would be an interesting starting point for a psychic vampire (see the Vampirism power on page 135 of *Powers*).

Fantasy: Imagine a college of bards who can fill their audience's heads and hearts with vivid imagery just by singing or delivering a speech. This could be Telesend (Sense-Based, Hearing; Sensie) and requiring a successfull Public Speaking or Singing roll.

240 1¾-inch full color tiles, six cheat/reference cards, & eight-page b&w rulebook; $19.99

The majority of games from Twilight Creations have seen the players battling hordes of zombies or monsters across a field of randomly drawn tiles representing a town, an army base, a shopping mall, and a dark, *dark* wood. With their latest release, Twilight Creations give the tile-laying game a twist by making the tiles what you fight with. Designed for two to six players, ***Hidden Conflict*** is a war or skirmish game in which the tiles are both fought over and fought with, and which also possesses a managed, almost constrained random element.

The set-up is simple. While mankind has been busy warring with itself, the true enemies of humanity have been gathering. Now they stand ready to launch an apocalyptic assault, and whoever survives and wins, gains control of the Earth.

What you get matches the simplicity of the set-up. Some 240 tiles are divided into six color-coded forty-tile factions and a cheat or reference card for each faction. The rulebook though is not as explanatory as it should be. Even better, Twilight Creations have assigned a different artist to illustrate each faction, which very nicely gives each faction a singular look. The six factions are in turn, Demons, Ghouls, Humans, Vampires, Werewolves, and Zombies.

The tiles come in three types: Fighters, Events, and Items. Each Fighter has a Level rating from one to six (each Level 1 Fighter representing a Faction's Leader), an attack and defense value, plus a Special Ability. For example, "Fast" lets a Fighter to attack first, while "Scout" enables a Fighter to examine an adjacent un-revealed face down tile. Other Special Abilities allow a Fighter to resist weaker opponents, aid another Fighter, and even hide before a battle begins.

Events are divided between Instants that have an immediate effect and those that can be saved for later use. For example, "Daybreak" is an Instant that removes all exposed "night" creatures -- Ghouls, Vampires, and Werewolves, from play. Its counterpart, "Scatter," sends all exposed "day" creatures -- Demons, Ghouls, and Humans, into hiding face down amongst the other tiles. "Lost" can be saved and used later to cancel a Fighter's Special Ability, while "Hypnosis" lets a player temporarily control an enemy Fighter. Items, available only to the Ghoul and Human factions add weapons and armor, and need to be attached to a specific Fighter.

A game starts with what seems initially a complex set-up process. Not all of a faction's tiles are used in a game, the more players involved, the fewer the number of tiles used -- either 29 for a two-player game, 25 for three players, and 20 for four to six players. A player chooses these from the forty tiles in his faction, discarding the rest. He then selects five Fighters as his starting force, one of which has to be the Leader tile. Then everyone's are mixed together face down in the middle of the table. From this morass, the tiles are collected together into stacks three tiles deep. These stacks are used to create a square or rectangular "tile" board. This then forms the game's playing surface.

On a turn a player sends up to three Fighters to each attack the top tile on one of the "tile" board's stacks. These tiles are turned over and resolved. If an Event, this either happens immediately, or is passed to the player whose faction color matches that of the revealed tile. It can then be used later in the game. If a Fighter from an opposing side, then combat is resolved in a simple comparison of attack and defense values, killed Fighters entering the Graveyard from where they might be resurrected. All revealed surviving Fighters are returned to their players' hand. After Events and Combat, a player can move his Fighters around the "tile" board. Play continues like this until the last Leader is left standing, its player being the winner.

Which all seems so simple, and it is. Except that the device of the stacked "tile" board adds both a random element and one of unpredictable exploration. Both, of course, are partly predetermined by the players. Further, because the combat mechanics are so simple, the game play focuses on the effects of both the Events and the Special Abilities on the Fighter tiles. That the Events vary slightly from one faction to the next adds to the replay value and gives ***Hidden Conflict*** its customizable aspect. Understanding how both work will grant the players the winning edge.

Unfortunately ***Hidden Conflict*** is let down by an underwritten rulebook and not really being that interesting a game for either two or three players. More participants means a greater the variety of tiles in play, and results in more things going on. Although this is very much a war game, the design of ***Hidden Conflict*** with its interesting use of tiles does much to hide this fact and make it more palatable to the non-war gamer. It is also this clever design that gives the game its high replay value and opens it up to further expansions, some of which are already planned. ***Hidden Conflict*** may look simple, but in keeping with the title, keeps its challenges and strategies concealed until the battle begins.

Fury of Dracula, Second Edition

Published by [Fantasy Flight Games](#)

Designed by Stephen Hand & Kevin Wilson

Edited by James Torr

Art & Graphics by Andrew Navaro, Scott Nicely, Kevin Wilson, Ed Bourelle, Anders Finer, Wes Louie, Megan Stringfellow, Mike Capprotti, Aaron Habibipour, & Guy Gentry

Full-color boxed set, two to five players; rules, board, five plastic miniatures, five character sheets, reference map, four dice (one specialized for rail travel), 220 cards (items, events, tactics, locations, powers, & reference), & 81 counters; $49.95

Fantasy Flight Games has spent the last couple of years gearing up to re-release some old gaming favorites. Sandwiched between *Arkham Horror* and *Britannia* is the old Games Workshop piece *Fury of Dracula.* As in so many of his movies, the vampire wasn't destroyed at the end of the novel (that's the game's backstory and they're sticking to it) . . . he survived to vex his old enemies once again, eight years later.

The object of the game is to destroy Count Dracula (if you're playing the hunters) or to infest Earth with your vampire hordes (if you're the Prince of Darkness).

The action plays out on a map of Europe, nearby Asia, and the surrounding seas. Cities are all connected by roads, and most by rail as well. The players use pawns representing the famed protagonists -- Lord Godalming, Dr. Seward, and others -- to show their progress from town to town. Dracula wanders the same map, but his location is tracked secretly by playing corresponding location cards, and he sets fiendish plots in motion as he goes. Hunters can only corner him by stumbling upon his trail, but they'll spend more time cleaning up devilish messes like outbreaks of plague, packs of ravenous wolves, hoaxes in the newspaper, minions doing Dracula's bidding, and the all-important vampiric servants who ultimately win him the game.

The places/cards he's been to remain on the board, shifting along a track, and if his pursuers come across such a locale they must try to foil him or his lingering plots. Eventually cards fall off the end of the track to show the trail has gone cold, and any encounter marker on that card may be "matured" -- that is, a long-standing plot has come to fruition, and Dracula gets some added benefit from it. If the fiend hasn't been there, the hunters may use the town to rest and grab item or event cards.

Items are the usual fare you'd expect when dogging a bloodsucker: garlic, stakes, holy hosts, crucifixes, and some mundane bits like pistols and knives (better against his minions than the "man" himself). Event cards have symbols on the back to show whether they assist the good guys or bad guys, but they're drawn blind from the bottom of the deck, so getting them is a calculated risk. These may provide new allies in the fight, news stories that narrow down the villain's location, or one-time attacks or effects.

Each round, time passes; half the game happens in the daytime, half at night, and Dracula has the advantage in the

dark. Combat has modified rock-paper-scissors elements, and players choose from three basic tactic cards: dodge, punch, and escape. Hunters can collect weapons that give them new options, and the Prince of Darkness has several moves he can pull only at night like Mesmerize and Strength. Everyone compares initiative rolls on six-sided dice, and the winner's card is used to decide the outcome. Players may escape, take damage in the form of health or blood points (depending on whether they're human), get bitten, or lose their weapons. Eventually the team will track down Dracula and kill him, or the Count's vampire legions will overrun Europe, ending the game.

Fantasy Flight's reputation is one of high component quality, but in this game they've outdone themselves. Every piece is a tiny work of art, every card a stylish rendition, each character sheet a masterpiece. The map board uses sepia tones that suggest a period illustration, although this also makes distinguishing between the similar colors (land and sea zones) harder to get used to, but it's still a gorgeous picture and a lovely effort all around.

Some bad points: Some of the counters are exceedingly small and could be lost with a solid sneeze, a careless hand, or poor accounting. The event cards are either "keep" or "use immediately," and it seems awfully easy to get an immediate card that only works if certain conditions are met -- qualities that can easily not be there, gouging you out of a valuable opportunity. Fights can take a while, and wearing down a hunter or Dracula is balanced to the point of being frustrating. And the most disappointing factor: This . . . is a *looong* game. Both the heroes and villains stand to advance when the game goes through a full cycle of day and night, but this can feel like forever (the game is an all-night affair). There are several options, especially for Dracula, to manipulate events to one's advantage, but it just doesn't feel like you're really in control of your game.

There are a number of differences between the old and new versions. The card trail is a much improved way to track Drac (he used to move on his own map hidden behind a screen), though the "history" he leaves makes it far easier for hunters to work out where he is. The chances of drawing the critical vampire encounters were marginally better in the previous set, but this one gives you greater freedom (you spend blood points instead of drawing the right event card) to exchange chits. Combat once used an unwieldy grid to cross-reference attack forms, so having it all on cards is a blessing. The game is now for five players, not just four, having added Mina Harker into the mix. Oh, and the definite article "the" has been removed from the title.

Whether you're a fan of the first edition and can't find it on eBay or want to see a good idea given a smoother execution, **Fury of Dracula** is a fine reworking that adds enough to make it worth a second look (even if you do own the original). It hasn't lost that sense of true nail-biting excitement, and the cat-and-mouse game is tenser than ever. New options (for both sides of the struggle) add strategy and urgency, so you may not know if you're the hunter or the hunted, but you will be among the entertained.

--Andy Vetromile

Things I Love As A Player

We're rounding up the first [quadrology](#) of [love](#)-[hate](#) columns by taking a look at some of the things I love as a player. (If I haven't stressed it enough in the past, I've only been focusing this series on things that I love when *game companies* do them. Yes, I hate it when GMs kidnap my dog and scratch "PIGGY" on my car with their keys . . . but that's usually beyond the control of the game publishers, and might be the focus of another column series.)

Let us begin!

Strange settings that give their information as directly as possible. I'll be honest; I *want* to like a lot more unusual game worlds than I actually do. There are so many bizarre game settings that seem like they'd be interesting -- cool covers, neat gear, interest-piquing passages throughout the book -- but I just can't connect with. I suspect the primary reason, for me, is that many games do a poor job of summing up what, exactly, they're about.

In this way, movies and television shows have a tremendous advantage over the written word, since it's easy to convey a tremendous amount of information visually. In 30 seconds of footage, it's trivial to convey the kind of world that, say, *Star Trek, Star Wars, Who Framed Roger Rabbit,* or *Fifth Element;* compare this with some unusual RPG settings, where you can read a 10-page introductory story and still not know what the game is about.

In pondering my column for this week, I think I stumbled upon one of the reasons. Many games do a poor job of bringing the reader up to speed on what a game is about, both in terms of the specifics of the game world and the tone of that setting. Unfortunately, most games don't do this effectively; it's a sad state of affairs when I try reading a new setting, only to give up after 10 minutes or so and go online to find a review of that product, so I can determine what it's about.

Most recently, this happened with the ***Eberron*** campaign setting; after reading it for a good number of pages, I still had no idea why most of the material there couldn't have been plunked down in a ***Forgotten Realms*** setting. And, actually, I was pretty surprised by my disconnect with the setting, since previous ***Dungeons & Dragons*** settings had all done *extremely* good jobs in establishing a tone almost immediately: ***Dark Suns, Ravenloft, Spelljammer,*** and (to a lesser extent) ***Planescape.***

So I love games that I'm able to pick up and explain -- or have explained to me -- as quickly as absolutely possible. Some other games that spring to mind as being good at bringing a player up to speed as fast as possible:

- ***Aberrant:*** Since it's one of the few supers games that actually tells its backstory using comic book elements, it was incredibly easy to get drawn into this world. It's a near-future low-sci-fi supers setting, where supers are treated as celebrities.
- ***Vampire: The Masquerade:*** This game had the advantage that everyone knows what vampires are, and it doesn't disappoint on those expectations (unlike the similarly themed ***Werewolf: The Apocalypse,*** which spends 90% of its opening telling the reader that everything they know about werewolves is wrong).
- ***Shadowrun:*** Again, this game -- in all its iterations -- wears its intentions on its sleeve (or, in this case, cover); it promises a cyberpunk game with trolls and elves, and it delivers it from page one. I think it also helps that the name of the game is also the name of the primary type of missions -- and once you know what a shadowrun is, you're 90% of the way toward understanding what ***Shadowrun*** is. Sadly, most future supplements seem to rely *waaaaay* too much on knowledge of the setting's nuances and terminology to have the same draw-in appeal, but the core book has universally been incredibly approachable.

I could spend time muttering about games that fail to live up to this "explain things as quickly as possible" ethos (***Fading Suns,*** I'm looking at you), but for now I'll just content myself with basking in the memories of those games where I could scan a few pages and be filled with a sense of the world and the compulsion to keep turning pages.

Boxed sets. Yes, I know they've gone the way of the dodo, and I understand the economic forces that caused their extinction. But I don't care; I still love the old RPG boxed sets. In a time when my budget (a.k.a. "being a kid at

home") meant that I'd only be getting one or two RPG products every six months or so, a boxed set was able to multiply that delight times the number of products in the box. And some of those boxed sets -- such as the **DC Heroes, Ghostbusters,** and **Planescape** ones -- proved to be near-endless bounties of goodies.

Fortunately, I take some solace in realizing that those beloved boxes are somewhat replicated by the proclivity of web exclusives and "enhancements"; a fat hardcover and a few interesting PDF documents go a long way toward recreating that experience. But even so, nothing quite compares to cracking the plastic on a new game and never knowing *what* will come tumbling out.

Game books that include interesting powers. I think one of the biggest complaints I have against the stock **d20 System** is that, for the most part, a vast majority of the abilities, feats, skills, powers, and spells are devoted to . . . well, killing monsters. I remember finally getting to hold Wizards of the Coast's **Epic Level Handbook** in my anxious little hands; this book finally introduced spells higher than 9th level for the **Dungeons & Dragons** game. So, like any good munchkin, I immediately tried to find out what the highest-level spell they had devised. What wonders would it behold? And there it was: *vengeful gaze of god.* The effects of this? 305d6 in damage to the target, 200d6 of damage to the casterrrrzzzz . . . <snerk> sorry. Dozed off. Yes, the most powerful, mightiest spell does . . . a whole lot of damage. Yee-haw.

Let's compare this with the highest-level ability for Obfuscate, from the **Vampire: The Masquerade** game. (Obfuscate, as the name suggests, is the art of remaining hidden: false faces, turning invisible, and so on.) Anyway, the most powerful ability -- the name of which I'm not certain of, because the book's buried in the bottom of a stack of boxes -- will completely remove all evidence of the user's existence from the Earth: all mention of him from documents, all memory of him from minds, and so on.

Now, the GM in me notes that this ability immediately evokes an adventure or two . . . most of them revolving around a third-act revelation that the mysterious stranger the party has recently met up with was, in fact, a part of their lives for the entire length of the campaign (they just don't remember him). But, even though that high-level power would never be within reach of a normal **Vampire** campaign, the player in me loves *all* the Obfuscate abilities -- hiding in shadows, having a supernatural disguise, and so on. In fact, most of the **Vampire** abilities are evocative to me; being able to rewrite memories, compel people to bow before your majesty, being able to summon and talk to animals, and so on.

This is important, since, to me, being able to deal a lot of damage isn't a compelling enough "neat-o" ability for a character. Speaking solely for myself, I like to connect with my characters' abilities to do things that otherwise are very difficult or impossible for others, and I don't get enough of that connection with most of the **d20 System** abilities, no matter *how* they're gussied up to appear different:

"I'm able to deal 4d6 damage every other round using two weapons!"
"With my mighty striking blow, I'm able to increase my chances of a successful strike by +2, turning the resultant points to additional damage!"
"I'm able to reflect one blow a day back upon the attacker, dealing it damage from an unexpected source!"

And so on.

Anyway, I understand that the audiences for the **d20 System** and the various **World of Darkness** products are vastly different, and I know that the former would definitely be fun to me in the right circumstances. But when it comes to having that "gee, whiz!" desire to play a character, I know I always am more attracted to weird abilities compared to powerful ones.

* * *

Well, that's it for this installment. As ever, feel free to make your loves known by e-mail or the *Pyramid* discussion boards. In the meantime, keep on spreading the love in all ways that are legal.

Listening

Cold mountain sun caresses the gates of the dwarven freehold of K'brea as Senior Engineer Hecrak hen Ki surveys his troops. His name, a whole syllable longer than his father's, marks him as a self-dug dwarf, one who has descended to his post by craftsmanship rather than breeding.

This close to the surface, the gatekeepers can smell the in-draft, carrying autumn frost, wood smoke, and blood. On the plain, the pitiful human sun-shelters have been burned. He no longer needs to touch the stone to feel it; the buzz of hundreds, thousands of kobold vermin reach him even through his boots, nearly drowning out the usual hum of the living belowcity. They look to him now. He has seen his four centuries. His sons have already passed him, and carry names of three or even four syllables. As good a day for a glorious death as any.

As far as visiting researchers have been able to work things out, the age of brass and steam arrived a little over a dwarven generation ago in the world known to Infinity as Kenner, an attempt at rendering the local word for "Deep-home." The web of trade between the depholds had been steadily growing for centuries until it reached a critical point. Then technological development exploded like a heavy mining charge.

Long held craft secrets were suddenly freely exchanged. Unimagined wonders and horrors saw the gaslight of the greathalls. Soon, they were brought into the sunny world of elf and man. Eager man-lords and elven thanes brought new wealth and exotic wares to the dwarves as they scrambled for toys, tools and war golems. Those who tried to cheat a dwarf soon learned what it meant to earn the enmity of an entire clan.

Of course, it couldn't last. More than a century ago, a dwarf known only as Pneu'chun-ra, the Steamlord, rose to the position of clanfather of the ruling faction in the great freehold of K-thoa, Deep-Glitter. Within a year, his Low Engineers held the freehold in an iron grip. Within a decade, the surrounding freeholds surrendered or had their gates crushed with steam hammers, their mines penetrated by armored moles, and their guards slaughtered by golem warriors. While some strongholds held out, most fell to other threats once isolated and deprived of the support of the rest of dwarfdom. The last free city, K'brea, was laid waste by a kobold horde in the twentieth year of the Steamlord.

Dwarven Castes

Kenner is a strangely divided world: At first sight its inhabitants are the regular cast of fantasy tropes, scrubbing by at tech levels 1-3. However once you get underground, you'll rarely drop below TL4, and will likely run into TL5 devices sooner than later. For purposes of calculating point values, assume TL3 as an average. In dwarven society, technological knowledge, skill and (curiously) personal tech level form the bedrock of what other races would call political power. Status levels range from the powerful Low Engineers at status 4-5 to the pariah Stonecunner mystics at -2 or less.

To make a dwarven character, use the template in the Basic Set, but add either Social Stigma (Disowned) or at least a total of 15 points worth of Allies, Contacts, Social Regard, or other appropriate clan related advantages and disadvantages. Many have an Intolerance of "primitives" (anyone of lower tech level, including other dwarves) at Quirk level or higher. Clan members generally train within their clan, and belong to the same occupational caste. Unless you prefer to play a common worker or a free dwarf in exile among humans or elves, give your dwarf a place in his community by adding one of the following templates:

Low Engineer   *57 points*

Advantages: TL5 [10]; Status 5 [25] and one of either Legal Enforcement Powers 3 [15] or Military Rank 3 [15]

Disadvantages: Code of Honor (Professional) [-5]; Duty (to Steamlord) [minimum -5]

Skills: Either Axe/Mace, Axe/Mace Art, Axe/Mace Sport or Thrown Weapon (Axe/Mace) [4]; No less than [4] points in either Accounting or Leadership and [8] points in Engineer. Remember to add at least [1] point for the Mathematics prerequisite. Common Engineer specialties include Steam Engine, Clockwork, Mining and Robotics; some with knowledge of the latter also dabble in Alchemy or Chemistry, but known alchemists may lose considerable renown and respect.

The Low Engineers are the Steamlord's governors, administrators, planners and commanders, and have accordingly been given the right and honor of taking five-syllable names, and given instruction in the deepest secrets of technology; only the common workers are required to use all these syllables when addressing them (Stonecunners are not supposed to speak to them at all), and higher ranks are permitted increasing degrees of familiarity. At least three will be present in a Steamhold at any time. They carry golden tablets with inscriptions detailing their authority counted, according to their skill set, in number of Master Engineers and machinery, or Gatekeepers and golems they are entitled to command. Very senior Low Engineers may possess several such tablets, giving him both civil and military authority.

To make a Master or Apprentice engineer, use the above template, but remember that none of these have any military authority. Reduce their Legal Enforcement Power to two or one, accordingly. Exchange Accounting or Leadership with an appropriate Mechanic or similar practical skill. Many Engineers are trained in artistic skills as well, with common specialties being Calligraphy, Illumination, and Sculpture. Many are Connoisseurs, and some of them can get quite fanatical about their pet crafts, but none of these skills are requirements.

Master Gatekeeper   *63 points*

Gatekeeper

Advantages: TL4 [5]; Status 4 [10]; Legal Enforcement Powers 2[10]; Military Rank 2 [10] and at least [20] points worth of Languages, Cultural Familiarity, Charisma, Combat Reflexes or Wealth.

Disadvantages: Code of Honor (Soldier's) [-10]

Quirks: Some Gatekeepers get sunburns, which are good for a [-1] point temporary Social Stigma until it clears up, when it becomes a negative Reputation of equal value (good for the occasional jab, but no real liability). A gatekeeper who works outside enough to keep up a permanent tan might aquire a Social Stigma or bad Reputation by becoming known as a "high dwarf," worth [-5] points.

Skills: Diplomacy [2]; Merchant [2] and [4] points either in Forgery, Counterfeiting and Smuggling or Detect Lies, Interrogation and Tactics. Two combat skill sets are available. Some gatekeeper clans still train in the traditional martial arts, while others employ a range of newer inventions.

The former have at least: Axe/Mace [4]; Crossbow [2]; Fast Draw [1]; Shield [1] and either Brawling, Boxing or Wrestling [2], with no less than five points in Techniques.

The latter learns either Knife, Shortsword or Saber at [1] point as a backup in case Artillery or Gunner (Cannon) [2], Guns (Musket) [2] and Battlesuit [2] isn't sufficient. Though not formally taught, most have acquired considerable experience worth at least [3] points of Mechanics and Operation skills through surviving various trials and catastrophic failures. A very few may have acquired forbidden Engineer knowledge through a little unofficial destruct-testing of advanced equipment assigned to them.

The gatekeepers make up the deepholds' soldier caste, and are the ones most frequently encountered above ground. Traditionally, they are supposed to defend the gates of their home city. But the Steamlord's novel thinking has resulted in the definition of "gate" being somewhat extended, sometimes to include rather large fiefdoms, inhabited by whole nations of the savage races. Some master gatekeepers engage in sporadic attempts to aid these unfortunates in bettering themselves as much as their inferior pneumas allow, condemned as they are to a pitiful existence under the merciless glare of the sun and the pitiless rage of the elements. Results are mixed, to say the least. A Master Gatekeeper answers to a Low Engineer, but are usually given rather free reins as long as they are operating at the gates and are not engaged in actual war; underground operations may see quite keen interest taken by the Engineers, who dislike having their projects disrupted, be it by invasion, riot or just general unrest.

The Masters hold a rank comparable to a sergeant, but often receive the responsibilities of anything from captain to commander, with additional duties of diplomat and customs inspector, depending on how preoccupied their superiors happen to be at the moment. To make a regular gatekeeper, halve the points available for advantages and skills and reduce Status, Military Rank and Legal Enforcement Powers accordingly.

Master Stonecunner

9 points

Advantages: Legal Immunity 1 [5] and at least [30] points worth of Spirit Empathy, Ritual Magery, Visualization, Sensitive Touch, Subsonic Hearing, Universal Digestion, or Vibration Sense.

Disadvantages: TL1 [-10]; Wealth -3 [-25] Second-Class Citizen [-5]; Status [-2]; Disciplines of Faith (Asceticism and Ritualism) [-20]

Skills: [16] points in Symbol Drawing (Stonecunner Runes), Ritual Magic (Stonecunners) and Hidden Lore (Dwarven Mythology). Stonecunners only learn one path from their Master, but learn it well; [8] points invested in either of the Path of Earth, Making and Breaking or Animism, as well as another [8] in the most useful rituals of his path. Most stonecunners have at least [4] points in more mundane medical and craft skills.

The stonecunners are vital to the deepholds. They know the way of deep, and can speak to the anima of the mountain, finding safe shafts, new seams, preventing cave-ins and warning of trapped fire or choking pneumas. Stonecunners are carriers of an ancient tradition of spirit magic, as old as dwarfdom itself, keepers of secrets no one uninitiated are allowed to even know the existence of. The oldest and wisest of them are rumored to be able to become one with the bedrock itself, walking through seams of iron ore or granite as if wading down a stream. Despite their presence in every deephold and the indispensable position they hold in dwarven society, they are almost universally feared and despised; walking the corridors of both worker's sleeping halls and engineer quarters, they endure insults like "talkers to ceilings," "rockfeet," and "sunbringers," and subsist on alms and scraps. Few dwarves would really dare to raise a hand to one of them, though this taboo has been eroding in recent years. While belonging to a pariah caste, they are no more numerous than the Low Engineers, and recruit among the clanless, outcast or disabled.

The Pneumatic and the Mechanical Paradigms

What may or may not be immediately apparent to outtimers will sooner or later become painfully obvious: There's something strange about Kenner's physical laws. Almost everything on this world appears to operate in roughly the same way as on homeline; things fall down, gunpowder explodes, hot steam expands, and fire burns. They just don't do it for the same reasons. Kenner is a high-mana, animist world; everything here has a spirit of its own. Most are dormant, reacting on reflex, making predictions and extrapolations of physical laws possible. But those who know the secret can awaken these Anima. Sometimes, they even wake up for reasons of their own. And when they do, all bets are off.

However, the majority of dwarves cling to the idea that their world operates on predictable, mechanical principles, even though they sometimes encounter powerful anima, in particular in the deep mines. These mineral and fire elementals, called "pneuma" by the dwarves, are generally written off as naturally occurring phenomena or hallucinations. One of the Steamlord's dirtiest secrets is the debt his numerous engineering feats owe to more than a little knowledge of alchemy and the stonecunner's craft.

The stonecunners tell tales of a mythic age, when the dwarves knew reliable Stone, not fickle Air as their true element and walked through the deeps like the high ones walk under the sun, free of the suffocating rock and forever safe from the raging elements above. The Song of Sacrilege, taught from master to apprentice stonecunner, tells the story of the blinding of dwarfdom, and how the stonecunners became keepers of the sacred truth. Some of its verses are important parts of stonecunner rituals, reminding dormant anima of ancient pacts and half-forgotten names.

The Path of Animism

This Ritual Magic Path involves contacting, communicating with or controlling spirits possessing inanimate objects or living creatures. On worlds with numerous and strong spirits, it could be the only or one of a few paths necessary to succeed as a ritual magician; the GM is free to adjust the available spells to his game world, from a selection comparable to the other schools or paths of magic, to covering the entire spectrum for high-mana worlds. Any magical effect which could be explained as an act of a spirit possessing an object is a candidate for inclusion in this school. Thus a powerful version of this path might, for example, include a selection of Animate, Awaken, Banish, Command, Control, Cure, Divination, Find, Repel, Sense and Summon spells, but exclude most "flashy" spells, like fireballs and invisibility.

Technological Marvels and McGuffins

The highest achievements of dwarven technology is comparable in style (if not in efficiency) to that of Victorian England. However, it is rather erratically applied, with few systematic attempts at industrial mass production. The state of affairs is partly due to the animist magic component in most of their high-tech machinery, requiring the personal attention of the Steamlord and his closest, Status 6 Low Engineers for any of these designs to function reliably. Pre-Steamlord dwarves would have recoiled in horror at the mere idea of mass production, seeing it as a horrific insult against their craftsman's honor to let anything less than perfection leave their workshops. This leaves dwarfdom in general at an average of TL4. The Steamlord is in fact familiar with large parts of the Song of Sacrilege, and has embarked on a campaign of uniting the two paradigms of pneuma and machinery. A slow, but steady progress of sorts is being made; the GM should be able to introduce any gadget of the age of steam or steampunk literature he feels his campaign needs.

Some characteristic products coming out of the steamholds might include light battlesuits for gatekeepers on riot duty, occasional robot (golem) servants, muskets and gunpowder charges, airships and gliders, heavy mining equipment, various DaVincian one-of-a-kind experiments, lenses and clockwork, and advanced wind- and water mill designs.

While magnetism is well known, compasses and other navigational tricks are likely to be rare; dwarves don't like to travel far above ground, and make sure they either have no choice or know exactly where they are going. Interest in the night sky is minimal. Gatling guns are a definite possibility, but not in large numbers. Medicine -- in particular anything relating to mining or industrial accidents, respiratory illnesses, and prosthetics -- is fairly advanced; what the Flesh Engineers can't handle, a Stonecunner might have a go at on the side. There's little interest in intellectual pursuits not related to the physical sciences, and aesthetics is practiced only as it applies to the crafts; anything hinting of mysticism is a subject of ridicule, scorn or vicious criticism. Unexplained phenomena are acknowledged, but it is assumed that the Low Engineers will soon discover the perfectly logical explanations behind them. Meanwhile, most miners are smart enough to listen to a stonecunner's advice.

Adventures Below and Above

Exploring the Deephome

Exactly what happens to outtimers who spend time on Kenner should provide years worth of debating material for parachronic science. If the GM assumes a high-tech, no-mana homeline, the characters may find themselves literally soulless in an ensouled world. On the other hand, since the world of Kenner may not even consist of atoms as homeline knows them, all sorts of mayhem -- from super powers to strange reality quakes or immunity to all spirits and spirit magic -- may be justified. Perhaps visits to Kenner are only possible in spirit, as a psychic projection, in a dreaming state or even by being born into a Kennerian body.

Once the outtimers are there, not in immediate danger of having their bodies' atoms start decaying, and, it's presumed, know how to get home, exploration may commence. The Steamlord's domain is a rather obvious target for Centran agents. How to infiltrate a civilization of people half the infiltrator's height is an exercise perhaps best left to the GM's and players' imaginations. Helping a human community attain sufficient respect to be recognized by the dwarven elite as something more than sad mockeries of dwarfdom could be a first step to getting access to deepholds as diplomats or traders. While the highest achievements of Kenner's technology alternates between being too magic-dependent or insufficiently advanced to be of much interest, some interesting results has been reached in metallurgy. Authentic "dwarf-made" artifacts would find eager buyers on a surprisingly large spectrum of worlds, and visitors might not find Kenner's numerous other sapient cultures as uninteresting as the dwarves do.

Maps

Free Dwarves

A small number of dwarven clans escaped the fall of the freeholds. They make a living among the other races as best they can, exploiting their advantages in a number of trades. Long term profits such as moneylending are popular, if risky. Trades which benefit from access to heavy machinery and high precision tools can leave clans with a considerable profit; the lumber trade, construction, and architecture is common, as well as crafts demanding long

apprenticeships and pride in a job well done (such as jewelry, stone carving, clockwork, and toys). The free clans have three castes -- Clanfather, Master and Apprentice -- and answer to no lower authority than the Clanfather. Such a clan could make great contacts and sources of unusual gadgets for a regular fantasy campaign, or expert consultants on dwarven culture for outtimers.

Some free dwarves remember the brass age, and dream of a day when they can be masters of their own deephold again. There are several potential sites, cities abandoned after natural disasters, pests, curses or invasions. The prize above all would, of course, be grand K'brea, the deepest symbol of freehold dwarfdom and, incidentally, a nearly completely impregnable fortress. There are numerous reasons to brave the unknown depths besides wholesale reclamation; consulting ancestral ghosts for lost secrets, recovering technological relics of the brass age, or just searching for lost heirlooms are among the most obvious ones. Solving the mystery of the sudden fall of K'brea could make a band of young apprentices quite famous -- and extremely wanted, should the answer turn out to render the Steamlord's honor in doubt . . .

Mapping the Deephome

Perhaps the world Infinity knows as Kenner isn't the end of it. Who knows how far the dwarves have dug, or where the Stonecunners go when they walk the seams in the deepest shafts? Maybe the underground world of the dwarves forms a timeline in itself, touching on several, or maybe even hundreds of different abovegrounds. What secrets could the dwarves learn from the inhabitants of these strange and far-off lands? Do they even know that the places they dig to aren't all part of the same planet? What if visiting outtimers set the stonecunners on the scent of homeline?

Everyone Loves The Steamlord! The Steamlord Is Thy Friend!

"You are the Steamlord's Chosen! Today, You are the Most Fortunate among Dwarfdom! So listen up, Gatekeepers! On this most efficient of days, *you* have been awarded a mission of the Deepest Significance! Sightings of Traitors, Highdwarves and possible Kobolds with false beards have been reported in sector XXXIV-Blue!!! The Steamlord himself has granted you the Honor of eradicating this threat to the Deephold! Report to Low Engineer M'hdbharsar-hren-Hc for release of equipment Vitally Important to the successful resolution of your Mission! Leeeeeeeeft-hrun! Hwun-too-hree-faah! 'Hi-ho- for the Steamlord we will crush our foe . . . ' Sing it, you kneebiting sons of roofsuckers!"

Echoes Of World War II

by James Ryman Bierly

On September 1, 1939, Nazi troops invaded Poland, and events were set in motion that would change the world forever. The Western world was shaped by the events of World War II on a scale that few other historical events can match. With the second world war came the dawning of the nuclear age, the beginning of the Cold War, and the creation of the nation of Israel and the United Nations. But the war did more than simply change the world's political landscape and create new technologies. It imprinted powerful lessons and themes on our collective consciousness, which have since taken on an almost mythic quality. Echoes of World War II reverberate in many great works of literature, especially genre fiction written in the years since. Let's examine some of those themes and ideas, and consider how they can be applied to a fantasy roleplaying campaign.

The Use Of Great Power Can Create More Problems Than It Solves

The detonation of the atomic bombs over Hiroshima and Nagasaki brought the second world war to an end. Years of conflict were finally finished and the troops could come home. It was a joyous occasion for the western world. Yet nowadays when those two fateful explosions are spoken of it is often in ominous tones. The Atomic Age brought a new level of fear to all international relations. Now, the entire world could be wiped out with the press of a button., not to mention the thousands of innocents killed in Japan by the bombs themselves. The use of maximum force ended the enemy threat, but spawned a far more deadly danger.

Roleplaying Applications

- Grant the players a useful magic item, but whenever the item is used, the player who used the item suffers in some way. Perhaps she gradually turns to stone, or becomes more evil, or changes into another race.
- While doing spell research, allow a player (or NPC) to create a powerful spell at a fairly low level. After the PC has cast the spell a few times, word will spread of its existence. Mages will come from far and wide to try to learn the spell, and many of them will use force if necessary. Once the technique has been learned by others, players will begin encountering it all over the world. Those mages who know the spell will have a great advantage over those who do not.
- The kingdom the players are allied with is at war with an evil nation. The ruler of the good kingdom discovers a shortcut to victory. Insert the quest of your choice here. But when the shortcut is taken, it unleashes a greater evil. Perhaps the players are sent to destroy a magic jewel which grants the enemy mages their power. When they do, it opens a portal to hell!

The Unifying Power of Evil

After the "War to End All Wars," Germany was in desperate straits. It had been thoroughly crushed by the first world war. Its economy was in ruins, and national pride was at an all-time low. As various factions fought for control of the battered country, Germany needed a savior. And that is what they got in Adolf Hitler. He united the people of Germany, and rallied them to war with a dream of world conquest and Arian supremacy. In hindsight, the lesson here is that, when a group of people are divided and desperate, they will sometimes allow evil men to rule them if the evil men can bring stability.

Roleplaying Applications

- A certain race -- be they orcs, vampires, demons, dragons, aliens, or what have you -- attempted to conquer the world but were defeated. However, their numbers are still great. A charismatic leader comes along and unites them, and the struggle is renewed. (In the years since WWII this plot has become a sci-fi/fantasy staple.)

- Brutal civil war and racial hatred has ripped a nation apart, and the battered people are looking for something to bring them out of the chaos and unite them once more. Adventurers may be needed seek famous relics from the glory days of the past which may help restore national pride and serve as a symbol of hope.
- If things get bad enough, the heroes may be forced to take up arms and unite a divided nation by force before the evil demagogue wins over the hearts of the people.

The Problem Of Appeasement

Hitler was allowed to violate the terms of the Treaty of the Versailles and rearm Germany because the world powers did not wish to risk another world war. They chose to stand idle when Hitler forcibly annexed Austria and Czechoslovakia. Had the League Of Nations acted sooner, a second World War may have been prevented.

Roleplaying Applications

- The heroes know that an extremely influential noble in their world is evil, but the power players of the game world chose to overlook his foul deeds. Many of them benefit from his existence, and would be greatly angered should anything happen to him. The PCs must decide if they are willing to risk everything to destroy the villain.
- The PCs must weigh the consequences of defeating a villain against the costs to themselves and the world.

The Horror Of The Concentration Camps

Adolf Hitler needed a scapegoat for the problems of Germany, and he chose the Jewish people. The Jews were moved to concentration camps, then killed. In the USA, hostility toward the Japanese reached an all time high when thousands of Asians were placed in internment camps for the duration of the war. Concentration camps hold some of the most chilling memories of World War Two.

Roleplaying Applications

- If the players hear that the local king is rounding up all the citizens of a certain race, they will instantly be suspicious. The king has become evil, and is using the members of the race for hideous experiments. Perhaps one of the heroes is a member of the race that is being gathered, and must avoid the king's troops.
- Alternatively, perhaps the king has good reasons for rounding up the members of a certain race. This plays against players' natural reactions to concentration camps, and makes an excellent twist to a scenario. Perhaps there is a plague ripping through the pixie community, and only one wizard (loyal to the king) capable of curing it. The king has rounded up all the pixies in order to cure them. Will the PCs distaste and distrust of such institutions be swayed? Might they try to keep an eye on the proceedings?
- Another twist on this concept is to have the king originally round up a certain race because of Good or at least Neutral reasons, but as time goes on the camps become institutions of evil. The pixies are originally gathered together so that they can be healed, but once the healing is completed the king begins getting missives from people who think their towns are better off without pixies. So the king orders that the pixies stay in the camps. Eventually, he decides the cost of maintaining the camps is too great, and orders the deaths of the pixies. Can the heroes save this peaceful race from extinction?
- When the PCs are placed in a concentration camp, they must find a way to liberate themselves. While there, they meet many of the other innocents interred there. Should they merely save their own skins, or try to rescue those around them as well?

The events of the past provide many themes that can enhance a roleplaying campaign. World War II may be over, but echoes of that conflict still resonate in our society today.

Ajani the Soul-Thief

for *GURPS Fourth Edition*

by Bevan Thomas

Raised by a plains-dwelling tribe, even at a young age Ajani demonstrated an affinity for the spirit world. When Ajani came of age, he was apprenticed to the local shaman. As part of his initiation, Ajani was transported to the Underworld to gain an understanding of the passage of the soul. Ajani's encounter with this gloomy, mist-shrouded land shook him to his core, and at that moment Ajani decided that he would never find himself trapped there. He would never die.

Though for the next few years Ajani seemed to serve his master well, he secretly studied forbidden sorcery, learning how to bend demons to his will. When his master confronted Ajani on his use of the dark art, Ajani killed him and fled. With his dying breaths, the old shaman cursed Ajani, saying that "you will feel your life slowly waste away within you, until your body is nothing but a hollow shell and your soul is sent screaming into darkness." As Ajani felt the curse wash over him, other members of the tribe saw him standing over the body of the shaman, and realized the horrible act that Ajani had committed. They drove Ajani out, forcing him into the wilderness.

For the next few weeks, Ajani did his best to survive on his own, too filled with fear and guilt to attempt to reenter his tribe. In horror, Ajani experienced the extent of the curse as he felt his life slowly bleeding from him. No spell or herb that he knew could heal him, and so in desperation he summoned a powerful demon and struck a deal. The demon taught Ajani a spell that would allow him to replenish his lost life-force by consuming the souls of others, and in return he released the demon and six of the demon's brothers against his former tribe, allowing the demons to feast upon the souls there. Horrified at what he had done, Ajani fled and wandered the wild, racked with grief.

Eventually he arrived at a village belonging to another tribe, and was already starting to again feel the effects of the shaman's curse. In desperation, Ajani murdered a woman and then drank her essence, escaping again before the crime could be discovered. However, whenever he started to feel the hunger again, he struck.

Over the years, this cycle continued, and it has taken its toll on Ajani. He has become emaciated and worn, with a face that appears stretched. However, more drastically has been the cycle's affect on his mind. Ajani has become isolated from all those around him. He no longer agonizes over the lives he steals, but instead feeds off of them with no more concern than any predator has for its prey.

Ajani is not particularly brave, and prefer to strike from the shadows, using blowpipe darts tipped with a paralytic drug in order to stun his victims so that he may get close enough to drain their essence.

Ajani in the Campaign

Most of the elements of his background are generic, and should be modified as appropriate for the campaign. Relevant specialties would probably be replaced with terms that directly relate to the campaign world's tribal cultures, such as changing Religious Rituals (shamanism) to Religious Rituals (Wolf Clan rites) or replacing Survival (plains) with another Survival specialty if the tribe that the GM wishes Ajani to come from makes its home in another environment (such as the frozen tundra or a dense jungle).

The most likely role for Ajani in the campaign is that of an adversary. Most player characters would have little sympathy for Ajani goals and would seek to end the shaman's soul-feasting. Ajani is a particularly deadly adversary due to the subtlety of his magic. His enemies often do not recognize that supernatural forces are being brought against them until Ajani finally devours their life-essence. The trail of soul-drained bodies that he leaves behind him could attract the attention of PCs or people that wish to employ them, and Ajani choosing the associate of a player character for his next victim could give additional emotional intensity to a battle with the Soul-Thief.

Because of Ajani's solitary nature, he has no allies. However, he is willing to scavenge off of the works of others, using wars, purges, and other such events as smoke-screens for his own actions. Some people believed to have died in battle were actually spirited away from the conflict by Ajani and then had their souls extracted for his sustenance.

Ajani   *300 points*

Attributes: **ST** 8 [-20]; **DX** 10 [0]; **IQ** 14 [60]; **HT** 12 [20]
Will 16 [10]; Per 14 [0]; HP 8 [0]; FP 14 [6]
Base Speed: 5.5 [0] Basic Move: 5 [0]
Basic Damage: Thrust 1d-3, Swing 1d-2

Advantages: Channeling [10], Medium [10], Ritual Magery 1 [15], Oracle [15], Spirit Empathy [10] Perk: Autotrance [1]

Disadvantages: Callous [-5], Dependency (human soul-essence, occasional, illegal, weekly, aging +30%)[-65], Illiteracy [-3], Loner [-5], Obsession (living forever) [-10], Skinny [-5], Unattractive [-4]

Languages: Native [0], three others at accented [12]

Skills: Blowpipe-10 [4], Bow-10 [2], Dreaming-14 [1], Esoteric Medicine-13 (tribal healing) [2], Fast-Talk-13 [1], Herb Lore-13 [2], Hidden Lore (spirit lore)-15 [4], Intimidation-15 [1], Knife-11 [2], Meditation-16 [4], Naturalist-14 [2], Occultism-15 [4], Poisons-13 [2], Religious Ritual-13 (shamanism) [2], Ritual Magic-16 (malefic shamanism) [16], Staff-11 [4], Stealth-13 [8], Survival-14 (plains) [2], Symbol Drawing-15 (malefic shamanism) [8]

Paths: Path of Body Control-13 [6], Path of the Gate-16 [16], Path of Healing-16 [16], Path of Knowledge-16 [16], Path of Necromancy-16 [16]

Rituals: Analyze Magic-15 [1], Aura-16 [1], Banish-16 [10], Bottle the Soul-19 [5], Deathtouch-15 [10], Death Vision-18 [2], Detect Magic-17 [1], Great Healing-14 [4], Identify Spell-16 [1], Lend Energy-16 [1], Lend Vitality-16 [1], Major Healing-15 [2], Minor Healing-15 [1], Pain-14 [2], Paralyze Limb-11 [3], Plane Shift (Home Plane)-13 [8], Plane Shift (Underworld)-13 [8], Recover Energy-20 [5], Rooted Feet-11 [1], Seeker-15 [3], Sense Spirit-20 [5], Spasm-15 [2], Summon Demon-15 [9], Summon Spirit-19 [3], Trace-15 [4], Wither Limb-10 [4]

Bottle the Soul

This spell lets the caster trap the target's soul so that it can later be used to invigorate the caster.

The spell can only be cast on someone who is already dying, and during the spell, the target's dying breath must be trapped within a bottle. If the bottle's stopper is ever removed, then the essence escapes, and the spell is canceled; furthermore, the essence will automatically escape after 72 hours.

In order to complete the spell, the caster must drink the soul that is trapped in the bottle. Drinking the essence will make the caster one year younger, and also alleviate the caster from the need to make any aging rolls for one year. However, it also means that the target has been completely annihilated, and so cannot be resurrected, have his spirit summoned, or in any way be interacted with from beyond.

College: Necromancy.
Duration: See above.
Cost: 4
Time to cast: 1 minute.
Prerequisites: Magery 2, Lend Vitality, and Summon Spirit

Ticket to Ride: Märklin Edition

Published by [Days of Wonder](#)

Designed by Alan R. Moon

Boxed, full-color, two to five players; map board, 240 train cars in five colors, 15 passengers (three per player), five scoring markers, 118 train cards, 46 destination tickets, 74 merchandise tokens, & rule booklet; $39.95

Ticket to Ride: Märklin Edition is the third in Days of Wonder's popular and award-winning series of railroad building games. Märklin, for those not in the know, is one of the biggest names in the model train hobby (in fact, going first depends on being the owner of the most Märklin cars), and they lend images from some of their products to cards in the game.

The object of the game remains to score the highest at the end of the game.

As in previous editions, players take turns collecting train cards, building sections of rail, and selecting destinations. To connect a pair of cities, you have to play as many cards of like color as there are sections of track between the two locations. Locomotives are wild cards that can be substituted for the colored "cars." You get points for each segment of train you complete and for each ticket you finish (tickets show two cities you have to unite with your rail lines).

Unlike those others, there's no reward here for achieving the longest continuous stretch of track; instead, there's a bonus for finishing the most tickets. You're now building on a map of Germany from one nearly unpronounceable burg to the next, with a few of the lines leading into nearby countries (some of which do figure into the destination tickets). Locomotive cards come in a couple of versions: the old wild cards, and the new "4+" variety. The latter are still wild, but are only useable if you're building a track of four or more segments (though there are many more of those on this map -- it tends to be a higher-scoring game).

The biggest single change, however, is passengers. Unlike a lot of railroading games, the ***Ticket To Ride*** series was all about laying down track and that was about it; there was no sense that there was travel or commerce. But with ***Ticket to Ride: Märklin Edition*** you have both. When you fill in a section with your train cars, you may place one of your three passengers on one of the two connected cities. As your action in a future turn, you may then have the traveler move along your lines to collect tokens from little stacks at certain cities. The larger the town, the more trading there is. The setup is the same each game, with Berlin offering the highest-scoring opportunities. When the first counter is taken, the next one down is worth one less, and eventually the piles may become exhausted. Send a passenger on his trip too early and you won't have the lines to visit enough cities. Wait too long, and someone else beats you to the goods. Once he's done with his run, the passenger is removed from play.

Accordingly, there's a new card type one may draw from the train deck, with a picture of a passenger on it. If you have these, you may play them as your traveler moves about the board. Each one allows you to use a section of someone else's track for your itinerary, and that can be critical to plugging holes in your almost-complete rail line.

Those Märklin pictures are a nice graphical addition to the game. There are some positively spiffy locomotives, and these complement the game's overall post-modern look well. The merchandise tokens are small, and picking them up makes you feel you're all thumbs (especially since, when you try to gather them, you're striving to avoid accidentally pushing already-placed train cars out of the way to get to them), but the size is the only shortcoming among the pieces. One really nice feature is that someone thought to design the scoring counters to stack in case two or more players

have to share the same value on the point track along the board's edge.

Perhaps there was pressure to create a version using travel, but if this edition is pandering, it's pandering of the best sort. European game designers seem to have a knack for releasing the same game with just enough of the right tweaks to make it a different game or to change the strategy one uses. The massive rail systems of old may not serve you as well as a staccato sprinkling of smaller segments that account for a somewhat scattered selection of destination start and stop points. Whether it's having to familiarize yourself with the ins and outs of a whole new map or learning to build rail lines in a way that offers you the best merchandise routes, *Ticket to Ride: Märklin Edition* throws the switch on the tracks once more, keeping what works and adding what keeps the franchise a success.

Blue Rose: The Roleplaying Game of Romantic Fantasy

Published by [Green Ronin Publishing](#)

Designed by Jeremy Crawford, Dawn Elliot, Steve Kenson, & John Snead

Cover by Stephanie Pui-Min Law

Illustrated by Elaine "Lilith" Bettocci, Elizabeth Danforth, Eliza Gauger, Jonathan Kirtz, Stephanie Pui-Min Law, Leo Lingas, Jennifer Meyer, & Lisa Wood

Cartography by Phillip Lienau

224-page b&w softcover; $29.95

Blue Rose marks the *d20 System's* entry of the into a genre of kinder, gentler, even more feminine RPGs currently occupied by *[Hearts, Swords, Flowers](#)* and *Cat the RPG.* Inspired by the novels of Diane Duane, Mercedes Lackey, and Robin McKinley, this is the roleplaying game of romantic fantasy, a sub-genre that places the emphasis upon relationships, entanglements, love, and romance, rather than monster slaying, epic quests, or saving the world from some great evil. Except that it is not a *d20 System* RPG.

Taking its cue from the publisher's highly acclaimed *[Mutants & Masterminds](#)* the designers of *Blue Rose* go several steps further in taking a filleting knife to the meat of the *d20 System.* The result is that this OGL title is powered by the new *True20* system, which retains the *d20 System's* salient features -- such as the d20 roll plus modifiers mechanic, and the feats -- but simplifies their use and application. One result has been that the *True20* system has been spun off and released as a stand-alone product, *True20 Adventure Roleplaying.*

The setting for *Blue Rose* is Aldea, a young world with barely 1,500 years of recorded history. Prior to this in the Mythic Age, the Gods of Light created the world as an exercise in joy, before using it as a vessel to protect souls from Shadow's corruptive influence. Indeed the cycle of life and death was introduced together with reincarnation to ensure the continued existence of souls. More specifically, *Blue Rose* focuses on Aldis, the Kingdom Of The Blue Rose, a beacon of understanding, tolerance, and Light following the Dark Age of the Sorcerer Kings. Ruled wisely by the young Queen Jaellin, selected like her forebears for her fine qualities by the Golden Hart (which can also deselect the Monarch, and has), she is aided by her Nobles (also chosen from any walk of life for their alignment to Light) and several knightly orders. These include the Sovereign's Finest, essentially trouble-shooters, that protect the kingdom from the monsters and dark magic left over from the Shadow Wars against the Sorcerer Kings, the Lich Kingdom of the Kern (last bastion of the Sorcerer Kings), and the fanatical Theocracy of Jerzon. Allied with Aldis are the Rhydan, which are intelligent animals that often become the companions to -- and even bond with -- humans. The Rhydan along with several other races are accepted in Aldis as long as they profess alignment to Light, but there are prejudices against both them and same-sex relationships in neighboring nations.

Blue Rose's paring down begins with the characteristics. Replacing the usual 3 to 18 scale of the six attributes is a scale of -5 to +5, players starting with six points to buy positive levels. In effect, players are buying the *d20 System's* characteristic bonuses, which is then applied to a d20 roll as normal.

Instead of race, a character selects a Background, which also includes various types of Rhydan -- Rhycats, Rhy-horses, and Rhy-wolves. No Rhydan is capable of speech, instead communicating through mind touch, and since they lack opposable thumbs, fine manipulation and weapon use is impossible. The stripping down continues with the concept of character classes; *Blue Rose* has just the three which it calls Roles. The Adept is a mixture of the Scholar and the Mystic, skilled in the arcane arts; the Expert is skilled in various areas; and the Warrior is a combat specialist. A Role provides skills and feats, suggesting favoured feats, and also how both can be used to model different character types, such as Healers, Bards, Nobles, Thieves, Knights, and Rangers. Skills themselves are fewer in number and are acquired on a yes/no basis, skill Rank determined by a character's level rather than being purchased as in the *d20 System.* As a character gains levels, he gains more feats, and to reflect both this and *Blue Rose's* magic system there are lots of feats listed. Interestingly, *and* radically, there is no experience point system, and instead the GM awards levels at an appropriate juncture in a campaign.

Alignment is also simplified to three: Light, Shadow, and Twilight. In addition a character has a Calling (a goal or motivation) plus a dual Nature comprised of Light and Shadow side. Both are modelled upon Tarot cards, calling upon the Major Arcana, like Death for "Creating change," or The Sun for "Championing the everyday"; and the Minor Arcana for a character's nature. Thus the Knight of Swords has Bold as its Light Nature and Boastful as its Shadow Nature. A list is given for all three. Roleplaying all three is also a method of regaining Conviction, *Blue Rose's* equivalent of action or luck points. A character begins with a few Conviction points, his maximum increasing every few levels. Conviction is expended to re-roll a die, temporarily gain an unowned feat, gain a dodge bonus or extra action, recover quicker from damage, or to escape death.

If *Blue Rose* shows the influence of *Mutants & Masterminds* anywhere, it is in its combat system, particularly with regard to damage. Instead of rolling for it, damage is a combination of a character's Strength score plus weapon damage rating. The target makes a Toughness saving throw directly against this value, the result determining a character's damage status rather than how many hit points he has lost. This can be Dazed or Staggered, Wounded or Disabled, the resulting damage condition better modelling both lethal and non-lethal damage than in the *d20 System.* For minions (or Mooks) damage is further simplified, each having only three states: normal, unconscious, or dead. Further a character can choose to inflict a lesser status upon a minion, say making them unconscious rather than killing them, thus reflecting a character's greater skill.

Blue Rose's magic is also radically different, with all characters allowed access to it, but the Adept Role possessing greater ranks. It is divided into roughly six types -- animism, healing, meditative, psychic, shaping, and visionary. Once a character has the basic talent for a type, he can select further feat-like Arcana for that type. Mechanically, they work much like skills and nor are they single use abilities. Many are capable of doing several things, and they can be used as often as a player likes, but this is offset by a fatigue cost offset for many Arcana.

Of course, magic has its dark side, Sorcery being known as the Shadow Art. It taps into the mind's dark recesses, exposing the caster to Corruption. This can also be acquired by carrying out an act of the character's Shadow Nature in a corrupt place, although Sorcery is an easier path to Corruption. Corruption's effect is to penalize a character's Constitution and Wisdom *and* loosen control of his Shadow Nature. It can be staved off with Conviction, but embracing Corruption can make a character very powerful. Fortunately redemption is possible, but it takes considerable effort.

Playing *Blue Rose* places its emphasis on social interaction and social connections, plus romantic entanglements and intrigues. The advice on this is sound enough, though no doubt could be developed further -- *Hearts, Swords, Flowers* could be of help here. The GM is also given a bestiary with its entries given in *True20* format, and a starting scenario. "The Curse of Harmony" is short, but does touch upon *Blue Rose's* various themes -- tolerance, religious differences, corruption, and giving aid, thus serving as a decent model for the GM. Finally an appendix gives guidelines for adapting other *d20 System* material.

Physically, *Blue Rose* is up to Green Ronin's usual standards with illustrations to match the genre. The writing is solid, but the book suffers from a lack of explanation in places. More examples would have helped, such as for character generation. Another problem for some might be the setting. Aldea is perhaps too saccharine, too black and white, but then it is trying to emulate a particular genre.

And in hewing to the romantic fantasy genre, **Blue Rose** could be argued as being Shoujo Manga's occidental counterpart. It definitely gives you everything necessary to play, and once past the lack of explanation, the new rules are light and simple, with an excellently designed magic system that allows a PC an easy-to-use wide choice. Indeed the magic system is so good that rename the Arcana Force Powers, rename Conviction the Force, plug in spaceships and lightsabers; and the mechanics of **Blue Rose** would be perfect for a *Star Wars* game.

While the setting for **Blue Rose** might not be everyone's cup of tea -- much like the genre it emulates -- this is not to say that it is not well done. That it certainly is, for **Blue Rose** provides the GM with everything necessary to play. Ultimately though, it is the mechanics that support the setting that really shine here, for **Blue Rose** is an elegant evolution of the **d20 System.**

--Matthew Pook

Things I Hate As A GM (Player Edition)

Okay; for the past month I've been going over the truth-table diagram, looking at the intersection of "love/hate" with "GM/Player." However, I realized early on that I was only addressing things from the point of view of things I loved or hated from manufacturers. So, never one to let a good, long-running series of columns leave the station without trying to milk that puppy 'til the cows come home, I rammed a few more metaphors together and decided to look at things I love and hate as a GM/Player, looking at GMs/Players.

Make sense?

Yeah, me neither. Suffice it to say, today we're looking at things I hate as a GM in my players.

Ready? Good!

* * *

PCs who seem to own One Of Everything. I've never been a huge fan of micromanaging equipment; I don't much care for the classic ***Dungeons & Dragons***-esque minutia of itemizing every copper piece, scrap of lint, and iota of turkey jerkey. For the most part, I usually prefer to trust players and go with the flow when they claim to possess certain common objects that I've seen most people carry: pen knives, a paper clip or two, a belt, and so on. Unfortunately, some players seem to have an unending supply of previously unknown useful items, despite no previous justification or in-character inclination toward packratitude.

Me (as GM): Okay; you approach the warehouse, and you realize it's really dark.
Player: I pull out a flashlight.
Me: You have a flashlight?
Player: Yeah; one of those police-issue ones that can double as a club.
Me: Uhhh... okay, fine. Anyway, you approach the door and discover it's locked.
Player: I pull out some lockpicks.
Me: Lockpicks?! You don't have any skill that would be useful with them . . .
Player: No, but I thought they might be useful.
Me: Right. Well, unfortunately, there's nothing to pick. It's a magnetic lock.
Player: Huh. Good thing I brought an oxyacetylene torch!
Me: . . . Luckily I brought one, too. Hand me your character sheet.

Unfortunately, it's a thorny issue, since I don't like to discourage players from being creative, and the obvious alternative some players take is to spend countless hours in "buying sprees" before an adventure. But, ultimately, my desire is for players to solve problems with their characters, not with a Bat-Utility-Belt approach that allows them to always have that 50-foot rope, power drill, and World Almanac at ready reach.

Players whose characters pry up everything that isn't nailed down. While the idea of collecting "loot" is a time-honored tradition in many games (yes, ***Dungeons & Dragons,*** I'm fixing my steely gaze on you), in many -- indeed, I argue *most* -- genres, it isn't really appropriate. After all, in my games I'm usually most interested in emulating other genres: spy movies, space opera television shows, comic books, and the like. And in most of those genres, you don't see Bond pulling out a device he looted in the last movie, or Kirk falling back on a techno-babble solution from a few episodes ago. Unfortunately, a lot of players *like* having their characters strip the fallen bodies of their foes, and they too often expect to be able to whip out those devices at a later time. And coming up with a new reason to take away their toys every single adventure weighs on my soul.

For years I favored a solution akin to ***Champions/Hero System,*** which requires players to pay character points for anything they keep. In this regard, there's no real difference between holding onto Dr. Destructablo's 12D6 Laser Blastarino and building your own. However, I think this is a bit overzealous; for example, one of the pivotal moments in Alan Moore's ***Whatever Happened to the Man of Tomorrow?*** revolves around him remebering and utilizing a

previous device. Nowadays I'm more inclined to allow players access to previous looted stuff, but force them to spend "fate points" or whatever game-altering mechanic the system uses. But that doesn't change the fact that, ideally, such uses would be few and far between; much like point #1, above, I prever the players to solve problems with their characters.

Loner PCs. Any player who consistantly forces me to take them aside so they can have their own private adventures -- bringing the rest of the group's gaming to a screeching halt -- earn a bit of inner scowling.

(Curiously, at least twice I've had players *lie* to me about the extent that their characters would be loners; I was reassured that, although their concepts included more of the loner-esque quality, they would primarily remain with the group. Usually it was about two minutes into the first adventure before said PCs wandered off.)

* * *

Anyway, that's it for this week. I wouldn't be so crass as to include a link to the beginning of my massive eBay sell-off, but instead would encourage you all to share your own thoughts on your peeves via e-mail or on the discussion boards. Next week we'll continue the non-stop love or hate, depending on our mood.

Designer's Notes: GURPS Space, Fourth Edition

Wild Life: A Worked Campaign Example

by James L. Cambias

"Wild Life" was one of three "worked example" appendices cut out of the first draft of *GURPS Space Fourth Edition* for reasons of length. The goal was to create a near-future, relatively hard-SF setting in which humans (and thus the PCs) were genuinely the underdogs. Potential themes to explore include rebellion, the ethics of collaboration and resistance, and understanding the Other.

The tone would most likely be Thriller or Action-Adventure, though it could shade into Space Opera. Genetic and psychological manipulation of humans by aliens could inject a note of horror.

The scale would start fairly small, but as the PCs and the rebellion they support gain in power, they can have more of an effect on the game world. Similarly the physical scope would initially be a single town or province, but could ultimately become interstellar.

I tried to keep the science very hard, with only one piece of "rubber science" -- the Shahar faster-than-light drive. I assumed a Hard-SF TL9, with superscience faster-than-light drives and TL10 alien biotechnology. Within those limits, it can support adventure styles ranging from harshly realistic to blatantly cinematic.

Since the days of Johannes Kepler, humans wondered if there was other intelligent life in the Universe. In 2053, they found out.

The conquest of the Solar System was fast and ruthless. The Shahar first strike destroyed satellites, missile silos and warships, and was followed quickly by landings in Earth's major cities. The ultimate Shahar weapon was the Pacification Plague -- a deadly human-specific virus. It killed 99 percent of those infected, guaranteeing that the vast majority of survivors were the humans willing to accept the Shahar antiviral drugs -- and thereby submit to their control. Half the human race died of the plague and the desperate military campaigns against the invaders, but the Shahar didn't mind; their plans for the Earth required some empty room for colonists and the new human species which they planned to create.

That was 50 years ago. The initial war of conquest ended, a series of doomed revolts were put down, and now it seems humanity has accepted its role in the Shahar Family of Species.

The Shahar

Earth's new masters are an advanced species of carnivores, who use genetic manipulation to mold conquered species into ideal servants, and to shape themselves into ideal masters.

Society

Shahar society is very stable, chiefly through the ceaseless efforts of social engineers to keep it that way. Young Shahar are constantly tested for aptitude in various fields -- military, administration, science, etc. -- and based on those

tests are trained and indoctrinated for placement in one of true numerous professional castes.

Membership in a caste guarantees certain privileges and responsibilities; in human terms it's like belonging to a combination of professional association, labor union, social class, and political party. Within its area of expertise, a caste is supreme, and all important decisions on issues affecting that area must include a caste leader in the process. Caste membership is not hereditary, but there is strong pressure to marry within one's caste. It is an explicit goal of the Shahar social engineers to make all castes genetically optimal for their jobs.

The three most important castes are the Social Engineers, the Military Officers, and the Administrators. The most respected and high-status members of those castes make up the majority of the Objective Council, which determines the long-term goals and strategies of Shahar society. The Objective Council's exact membership changes depending on what is going on. When military affairs are paramount, there are more Officer members. In peacetime, the balance shifts and more members from castes in trade, industry, and the sciences join.

Ancestry

The Shahar homeworld, Ahur, is slightly smaller than Earth, and considerably drier. Less than half its surface is covered by water, and continental drift has created a landscape with no large ocean basins. The Shahar evolved from bipedal pack hunters and scavengers in the vast dry plains of Ahur. Their small forelimbs and headlimbs originally functioned as claws for killing prey, but evolved to more general-purpose manipulators. According to Shahar texts (which may or may not be "edited" for humans), the Shahar path to intelligence began with increasingly complex communication and social behavior in hunting packs, progressed to herding of game animals and the use of language, and only then to the creation of tools.

The Planet Ahur

World Type: Standard (Garden)
Size Factor: 0.73
Blackbody Temperature: 295 K
Density: 1.1
Diameter: 0.84 Earth diameters (6,657 miles)
Mass: 0.65 Earth masses
Gravity: 0.92 G
Atmosphere: Standard (low oxygen); pressure 0.83 bars, oxygen content 12%
Hydrography: 50% ocean coverage
Average Temperature: 304° K (88° F)
Climate: Warm
Resource Modifier: 0 (average)
Affinity Rating: 8 (for Shahar)
Population: 4 billion
TL: Standard TL10 (advanced in biology and memetics)
Society: World Government, Meritocratic Caste system
Control Rating: 4
Per-Capita Income: $72,000 (Average TL10 wealth)
Economic Volume: $288 trillion
Manpower: 24,000
Facilities: 172,800
Military: 12 Armies, 4 Elite Armies (the Expeditionary Force), 6 Special Army (Aerospace Forces), 2 Special Elite Army (Expeditionary Assault Force), 12 Reserve Armies, 12 Militia Corps.
Fleet: 2 Major Fleets, 2 Minor Fleets, 1 Cruiser Squadron
Facilities: Very Large Spaceport in orbit (plus numerous Frontier spaceports at airfields

on the surface), 2 Large Naval Bases in orbit, 2 Average Naval Bases on surface, 1 Small Naval Base (exploration command, in orbit), 2 Large Shipyards in orbit, 2 orbital industrial habitats, Advanced space elevator, 40 spaceplane shuttles, 10 launch lasers. **Notes:** Ahur is a dry planet, with broad plains and rocky deserts interrupted by old mountain chains and a few shallow seas. There are no polar caps, and snow is rare even at high latitudes. It has no moons, and rotates with a period of 18 hours.

History

Roughly 100,000 years ago, overgrazing set off a catastrophic climate shift on Ahur, reducing large regions to desert. The Shahar population went into a nosedive; there may have been only a few hundred Shahar alive at the height of the crisis. The desert crisis also served as a powerful Darwinian culling of the species: the Shahar who survived understood the importance of cooperation, sound management of their lands, and long-range thinking. They were also, on average, smarter and tougher than their ancestors.

As the planet recovered, the Shahar spread across its surface once more, but they no longer lived in feuding tribes. They established a government which united the various clans and bands, resolving disputes and allocating land. At first it was a simple gathering of tribal elders, but later developed into a kind of federation. Though various tribes at times renounced it or rebelled against it, and beyond the borders groups of barbarians fought and raided, the central government (known as the Enershen, or "Family of Families") alway controlled the bulk of the planet's population.

The 20,000-year history of the Enershen is the history of the Shahar civilization, even to the present day. In that long time it has changed structure dozens of times. Since approximately 3000 BC, the government has been technocratic: plans and policies are devised and implemented by experts, selected and trained for government early in life.

Designer's Note

In creating the Shahar, I wanted alien overlords who had a good reason for trying to conquer the Galaxy. The Shahar are doing it because they think it's the right thing to do -- and who knows? They might be right. They're powerful, but they have some Achilles' Heels the human rebels can exploit. The biggest is the other subject species, who might well join an uprising.

Shahar science followed a different path than Terran. The Shahar first developed a good understanding of biology, especially ecology and genetics. That in turn led them to chemistry and thermodynamics during the first millennium BC. Electricity and magnetism came relatively late in Shahar scientific history. They had electric power by AD 1200, and an understanding of electromagnetic waves by 1400.

The first Shahar space flight was in AD 1600. A two-stage vehicle put an unmanned satellite in orbit in 1615. Exploration of their star system proceeded slowly and methodically during the 17th and 18th centuries. Computer science developed during the same era, and made the entire administration of the Enershen dramatically more efficient. As with most of their technologies, the Shahar preferred to concentrate on large, centrally-administered systems, so today they have powerful mainframe computers but no personal devices. Individuals have personal terminals instead, linked to the central systems.

One aspect of Shahar science which humans have found amusing is its tendency to go off on long, well-funded wild-goose chases. Metallurgy led to a long digression into what humans might call alchemy, while the first discoveries in quantum physics led to pointless investigations of consciousness and "psychic" phenomena. On the other hand, a similarly bogus-seeming project in 1820 to penetrate "higher dimensions" paid off handsomely with the development of the Tube Drive. Suddenly the Universe was open to the Shahar.

The first alien civilization encountered by the Shahar were the Tarcaseru, in 1853. Since at the time the Tarcaseru were still only experimenting with working iron tools, there was no real resistance to the Shahar, and the Shahar had established a colonial government before even formulating plans on what to do.

The Family of Species

The Shahar have organized themselves and six other species into a single polity, known as the Enershakun, or Family of Species. Their goal is to make all intelligent life into a single, interdependent society. To accomplish this, the Shahar have embarked on a policy of genetic engineering, selective breeding, and social manipulation of their subject species. Each is being specialized for a particular role. The Shahar, naturally, have chosen to develop their own abilities at government, manipulation, and leadership. They are be the natural-born rulers of the Family.

Gustrogins are physically the largest of the Family, and consequently the Shahar have made them workers and soldiers. The Shahar engineers have attempted to make them docile, obedient, and patient, and are working on improving their stamina and notoriously poor vision.

The Tarcaseru had a highly complex society of their own and showed a natural talent for communication and organization. The Shahar have emphasized these traits in them, turning them into a whole species of middle managers and bureaucrats. Most of the day-to-day administration of the Family of Species is conducted by Tarcaseru, and they are the most thoroughly integrated into the new society.

The Qasuti are the only completely aquatic species in the Family, and the Shahar rely on them for work and miliary operations in underwater environments. Because they live where few Shahar wish to visit, the Qasuti have retained a bit more autonomy, and have undergone little biological modification.

The Ascended are seen only infrequently on Earth, but are often encountered in orbit and in deep space. The conquest of the Ascended was an exceedingly bloody affair, and the Shahar took the unusual step of implanting symbiotic drug-producing organisms in the bodies of all Ascended who leave their home world. The drug symbiotes produce a constant supply of hormones which make the Ascended calm, peaceful, and obedient.

Finally, there are the newest members of the Family: humans. The Shahar were impressed by humans' dextrous hands, superb pattern-recognition, and capacity for sustained effort. They have decided to make humans into a new technical caste within the Family, and to that end have been developing the new human race to be less competitive, more attentive, and not as constantly sexual.

The Shahar honestly believe they are doing good. By conquering humanity and incorporating Homo sapiens into the Family of Species they are bringing peace and stability to Earth, preventing interstellar conflict, and helping to bring about the final unification of all intelligent life.

The Occupation Government

The Shahar rule Earth and the Solar System through an arrangement which is designed to encourage human loyalty to the Family of Species rather than local governments or institutions. They replaced most of the human political divisions with a new system of administrative provinces, each with a few million inhabitants.

Each province is controlled by a Provincial Administrator. The Administrators are humans or Tarcaseru in areas deemed sufficiently loyal, but in unreliable zones they are always Shahar. The Administrator commands a police force of 1,000 to 5,000 human officers; military forces are not under the Administrator's control.

The provinces in turn are grouped into large regions of about 100 million people. The 49 regions of Earth each have a Shahar Tharshen (literally "leader of families"), who controls both the provincial administrators and the regional military forces. Tharshens have wide authority in governing their regions.

Designer's Note

The discussion of the Occupation regime has been cut down somewhat. To make the Shahar conquest more plausible I originally listed some "quisling states" who supported the invaders. In retrospect I think that tied the setting too much to present-day geopolitics. How things will line up in 2053 is impossible to predict.

Off Earth, the outposts in Earth orbit and on the Moon are organized as a
single Region with only two million people, and there is another Region incorporating Mars and the outer Solar
System, which has a total of one million inhabitants.

All 51 Regions are under the ultimate authority of the Tharshathar (literally, "leader of leaders"), who is the ruler of
the Solar System and answers to the Social Engineers on Ahur.

Technology

The Shahar and the Enershakun in general are a mature TL9. Earth and the human outposts in the Solar System are a
mix of old TL8 and new TL9 equipment.

The Tube Drive

One "emergent superscience" which enabled the Shahar to conquer other civilizations is the Tube Drive, or
Hetharushath. It creates a temporary wormhole linking distant points in space. The Tube Drive gets around relativity
by rearranging the geometry of spacetime. Tube Drives are incredibly power-hungry, and only the biggest spacecraft
can carry one. The effect lasts several minutes, so a whole task force can use the wormhole created by a single large
ship.

Tube Drives only work in a relatively weak gravity field. They don't function within the orbit of Mars, and ships must
stay at least half a million miles away from Jupiter. The path between the ship and the target system must be clear of
solid matter or dense gas, and can't pass through any gravity fields. The maximum practical distance for a single
wormhole is currently half a light-year, so on an interstellar voyage ships must make multiple hops. From Earth to
Ahur is about 50 light-years, which takes more than 100 wormhole hops. Each jump requires at least 2 hours to
accomplish, sometimes more depending on the power plant available.

The nature of the Tube Drive affects Shahar strategy. The ships with drives are large and incredibly expensive. They
are seldom risked in direct combat. Instead, fighting is done by smaller craft, often using strap-on boosters.

Biotechnology

The Shahar are advanced in biotechnology, reaching TL10 in some areas. Their specialties are genetic engineering and
a thorough knowledge of alien biochemistries. This lets them create tailored diseases, modify their subject species, and
improve their own genome. Brain-manipulation equipment is not available; the Shahar still don't understand the
neuroanatomy of the various species they rule to be able to link up directly to them.

Military Forces

With the Solar System finally pacified, the Shahar have significantly reduced their military commitment in the region.
The ships and troops are needed elsewhere, and the threat from rebellious humans seems to have ended. Increasingly
the job of maintaining order falls to human military forces.

Space Forces

The Shahar space forces in the Solar System no longer contains any major offensive units. The great carriers and giant
weapon platforms have gone off elsewhere. There are a handful of light starships to defend the system from external
threats, some patrol craft to monitor inhabited worlds and protect commerce, and a small group of high-speed
transports to allow rapid response to disturbances.

Ground Troops

Today there are about half a million Shahar and Gustrogin troops on Earth. The 20 Shahar divisions are mostly armor, artillery, aircraft, and special warfare units. They are accompanied by an infantry force of 20 Gustrogin divisions. The Shahar and Gustrogins are grouped into 3 rapid-reaction armies of 10 divisions each. The armies are based in Colombia, Egypt, and Vietnam, with a fourth hunting rebels in the Alaska-Siberia region.

Integrated Human Forces

Human units under Shahar command are now by far the largest military force in the Solar System. There are currently 67 human divisions with Shahar officers. Half are armed and equipped with pre-invasion TL8 gear. The other half are TL9 light infantry, either motorized or airborne. Each Region has a garrison of one or two Integrated divisions.

In addition to the infantry divisions, humans also man the only naval force remaining on Earth, a fleet of aging TL8 cruisers, destroyers and gunboats left over from before the invasion. Most coastal Regions have a couple of small boats for patrol. The cruiser and destroyer squadrons are based in Japan, Capetown, and Panama. Though they are supposed to patrol the high seas, the Shahar really still don't trust the navy completely, and are content to let the ships rust in port. A division of Qasuti undersea troops supplement the navy, and are stationed at the same bases.

Species

Shahar

The Shahar are bipeds, with powerful hind legs for running and leaping. Their forelimbs are short and tipped with nasty-looking claws, and the four jointed limbs which serve in place of jaws have sharp tips (the feeding arms function as a single "hand" and so are bought as one Extra Arm). Their skin is smooth and colored a mottled gray-green. They see with a single eye, optimized for distance vision. Shahar have extremely complex voiceboxes, and can produce a vast array of sounds. Their language includes overtones and harmonics humans simply can't perceive.

Shahar home gravity is 0.92G, and their comfortable temperature range is 55 to 110 degrees Fahrenheit. On Earth they must wear filter masks to combat the high concentration of oxygen, but can breathe normally at altitudes of 10,000 feet or more. Point cost is 70 on Earth.

> **Designer's Note**
>
> I wanted the aliens to be hard-SF aliens rather than the space opera style "men in suits" type. The Shahar social and genetic engineering lets me get away with "typecasting" each species as warriors, bureaucrats, etc. Each species has some potential adventure hooks, either as potential allies or enemies of the rebel humans.

Attribute Modifiers: IQ+1 [20], DX+1 [20], HT+2 [20]
Secondary Characteristic Modifiers: Basic Speed +0.25 [5], Per+1 [5].
Advantages: Acute Hearing +2 [2], Discriminatory Hearing [15], Extra Arm (short, -50%), [5], Extended Lifespan 1 [2], Fearlessness +1 [2], Sensitive [5], Sharp Claws [5], Social Regard (alien overlord, +1) [5], Telescopic Vision 1 [5], Ultrahearing [5].
Disadvantages: Ham-Fisted [-5], No Peripheral Vision [-15], One Eye [-15], Short Arms [-10], Weakness (excess oxygen, 1d per 5 minutes, Fatigue only -50%, mitigated by filter mask -60%) [-6].
Quirks: Attentive, Chauvinistic [-2].

Gustrogins

The Gustrogins are large, powerful creatures, and the Shahar have done their best to turn them into docile workers. Using highly intelligent beings as so many draft animals is a waste of resources, but some human xenologists suspect the Shahar have deliberately made the Gustrogins occupy an inferior role to conceal the fact that they are far superior to their "masters."

Gustrogins have six limbs -- two arms, two legs, and a middle pair which can be used as either. When standing on four legs they are two meters tall, but can rear up to four meters on their hind legs. Their taste and smell are

exceptional, but other senses are poor. Ancestral Gustrogins had a harem system, but the Shahar have almost eliminated the males because they are too aggressive and hard to control. A small number of Gustrogin males live in special compounds on Gustrog under heavy Shahar guard, and all reproduction is by artificial insemination.

The Gustrogin homeworld (Gustrog) is slightly larger than Earth, with a gravity of 1.1 and an atmospheric pressure of 90%. It is a chilly planet, and the comfort range for Gustrogins is 20 to 75 degrees.

The template represents a female Gustrogin, as males are never encountered on Earth. Males add +4 ST, Bad Temper, Code of Honor, Lecherousness, and the Social Stigma "Valuable Property." Point cost for both sexes is 104 points.

Attribute Modifiers: ST+10 [100], HT+2 [20].
Secondary Characteristic Modifiers: Per-2 [-10].
Advantages: Acute Taste/Smell +6 [12], Discriminatory Smell [15], Extended Lifespan 1 [2], 2 Extra Arms (leg manipulators reduce move by half when used as arm, -2 manual DX, -60%) [8], 2 Extra Legs (can move at half on two legs, +20%) [12], Versatile [5].
Disadvantages: Bad Sight (mitigated with lenses, -60%) [-10], Ham-Fisted [-5], Increased Consumption (4 meals per day) [-10], Restricted Diet (citrus fruit and pickles) [-10], Weakness (capsicum peppers, 1d/minute if touched or eaten) [-20].
Quirks: Congenial, Dreamer, Nosy, Proud, Sensitive [-5].

Qasuti

The Qasuti are aquatic organisms, sometimes called "star crabs" by Terrans. They are radially symmetrical, with two body segments each bearing five limbs. The rear limbs are swimming fins, and propel the Qasuti at a rapid pace underwater. The forward limbs are for catching food, building shelters, and fighting. A Qasut's body is covered with an exoskeleton, and when the forward arms are folded back they are sleek and streamlined. Unusually, a Qasut's eyes are located on its arms, just behind the pincers. A Qasut's body is a squat blimp shape a meter long, but with fins and pincers extended, the length is closer to two meters.

Qasuti come from a world with no land at all, and their ocean is somewhat more acidic than the waters of Earth. Qasuti can't eat any Terrestrial foods at all, and must wear protective suits to prevent long-term health problems from swimming in alien seawater.

While the Shahar consider the Qasuti a completely integrated and loyal species, they may be deluding themselves. The Qasuti consider the Shahar to be their dupes, helping them spread across the Galaxy and doing all the "heavy lifting" of conquest while the Qasuti simply take over all the watery parts of the Shahar empire.

Humans and Qasuti often have difficulty communicating because of the extremely alien nature of their minds. They have great difficulty "quantizing" things or breaking them up into units, rather than considering things as a continuum. To humans, all their ideas seem maddeningly fuzzy, while to Qasuti, humans (and Shahar) are apparently incapable of perceiving subtleties. Because they are aquatic, home gravity isn't especially important, and their comfortable temperature range is 25 to 80 degrees. Point cost for Qasuti is 56 points on Earth, 76 on their home planet.

Attribute Modifiers: ST -1 [-10], DX -1 [-20], HT+2 [20]
Secondary Characteristic Modifiers: Basic Speed +0.75 [15].
Advantages: 360-degree vision [25], Acute Hearing +2 [2], Discriminatory Hearing (underwater only, -30%) [10], Doesn't Breathe (gills, underwater only) [0], Enhanced Move (water speed 12) [20], 3 Extra Arms [30], Sharp Claws [5].
Disadvantages: Aquatic [0], Callous [-5], Loner [-5], Restricted Diet (native food only) [-20], Xenophilia [-10].
Quirks: Staid [-1].

Tarcaseru

The Tarcaseru serve the Shahar as a caste of administrators, bureaucrats, and middle managers. They are by far the

most loyal of the Family of Species; if anything they are more devoted to the concept than the Shahar themselves.

Their homeworld is a large, low-density planet poor in metals and heavy elements, which retarded their technological development by several millennia. During that time they evolved a very complex, stable society controlled by a hereditary caste of scribes; when the Shahar arrived, the Tarcaseru scribes effectively inserted themselves into the alien society in much the same role.

Physically, Tarcaseru are small, lithe bipeds with two arms, a tail, and scaly skin which makes them look rather like dinosaurs. The head is the most distinctive feature: a round skull with three independently movable eyes and a set of complicated biting and grinding mouthparts.

They have a very low tolerance for any metals, and cannot eat most Terran plants except those which grow in water. Tarcaseru on Earth must take chelating tablets to avoid potentially dangerous metals in the water they drink (this is a long-term health effect, and so counts as a 0-point disadvantage). They are situational hermaphrodites: a well-fed Tarcaser is female, while a hungry one is male.

A Tarcaser stands about four feet tall, and is native to a gravity of 0.75G. Their comfortable temperature range is extremely warm, even more so than the Shahar: 70 to 125 degrees. On Earth they often go about in heavy furs. Point cost to be a Tarcaser is 36 points.

Attribute Modifiers: ST -1 [-10], DX +1 [20]
Secondary Characteristic Modifiers: Per +2 [10].
Advantages: 360-degree vision [25], Enhanced Tracking 2 [10].
Disadvantages: Bad Grip [-5], Restricted Diet (only water plants and fungi) [-10].
Quirks: Careful [-1], Distractible [-1], Imaginative [-1], Responsive [-1].
Features: Diet-controlled hermaphrodites.

The Ascended

The Ascended have a fascinating evolutionary history. On their homeworld, the shallow seas are dotted with thousands of islands covered by large groves of trees which thrive in the seawater and form canopies of jungle across the shallows. The ancestors of the Ascended were tentacled undersea predators who began to climb out of the water to hunt and scavenge in the forest canopy. Over millions of years they evolved stronger arms, excellent binocular vision, and the ability to live out of water for days at a time.

Ascended civilization is quite old. By the time the first Shahar expeditions reached their home system, the Ascended homeworld was surrounded by a belt of orbital habitats, home to tens of millions of individuals.

Their lack of political unity was what enabled the Shahar to conquer the Ascended. Ascended civilization never developed large states; their "natural" polity is apparently a small community of a few hundred, jealously territorial and fiercely independent. Ascended communities also function as economic enterprises, like a combination small town, collective farm, kibbutz, and corporation. The Shahar were able to snap them up one at a time, often allying with a coalition of rival communities to defeat a powerful one.

They are completely silent, communicating by color-changes and sign language. They have four powerful arms for climbing and walking, and four smaller tentacles for feeding. Unlike Terran cephalopods they cannot use jet propulsion underwater. Ascendeds have excellent vision, with four eyes -- two optimized for underwater darkness and two set close together for depth perception among the treetops. They are omnivores, tending more to meat-eating. Home gravity for the Ascended is 0.8G.

The template below depicts a modified Ascended with a Shahar drug implant for personality regulation. Without it their self-control numbers for Bad Temper, Loner, and Selfish are 9- instead of 15-. Since they are citizens of an interstellar state, there is no disadvantage for inhuman appearance. Cost with the implant is 53 points; cost without is 33 points.

Attribute Modifiers: ST-2 [-20], DX+1 [20].
Secondary Characteristic Modifiers: Basic Move -4 (walking only, -50%) [-10], Per+2 [10], FP-2 [-6].
Advantages: Amphibious [10], Brachiator [5], 2 Extra Arms (extra-flexible, +50%) [30], 4 Extra Arms (foot manipulators, -30%) [28], Flexibility [5], Gills [10], Immunity (all forms of space or motion sickness) [10], Mute (mitigated by talking hand computers, -60%) [-10], Nicitating Membrane 1 [1], Night Vision 5 [5], No Neck [5], Temperature Tolerance 1 (30 to 95 degrees) [1].
Disadvantages: Bad Temper (15) [-5*], Curious [-5*], Dependency (seawater, weekly) [10], Hard of Hearing (not in water, -10%) [-9], Loner (15) [-2*], Oblivious [-5], Selfish (15) [-2*].
Quirks: Broad-Minded [-1], Careful [-1], Imaginative [-1].
* Control numbers include effect of drug implant.
Features: Skin changes color with mood.

New Humans

Also known as Shuman, Shiseiji, and many more unprintable terms. If the Shahar get their way, these are the future of humanity. Among Wild Humans, New Humans get a -2 reaction penalty, but not among the bulk of the population. Point cost for a New Human is 4.

Secondary Characteristic Modifiers: Will -1 [-5].
Advantages: High Manual Dexterity +2 [10], Single-Minded [5]
Disadvantages: Selfless [-5].
Quirks: Sterile (can be reversed by hormone shots) [-1].

Wild Humans

The human groups who are still actively trying to fight off the alien conquerers are known as "Wild Humans" both among themselves and to the Shahar. That they have managed to survive at all is impressive, but their lack of cooperation has greatly reduced their effectiveness at fighting the aliens.

The Immune

The Immune are humans who survived the Pacification Plague. They and their descendants are naturally resistant to the virus. The trait is recessive, however, so only children of two Immune parents are themselves Immunes (though they do carry the gene). All Immunes have the advantage Immunity to Pacification Plague [5 points].

Immunes have gathered in Great Britain, which was hit hard during the initial invasion. Today there are nearly two million Immunes living in the rebuilt sections of London. As one might expect, they are a mix of peoples from all over the Earth.

Organization

The Immune community has an organization which is both very informal and very secure. Families are the most important unit of Immune society, and the most prominent members of each family meet with other leaders to reach decisions. At the top are the inner circle known as "Elders" (though age is not the only qualification). One's importance within the Immune power structure largely mirrors one's social role in everyday life, so that the Elders are all people with substantial personal influence and resources.

Designer's Note

I wanted to provide a range of human rebel groups to support different campaign styles. The Seawolves are good for straight military adventure. The Immunes lend themselves to paranoia and intrigue. The Miranda group allows space adventure and the chance to voyage to other star systems. The Resistance is best for small-scale rebel activities, and makes a good starter frame for low-powered characters. Several of the original chapter vignettes chronicled the exploits of the Alien Fighter Army.

The clannishness of Immune society makes it very hard for anyone to infiltrate, and it feeds on and reinforces the need to keep the existence of the Immunes secret from outsiders.

The Immunes do not have much in the way of military hardware or weapons. They do maintain a few caches of small arms and explosives, but those are mostly for use defending the secret of the Immunes rather than for fighting the Shahar. Their biggest asset is simply their numbers and loyalty, as they have gradually infiltrated much of the Shahar administration in the ten provinces of the British Isles. This gives them excellent sources of information and a limited ability to influence policy by altering information.

Goals and Methods

The Immune leadership takes a very long view. Their plan is simply to exist and conceal their nature. Over time they will increase their numbers and gain access to higher positions within the Shahar government. They do have extremely good internal security and deep-cover infiltration techniques, and are very well-disciplined. They almost never resort to direct action, and on the very rare occasions when Immune leaders have authorized violence, the operations have been very thoroughly planned, with an emphasis on total secrecy.

Staying hidden is the keystone of Immune strategy. This means they must avoid any testing which might reveal their virus resistance. To compensate, a substantial proportion of Immunes have gone into medical professions. This also allows them to search for carriers of the Immune gene, and falsify records to conceal oddities in the distribution of antiviral drugs.

A small sub-faction of Immunes insist that the Shahar will eventually discover their existence, and either develop a completely new Pacification Plague or simply round up all the Immunes. This group wans to make common cause with other rebel factions and prepare for war. As yet, they have had no influence on the leaders.

Relations with Other Factions

The Immune are not on the best of terms with the other rebel groups. Many Immune leaders believe that the Shahar antiviral drugs somehow "tainted" the recipients, so that everyone who is not n Immune is no longer a true human. Most Earth-based wild humans think the Immunes are nothing more than an unusually eccentric Resistance band; only the top Seawolf command knows otherwise. They have limited contact with the Miranda colony, and a handful of Immunes have been smuggled off Earth to Miranda in the hope of eventually creating a resistant population there.

Sea Wolves

The Shahar homeworld is drier than Earth, and quirks of continental drift left it with few large ocean basins or strategic waterways. Naval warfare was never a major part of Shahar military thinking. During the invasion the Shahar were unable to locate many Terran submarines. Twenty subs -- mostly American and Russian -- were ordered to remain hidden as the nucleus of a resistance force. Over the past decades the submariners established secret bases in the Arctic and on the sea floor, made contact with other resistance organizations, and trained up new sailors to carry on the fight.

Leadership and Structure

The Seawolves consider themselves a military force and so have a very well-defined chain of command. The entire service is under the control of the SCAN (Supreme Commander, Allied Navies). Noncombatants are under Naval discipline.

Bases and Assets

At present the Seawolves have 12 nuclear submarines, carefully maintained and upgraded whenever possible with stolen Shahar technology. They also have a handful of small minisubs, surface boats, and a growing number of

aircraft. Over the years the Seawolves have stolen or built a number of special weapons, including nuclear X-ray laser warheads to knock out Shahar spacecraft and satellites, a powerful EMP weapon capable (in theory) of destroying electronics in an entire continent, and a giant particle accelerator occupying the whole length of a nuclear attack sub.

There are four main Seawolf bases. The biggest is Svoboda ("Freedom") on the sea floor north of Siberia. The core of the base is a Cold War relic: a hidden Soviet submarine resupply station. Today it is a cramped but thriving town of nearly 10,000 people, and is where most of the Seawolf construction and maintenance facilities are located. Next-largest is the semi-public base at Ducie Island, near Pitcairn Island in the Pacific. The Ducie settlement is apparently an outpost of refugees, living a simple life fishing and farming. Most of the Seawolf children and elderly live on Ducie.

The third biggest base is the research lab and backup maintenance facility on the Amery Ice Shelf in Antarctica. Amery is where the Seawolves analyze captured Shahar technology and try to develop weapons and countermeasures for use against the aliens. The smallest permanent Seawolf enclave is an underground complex on Ellesmere Island in northern Canada. It has powerful radio and optical monitoring equipment, and is used for eavesdropping on Shahar communications traffic and observing their ships in space. It is also a backup weapons store, and has the Seawolves' supply of land-based anti-space missiles.

Goals and Tactics

The Seawolves are not interested in anything less than the defeat of the Shahar. To accomplish this, they are pursuing three main goals. First, learning as much about enemy capabilities and weaknesses as possible. Second, developing weapons to use against them. Third, keeping the flame of resistance alive and remaining a force in being.

Intelligence-gathering is done by a variety of means. The Seawolves maintain contact with land-based resistance groups. Sometimes they make use of resistance organizations to support espionage missions by navy personnel. They also have an extensive network of listening and observation posts. The Seawolves are undoubtedly the best-informed faction of Wild Humans.

Weapon development has lagged behind, due to a crippling lack of scientists. The Seawolves do their best to figure out captured Shahar equipment, and have refitted some of their subs with alien weaponry.

Finally, supporting resistance and protecting their own existence is the task which takes up most of the resources of the Seawolves. They try to stay in contact with all of the other resistance groups. They also raid commercial shipping when no Shahar satellites are overhead.

Relations with Other Factions

The Seawolves try to remain on good terms with anyone who wants to fight the Shahar. They stay in touch with the Miranda colony via encrypted radio burst transmissions, and have agents all over the Earth. While most of the other resistance factions are grateful for the support and information the Seawolves provide, they do generate a certain amount of resentment because of their attitude that they are the only "real professionals" fighting the Shahar.

The Miranda Colony

During the chaos of the invasion, four human spacecraft managed to remain hidden, and arranged a rendezvous in orbit about the planet Uranus. The crews took refuge in the maze-like interior of the moon Miranda, and over the past 50 years the colony has grown to a population of 239 people. The Miranda colony has been carrying out a vast project to build self-replicating robot mining machinery and automated factories, so the human population is now dwarfed by the number of robots on Miranda -- approximately 20,000. With their robotic labor force, the Miranda group can offer immense space-based industrial capacity in the event of a full-scale revolt against the Shahar.

Leadership and Structure

The Miranda colony is entirely democratic, with all major decisions made by a vote of the adult population. Oversight of specific projects is assigned to individuals, who must report to the colony as a whole from time to time.

Because direct neural-interface links are part of daily life for the Miranda community, much of their decision-making is done over the colony's computer network. To outsiders, this makes the Miranda group look a lot like some kind of creepy hive mind. Coupled with their lavish use of cybernetic implants, this gives them an unsettling resemblance to sinister cyborgs in pre-invasion SF movies.

Bases and Assets

The colony is a large underground complex inside the Uranian moon Miranda. The moon's interior is a maze of faults and fracture planes, with large natural voids. The colony's mining operations have expanded on the original caves to create a vast network of passages and chambers extending hundreds of kilometers. The colony is now comfortably large for its few human inhabitants, and their hydroponic farms produce a steady (if not very diverse) supply of food.

To launch vehicles without telltale rocket flares, the colonists built a large magnetic catapult. Its exit is disguised as a crater, and waste heat is dumped into the moon's icy interior. Using the catapult, the Miranda rebels can put unmanned spacecraft anywhere in the Solar System with minimal chance of detection.

Of the four spacecraft which brought the refugees to Miranda, two had to be cannibalized to create the colony in the first place. The other two have been upgraded and armed, and are the core of a growing space fleet.

Objectives

The Miranda group is facing a crisis. The old rebels who dreamed of leading a robot armada to liberate Earth are becoming a minority. They are opposed by a newer faction which proposes to seek out a new home for humanity among the stars. Since both sides agree that there is a need for more spacecraft, the colony is expanding the shipyards. But until they can reach consensus and decide whether to build insystem warships or interstellar arks, very few craft are actually being launched.

Relations With Other Factions

The Miranda colony is physically the most isolated Wild Human group, and that makes it hard for them to keep in touch with the other factions. The Mirandans almost never communicate directly with Earth. Instead they use repeater drones or stealthy spacecraft to get messages to contacts on Mars or Earth, while satellites or probes pick up transmissions for relay to Miranda.

They have limited but secure contact with the Seawolves. The Mirandans see the Seawolves as reliable allies, but worry that their focus on Earth itself is too narrow. They have very little contact with the Immunes, since Mirandan cybernetic augmentation plays into the Immune attitude that they are the only true humans left. Their chief allies among the Resistance are the Alien Fighter Army in Japan and the Red Freedom group on Mars.

The Resistance

The Resistance is the term for a very loose, widespread group of rebels against the Shahar, spread across Earth and Mars. Its very diffuse nature has made it hard for the Shahar to wipe out completely, but it also limits the effectiveness of what could otherwise be the most powerful Wild Human group.

Leadership and Structure

The Resistance is made up of a great variety of groups with many different styles of organization. In North America and Australia, Resistance cells are mostly "militia" units with elected officers and a quasi-military chain of command.

In Europe and Latin America the Resistance follows the classic "cell" structure. Chinese and Russian groups are based on old criminal groups like the "Mafiya" or tongs. In South Asia and Africa the Resistance is less formally structured, and is usually based on family alliances. Japan's Resistance is an odd fusion of pre-invasion "Otaku" clubs and paranormal cultists, who call themselves the "Alien Fighter Army."

Bases and Assets

The one common element of Resistance groups is their desperate shortage of supplies and equipment. Most have nothing but small arms, with maybe a few old anti-tank rockets or grenades. In rural areas they may have a secret headquarters -- often an old bomb shelter.

What the Resistance does have is numbers. Worldwide there are nearly three million members. Unfortunately, this means the Resistance has the worst security of any of the Wild factions.

The most powerful Resistance sub-group is the Siberian Freedom Army, which preserves a remnant of the old Russian army and finances itself through protection rackets and vice operations at Siberian mining operations. The Siberian Freedom Army works closely with the Sea Wolves, and would likely be the nucleus of any land forces the submariners organize in the event of a general uprising.

Goals and Tactics

While all Resistance groups want to defeat the Shahar, most have secondary goals, usually related to how things will be run after the aliens leave. Conflict among Resistance cells is chronic, and probably half the Shahar arrests of Resistance members are sparked by anonymous tips from rivals within the movement.

Most Resistance groups content themselves with producing anti-Shahar propaganda, recruiting new members, and scrounging weapons to stockpile against The Day. More adventurous groups engage in small-scale sabotage, raids on isolated Shahar and occupation outposts, and occasional espionage.

Relations with Other Factions

As one would expect from a chaotic, undisciplined rebel movement, Resistance relations with other factions are changeable and unreliable. The Seawolves maintain ties with certain Resistance groups, especially the Siberian Freedom Army and the People's Liberation Force. The Immunes don't trust the Resistance at all, but a faction of the more activist Immunes have formed their own Resistance network in south Britain. The Miranda colony has made very tentative contact with the Alien Fighters Army in Japan.

Beyond Earth

Though the heart of the conflict between humans and Shahar is on Earth, both the Wild Humans and the aliens have operations on other worlds in the Solar System.

Earth Orbit and Luna

The invasion destroyed everything in Earth orbit, and the resulting debris coupled with some last-ditch "space denial weapons" fired by the Terrans left an unsafe zone stretching from the upper edge of the atmosphere all the way to geosynchronous orbit. For years Shahar spacecraft had to rendezvous with armored shuttles in high orbit.

A costly sweeping operation has been going on for 30 years now. The heart of

Designer's Note

One purpose of the Solar System section was to provide a "gazeteer" of the planets and moons in *GURPS Space* statistics. I've cut most of that out here in order to focus on the places relevant to the struggle against the Shahar.

the project are two giant "Dustpails" made of thick Kevlar reinforced with carbon nanotubes and layers of aerogel. Each Dustpail is a cone 100 meters wide and 200 meters long, controlled by steering jets on the rim of the mouth. They circle the Earth in elliptical retrograde orbits, swinging between geosynch and low orbit against the normal orbital motion of the debris, scooping up fragments with each pass.

The chance of getting hit by debris is low enough for spacecraft to visit Earth without much danger, but still too high for permanent bases in orbit. In low orbit (up to 200 miles altitude) and geosynchronous orbit, where the debris is most concentrated, a spacecraft has a 1 in 200 chance per hour of getting hit by something big enough to do damage (roll 3d each hour, on a 3 the vehicle takes 1d damage). Between geosynch and low orbit the chance is 1 in 200 per day.

Because Earth orbit is so unsafe, the Shahar concentrate their space assets in lunar orbit or on the surface of the Moon. The heart of their lunar presence is the old Chinese base at Mare Fecundatis, which has been enlarged into a city of 100,000 people (about half humans, with the rest Shahar, Ascended, Tarcaseru, and New Humans).

Mars

When the Shahar invasion fleet arrived, there were already 150 people on Mars. The Shahar decided to continue the terraforming program. Their technology has greatly accelerated the project, and today there are a million people on Mars and its moons. Half are New Humans, another fourth are unmodified humans, and the remainder are Shahar and Ascended.

The primary settlement on Mars is the orbital elevator terminal atop Pavonis Mons. There, a multilevel city occupies the whole mountaintop, and is home to 300,000 people. Pavonis City also houses the Shahar garrison unit for Mars: two regiments of human infantry (2,000 troops) and a squadron of Shahar aerospace fighters.

Rebel activity on Mars is limited by the hostile environment. Any overt resistance would have disastrous results. The Shahar have used a sophisticated program of memetic warfare to channel dissent among Martians into anti-Terran sentiment.

Miranda

Miranda is the smallest and innermost of Uranus's five large moons. It circles the planet every 34 hours, and keeps one face to Uranus. Miranda's diameter is 217 miles, and its surface gravity is about 0.015 G. The local temperature is typically -335 degrees Fahrenheit. Uranus orbits the Sun at an average distance of about 19 AU, taking 84 years to make a circuit.

Miranda is a mass of rock and ice with a curious patchwork appearance. At some point in its history Miranda was shattered by an impact with a large body, and the fragments recombined in a new arrangement. The interior of Miranda is a maze of fractures and chasms, which the colonists have used to hide their base, deep beneath Prospero crater.

Outside the Solar System

The Shahar control 14 star systems, occupying a roughly egg-shaped volume of space 100 light-years long by 50 wide, extending toward the constellation Scorpio. The Shahar home system lies near the center.

The Gustrogin and Tarcaser home systems are on the far side of the egg, fairly close together. Qas, the Qasuti homeworld, is the closest to Earth, and was the staging area for the conquest of humanity. The Ascended home system is somewhat apart from the others, "up" along the Galactic axis from Ahur.

In addition to the home systems there are eight colony systems within Shahar space. The newest colony project is the planet Karar, along the route between

Earth and Qas.

Karar

The Karar system is the only other place where humans are found in large numbers. It is a binary K2 pair with a large gas giant orbiting one partner. The giant has six large moons, of which two are lifebearing worlds and a third is a promising subject for terraforming. All three moons are tidally locked to their giant primary.

The inner moon is entirely covered by ocean. The majority of inhabitants are Qasuti, but there are half a dozen floating settlements for other species. The population is 260,000, of which 15,000 are New Humans.

The third moon is the size of Mars and has a thriving native biosphere. The Shahar colony has a population of just under 1 million, including 50,000 New Humans.

The fourth moon is the largest, with a mass half that of Earth, but an unbreathable methane atmosphere. The Shahar plan to terraform it, and there is a small base with a few New Humans among the staff.

The Wild Humans of the Solar System know little about the human colonists at Karar. Presumably they are there as a test of their ability to fit into the Family of Species structure. One key unknown is how the success or failure of the project will affect the rest of humanity. If the New Humans turn out to be a bad fit with the Shahar and their other subject species, will the Shahar try more modifications -- or choose extermination?

bloodless and non-destructive as possible, so that this isn't a postapocalyptic landscape.

I also wanted to give the aliens ostensibly benevolent motives. They think they're doing good, and there's a significant number of humans who have come to agree with them. That means the rebellion is as much a war of ideas as it is one of guns and bombs. It should be possible to run a low-combat campaign in which convincing key individuals is as effective as blowing stuff up.

Worlds of Power

for the *d20 System*

by Nicholas Luna

As the slathering creatures surrounded the party, our mage's brow was damp with sweat as he struggled to muster a power I'd seen him tap a thousand times before. No doubt about it: If we didn't escape this strange world fast, we were likely to leave it as dinner and spirits.

* * *

This article provides rules for varying the level of magical energy available in a game world. This provides a measure for you to create worlds where magic doesn't function as easily as it does in standard *d20 System* worlds, to a world where magic is one of the most potent forces available to mortals.

World Mana Level

Different worlds have differing amounts of ambient magical energy. This magical energy is the Mana Level. The World Mana Level affects the use of magic on a planetary (or greater) scale.

The World Mana Level has a minimum rating of -10 (dead magic) and theoretically no upper limit, although +10 is a practical limit.

Rating	Magic	Examples
-10	Impeded Magic X	Dead magic. Spells, spell-like abilities, and supernatural abilities simply do not function at this WML.
-9	Impeded Magic IX	This is the WML for "real" Earth, and similar "realistic" Earth worlds -- for game purposes.
-8	Impeded Magic VIII	
-7	Impeded Magic VII	
-6	Impeded Magic VI	
-5	Impeded Magic V	This is the WML for worlds such as Earth when Howard's most famous barbarian ruled.
-4	Impeded Magic IV	
-3	Impeded Magic III	
-2	Impeded Magic II	This is the WML for worlds such as Earth when ancient beings from beyond the stars dreamed.
-1	Impeded Magic I	This is the WML for worlds such as Earth during and after Armageddon.
+0	Normal	This is the WML for worlds like standard *d20 System* fantasy worlds, or Earth during the Sixth Sun of the Mayan Long Count. Spells, spell-like abilities, and supernatural abilities function normally.
+1	Enhanced	This is the WML for worlds such as Earth during the Fourth Sun of the

	Magic I	Mayan Long Count.
+2	Enhanced Magic II	
+3	Enhanced Magic III	This is the WML for worlds such as Earth in the future when the remnants of humanity battle each other and numerous creatures from multiple dimensions using magic and high technology.
+4	Enhanced Magic IV	
+5	Enhanced Magic V	
+6	Enhanced Magic VI	
+7	Enhanced Magic VII	
+8	Enhanced Magic VIII	
+9	Enhanced Magic IX	
+10	Enhanced Magic X	

Effects on Spells/Spell-like/Supernatural Abilities

Impeded Magic

For effects based on caster level, subtract the WML from the character's caster level to determine the spell effects. For effects not based on caster level, reduce them by (WML   10%). Increase casting times by a multiple equal to the Impeded Magic level. Fortitude and Will saves against spells receive a bonus equal to the Impeded Magic level.

For example, a 7th-level mage on a WML -5 world is going to cast a *fly* spell. This will take him (1   5) 5 standard actions to cast (essentially two full-round actions and a standard action). The duration, which would normally be seven minutes (one minute/level) is two minutes (-5 caster level) and if a creature resists, he has a +5 bonus to his Will save.

Enhanced Magic

For effects based on caster level, add the WML to the caster's effective level. Fortitude and Will save DCs are increased by the WML.

Spells, spell-like abilities, and supernatural abilities cast in enhanced magic areas automatically have certain Metamagic feats applied to them with no additional cost in spell points or spell slots.

- **Enhanced Magic I:** Spells are automatically affected by Empower Spell.
- **Enhanced Magic II:** Spells are automatically affected by Empower Spell, and Enlarge Spell.
- **Enhanced Magic III:** Spells are automatically affected by Empower Spell, Enlarge Spell, and Widen Spell.
- **Enhanced Magic IV:** Spells are automatically affected by Empower Spell, Enlarge Spell, Extend Spell, and Widen Spell.
- **Enhanced Magic V:** Spells are automatically affected by Empower Spell, Enlarge Spell, Extend Spell, Maximize Spell, and Widen Spell.
- **Enhanced Magic VI:** Spells are automatically affected by Empower Spell, Enlarge Spell, Extend Spell, Maximize Spell, and Widen Spell.

Enhanced Magic VII: Spells are automatically affected by Empower Spell, Enlarge Spell, Extend Spell, Maximize Spell, and Widen Spell.

- **Enhanced Magic VIII:** Spells are automatically affected by Empower Spell, Enlarge Spell, Extend Spell, Maximize Spell, Quicken Spell, and Widen Spell.
- **Enhanced Magic IX:** Spells are automatically affected by Empower Spell, Enlarge Spell, Extend Spell, Heighten Spell (+1), Maximize Spell, Quicken Spell, and Widen Spell.
- **Enhanced Magic X:** Spells are automatically affected by Empower Spell, Enlarge Spell, Extend Spell, Heighten Spell (+2), Maximize Spell, Quicken Spell, and Widen Spell.

For example, a 7th-level spellcaster on a +3 WML world is casting a *fireball* spell. His effective caster level is 10th, so the range of the spell is 800 ft. (400 ft.+400 ft.), and the spell is automatically Empowered, Enlarged, and Widened. This increases the range to 1,600 feet, the fireball affects a 40-ft. radius spread, and -- assuming the character puts all available damage dice into the spell -- it deals 15d6 points of damage.

Effects on Spellcasters

On worlds with Impeded Magic, spellcasters find their effective caster level reduced, as noted above. In addition, the number of spells they can use in a day is reduced. The caster level reduction applies when determining how many spell slots, or spell points the character receives. This also applies to caster level checks, such as required to penetrate spell resistance. On worlds with Enhanced Magic, the caster level increase provides a greater number of useable spells or spell points, and to caster level checks to penetrate spell resistance.

For example, on a -4 world, a 5th-level Wizard has the spell complement of a 1st-level Wizard (3 level-0 spells, 1st-level spells, or 2 spell points).

However, on a +4 world, the 5th-level Wizard would have the spell complement of a 9th-level Wizard.

Note however, that the WML has no effect on the maximum spell level of spells that a character can use.

Effects on Spellcasting

Impeded Magic

To cast a spell on a world with the Impeded Magic traits (-1 to -9), the spellcaster must roll a caster level check. The DC for this check is 20 + spell level + Impeded Magic Level. So, if a mage wants to cast fireball while on a WML -5 world, he must roll a caster level check with a DC of 20 + 3 + 5 = 28.

Enhanced Magic

Casting a spell on an Enhanced Magic world is the same as casting a spell on a +0 world, with the modifications to the spells as described above.

Effects on Magic Items

The effects of magic are based on the WML in which they are created. Taking items from one WML to another can alter the power of the item.

Armor and Shields: For the basic bonus provided, apply the difference between the creation WML and the current WML to the bonus. For example, a +1 heavy wooden shield created on a standard **_d20 System_** world (+0) is taken to a +3 WML world. So on the +3 WML world, the shield is in practice, a +4 heavy wooden shield. A +1 heavy wooden shield created on +3 WML world and taken to a -1 WML world would provide no magical bonuses. Other armor abilities function as described, unless they duplicate an effect that would be modified by caster level or the other rules

concerning the WML. Items that provide skill bonuses apply the same modifier as the enhancement bonus x2.

Weapons: Weapons are modified in the same manner as armor and shields.

Potions: Potions simply provide spell effects, and are modified in the same manner as spells.

Rings: Rings the duplicate spell effects are modified as per spells. Rings that provide skill bonuses are modified in the same way as armor and shields. Adjudicate other effects as necessary.

Rods: Rods that act as weapons are modified as per weapons. Rods that duplicate spell effects are modified as per spells. Rods that provide skill bonuses are modified as per armor and shields. Adjudicate other effects as necessary.

Scrolls: Scrolls simply provide spell effects, and are modified in the same manner as spells.

Staffs: Staffs provide spell effects, and are modified in the same manner as spells.

Wands: Wands provide spell effects, and are modified in the same manner as spells.

Wondrous Items: Wondrous items can provide a wealth of abilities. Determine which effect described above is closest to the power of a wondrous item and modify as appropriate. For other effects, adjudicate as necessary.

Item Creation: The most significant effect of WML on magic items is in the creation process. In an Impeded setting, increases the experience point cost of an item by (Impeded Magic level   10%). For example, in a -5 world, the experience point cost is increased by 50%. Magic items cannot be created in a -10 setting.

In Enhanced Magic settings, the experience point cost is reduced by (Enhanced Magic level   10%). So on a +3 WML world, magic items cost 70% of the normal experience point cost. In a +10 setting, the cost is reduced by 95%. In worlds with a +11 or better, the reduction increases by one point to a maximum reduction of 99%.

Note that the caster level modification for WML applies to the caster level of magic items.

Effects on Creatures

The World Mana Level can have an effect on the following creature types -- Constructs, Dragons, Elementals, Fey, Outsiders, and Undead. Apply the following to these creature types. All of these creature types have a base World Mana Level, based on the world in which they originated. (In most cases, use the stats as if from a +0 world, then modify.) As with armor and shields, if the creature moves to a setting with a higher WML, it gains benefits, while a creature that moves to a lower WML suffers penalties.

- **Strength:** The creature's Strength increases or decreases by double the WML difference.
- **Constitution:** The creature's Constitution increases or decreases by the WML difference.
- **Hit Points:** Multiply the WML difference by 5%, and multiply the creature's hit points by this amount after determining its new Constitution score.
- **Massive Damage:** Add the WML difference $\times 5$ to the creature's Massive Damage Threshold.
- **Defense:** The creature gains or loses a natural armor bonus equal to the WML difference.
- **Damage Reduction:** The creature gains or loses damage reduction equal to the $2\times$ the WML difference. If the creature does not normally have damage reduction and moves to a higher WML, it gains DR equal to 2x WML difference/magic.
- **Spell Resistance:** The creature's SR increases or decreases by double the WML difference.
- **Spell-like/Supernatural Abilities:** These are modified in the same manner as spells.
- **Challenge Rating:** Figure on a case-by-case basis.
- **Level Adjustment:** Figure on a case-by-case basis.

As an example, a ghoul from a +0 WML world:

Medium Undead

Hit Dice: 2d12 (13 hp)
Initiative: +2
Speed: 30 ft. (6 squares)
Armor Class/Defense: 14 (+2 Dex, +2 natural), touch 12, flat-footed 12
Base Attack/Grapple: +1/+2
Attack: Bite +2 melee (1d6+1 plus paralysis)
Full Attack: Bite +2 melee (1d6+1 plus paralysis) and 2 claws +0 melee (1d3 plus paralysis)
Space/Reach: 5 ft./5 ft.
Special Attacks: Ghoul fever, paralysis
Special Qualities: Darkvision 60 ft., undead traits, +2 turn resistance
Saves: Fort +0, Ref +2, Will +5
Abilities: Str 13+1, Dex 15+2, Con --, Int 13+1, Wis 14+2, Cha 12+1
Skills: Balance +6, Climb +5, Hide +6, Jump +5, Move Silently +6, Spot +7.
Feats: Multiattack.
Challenge Rating: 1.

Ghoul Fever (Su): Disease--bite, Fortitude DC 12, incubation period 1 day, damage 1d3 Con and 1d3 Dex. The save DC is Charisma-based.

An afflicted humanoid who dies of ghoul fever rises as a ghoul at the next midnight. A humanoid who becomes a ghoul in this way retains none of the abilities it possessed in life. It is not under the control of any other ghouls, but it hungers for the flesh of the living and behaves like a normal ghoul in all respects. A humanoid of 4 Hit Dice or more rises as a ghast, not a ghoul.

Paralysis (Ex): Those hit by a ghoul's bite or claw attack must succeed on a DC 12 Fortitude save or be paralyzed for 1d4+1 rounds. Elves have immunity to this paralysis. The save DC is Charisma-based.

If this ghoul finds himself transported to a +3 WML world, he will have the following statistics.

Medium Undead

Hit Dice: 2d12 (15 hp)
Initiative: +2
Speed: 30 ft. (6 squares)
Armor Class/Defense: 17 (+2 Dex, +5 natural), touch 12, flat-footed 15
Base Attack/Grapple: +1/+5
Attack: Bite +5 melee (1d6+1 plus paralysis)
Full Attack: Bite +5 melee (1d6+1 plus paralysis) and 2 claws +3 melee (1d3 plus paralysis)
Space/Reach: 5 ft./5 ft.
Special Attacks: Ghoul fever, paralysis
Special Qualities: Damage reduction 6/magic, darkvision 60 ft., undead traits, +2 turn resistance
Saves: Fort +0, Ref +2, Will +5
Abilities: Str 19+4, Dex 15+2, Con --, Int 13+1, Wis 14+2, Cha 12+1
Skills: Balance +6, Climb +8, Hide +6, Jump +5, Move Silently +6, Spot +7.
Feats: Multiattack.
Challenge Rating: 2.

Ghoul Fever (Su): Disease -- bite, Fortitude DC 15, incubation period 1 day, damage 1d6 Con and 1d6 Dex. The save DC is Charisma-based.

An afflicted humanoid who dies of ghoul fever rises as a ghoul at the next midnight. A humanoid who becomes a

ghoul in this way retains none of the abilities it possessed in life. It is not under the control of any other ghouls, but it hungers for the flesh of the living and behaves like a normal ghoul in all respects. A humanoid of 4 Hit Dice or more rises as a ghast, not a ghoul.

Paralysis (Ex): Those hit by a ghoul's bite or claw attack must succeed on a DC 12 Fortitude save or be paralyzed for 1d4+1 rounds. Elves have immunity to this paralysis. The save DC is Charisma-based.

Lines of Power and Intersections

Ley lines (also leys, dragon lines, lines of power) are lines of magic and psychic energy that some say crisscross the Earth, and are also part of many other worlds. These lines of power can increase the power of spells, spell-like abilities, and supernatural abilities, simply by being in proximity of the lines.

Ley Line Ratings

Ley lines vary in power, much as spellcasters do. Every ley line has a rating, ranging from 1 to 5. This rating acts as a bonus to a spellcaster's caster level, or to the effective caster level of a spell-like or supernatural ability. A character's proximity to a ley line affects the bonus he receives as detailed on the table below.

Distance	Effect
0-20 ft.	Listed line rating
21-100 ft.	Line rating -1
101-1,000 ft.	Line rating -2
1,001 ft.-0.5 miles	Line rating -3
0.5-1 mile	Line rating -4

Intersections, locations where two or more ley lines connect, provide similar bonuses. The rating of a ley line intersection is equal to the rating of the most powerful ley line in the intersection, plus one-half the rating of the next most powerful ley line (round down), plus one per additional ley line (or 0.25 if the remaining lines are rating 1). Ley intersections use the table above to determine rating reduction by distance.

In addition to a caster level increase, proximity to a ley line can provide a spellcaster with additional spell points to draw on. A spellcaster receives the effective rating in bonus spell points every round. These spell points must be used during the round they are received (therefore, they do not build up from round to round). If the caster leaves the area, he loses access to the points.

If you are using a spell slot system, as per standard *d20 System* rules, then instead of additional spell points, there is a chance that a used spell slot is not actually used. To determine this, roll 1d20 plus the line or intersection rating against a DC of 25 + effective spell level. If successful, the spell slot is not used and thus, can be reused. The slot can be reused to cast the spell that had occupied it, or it can be filled with a new spell following the normal rules.

For example, if Bob is 15 feet away from a rating 6 intersection, and he casts fireball, a 3rd level spell, the check is 1d20+6 against DC 28. If successful, that 3rd level slot is not treated as used for the day.

Special Times

Ley lines and intersections can provide additional power during certain times.

Astrological Alignment: When the planets and the stars align in certain patterns, the ley lines and intersections on a world can flare up, providing extra energy. Depending on the pattern, an astrological alignment can increase the ratings of ley lines and intersections from +1 to +10. However, when an astrological alignment increases a rating to more than 5, spellcasters that draw power from the ley lines and intersections suffer damage with every spell cast. This damage equals the effective rating -5.

For example, the planets have aligned, providing a +4 increase to ley line ratings. Mick, a spellcaster, draws on the power of a rating 4 ley line to increase a fireball spell. The effective ley line rating is 8, so Mick suffers 3 points of damage when he casts the spell.

Equinox: On the equinox days, ley line energy increases significantly -- add +5 to the ratings of the ley lines. However, when an equinox increases a rating to more than 5, spellcasters that draw power from the ley lines and intersections suffer damage with every spell cast. This damage equals the effective rating -5.

Solar Eclipse: A solar eclipse increases the ratings of ley lines by +2. However, when an eclipse increases a rating to more than 5, spellcasters that draw power from the ley lines and intersections suffer damage with every spell cast. This damage equals the effective rating -5.

Solstice: On the solstice days, ley line energy increases significantly -- add +5 to the ratings of the ley lines. However, when a solstice increases a rating to more than 5, spellcasters that draw power from the ley lines and intersections suffer damage with every spell cast. This damage equals the effective rating -5.

Mini-Character Lenses for GURPS

by Eric B. Smith

A mini-character lens is a small template that cost just 10 points which can be used to help flesh out a character, giving the character knowledge in an area of expertise that he might not otherwise have. This can explain a misspent youth, cross-training on a starship crew, or just dabbling in another field. Most of these lenses are composed of skills.

A *GURPS Character Assistant* file for this article is available HERE.

These lenses work particularly well when combined with character templates from the various *GURPS* books, allowing characters to fill niches outside of the primary one the template is designed for. You could also create a smaller version of most of these templates for just 5 points simply by cutting the points in the listed skills in half.

Remembered Skills

"My father's plane; I trained on it!"
-- Kate Brewster (Conner), *Terminator 3*

Often in fiction a character suddenly remembers that he knows just the skills that are necessary to save himself or the party from certain doom -- they can fly the plane, hack into the computer system, or pick the lock to get the team on to the next phase of the adventure. These mini-lenses can be purchases as a "potential lens" in advance, paying the 10 points for a lens plus an Unusual Background of 2-5 points, but just when the need is greatest you may pick any appropriate mini-lens and add it to the character, removing the Unusual Background and reducing the point cost of the character appropriately. The GM may even allow the player to create the mini-lens himself; the key is that it must contain two or more *related* skills that are important at the moment and are somehow linked through the characters past.

The Lenses

Breaking & Entry Specialist

You know how to break into buildings covertly, or possibly using brute force. Perhaps you did some second story work, or you used to install security systems. Half the knack of breaking & entry is in knowing where, and when, to break and enter.

Lockpicking/TL (A) IQ [2], Observation (A) Per [2], and 6 points from among Climbing or Stealth both (A) DX [2], Electronics Operation/TL (Security) (A) IQ [2] or IQ+1 [4], or Forced Entry (E) DX+1 [2] or DX+2 [4].

Engineer

The most important skill for a ships Engineer is not Engineer, but rather Mechanic. Engineer represents skill in how to *design*something; Mechanic represents skill in how to *fix*something. A good ships Engineer will likely have skill in both, particularly if he speaks with a thick Scottish accent.

The other important concern with designing an Engineer is what the specialty for Mechanic and/or Engineer will be. The most useful specialty for most adventurers will probably be based on Vehicle Type - Starship, Automobile, or Light Airplane are probably good choices.

Engineer/TL (type) (H) IQ-1 [2], Mechanic/TL (same type) (A) IQ+2 [8]

Gunner

Whether a Tank Gunner, the Gunner onboard a Naval Ship or Starship, or the man who aims and fires the Howitzers used in Artillery battalions, all use the basic skills. A Gunner should not only know how to fire his weapon, but also how to maintain it and fix it, particularly in the event of misfires.

Armoury/TL (Heavy Weapons) IQ [2], and 8 points either Artillery/TL (any) (A) IQ+1 [4] or IQ+2 [8] and/or Gunner/TL (any) (E) DX+2 [4] or DX+3 [8].

Hacker

Cinematic Computer Hackers are a staple of the *Cyberpunk* genre, and common in other genres. Many times a character in a story just happens to know a "little bit" about computers, and can hack into the computer systems in a nick of time. Being a Hacker isn't easy; not only do you have to know how to break into computer systems but you also need to keep up to date on all the latest technologies so as not to be outclassed or surprised by a new innovation.

Computer Hacking/TL (VH) IQ-1 [4], Computer Programming/TL (H) IQ-2 [1], Current Affairs/TL (Science & Technology) (E) IQ [1], and Expert Skill (Computer Security) (H) IQ [4].

For a realistic Hacker replace Computer Hacking with Computer Operation/TL (E) IQ+1 [2], Electronics Repair/TL (Computers) (A) IQ [2].

Journalist

Many a person has aspired to be a journalist. With pen and paper, a video camera, or internet access just about anyone can be. Of course, the *good* journalists check their sources, but many people have made their living rumor mongering or ambushing their interviewies.

Research (A) IQ [2], Writing (A) IQ [2], Electronics Operation (Media) (A) IQ-1 [2], and 4 points in Public Speaking or Photography both (A) IQ [2], Fast-Talk or Interrogation (A) IQ [2], Detect Lies (H) Per-1 [2], or Current Affairs/TL (any) (E) IQ+1 [2].

Medic

A Medic has been trained in basic First Aid, perhaps as a corpsman in the Military or to work as a paramedic in an Ambulance crew. The training is more directed towards "scoop and run" than long term care.

Diagnosis/TL (H) IQ-1 [2], Electronics Operation/TL (Medical) (A) IQ [2], First Aid/TL (E) IQ+2 [4], and 2 points in a combination of Pharmacy/TL or Poisons/TL both (H) IQ-2 [1] or IQ-1 [2].

In a low tech setting replace Electronics Operation with an extra 2 points in Diagnosis (H) IQ [4].

Pickpocket

A pickpocket has spent some time on the street thieving -- picking pockets, cutting purses, shoplifting, or scamming passers by.

Knife (E) DX+1 [2], Fast-Talk (A) IQ [2], Filch (A) DX [2], Pickpocket (H) DX-1 [2], Sleight of Hand (H) DX-2 [1], Streetwise (A) IQ-1 [1]

Pilot

The chief skill of a ship's pilot is, not unsurprisingly, Pilot, though for small naval ships use Boating and for large vessels use Seamanship or Submariner. Most Pilots should also have skill in an appropriate Navigation skill, and many ships require more than one specialty to pilot properly: A space ship which can land on a planet's surface then take off and fly to the moon may require Piloting (Aerospace) and Piloting (High-Performance Spacecraft), while a sailboat which has a supplemental motor would require both Boating (Sailboat) and either Boating (Large Powerboat) or Boating (Motorboat).

2 points in Navigation/TL (any) IQ-1 [1]x2 or IQ [2], and 8 points from among Boating/TL (any) (A) DX+1 [4] or DX+2 [8], Seamanship/TL or Submariner/TL both (E) IQ+2 [4] or IQ+3 [8], Submarine (any) or Piloting/TL (any) (A) DX+1 [4] or DX+2 [8]

Socialite

You get along well in social situations, and can sometimes convice others to go along with your ideas.

Charisma 1 [5], Fast-Talk (A) IQ [2], either Savior-Faire (Any) (E) IQ+1 [2] or Streetwise (A) IQ [2], and one of Carousing (E) HT [1], Diplomacy (H) IQ-2 [1], Intimidation (A) Will-1 [1], Sex Appeal (A) HT [1], Leadership or Public Speaking both (A) IQ-1 [1].

Storyteller

A storyteller likes to tell stories or jokes, and is quite adept at keeping his companions entertained during those long boring times that can sometimes happen between adventures.

Expert Skill (Bardic Lore) (H) IQ-1 [2], Public Speaking (Storytelling or Jokes)* (E) IQ+2 [4], and 4 points among Research (A) IQ [2], Singing (E) HT+1 [2], or Current Affairs (any) (E) IQ+1 [2] or IQ+2 [4].

*Note: These are *optional specialties* of the Public Speaking skill, reducing difficult from (A) to (E).

Survivalist

A Survivalist has spent some time in the wild hunting, fishing, and camping. If dropped into the wild with at least some tools he stands a decent chance of surviving and even thriving.

Naturalist (H) IQ-1 [2], Navigation (Land) (A) IQ-1 [1], Survival (Any) (A) Per [2], 2 points in one of Guns/TL (Musket, Rifle, or Shotgun), Beam Weapons/TL (Rifle) all (E) DX+1 [2], Bow or Spear Thrower both (A) DX [2], or Crossbow (E) DX+1 [2], and 3 points from among Climbing (A) DX-1 [1] or DX [2], Fishing (E) Per [1] or Per+1 [2], Hiking (A) HT-1 [1] or HT [2], Swimming (E) HT [1] or HT+1 [2], or Tracking (A) Per-1 [1] or Per [2].

Spellcaster

Creating a list of spells which are always useful is almost impossible, but what isn't difficult is to give a list of spells which are easy to acquire. A typical dabbler spell caster will either have Magery 0 [5] and 5 points in spells or 10 points in spells and live or work in a high mana zone (or a high sanctity zone) where he can cast his spells.

The first list of spells consists of spells with no prerequisites. Anybody can pick them up with minimal training. This list can also be useful if trying to build a Mage with a spell that has a prerequisite of something like "1 spell from 10 different colleges." All of these spells listed here are (H) IQ-2 [1] or IQ-1 [2].

Air: Seek Air, Purify Air.
Body Control: Climbing, Debility, Itch, Touch.
Communication & Empathy: Sense Foes, Sense Life.

Earth: Seek Earth.
Enchantment: One-College Powerstone.
Fire: Ignite Fire, Seek Fire.
Food: Seek Food, Test Food.
Knowledge: Tell Time.
Light & Darkness: Light.
Making & Breaking: Inspired Creation.
Mind Control: Dull Hearing, Dull Taste and Smell, Dull Vision, Keen Hearing, Keen Taste and Smell, Keen Vision.
Movement: Haste.
Plant: Seek Plant.
Sound: Keen Hearing, Sound.
Technological: See Radiation, Seek Fuel, Seek Machine/TL, Seek Plastic, Seek Power/TL, Test Fuel/TL.
Water: Seek Water.

The second list of spells consists of spells which have just one prerequisite. The prerequisites are listed in (parenthesis) after the spell or spells they apply to.

Air: Create Air, No-Smell, Stench (Purify Air).
Body Control: Spasm, Tickle (Itch).
Communication & Empathy: Sense Emotion (Sense Foes).
Earth: Seek Pass, Shape Earth (Seek Earth).
Fire: Create Fire, Extinguish Fire, Shape Fire (Ignite Fire).
Food: Decay, Season (Test Food).
Healing: Body-Reading (Sense Life).
Light & Darkness: Colors, Continual Light, Remove Shadow, Shape Light (Light).
Movement: Glue, Grease (Haste).
Plant: Identify Plant (Seek Plant).
Protection & Warning: Sense Danger (Sense Foes).
Sound: Silence, Thunderclap, Voices (Sound), Sound Vision (Keen Hearing).
Technological: Identify Metal (Seek Earth), Identify Plastic (Seek Plastic), Magnetic Vision (Keen Vision), Preserve Fuel/TL (Test Fuel/TL), Radio Hearing (Keen Hearing), Reveal Function/TL (Seek Machine/TL).
Water: Purify Water, Seek Coastline (Seek Water).

Things I Hate as a Player (GM Edition)

Given the pattern of What Hath Gone Before, this should be the week where I'm lovey-feely and espouse the various traits of players that I, as a GM, love. Unfortunately, I'm in a somewhat cranky mood, having filed my taxes this past year. While it's flattering that the government thinks our household is doing so well, I am nevertheless taken aback by the need to send off checks that total more than I spent on my first car (which, for those of you playing the phone game, came to pass a mere three years ago or so).

So, I'll be jumping around a smidge and indulging my current cantankerous nature by looking at things I hate about GMs from the player's side of the duck blind.

* * *

Puzzles for which there is only one possible solution. Actually, any encounter for which there is only one possible solution. Too many GMs treat their scenarios like *Choose Your Own Adventures* on LSD, where one wrong decision will subject the players to horrible punishment (and the players don't have the *Choose-Your-Own-Adventure* advantage of using their fingers as bookmarks to rewind). Obscure riddles with one answer, puzzles that have one solution, suspects that require one specific question to unlock the answer, and so on. (Yes, I know I'm guilty of this. I apologized, flagellated myself, and sought forgiveness.)

Players are good at coming up with nonobvious solutions to problems; I suspect that most players pride themselves on those moments of clarity when the pieces fall into place, and an answer appears. Sure, it might not be the answer the GM was thinking of, but as a GM I've started leaning more toward "let the solution possibly work." But too many of these conundrums are warded -- by design or GM fiat -- against alternate possibilities.

This thing-I-hate is closely related to . . .

* * * **Adventures that are specifically designed to thwart the special abilities of the party.** Now, I don't mind the occasional "This room is protected from teleportation attempts" or the like, but far too many GMs layer on the anti-ability paint with a gloopy abandon. (Are there any classic *Dungeons & Dragons* adventures where every square inch of a 17-mile dungeon isn't protected from *teleport, dimension door, passwall, dig, find the path, true sight,* and so on? How often does the phrase "by no means other than a *wish*" appear?) Similarly far too many NPCs have special doohickery that renders them immune to mind reading, knowing alignment, etc. ("Good gravy; how many *amulets of protection from scrying that only work for one specific person* are there in the universe?!")

Yes, I know that I bemoaned in an earlier installment that I hate it when games give abilities such as detect lies or mind-reading. Here's the rule: If the GM doesn't want to deal with an ability, he shouldn't allow it in the campaign. For example, in most *Dungeons & Dragons* games I've run, I've declared that most divination abilities are unpredictable . . . especially means designed to reveal alignment or the like.

Seriously: If I were playing a game as a mighty soldier, and every campaign consisted of my character's arms getting broken, I'd eventually give up and revert to sudoku. So why do so many GMs think it's okay to strip a character of an ability just because they don't want to deal with it?

* * *

Campaigns where NPCs become the be-all and end-all of the campaign. One memorable campaign series I played in consisted of the PCs rescuing and escorting a powerful NPC to the location of another NPC; the climactic adventure detailed how the two of them duked it out while the rest of us were relegated to mopping up the minions of the big-bad-powerful NPC. There was nothing any of us could do to influence the outcome of this scene, and the final battle was resolved as a series of NPC-to-NPC rolls made by the GM behind the screen. (Why this step was necessary, I don't know. Maybe to enhance the sense that "anything can happen" . . . although in actuality it's "anything can happen, but nothing we have any say over.") By the end I had considered requesting to be replaced by my Apple IIgs (this was

a while ago), with a BASIC program that would generate my character's required dice rolls with a press of the space bar.

While a lot of published adventures have the problem of being led around by powerful NPCs (**War's End** for **Torg?** I'm looking at you . . . through a piece of pinhole-poked cardboard), I've also encountered this structure time and again from other GMs in their own campaigns. I suspect there are a number of reasons for it -- this structure allows the players a chance to interact with the bigwigs of the gaming world, it's a means of providing a degree of structure without the usual single-corridor dungeon of usual railroading. But it still drives me up a wall; after all, if the roles of the characters can be taken by anyone with a weapon and the players replaced interchangeably by any schlub with a handful of dice, what's the point?

And speaking of railroading . . .

* * *

Campaigns where there is only one choice. I'm reminded of a tale from a friend about an adventure where the PCs were met by a mysterious stranger with the offer of adventure. The players all immediately recognized that this NPC was evil and trying to trick them into doing his bidding (a classic trope of many tales), but -- recognizing this -- the heroes had almost no choice but to do the bidding of the bad guy, since the GM made it perfectly clear that there wouldn't be an adventure that day unless they played along. (I'm not sure if the players chose "adventure at gunpoint" over "screw this; we're playing Tecmo Super Bowl.")

Now, I'm a big fan of old light-gun games like *Area 51* and *House of the Dead,* even though these "rail shooters" lead the players around on a controlled railway path like a Disney World ride. But there's a wide gulf between a video game and an RPG (despite what the general populous thinks), and one of the great things about roleplaying is the illusion of unlimited freedom. Unfortunately, being presented with only one choice -- especially if you as a player don't *like* that choice -- is one of those things I hate.

As an aside, the "tricked by Bad Guy to undertake evil mission" was also a central conceit of the **Advanced Dungeons & Dragons 2nd Edition** adventure **The Apocalypse Stone.** Unfortunately, I don't recall seeing anything in there about what to do if the PCs see through this seemingly obvious-to-me ruse.

* * *

That's it for this issue of hate. We should be back with the love for the next couple of weeks, unless I find myself needing to spend another $15K or so on various payments, in which case my next column might be about what it's like to sell a kidney.

Speaking of love, this issue of *Pyramid* marks the second official monthly installment of Paul Drye's "Infinite Crossroads" column. If you haven't read it already, check it out!

And, if you're reading this on Friday, you might want to swing by the *Pyramid* chat room to meet and bounce questions off Paul Drye. He'll be talking about the new column, and probably wouldn't mind answering some stuff about his role in **GURPS Traveller Interstellar Wars,** too.

Pyramid Review

Paranoia Mandatory BONUS FUN Card Game

Published by [Mongoose Publishing](#)

Designed by Steve Gilbert & Gareth Hanrahan

Illustrated by James Holloway

Proofed by Ron Bedison & Sarah Quinnell

Boxed, full-color card game for three to eight players; 150 cards, 154 clone, treason, & wound tokens, & rulebook; $24.95

Mongoose Publishing has released a ***Paranoia*** card game, and with such a property you'd think, "Well, of course." It's even called the ***Mandatory BONUS FUN Card Game.*** Such obvious merchandising opportunities probably weren't lost on the designers of the original game, either, nor their loyal fans, but it never came to pass. Now that it's finally off the ground, the question is whether it was worth the wait.

The object is to be the highest-ranking Troubleshooter when any player loses his sixth clone.

As a primer for those on the outside looking in: The [roleplaying game](#) is about a futuristic society forced to live in a huge complex under the watchful eye of an insane computer determined to protect its charges from "the Commies." Troubleshooters are The Computer's elite cleanup squad, ready to follow orders even unto certain doom to fix what goes wrong. A lot goes wrong, constantly, and conflicting loyalties and schemes among the agents mean the result is usually a bloodbath no one survives. And there are jokes.

The card game throws your team of Troubleshooters at a series of missions, like rooting out traitors and training Vulture squadrons. Some are straightforward, like finding mutants, while others are much more involved (the Internal Security card is mixed with other missions and dealt out to see who survives the purge).

Everyone gets a hand of action cards, and these have at least two different ways they can be used: on the mission, or on each other. Non-traitors will try to fulfill the mission requirements, which typically involved placing a certain number of wound and/or treason tokens on the card. People playing this game, on the other hand, will try to play the cards on their fellow Troubleshooters. Again, this could mean tokens, but it may also reverse the order of play, steal cards, or force someone to lose a turn, among other things. To be fair (which isn't really in keeping with the game), some Troubleshooters will play cards on themselves, since some effects are beneficial (drawing extra cards or performing more actions). Further limits may dictate the security levels you may target.

Clearance levels are based on colors of the spectrum, with everyone but the team leader at Red (the leader is brevetted to Orange). Higher clearances increase your hand size and the number of tokens you can take without dying or being declared a traitor. It's worth noting there are eight Red cards, enough for a full eight players, but increasingly fewer cards for higher levels (they apparently don't expect more than two people to be Ultraviolet at the same time).

Being team leader comes with a few perks, like an additional card for your hand and the ability to abort most missions, but it won't guarantee you a win. Successful missions give survivors a boost to their clearance level, while those who accumulate too many treason tokens during the course of events is executed at debriefing. If you garnered too many wound tokens during the mission, well, that problem is self-correcting . . . move on to clone number two. When

someone loses their last clone, the game ends and the highest clearance level wins (possibly posthumously). Failed missions -- well, suffice to say the result is seldom another promotion.

Fans of the RPG will recognize the deft and talented hand of James Holloway helming the artwork. His malleable characterizations and the fast and loose way he plays with reality continue to be a highlight of the game's appearance and presentation. This is coupled with great component qualities for everything up to and including the box. It could have been half the size and still contained everything, but at least this way there's room for the just-as-inevitable supplements.

The good news is the same as the bad: This game is almost exactly like a session of *Paranoia.* No one's game plan survives contact with the enemy (or your friends, or the hallway outside the briefing room, or . . .), which can be frustrating in a roleplaying game, but in a card game? You may feel like you spent good money on 20 Mission cards you'll never actually finish (as often as not because you lack the cards to succeed and not because teammates are administering a cone rifle probe). Play is fairly quick, but getting a spectacular plan to work without someone gumming the works with a card is tough. The game fields eight players, and that seems about four players too many. Cards get played out of spite, of course, and since missions end when someone runs out their hand, it's doubly and damnably difficult to swing any real progress deliberately.

You're not going to see much more use from the Ultraviolet clearance cards than you are the mission "success" effects, but what you will hear are peals of laughter. The tragicomic effects of all this backstabbing are still present, and it's a giddy thrill to see the same dynamics played out in a different medium. For that, Mongoose is to be commended -- it's one of the best examples of transitioning from one game format to another. But the roleplaying version's real beauty is lost in ***Mandatory BONUS FUN Card Game,*** the less-is-more meaninglessness of the setting. Where the RPG ends with the short-lived pain of ripping off the bandage, this game drags the action out as you wait for someone to lose that last, persistent clone. Without a concentrated effort of the sort seldom seen in a *Paranoia* session, the laughs become strained as the finish wears out its welcome. In similar fashion, it's the sort of game you'll pull out for a change of pace once in a while, but as part of the usual rotation it's just too much of a not-quite-good-enough thing.

Pyramid Review

Bone Wars: The Game of Ruthless Paleontology

Published by Zygote Games

Designed by Diane A. Kelly & James L. Cambias

Illustrated by Bryant P. Johnson

Four Paleontologist Cards, 33 Dinosaur Bone Cards, 71 Event Cards, & Rules Sheet; $19.95

Bone Wars: The Game of Ruthless Paleontology is the first release from new publisher, Zygote Games, a card game intended to both educate and entertain. Designed for two to four players, it combines three well-trod themes: dinosaurs, history, and science in a game about the Great Dinosaur Bone Rush of the late 19th century. Players take the roles of four genuine bone hunters whose rivalries will see them lie, cheat, steal, and besmirch their opponents, all in order to attain scientific immortality and prove themselves the greatest paleontologist of the age.

The deck is divided into Bone cards, Name cards, Event cards, and finally four Paleontologist cards, one per player. The personalities and histories of all four are detailed on the publisher's website, the cards here giving a name, a Prestige Point track (acquired to win the game), and an individual special ability. Bone cards are divided between skeletal elements and Fossil cards. Skeletal elements come as dinosaur skulls, limbs, and vertebrae, all color coded to different dinosaur families, and used to construct and revise complete skeletons. Fossil cards represent smaller finds, and cannot be revised. Event cards are also divided, into three types. Name cards describe individual dinosaurs, listing each by family, size, when it lived, plus the particulars of its skull, limbs, and vertebrae. Field Crew cards represent team members hired to help you find and excavate bones during a dig, and provide certain permanent abilities, such as gaining extra Bone cards or preventing a rival stealing Bones from you. Actual Event cards provide special actions that can only be used during the phases indicated on the card. Thus, Flash Flood can only be used during the Field Season to force an opponent to discard half of his Bone Cards, while Good Press is a defensive card played to prevent Prestige Point loss during the Controversy phase.

All of the cards are nicely designed to match the game's theme. Apart from the color of the Bone and Name cards, every card comes with a fitting illustration done in brown shades, along with a suitable quote. *Bone Wars* is certainly a good-looking game.

The game is played in turns consisting of three phases, with everyone acting in the same phase, playing one card at a time or passing. Once everyone has played as many cards as possible or has passed, the game moves onto the next phase. The first is Field Season, each player drawing four Bone and four Event cards, and then playing cards to steal bones and interfere in rival expeditions, all trying to acquire as many Bone cards as possible. In the Museum Phase, a player describes a new species or Fossil that he has unearthed. The new skeleton must consist of a Name card and two Bone cards, which can be of any color, but not of the same type.

Last is the Controversy Phase, when a player attempts to either add to, or revise the skeletons in play, either his own, or those of his rivals, done by adding a new Bone card or replacing an existing one. The new Bone card must match the color of the dinosaur's Name card and be a closer match in description to the details on the Name card for that Bone piece. Thus Barnum Brown's Dilophosaurus skeleton, which is blue, currently has a red skull with large nostrils, batteries of grinding teeth, and no front teeth. It can be revised by Barnum or a rival with a blue skull that has carnivore teeth and large eye sockets, because it is closer to the Dilophosaurus' actual description of carnivore teeth, long skull, and bony head crests. At the end of this phase, all unused Bone cards are shuffled back into the Bone deck, while Event cards are retained for the next turn.

To win a player must acquire a quantity of Prestige Points determined by the number of players. They are awarded for playing certain Event cards, for describing new dinosaurs in the Museum phase, and for revising a dinosaur during the Controversy phase. If you revise an opponent's dinosaur, then you gain a Prestige Point, but he loses one.

Designed by both a biologist (Diane A. Kelly) and a game designer (James L. Cambias), **Bone Wars** certainly captures its theme well. A pleasing touch is that winning can be achieved by not only building dinosaurs, but also by decrying the skeletons of others. This is reflected in the Bone cards' dual use -- building and revising. This actually gives a player something to do in the Controversy phase if he lacked the Name cards needed to build in the Museum phase. It also highlights a player's need to grab as many Bone cards as he can, they being the key to scoring.

Unfortunately, **Bone Wars** suffers from one or two problems. The first is the revision of skeletons during the Controversy phase, which requires a new Bone card to match closer the color and information on a Name card. A simple enough process, but the information is too small to read without picking up the intended card and checking it first. This interrupts both play and -- in our games -- the accompanying table talk. Also, in games with more players, fewer Prestige Points are needed to win, and in some games, with the right combination of cards, it is possible to reach this target and win the game on the second turn. The consensus was that the Prestige Point target be revised upwards for longer games. Nor did we think that there were enough Fossil cards, and we also wondered what happened when a skeleton was completed.

Finally, there is the matter of the game's educational aspect. One of my players is a science teacher, and he wondered who **Bone Wars** was aimed at. Certainly, the information on the cards is interesting, but learning from it is another matter. Our best guess was for older children who have enjoyed Steve Jackson Games' **Dino Hunt,** or for the teacher that wanted to impart the rivalries and controversies of the Great Dinosaur Bone Rush to a class.

Despite the slightly inelegant game play and the small rules queries, there is much to like about **Bone Wars.** The design more than matches the theme, with attractive cards, and in particular, Event cards that encourages interaction and a little roleplaying. It is perhaps a little dry, (probably not helped by all that brown), but **Bone Wars: The Game of Ruthless Paleontology** is very much a promising first try for Zygote Games.

Murphy's Rules

Hite's Handy Field Guide To Space Drives

"In space travel, we can define a 'miracle' as a technology that makes space flight easy."
-- Jon F. Zeigler and James L. Cambias, ***GURPS Space,*** *Fourth Edition.*

With an ominous theremin whir, we perceive the arrival of ***GURPS Space,*** *Fourth Edition.* We can only hope that it comes in peace. However, its approach is heralded not merely by the aforementioned eerie hum, but by a celebratory essay in this very, er, space. Since I already divagated on alternate space travel [campaign frames](#) the last time we had a new edition of ***GURPS Space,*** this time I think I'll poke around the inside of the cowling. What gets us there? Or, rather, what would get us there if we wanted to leave behind not just Earth, but tedious old physical law? I'll leave discussions of real space drives to the real space experts. For now -- to inanity, and beyond!

"Oh, the Dean Machine, the Dean Machine,
You put it right in a submarine,
And it flies so high that it can't be seen --
The wonderful, wonderful Dean Machine!"
-- Damon Knight

Despite having invented inertial location, Norman Dean is probably most famous, in science-fictional circles anyhow, for hoaxing the legendary John W. Campbell with his "Dean Machine," a device that somehow transformed angular momentum into forward motion by means of controlled uneven oscillations. A "Dean Drive," or oscillation thruster, would essentially be a giant flywheel, spinning to build up momentum. Using an unaccountably heretofore overlooked "nonlinear correction" to Newton's Law, the spin could drive a ship without the need for fuel (save for whatever fuel powered the wheel, most likely a mere atomic reactor). Dean began his research in 1946, and obtained a patent in 1959. Campbell illustrated the possibilities of a Dean Drive with a memorable [cover image](#) of a U.S. Navy submarine orbiting Mars. (If that doesn't get your gaming juices going, nothing does.) One Eric Laithwaite (who helped invent the linear induction motor) did Dean one better, demonstrating in 1974 that two flywheels -- a gyroscope, in other words -- created an antigravitational effect. In "How to Build a Flying Saucer," T.B. Pawlicki suggested combining the Dean and Laithwaite devices with a betatron, a kind of electron centrifuge, to focus centrifugal force along a single axis and thus create a whirring, toroidal (and dangerously radioactive -- hence all that scorched grass) saucer-craft suitable for all manner of interplanetary jaunts.

Both Dean and Laithwaite's drives are basically variants of the "overshot" perpetual motion machine, the most famous and enigmatic of which is probably Orffyreus' Wheel. "Orffyreus" is the Latinization of "Orffyre," a ROT13 encryption of the last name of Johann Bessler. Who, for that extra "wow factor," built his potential space drive in 1712! The locals at Gera didn't much care, so he pulled up stakes and moved on until the Markgraf of Hesse-Cassel (whose descendant would be similarly generous to the [Comte de Saint-Germain](#)) gave him rooms in the royal castle at Weissenstein. Here, Orffyreus built a five-foot wheel in 1717. Examined by savants, it was set spinning and sealed up in a tower for three months -- at the end of which time, it was still spinning away. Orffyreus was trying to get the Royal Society to buy his Wheel in 1718, but negotiations went awry when he destroyed it to prevent a snooping Dutchman from discovering its secret. And that was the end of the Hanoverian Space Age.

"Just imagine a machine that is constructed such a way, that it does not operate by steam or electricity, but by those waves that man generates in his tone, in his speech. Just imagine such a motor that one may operate by those waves or perhaps by the generation of his spiritual life. It was still an ideal. Thank God that it was an ideal at that time, because what would have become of this war when this Keely-ideal had become a reality in those days!"
-- Rudolf Steiner, lecture held in Berlin (June 20, 1916)

Former flutist and stage magician John Worrell Keely also used gyroscopes in at least one of his designs, but for him the real secret was acoustical manipulation of the ether. In 1872, he announced his invention of a machine that ran on tuning-fork vibrations, using the sympathetic identity of all particles of the ether. The secret was "quadruple negative harmonics." At various times, he referred to his machine as a "vibratory-generator," or better yet as his "hydro-pneumatic-pulsating-vacu-engine." His vibratory engine, whatever it was called at the time, ran once a "liberator" had

used sound to convert the atoms of air (or water) into etheric force. He refused to show his machines to anyone, or to release industrial versions, which cost him the patronage of, among others, John Jacob Astor. Once Keely perfected his machine, he planned to use it for "aerial navigation," no doubt including trips to Mars. (There exists a tenuous connection between Keely and the enigmatic [Sonora Aero Club](#) -- he reportedly created a "device for lifting heavy weights" for "a gentleman in California.") Keely's notion combined a sort of pre-Einsteinian notion of matter-energy equivalence with Theosophical mysticism, and he was openly accused of sorcery at various times. Madame Blavatsky predicted that Keely's invention would only work for him, describing him as an intuitive adept. As it happens, she was right, in a way. Following Keely's death in 1894 (he was run over by a streetcar), nasty-minded skeptics pried up the floor of his laboratory and discovered fan belts hooking his machines up to compressed air tanks and a silent water wheel.

"They called me deranged. The hope is that they are right! It is of no greater or lesser import for yet another fool to wander this Earth. But if I am right and science is wrong, then may the Lord God have mercy on mankind!"
-- Viktor Schauberger

Speaking of water and odd mysticism, an Austrian forester and amateur hydrologist named Viktor Schauberger became fascinated with water eddying and spiraling around branches in streams. He patented a number of inventions, mostly of the turbine sort, and developed a number of weird manias about water purity and the need for healthful cycles of growth in the soil. He and Hitler met in 1934 to discuss such matters, and although his devotees now claim that he sensed Hitler's doom, he wound up building turbines for Siemens, and then engines for Messerschmitt and Heinkel, during the war. He also spent part of 1941 confined in a mental hospital; perhaps it was here he developed his "Repulsine," which (as far as I can tell, being neither a hydrologist nor a mental patient) used the power of "implosion" to create a self-sustaining vortex from which energy could be drawn. In 1945, the Soviets and Americans both looted his laboratories; Schauberger wound up in the United States sector of Austria. He seemed to concentrate on drawing free energy from his various vortices, rather than on building spaceships or antigravity machines with them, but apparently he produced reams and reams of journals and designs both during the War and after. He died in 1958, five days after returning from a trip to Texas to visit his son Walther. As an interesting coda, the Russian émigré Evgeny Podkletnov claims that his father was part of the Red Army unit that confiscated Schauberger's papers -- and Podkletnov also claims that in 1992 he produced a gravity-reducing screen by means of a rapidly spinning superconductor.

"Mr. Brown claims that a gravitational anomaly exists in the neighborhood of a charged condenser. This effect has not been well documented by Mr. Brown, nor has the writer undertaken to refute it."
-- from the conclusion of the Office of Naval Research report on Townsend T. Brown (ONR File 24-185, Sept. 15, 1952)

Speaking of spinning electrical antigravity things, then, we return to 1917. That year, Professor Francis Nipher, President of the St. Louis Academy of Sciences, demonstrated an equivalence between electromagnetism and gravity, using electrical currents to nullify gravity -- indeed, to create a powerful repulsion force. For whatever reason, Professor Nipher's research fell into obscurity. A few years later in 1921, the physicist Thomas Townsend Brown demonstrated a lifting force created by high-voltage electrical static arcing across capacitors. This effect, later named the Biefeld-Brown Effect, is also called "ion wind" (or electrohydrodynamics) by conventional physicists, but to the right kind of physicists, it's antigravity and reactionless propulsion all in one. During WWII Brown, excitingly, ran the Navy Bureau of Ships' degaussing program -- which is to say, the [Philadelphia Experiment](#) was performed on his watch in 1943. Which, even more excitingly, was the year that Brown had "a nervous breakdown." To cap it all off, in 1956, while working openly on "electro-gravitic propulsion research" for Lockheed, Brown helped found the National Investigations Committee on Aerial Phenomena (NICAP), the grandfather of all civilian UFO study groups. Further, he announced that his effect explained UFO behavior. Which, to be fair, if there *were* UFOs, and if the Biefeld-Brown effect were about a million times stronger, it would.

"The Nazis developed a unique approach to science and engineering quite separate from the rest of the world, because their ideology, unrestrained as it was, supported a whole different way of doing things. . . . The trouble was, when the Americans took it all home with them they found out, too late, that it came infected with a virus. You take the science on, you take on aspects of the ideology, as well."

-- "Dan Marckus," quoted in *The Hunt for Zero Point,* by Nick Cook

In 1952, Brown went back to the Navy and proposed Project Winterhaven, the construction of a saucer-shaped fighter to be propelled by electro-gravitation. The Navy, in a fairly impressive show of disinterest, sent a Pasadena scientist with the Office of Naval Research (ONR) out to evaluate the written records of Brown's experiments, refusing even to fund a demonstration. The ONR report said, basically, that there was no such thing as electro-gravitational propulsion, and if there was, it was just ion wind and couldn't work for flying saucers anyhow. In *The Hunt for Zero Point,* Nick Cook postulates that the reason that the Navy was uninterested in buying an electro-gravitational flying saucer from Brown was that they already had one, the [Flügelrad V-3](#) that they'd captured from the Nazis. By some accounts, the Nazi "Projekt Saucer" had used the Biefeld-Brown Effect; by most accounts, they had used Viktor Schauberger's research into air turbulence to create a version of bronze called Luftschwamm, an improved material coating for the saucer's skin. Cook also postulates that the Nazis had mastered "zero-point energy," which is essentially the energy that quantum physics predicts pervades everything, because absolute zero would be knowable, and therefore can't happen. Or something like that. Actual quantum physics also says you can't reduce an energy state below zero point, by definition. It's all very creepy and uncertain, as quantum physics tends to be -- take care not to draw your flying saucer energy from the Abyss, lest the Abyss draw its energy from you.

"Look, I don't know Bob Lazar. All this sounds fine. I probably met him. I might have said to somebody I met him and I liked him, after I met him, and if I liked him. But I don't remember him . . . I mean you are trying to force questions on me that I simply won't answer."
-- Edward Teller, on Bob Lazar

On the good side, though, zero-point energy provides the other half of the space drive equation. It's all well and good to have your gravity screen or your oscillation thruster or what have you, but you've got to power it somehow. Bob Lazar, however, knows how to kill those two birds with one stone -- provided the stone is made of naturally occurring, supernova-fresh Element 115, that is. Lazar claims to have been recruited by Edward Teller in 1988 to work at Area 51 reverse engineering crashed UFOs for the Air Force. While noodling around with one of the nine crashed saucers, he sussed out the secret to their antigravity and their propulsion, namely Element 115. Under particle bombardment, you see, you can turn Element 115 into even better Element 116. As Element 116 decays, it releases antimatter, which you use to power the ship -- and to power the particle beam, one imagines. (Shades of Orffyreus' Wheel!) The other great thing about Element 115 is that the strong nuclear force around its superheavy nucleus can be amplified into a kind of secondary gravity, or "Gravity B." The aliens use Gravity B to propel their ship -- and, one imagines, to fold space for interstellar travel as well. And thus they travel the stars on their enigmatic missions. And just perhaps -- thanks to the cleverness of Bob Lazar, or to the stolen Viktor Schauberger papers, or to Nazi zero-point energy, or to the acoustic sorcery of John Worrell Keely, or even to the secret of the Orffyreus Wheel discovered by the Comte de Saint-Germain in a Hesse-Kassel tower and brought to America in 1776 -- just perhaps, so do we.

Koshezak and Betenamal

by Paul Drye

Agents have certainties these days. Watch For Centrum. Keep The Secret. The earliest days of parachronic travel were more wide open, with not even a consensus that knowledge of parachronics had to stay in Homeline's hands alone. A lot of events contributed to that last attitude, but one of the things that really hardened it was the freebooters. That's a word that's had to be forgotten twice on Homeline, once in the 19th century and once in the 21st. The first time around it was technologically advanced European and American citizens waging war for their own private ends on entire countries that couldn't resist them -- conquistadors and filibusters. After the middle of the 1800s, though, the practice faded away.

Unfortunately there was a window in the early days of crosstime travel when it was possible again. The modern freebooter was a solo operator, since the transport of private armies would be noticed by even the small and distracted Infinity of the day. On the other hand, they could assault primitives with 21st century technology, and sometimes more if the freebooter had had contact with advanced timelines first. Most of these assaults failed, but there were a few successes that deranged some world or another rather badly. Public opinion swung strongly against the ones that were discovered, and eventually Infinity cracked down on them, thinking that it would cost them more in the long run than what it would take to fund several military campaigns right away. The last and most difficult of these to finish off was Jacob Serik.

The Serik Conspiracy

Equus was a non-descript timeline found on Quantum-6 in 2002. Its divergence point seemed to be the exact sequence of invasions and migrations following the domestication of the horse in the Volga River area around 2200 BC. The precise details are hard to place because this was not a literate area at the time, and Middle Eastern civilization was hit harder by the subsequent chariot-borne warriors. The present day on Equus is 180 AD, and until 25 years ago the Iron Age had only begun about a century before; iron smelting was still restricted to the Fertile Crescent. Most parts of the world were TL 0 or 1, or TL 1+ where things were most advanced.

This, unfortunately, is where Jacob Serik comes into the picture, driving Britain to TL1/2 and even a smattering of TL3 items like horse stirrups. An early agent for Infinity, he had considerable access to people in other timelines in those informal days, and secretly used it for his own ends. Whenever he was assigned to work on newly discovered lines that were divergent after about 1980, or on historical echoes close to Homeline's year, Serik worked to set up a bizarre conspiracy. The allies he recruited were the only people he felt he could trust: his doppelgängers in worlds such as Earth-Beta. After simply looking himself up in the Boston phone book, then knocking on the front door of the listed address, he would convince them to sign on. Most of his "copies" had the same attitudes and quirks as the original Serik, who was in his early forties in 2002, and set psychologically since the 1980s. Six are known to have joined him. Evidence obtained later indicates that he did murder at least two of his other selves because they wouldn't

play along.

In 2003, Serik-1 picked Equus as a suitably primitive and uninteresting timeline for his ultimate plan: the creation of a plaything empire. While recruiting his counterparts he'd been carrying along filched parachronic parts, and now arranged for them and the other Seriks to be jumped to a rendezvous in a late 1990s historical echo. He then translated himself, destroying a hijacked projector facility behind him and leaving very little evidence of his destination. Infinity knew it was sabotage immediately, but it took several weeks for them to figure out where he'd gone. By then Serik had set up shop in an abandoned Birmingham, England warehouse, and jumped once again, sending himself, his doubles, and all the equipment they'd purchased from survivalist and camping shops through to Equus.

Koshezak was the country around the Severn River Gorge on Equus, to the west of where Birmingham was on Homeline. Serik picked the area because of its role in the Industrial Revolution: a place where iron and coal were in close proximity, and a navigable river led down to the sea. Unlike the 18th-century English, however, Serik had a different revolution in mind: the introduction of iron weapons into Bronze Age Europe.

After cowing one large village with modern weaponry (and its effect on the village's petty nobility), the conspiracy leveraged the new manpower into conquering several other settlements. Within six months they controlled an area about 30 miles in diameter centered approximately on the location of Homeline's Telford. Using ruthless terror techniques, the Seriks assembled a bloodthirsty group of about 100 locals who owed everything to them, and used that group to keep the other few thousand down. A warrior/death cult was introduced, complete with brutalizing bonding rituals and facial scarring to make the chosen ones stand out. These "wings" across their cheeks would become the defining symbol of Koshezaki, eventually being imposed on all people living in the core territory from the smallest children on up.

At this point the conquest stalled for a year while the conspiracy introduced iron-working -- specifically, how to make iron spears and armor -- to their new military. Britain, Ireland, and even eventually France along the English Channel experienced a massive convulsion of violence. The Koshezak army doubled and redoubled in size, and were essentially unbeatable with their new weaponry and a few other innovations such as ultralight aircraft reconnaissance.

Infinity finally managed to track down Serik and his cohorts in 2010, at the tail end of a huge push to tie up loose ends after The Secret became the cornerstone of parachronic policy. However, for nearly seven years the half-dozen versions of the Homeline villain took sociopathy to new heights. Little armies were pushed around the British Isles like life-sized wargames with blood. Violence was inflicted on a remarkably large scale for a culture restricted to spears, horses, and sailing ships, and often for no better reason to see the target towns and petty kingdoms squirm. Other times the expeditions were designed to bring back plunder, fuelling a slave-based luxury economy in Koshezak proper, with the Seriks most definitely at the top of a pyramid of bacchanalian consumption. All was not entirely well for them, though, as they began intriguing against each other. When one was assassinated, likely at the instigation of another, it brought the break that Infinity was looking for in their investigation. One of the Seriks -- named Serik-2 so as to specify him from the original and the others -- was captured on Orichalcum, scouting for some piece of Bronze Age tech that would give him the upper hand against the others. Serik-2 soon turned coat on the others, declaring, "If I can't have it, neither can they." He was dumped on Coventry after spilling his guts, and a month later Infinity moved against Koshezak.

Resistance to the crosstime assault was mind-bogglingly fierce for early-Iron-Age warriors fighting back against TL9-equipped soldiers; in their paranoia, the Seriks had planned for the attack since before they left Birmingham. Still, it took only two days for the ground fighting to end, with Koshezak under Infinity's control and some 5,000 dead -- only 61 of which were Infinity agents.

Today, Koshezak is very poor and has a population of perhaps a thousand people -- 10% of what it was before the Seriks came along. Though the main war is over, the area is still highly disrupted, and the tribes and petty chiefdoms in the surrounding area continue to attack one another and jockeying for status as a new equilibrium is worked out. The Serik stronghold was a wooden motte-and-bailey castle, which was burned to the ground by angry natives after Koshezaki power was broken. There are some stone-lined rooms underneath the moldering remains. Investigators can find out about the building and its basements with a minimal amount of research, but there are no maps on file; after

finding what was down there, no one was in a cartographic mood.

Koshezak is closer to a dungeon adventure than one usually encounters in Infinite Worlds. It's quite literally a ruined castle with a catacomb underneath, though the GM should feel free to deemphasize that latter aspect if that's not the campaign's style. Plot McGuffins may be stored in a small set of storage rooms underneath the motte for quick retrieval. On the other hand, the rooms may be enhanced to any level of complexity beyond this, and a conventional "find-the-treasure" adventure presented. Equus is a no-mana line, so challenges will of necessity be non-magical, but there is room to maneuver since the Seriks had conveyor access to many other timelines.

Betenamal

After Infinity's intervention and the collapse of the Seriks' reign of terror over the surrounding lands, the several thousand Koshezaki left alive were threatened with extermination as long as they were anywhere near their former victims. Unfortunately for Infinity, their freedom of action was restricted by a media leak the day after their assault started. Massive public attention focused on Jacob Serik's actions, and while a few back-room suggestions were made that it would be best for The Secret if the Koshezaki died off, it needed to look as if something was being done. Even breaking them up and scattering them around Western Europe wasn't possible because of their distinctive facial scars, which were now a badge of loathing as distinctive as a swastika on Homeline. Eventually Infinity's higher-ups decided to relocate the Koshezaki to the nearest reasonably isolated, uninhabited land near Britain: the Azores.

Most Koshezaki grudgingly accepted the help (though Infinity didn't push anyone, glad to leave as many of them to their fate -- and out of Homeline's hair -- as they could), and a colony of some three thousand were relocated to several pre-fab villages on the central Azorean islands. Once the media's attention moved away from Jacob Serik, Infinity did what they could to forget about them. The result is a number of very poor people, even by early-Iron-Age standards, living in what they call Betenamal ("Land of Exile"). They've started to make a little progress in the last year due to an Infinity Agent named Nayin Jones, outlined below, who has roots in both Homeline and Equus. At her urging the Koshezaki have even started trading with the mainland using as agents their now-teenaged children born since the end of the war -- and so lacking the distinctive scars that would give them away.

The main settlement is about 500 people on the island of Horta, mostly in Mashi, a village on the harbor of Faial. Two smaller towns are on Pico Island, one about four miles across the channel from Mashi on the site of Madalena and another near where Lajes would be on the south coast. The rest of the population is spread around small fishing villages on the other three central Azorean islands. The towns are entirely oriented toward fishing and agriculture, as one of the things that recommended the Azores to Infinity was a near-total lack of other resources that the Koshezaki could use to try and reconquer parts of the mainland. Unfortunately this means things are tending to run down, as metal tools and other items can't be repaired or replaced. Sympathetic people in Infinity have managed to semi-legally filter some iron and trade goods to them, but the Koshezaki are going to return to Stone Age technology within a generation or two if the new attempts at trade with the British Isles and Iberia don't work out.

Betenamal is a place designed to make characters uncomfortable for short periods of time. It's so far off the beaten path that they'll only need to go there when directly investigating something related to the Serik Conspiracy. Mashi and the other settlements are like the worst stereotypes of Indian reservations: poor and despairing, steeped in alcoholism (the Seriks have to answer for this last problem too: they introduced distillation to Equus so they wouldn't have to go to another timeline for something stronger than beer). The people themselves are quite unpleasant also, resentful of their treatment at the hands of out-timers, and often with mass murder in their past. The younger generation is less damaged, definitely delinquents who've been raised in a toxic psychological environment but at least with the potential to get better. The older Koshezaki are hopeless cases, but a GM could use the younger ones for a twisted take on the *Dangerous Minds* bad-kids-made-good genre.

People

Nayin Jones

The one person who cares the most about the Koshezaki is an I-Cop in the Justice Division. Her area of expertise is agents looking to score big by putting unsanctioned pressure on natives of primitive timelines. With that background, it's not too surprising that Nayin Jones would be interested in the Serik Conspiracy, but there's more to it than that.

Her adoptive father was William Jones, a British agent for Infinity at the time of the invasion of Koshezak, and one who suffered injuries during the assault that saw him cashiered and retired. However, he was injured in the course of trying to protect a four-year-old girl whose parents he'd just had to kill to save his own life. After being turned into a casualty his father's unit mates returned the girl to Homeline as a way of finishing what he'd been trying to do before he was shot through the chest. In 2027, Infinity would've arranged to have the little refugee put up for adoption, even assuming the unit had gone against the modern policy to avoid bringing back strays. Without such rules in the early days of crosstime travel, Jones informally took the child as his daughter after being discharged from hospital. He raised her until the age of 18, when he finally died from long-term complications of his injuries. Nayin joined the Infinity Corps a few months before he passed away. She's been a field agent for the last year.

Nayin's life is shaped by three things: being the sole Koshezaki who lives on Homeline, having to watch the slow fading of her adoptive father in the aftermath of his injury, and the facial scars she bears that mark her out as different on Homeline, and an object of hate on Equus. She's a profoundly lonely person, who garners some sympathy from others who learn her story but blows it away through her abrasiveness. She would be a lot happier if she could put the past to rest; unfortunately she feels she can't. The only thing that keeps her together is her quest to bring some measure of a proper life to the people of Betenamal, some of whom are probably her relatives. In other matters she's a typically conscientious I-Cop; when it comes to Betenamal, she indulges in regulation bending for their benefit.

She is European, with black hair, blue eyes, and darker skin than is usual for a native of Britain. She is fit, but otherwise of average height and weight. Her most distinctive feature is two triangular scars across her cheekbones, each about three inches across and an inch high at their thickest. They were rubbed with coal dust when they were inflicted and so are an obvious blue-black against her skin.

Nayin Jones   *150 points*

Age 22; Human; 5'6"; 130 lbs.

ST 11 [10]; **DX** 12 [40]; **IQ** 11 [20]; **HT** 11 [10].
Damage 1d-1/1d+1; BL 24 lbs.; HP 11 [0]; Will 13 [10]; Per 11 [0]; FP 14 [9].
Basic Speed 6 [5]; Basic Move 6 [0]; Block 0; Dodge 10; Parry 10 (Karate).

Social Background

TL: 8 [0].
CF: Homeline (Native) [0].
Languages: Centrum English (Accented/None) [1]; French (Native) [4]; Homeline English (Native) [0]; Koshezaki (Accented) [2]; Spanish (Accented/None) [1].

Advantages

Combat Reflexes [15]; Fit [5]; Language Talent [10]; Legal Enforcement Powers 2 [10]; Patrol Rank 1 [5].

Disadvantages

Bad Temper (12 or less) [-10]; Code of Honor (Infinity Patrol) [-5]; Duty (Patrol) (15 or less (almost always)) [-15]; Impulsiveness (9 or less) [-15]; Sense of Duty (Koshezaki of Betenamal) (Large Group) [-10]; Sense of Duty (Patrol) (Small Group) [-5]; Stubbornness [-5]; Unnatural Feature (Facial Scars) -1 [-1]. Quirks: Closes her eyes for a few seconds when shocked; Gets upset when children are in danger; Glares at people; Self-Righteous [-4].

Jacob Serik

There are still instances of Jacob Serik floating around; Serik-2 on Coventry to be sure, and others on their native timelines who had nothing to do with the conspiracy. Agents could encounter them at any time, as well as possible escapees from the assault on Koshezak nearly two decades ago. The stats below are for Serik-2. Serik-1 would be a little older (68 as opposed to 64), and any other Seriks in on the conspiracy would be over 60 by now. All are similar to one another, though there is room to twist Serik-2's skills and abilities in a variety of ways.

Serik-2 has a history similar to most of the others. He was born in Boston in 1959, and was in the US Army during the early 1980s. After mustering out he worked as a police officer in Massachusetts -- Serik-1 was recruited to Infinity from the Malden Police Department in 1999. Apart from the skills implied by that backstory, the Seriks are mostly shaped by their common psyche: high-functioning sociopaths, very bright, with a fascination for swashbuckling adventure stories like *A Princess of Mars* and *Lest Darkness Fall.* Serik-2 no longer has an outlet for his peculiar passions, but he does still enjoy teasing his fellow covenanters with disgusting stories of what he could do when he was in absolute power. He certainly would like to get back to "the good old days," but is currently resigned to the idea that that will never happen.

He is a tall, thin man of European descent, with light gray hair that is cut short and now very thin. He wears a grey moustache. His eyes are watery blue.

Jacob Serik   *155 points*

Human; 6'2"; 170lbs

ST 10 [0]; *DX* 11 [20]; *IQ* 14 [80]; *HT* 10 [0].
Damage 1d-2/1d; BL 20 lbs.; HP 10 [0]; Will 14 [0]; Per 15 [5]; FP 10 [0].
Basic Speed 5.25 [0]; Basic Move 5 [0]; Block 0; Dodge 9; Parry 10 (Brawling).

Social Background

TL: 8 [0].
CF: Western (Native) [0].

Adventure Seeds

- There is at least one Jacob Serik still alive and well, though stuck on Coventry. If he disappears, all hell will break loose, 20-year-old history or not. He's still a well-known name among Homeline's general public, and definitely a symbol for the abuses rooted out in the years leading up to 2010. The only question is, who has something to gain from it? Serik-1 was presumed dead in the assault on Koshezak, but who can be sure when several genetically identical copies of him were floating around? Would he even try to spring one of his counterparts after all this time, especially after the infighting of the Empire's last few years? Or is this all the start of some obscure power play within Infinity itself? Someone might be using him as a source of information about how to conquer a primitive timeline, possibly without his consent.
- Over 10 years, the Koshezaki brought enormous amounts of plunder back to the Serik stronghold. Common belief is that is was scattered to the winds after the conspiracy was brought to an end, but there are persistent rumors that some or all of it is still cached in the area. After all, while Koshezak was only 30 miles across, that's still more than 700 square miles of land to search, about the size of Luxembourg. However, any hint of a treasure hoard will bring in Nayin Jones, who will want to use it to better the lives of the Koshezaki in Betenamal. She knows they don't have much right to it, having stolen it themselves, but she'll harden herself against caring and put any legal and extra-legal pressure she can on the finders.
- Preferably some time after encountering Nayin Jones in another context, the adventurers have just begun a seemingly unrelated operation when they are called back to Homeline. The projector site through which they passed en route to their current timeline has been destroyed in a way reminiscent of Serik-1's break from Infinity back in 2003. The connection is made far more ominous by a corpse left behind, which bears the distinctive scars of a Koshezaki. Everyone is now under suspicion, including the adventurers. Jones will contact them, a suspect herself and ignoring a directive to avoid muddying the case. She's learned that in order to avoid a public relations disaster she and they are going to be thrown to the media in order to buy time for the real perpetrators to be found -- not that Infinity is sure the PCs *aren't* involved anyway. It is up to the GM to decide if Jones herself is innocent, or if her year of marginal illegalities on behalf of the surviving Koshezaki haven't finally led to some grand criminal scheme of her own.

Using Koshezak in Other Settings

Equus is already a fantasy setting, albeit an unusual one. Typical fantasy campaigns revolve around great events; in this world, those great events happened 20 years ago. The Koshezak War was in their parents' time, and the adventurers are instead living with the turmoil-ridden aftermath. What's it like to be an ambitious warrior or wizard one generation after the Time of Big Damn Heroes? For a particularly odd set of adventures, the player characters could all be the sons and daughters of the Koshezaki, the first ones who can return to the world incognito. Can they make their own lives, or are they considered the Children of Great Evil no matter what they do?

Given the number of science fiction authors who are also fans of Rudyard Kipling, the Koshezaki variety of "The Man Who Would Be King" fits into a long line of high-tech filibusters. Most SF game settings have some laws that can be used to isolate primitive worlds from conquerors, but few of them explore what happens when those laws are inevitably broken. The sad history of Koshezak -- and its shabby follow-up treatment by the organization whose rogue

agent caused the trouble -- can fill in for this absence of details.

A Decidedly Different Elf

for *d20 System*

by Caias Ward

Valnor Stormaxe swung with more caution at the elf; he barely connected with his blow, exposing a thin trace of blood from otherwise flawless blue skin. Mallifor pressed his own attack, several bolts of energy streaking from his hands and slamming into the elegantly dressed elf. The elf staggered back, reaching for its own spell components.

Valnor pressed his attack, shrugging off his shield and gripping his ax with both hands. He stepped forward as the elf stepped back, closing the distance with his waraxe blade. It bit deeply into the elf's chest, cracking bone as he pulled it free. Mallifor gestured again for good measure, several bolts of energy striking the elf. The elf stumbled, about to fall . . .

And laughed. The elf straightened up, exposing its slashed torso. Valnor recoiled in horror as the flesh knitted itself shut and the blood crawled back into its body. Mallifor did not give up his attack, his incantation blasting the elf with several fiery rays; the elf ignored them except for a disappointed look upon its face and a clucking sound from its mouth. It smiled, showing beautiful and savage teeth.

"I'm bored with this, human," the elf drawled at Mallifor, its voice at once menacing and disinterested. "My turn."

Mallifor recognized the gestures as that of a fireball, but his last living thoughts on the matter were the numbing cold that exploded around him and the snickering of this unnatural elf . . .

* * *

The word "elf" conjures up a particular image that is very familiar to many *d20 System* players. For the most part, elves are forest dwellers, long-lived and skilled in magic and swordplay. While distant at times, their race has a tendency towards good and have long racial hatreds for many evil races. They value freedom and the rights of others; humans and other shorter-lived races often consider them "otherworldly." Still, when they are compared to other player character races, the oddities and allure of elves sometimes fade. The "common" elf presents no more mystery than a human or goblin.

But what if the common elf was an offshoot of a much more ancient race? What if the high elves, dark elves, and wild elves all had a common progenitor, one lost even from the memories of elves and for good reason?

Kolen-Jhan

Medium Outsider (Cold, Elf, Extraplanar)

Hit Dice: 7d8+14 (45 hp)
Initiative: +7
Speed: 50 ft. (10 squares)
Armor Class: 20 (+3 Dex, +7 natural), touch 13, flat-footed 17
Base Attack/Grapple: +7/+8
Attack: +1 Cold Iron Rapier +11 melee (1d6+1) or +1 Composite Longbow +11 (1d8+1)
Full Attack: +1 Cold Iron Rapier +11/+6 melee (1d6+1) or +1 Composite Longbow +11/+6 (1d8+1)
Space/Reach: 5 ft./5 ft.
Special Attacks: Spells
Special Qualities: Damage reduction 10/cold iron, darkvision 60 ft, elf qualities, cold affinity, fast healing 3,

resistance to acid 10 and electricity 10, spell resistance 18
Saves: Fort +7, Ref +8, Will +6
Abilities: Str 12, Dex 16, Con 14, Int 17, Wis 13, Cha 13
Skills: Bluff +11, Concentration +15, Diplomacy +15, Disguise +11, Hide +8, Knowledge (arcana) +13, Knowledge (the planes) +13, Move Silently +8, Sense Motive +11, Spellcraft +15, and Spot +14
Feats: Improved Initiative, Skill Focus: Concentration, Weapon Finesse
Environment: Any (cold mountains or cold evil-aligned plane preferred)
Organization: Solitary, Troupe (2-5 Kolen-jhan and equal to three times number of humanoid servants), or Household (10-30 Kolen-jhan, five to ten times number of humanoid servants, and two to three times number of frost giants)
Challenge Rating: 10
Treasure: Standard coins; triple goods; double items
Alignment: Always lawful evil
Advancement: By character class
Level Adjustment: +5

Kolen-jhan appear at first glance to be like any other elves. More than a moment's glance, however, reveals several startling differences. First, Kolen-jhan's eyes are solid black, large and luminous, with occasional slashes of ice blue through them from moment to moment. Secondly, their hair and skin are decidedly unnatural, both ranging in color from a dusky white to pale blue.

Kolen-jhan average a little less than five feet tall, with a slight build. They dress in finery of all kinds, to the point of decadence, and adorn themselves with jewelry of gold and silver. A Kolen-jhan is never seen without a weapon of cold iron, and such weapons are often enchanted to inflict the most suffering on their targets.

Kolen-jhan speak Common, Draconic, Elven, Giant, Goblin and their own language, a twisted form of Elven that may be understood by speakers of Elven that make a DC 10 Int check. Check once for each bit of information.

Combat

Kolen-jhan attempt to avoid melee combat with those they consider "lessers," saving melee for friendly or not-so-friendly duels with their own kind. Decidedly cruel, they will seek to eliminate opponents in a painful and efficient manner as its abilities dictate. Kolen-jhan have a particular disdain of divine casters, targeting clerics and other divine casters with their most powerful and violent spells. Normally, they will command their minions (alternately humans or hobgoblins, or frost giants) to melee with opponents while they use spells in battle.

Spells: Kolen-jhan cast spells as a 7th-level wizard. They may choose to specialize in a particular school of magic, often doing so in the Enchantment and Necromancy schools.

Typical Wizard Spells Memorized (4/6/5/4/2; save DC 13 + spell level, specialized in Necromancy, Illusion and Enchantment Prohibited):

0—detect magic, light, mage hand, message, read magic, resistance, touch of fatigue; 1st— mage armor, magic missile x2, ray of enfeeblement x2, shield; 2nd—blindness x2, resist energy, scorching ray x2; 3rd—fireball (cold), fly, haste, vampiric touch;4th—enervation, polymorph

More powerful Kolen-jhan sometimes multiclass as clerics of the Master of Chains (see sidebar) to eventually become Mystic Theurges, as rogues to become Arcane Tricksters, or become Eldritch Knights. Many Kolen-jhan become wizards and enter wizard prestige classes.

Kolen-Jhan As Characters

Kolen-jhan characters possess the following racial traits.

- +2 Strength, +6 Dexterity, +4 Constitution, +6 Intelligence, +2 Wisdom, +2 Charisma.
- Medium size.
- A Kolen-jhan's base land speed is 50 feet.
- Darkvision out to 60 feet.
- Racial Hit Dice: A Kolen-jhan begins with seven levels of Outsider, which provide 7d8 Hit Dice, a base attack bonus of +7, and base saving throw bonuses of Fort +5, Ref +5, and Will +5.
- Racial Skills: A Kolen-jhan's outsider levels give it skill points equal to 10 x (8 + Int modifier). Its class skills are Bluff, Concentration, Diplomacy, Knowledge (Arcana), Knowledge (the planes), Perform, Sense Motive, Spellcraft, and Spot.
- Racial Feats: A Kolen-jhan's outsider levels give it three feats.
- Immunity to sleep spells and effects, and a +2 racial saving throw bonus against enchantment spells or effects.
- Low-light vision.
- Weapon Proficiency: Kolen-jhan are automatically proficient with all simple and martial weapons.
- +2 racial bonus on Listen, Search, and Spot checks. A Kolen-jhan who merely passes within 5 feet of a secret or concealed door is entitled to a Search check to notice it as if he were actively looking for it.
- Cold Affinity: a Kolen-jhan may choose to memorize any fire-based spell it can cast to instead do cold damage. It may only do this with spells that are memorized.
- +7 natural armor bonus.
- Spells: A Kolen-jhan character casts spells as a 7th-level wizard. If the character takes additional levels of sorcerer, these levels stack with the wizard's base spellcasting ability for spells known, spells per day, and other effects dependent on caster level. A wizard character likewise uses the sum of its racial spellcasting levels and class levels to determine the abilities of its familiar.
- Special Qualities (see above): damage reduction 10/Cold Iron, Immune to Cold, Vulnerability to Fire, Fast Healing 3, Spell Resistance equal to 18 + class levels, Resistance to Acid 10, Electricity 10
- Automatic Languages: Common, Draconic, Elven, Giant, Goblin, and Kolen-jhan. Bonus Languages: Infernal, Abyssal, Aquan
- Favored Class: Wizard
- Level adjustment +5.

Kolen-Jhan Culture

Kolen-jhan culture is a military republic, based around the strength of a particular Kolen-jhan and the household he creates for himself. Often, households are made of unrelated Kolen-jhan, simply gathered together for mutual protection, with a agreed-upon househead (Vhansuth) that handles internal affairs. There is far less infighting than would normally occur for such an evil race due to a complex series of laws established for the society that regulate assassinations, dueling, the redress of grievances, and other matters. Many problems are handled in gladiatorial combat or formal household military actions and war games against another, rather than the treachery associated with dark elves or the freewheeling chaos of humanoid cultures.

When a matter extends beyond the interests of a single household (such as defense of a city, conquest of outlying regions, or conflict between houses), the interested households send representatives (Tavyn-mhen) to gather and discuss the issue. Depending on the issue, voting may require a set number of supporting Tavyn-mhen votes (financial dispute between two or more households) or a unanimous decision (setting of terms for inter-house military action). Clerics of the Master of Chains act as judges and interpreters of the law, but do not hold the great power that they might in a theocracy.

In many respects, Kolen-jhan society is meritocracy, where the worth of a household is determined by what it brings to the community. Be it military

The Master of Chains

The Kolen-jhan have forsaken the elven pantheons, worshipping their own twisted and perverse god, the Master of Chains. He is the god of slavery, subjugation, and conquest, only concerned with his mastery of others, befitting his Lawful Evil alignment. His clerics are cruel paragons of the Kolen-jhan race, a civilized veneer over a core of depravity and violence. Often, they are the trendsetters of Kolen-jhan culture, keeping a fine balance in Kolen-jhan cities and nations between decadence and collapse. When out among the

might, arcane research, divine power, or civic improvement, the Kolen-jhan reward those that advance the community and severely punish those that would bring it down. Granted, much of what is done is done in the name of self-interest, and it is a fine line between bettering the society and assuring benefits for themselves and their household.

Slavery is a common element of Kolen-jhan society. While slaves are treated firmly (some would say cruelly), the ambitious among them find ways to secure their freedom, often by set periods of service in the military or exceptional skills in arts, sciences, or magic. It is in the military that a slave can truly shine, should he survive his enlistment. Despite the rules of ownership, any slave has the right to request military service in his household; if this is denied, he can request to be placed in another household's military, where law requires he be sold to the highest bidder. It is the one check to intolerable cruelty on the part of the Kolen-jhan that a slave may escape to another household if he is willing to risk a military life denied to him by his own master.

As befits a decadent culture, arts have a solid place in Kolen-jhan society. Much of their work is disturbing to other races, portraying great violent and profane acts, yet holding a terrible beauty. Despite the nature of the work, the artisans of the Kolen-jhan are no less skilled than masters of other races. They focus on sculpture, architecture, painting in flesh and blood, and weapon and armor smithing. In climates that allow it, sculpture and architecture are done with ice, magically hardened and sometimes used to imprison still-living enemies in frozen tableaux.

world, they are the masterminds of slavery rings and cults dedicated to excess.

The holy symbol of the Master of Chains is six interlocking chain links of cold iron; these are worn against the skin by the Kolen-jhan cleric, leaving a permanent burn scar against the skin. The Master of Chains domains are Destruction, Evil, Knowledge, Law, Trickery, and War. His favored weapon is the spiked chain.

Feel free to add or substitute domains involving suffering, slavery, or the domination of others.

Introducing the Kolen-jhan

The Kolen-jhan can have a variety of introductions into your game:

- Through magic such as Hats of Disguise and Rings of Mind Shielding, the Kolen-jhan have kept themselves hidden in elven society until recently. A sudden swing in behavior will cause immediate conflict, so the Kolen-jhan will slowly work mistrust and deception into a community.
- As an extraplanar race, members of the Kolen-jhan may have only recently returned to the Prime Material Plane. They will immediately go to work recruiting allies for whatever cause they have at the moment, which many times involves the control of whole continents.
- The souls of the Kolen-jhan have been dormant for countless generations, driven down by the weakening of magic in the world. Recently, an unforeseen growth of magic has awakened the bloodline, causing some elves to transform into Kolen-jhan and resume their old ways. The new Kolen-jhan will be quite happy with their transformation; their friends and allies may not be as happy, however.
- Whole cities of Kolen-jhan are located in unexplored mountain ranges or even have an empire across an unknown continent. Keeping to themselves, they trade through intermediaries, but continued unwanted contact has "inspired" them to expand their holdings at the expense of others.

Appendix Z: Traffickomancy

A New Path for Ritual Magic in *GURPS*

by Eric Funk

"Luxor, nexor, burst and BURN!"
"What is she doing?"
"Just a curse, dearie. Have a nice day. "
--Grandma Addams and Debbie Jellinsky, *Addams Family Values*

How many people follow this motto? "If another driver cuts you off, curse them!" Few take it literally, but beware those that do! What is one to do when stuck in gridlock or by a long train? It gives one time to burn . . . candles? Ever wonder why cars break down when you are going somewhere important, but not just around the block? Why do people have voodoo heads; fuzzy dice; icons of the Virgin Mary; or Saint Christopher, the Patron Saint of Travelers? They are foci for rituals!

Cars can be integral to the lives and livelihood of many people. While most citizens understand the basic principles of how a car works, few care to know how to maintain a car other than to fill the gas tank when it gets near "E" and to bring the car in for a checkup when the "oil" light comes on. It's like magic, one might say.

"In fact, very few people [. . .] know that the very shape of the M25 [highway] forms the sign odegra [. . .]. The thousands of motorists [are] grinding out a low-grade evil to pollute the metaphysical atmosphere for scores of miles around.
"It had earned him a commendation."
--Terry Pratchett, *Good Omens*

Technology is slow to enter the world of ritual magic, but as more adepts that grew up with it begin to survive beyond the "adventuring" age, they find time to research new rituals. Generic charms (see p. SPI92) and charms enchanted specifically for the vehicle can be attached to the rear-view mirror, or on the hood. From there, it will protect the vehicle, which usually means that any harm intended for the passengers will usually have to affect it first.

Unless they are a bus or a semi, most civilian ground vehicles are compact enough that they will be within a "five-yard radius"(see p. SPI91). The lack of space for large numbers of participants is offset by the tactical mobility of the site. Even a portable Sanctity 0 vehicle saves an adept seven hours of preparation over the span of a week (see p. SPI87).

Other options include enchant the vehicle with Chaperone to protect it from a mishap or curse. Another ritual to use if traffic is backed up is to use the Ritual of Obscurity and drive (slowly) on the sidewalk? This would prevent active detection by bystanders, and they instinctively avoid you. (See also the Loa Legba, deity of Crossroads, p. VO87.)

"And above all, watch with glittering eyes the whole world around you because the greatest secrets are always hidden in the most unlikely places. Those who don't believe in magic will never find it."
--*Roald Dahl*

Example Vehicle 1: Vintage Horse-drawn Carriage

This pristine, simple cab looks like a perfect reconstruction of the earliest carriages. Changing hands throughout the centuries, this vehicle has traveled across Europe, and can be found anywhere the campaign is held, even in the Americas. Its size allows for most two to four person rituals and permits one to park nearby and reduce range penalties.

Ritual Modifiers: Sanctity +4

Example Vehicle 2: "Old Yellow": 1940s Cab

This mobile antique is still in perfect condition. The engine still purrs, it never seems to need an oil change, and the seats are still in perfect condition (albeit with and off plaid pattern). Passengers may notice the presence of odd scented air fresheners and a small variety of dashboard ornaments, but there is nothing out of the ordinary to the untrained eye.

Ritual Modifiers: Sanctity +2

Example Vehicle 3: "Peace Wagon": 1960s van

This van was originally decorated in the style of "technicolor kaleidoscope" paint job with large Peace stickers and bumper stickers. Their outlines are still visible upon a close inspection of its dark matte paint job. It appears to have rusty joints and a poor-sounding engine, but it actually runs flawlessly. It can support rituals of up to eight or 10 people in the back, and the vehicle sports air conditioning. The interior radiates an aura of goodwill. At the GM's option, rituals performed within that harm the subject are at -1, and those that help, +1.

Ritual Modifiers: Sanctity +1

What effects did they decades of touring have on [Furthur](#)?

"I like traffic lights, but only when they're green."
-- Monty Python, *I Like Traffic Lights*

Path of Travel

Traffic Flow -- Defaults to Path of Travel-1 or Path of Luck-3

This ritual is designed to help long-distance driving and getaways. It can only be cast with a minimum duration of 30 minutes. The ritual creates a pool of points that the subject can use before the duration runs out.

The caster only knows if there are points remaining, but not how many.

The subject can "Spend" points of success as bonuses to long-distance driving rolls and Area knowledge rolls while in a vehicle for at least 30min (Max +5 at a time to a roll). The GM must make these rolls as spell failure when creating this "pool" results in negative points applying instead of positive ones. These bonuses help one to "coincidentally" have all automatic intersections and systems help one along, but not humans (such as a parade, funeral procession or motorcade).

Creative uses can also include speeding up library research and internet searching. This can only work when real and virtual travel (such as many websites or large libraries) or multiple rolls are required, and takes a minimum of one hour to complete.

Enhances Senses/Piercing Obscurity -- Defaults to Path of Travel-2 or Path of Knowledge-2

It cancels environment penalties to the senses equal to the Degree of Success (minimum 1, maximum modifier of +9). This can be applied to mechanical senses, such as microphones and cameras.

There is rumored to be a variant that cancels penalties to driving skills . . .

(Except for specialist (Travel) rituals, all defaults listen in GURPS Spirits are still available.)

From Path of Health

Dose (Inanimate): Defaults to Dose-2, Path of Travel-1 or Path of Health-5; counts as maintenance, a Critical Success or Success by 10+ recovers lost HT

Succor (Inanimate): Defaults to Succor-2, Path of Travel-5 or Path of Health-8; recovers 1 lost HP per roll

Malice (Inanimate): Defaults to Malice-1, Path of Travel-5 or Path of Health-8; resists with HT

Evil Eye (Inanimate): Defaults to Evil Eye-1, Path of Travel-7 or Path of Health-10; resists with HT instead of Will

From Path of Nature

Hasten Mount (Travel): Defaults to Hasten Mount-1, Path of Travel-4, Path of Health-7, or Path of Nature-6 : Increases vehicle speed by +10% instead of +1 Move.

From Path of Luck

Gremlins: Defaults to Path of Travel-2

Loyal Item: Defaults to Path of Travel-5

Here are some other rituals recommended by the adepts of the Path of Travelers:

Primary

Path of Cunning: Obscurity
Path of Luck: Chaperone
Path of Protection: Curse Sanctum, Ward

Suggested

Path of Cunning: Hallucination, Scry
Path of Protection: Ghost Shield

"Black magic operates most effectively in preconscious, marginal areas. Casual curses are the most effective."
--*William S. Burroughs*

Jane Richards, Ski Bunny

for *GURPS*

by Mark Gellis

Jane Richards was six years old the first time she went skiing.

Her parents loved skiing. They had met on the slopes as teenagers and married when Jane's mother completed her nursing degree and got a job at a hospital in Denver. Jane's father was originally from Idaho but he did not care very much where he lived as long as he was with the woman he loved and close to the mountains. Never an ambitious man, he had finished a degree in chemistry the same year his wife had started her career as a nurse and spent the next 30 years teaching at a local high school. He is completely satisfied with his life.

As soon as her parents thought she was old enough, they took their little girl to the mountains, strapped a pair of skis on her, and let her see for herself what it felt like to fly.

Jane grew up loving the mountains, and loved to ski. She was good at it, too. She was not quite good enough to make the Olympic team (although she tried), but she knew that whatever she did, she knew she wanted it to involve the mountains and the snow. As a teenager, she taught friends the finer points of skiing, and she spent many summers riding and hiking in the mountains. When she went to college, she studied Geology, but decided against working in a lab or with some government agency and instead got a job with a local resort as a ski instructor. She works in the off season as a wilderness guide. One of her most interesting jobs was working at a ski resort in Austria for a year; Jane loved living in Europe but eventually came back to the United States because she did not like being so far from her family. She can still speak German fairly well and is impressed by Americans who know more than one language.

Throughout the years, she has made a point to keep her skills sharp and learn anything she can that will help make her more effective at what she does. She can hunt, ride, cook, treat common injuries, and handle basic engine repair and home wiring, and she knows how to survive virtually any natural hazard from blizzards to avalanches.

If Jane has a weakness, it is that she hates to back down from a challenge, and she is willing to take risks. In fact, she *likes* it; it is an incredible rush to pull off some stunt she knows other people would be afraid to try. She usually gets away with it, too. Whatever gods watch over the Colorado Rockies, they seem to like this gal.

At the same time, Jane will not take risks with anyone else. In fact, when she is teaching or guiding anyone, she feels a personal commitment to keep them safe. If someone gets injured on the slopes, she stays with them until help arrives and she is certain they are going to be all right. And if someone she is guiding somehow gets lost in the wilderness (getting caught in an avalanche, etc.), she will keep looking for them until she is sure they have been found or until she is convinced they can no longer be alive.

People like Jane. She is smart and confident, and will take charge if she needs to, but works hard to avoid making someone feel stupid just because they do not know as much as she does. She sees herself as a teacher, like her Dad. The only difference is that she has a very big classroom.

Men especially like Jane. She is a very attractive woman. Most figure out very quickly, however, that she has little patience with men who simply see her as a possible conquest. She cannot respect anyone whom she thinks is trying to figure out what she looks like under a parka when they should be paying attention to what she is telling them about enjoying the slopes or hiking through the mountains without getting hurt.

She lives alone in a small, neatly kept house a few miles from the resort. She does not expect to share it with anyone in the near future. The only time Jane Richards gave her heart to someone, it got broken. Bill Finney was perfect for her. A fellow ski enthusiast, he worked as an automobile mechanic at a local garage and he was also an avid reader.

Handsome, funny, and good with his hands, he made Jane feel safe, made her feel like she had found someone with whom she could grow old.

In fact, Bill was very fond of her, but he was still in love with his former girlfriend, Debbie Johnson, who had left him when she started having an affair with a local hotel manager. It was not long, however, before Debbie realized that the hotel manager was not going to leave his wife, and she also realized that she hated the idea of anyone else having Bill. She reconciled with Bill and, a year later, Bill married her.

In a small resort town, Jane will sometimes see Bill on the slopes, or when she needs some work done on her car, and both of them find it awkward. Bill is very much in love with his wife, who has realized how lucky she is to have someone like Bill, but he likes Jane and he feels guilty about having hurt her.

Jane's parents, now in their 50s, live in a suburb of Denver, about a two-hour drive from the town where Jane lives. Jane has one brother, Michael, three years younger than herself. He is a sergeant in the United States Army.

Using Jane Richards in a Campaign

Jane is designed to be used in any modern campaign where the player characters are dealing with mountains or serious cold. She is the kind of NPC who can provide the technical and survival skills they might be lacking for a mountain adventure. In addition, she knows the area, and also knows a bit about whatever town serves as a home base during the adventure. Thus, a GM can use Jane in a variety of roles.

There are lot of things one can do in the mountains. Because they are isolated, sparsely populated, and because the terrain is both rough and treacherous, they make excellent settings for adventures. Even before PCs confront their adversaries, they will have to survive nature itself. And if something goes wrong, the heroes may find themselves in an environment where they are on their own and far from help.

Monsters love mountains. Because they are sparsely populated (and, often, some of the people who live there are eccentric enough to either leave them alone even if they know what they are or serve as their minions), discovery by those who might harm them is less likely, and the rough terrain makes it easy for them to attack anyone who invades their territory.

Typical monsters include ancient Indian spirits roused from their slumber by the greed and lack of respect for nature sometimes shown by both real estate developers and mining companies, ill-tempered creatures living in a cave or an abandoned mine that has become the local hangout for teens looking for a private spot for a party, and the now ubiquitous packs of werewolves who have made that midnight stroll in the snow with a flask of brandy and your sweetheart a very bad idea indeed.

A more realistic campaign can involve a natural creature, but one that is an unusually large, aggressive, and intelligent representative of its species. Grizzly bears and cougars are good options here. Wolves are also a possibility, although real wolves rarely attack people. However, animals that are abnormal for some reason are a stock plot device that any GM can use. These creatures might may be rabid or perhaps have been driven insane as part of some secret government or corporate research project.

In the case of a secret project, it is possible that the researchers engaged in fraud to get their funding (proposals that sound like they have been written by mad scientists usually do not get funded) and now they need to cover up the evidence of their crimes; this means eliminating any witnesses. Of course, the dangerously aggressive behavior of the animals in question might simply be an unexpected consequence of a perfectly sound research project, and any scientists or government agents who insist on joining the player characters on their expedition may be totally innocent of any sinister plans, as eager as anyone else to eliminate the danger to the public. On the other hand, it probably does not hurt to keep a close eye on them.

One can look for human monsters in the mountains, too. Whether the bad guy is a cultist with a compound and a group of fanatical followers, an ex-commando driven insane by his horrifying experiences on the battlefield, or a

cunning serial killer with a taste for the outdoors, any GM can build an exciting adventure by having a group of player characters hunt down some dangerous human quarry. The adventure will become even more exciting when the tables are turned, as they almost always are, and the hunters become the hunted.

Jane would also be useful if the player characters are engaged in a "treasure hunt." The "treasure" can be almost anything -- a frozen body of a prehistoric man left by an earlier expedition that ran into trouble, a lost mine that may hold untold riches, or the wreckage of a plane that crashed in the wilderness with something valuable onboard.

Such adventures can be played as straight "human vs. nature" stories, with the characters avoiding and surviving various natural hazards to reach the "treasure" and then bring it back. In some cases, the adventure may be a race against time, depending on what the player characters are seeking. A GM can also add other characters interested in finding the "treasure," dangerous and desperate individuals willing to kill to keep the player characters from reaching their goal.

Another option for including Jane in an adventure is to have her appear not as a guide but as a handyman. Perhaps she has quit her job as a ski instructor and is looking for work; she might take a position as a caretaker for a mountain lodge owned by one of the player characters or the wealthy individual who has hired them. Later on, her other skills may keep the player characters alive. And the fact that this is the first time she has worked as a caretaker (and perhaps only got the job because the previous caretaker died suddenly, leaving the owner of the lodge scrambling to find someone who could fill the position) may allow her to serve as a red herring that will distract player characters from the real villain.

Using Jane as a red herring is also possible if the adventure is set at the resort where she is working as an instructor. Jane is beautiful, capable, and confident; many characters might think she is too good to not be some kind of femme fatale.

Another way to use Jane in a campaign would be if her parents or brother had vanished, been attacked, or died under mysterious circumstances. A GM could simply use her as a client, hiring the player characters to find out what has happened to her family members, if he or she wanted. But it is likely that if the adventure involves searching mountainous or other rough terrain that Jane would insist on joining the party -- as she puts it, if she is paying for an expedition, she is going with it. The characters will probably be pleasantly surprised by how useful she is, and there might be some room for humorous role-playing if any of the player characters know how to ski, and do not realize how good Jane is on the slopes, and challenge her to a little contest. (If any PC should actually best Jane, she will be very impressed indeed.)

Jane also offers an opportunity for romantic sub-plots. She is beautiful and capable, exactly the sort of companion many male player characters (and some female ones) would seek. Can one of our heroes heal her wounded heart and renew her ability to love? If the character does this, he gains an Ally (and Jane's quirk of being wary of serious romance will be replaced with a new one emphasizing her love for the character), but her penchant for taking risks may make the relationship an interesting one.

There is also the possibility of a mystery plot because of Jane's personal history. If something should happen to Bill Finney or his wife, she might be a suspect. She might even be guilty.

Adapting Jane for earlier time periods is simple, as most of her skills will remain the same. Americans have been skiing recreationally since the 1870s, and the National Ski Association was created in 1904, so Jane could reasonably appear in any campaign set from the 1920s on (i.e., a Cliffhangers campaign), and perhaps even a late period Old West or Steampunk campaign, with minimal changes to her character (in most cases, Computer Operation should be replaced with Typing; in some cases, Driving, Mechanic, and/or Electrician might be replaced with more period-appropriate skills like Bicycling, Animal Handling, Teamster, Sewing, or even Electronics Operation (Communication), which would cover using a telegraph). Near or even distant future campaigns are also possible with small modifications; tourism is alive and well in many science fiction settings, and a character who can fix machines and serve as a wilderness guide will almost always prove useful in campaigns set in a post-apocalyptic world.

Adapting Jane for different locations (e.g., a British woman working at a resort in the Swiss Alps) is also a simple

matter of modifying her biography and a few of her skills.

Jane Richards   *200 points*

5'5" 130 lbs. Late twenties. Blonde. Blue eyes.

Attributes: **ST** 9 [-10]; **DX** 13 [60]; **IQ** 12 [40]; **HT** 12 [20]

Things I Love As A GM (Player Edition)

Okay; you know the drill. I'm letting my emotions flow freely onto the page, tapping my inner rage or giddy joy to discuss things I hate or love as a gamer or GM.

Unfortunately, as a relatively repressed self-controlled individual, my inner rage and giddiest joy generally manifests as random noodling on the page. Mmm . . . noodles.

Anyway, since I deviated a week to sate my booze-and-tax-frenzied fingers with hexadecimal hate, this week's mathematical iteration on our matrix is things I love as a GM. Remember: This go-around we're talking about things I love from players as a GM. The password is swordfish.

* * *

Players who use their game-world knowledge for good. One of the facts that struck me during my recent bout of putting RPG books on eBay was how many of them qualified under my classification system as "Mint; never read." Since I'm also a collector, this wouldn't be particularly disturbing . . . if it weren't for the fact that many of these game books were for systems I've run, and thus was theoretically supposed to be familiar with.

But at least ever since I ran an *Exalted* game having skimmed many chapters of the core rulebook (and probably years before that), I've contended myself with the fact that any players I run a game for using an established world or system will probably know that world or system better than I do. A lot better, usually.

Now, some players use this information as a club, and proceed to pretend that I'm a baby seal. The rules mongers will berate me for "incorrect" decisions while the continuity mavens will chastise me for not hewing closely enough to the official universe. Strangely enough, most of these players do not find themselves invited back to my campaigns after the initial player-testing mini-series is over. ("Hey! Are you going to re-start the *Otter: The Frolicking* campaign?" "Oooh, yeahhh . . . ummm, actually, we decided to restart the game on that day you said you weren't free." "But I'm free every day!" "Ahh. Erm. Well, we made up a new day.")

But the good players will go along with my madcap whims (since I'm not exactly a killer GM). And the *great* players will let me know -- either during the game or afterwards -- where I may have deviated from their expectations, and *give me ideas for how to incorporate it.* Thus a great rules-master might say, "I know you're allowing accumulated successes to advance the game, but you might want to make sure that we can't use that to make magic items, or else the game might get out of hand." Or a continuity hound might inform me something along the lines of: "I didn't want to say anything because it was important to your plot, but the Knights of St. Whitin are forbidden from killing unless it's vital to save an innocent life. So, if you wanted to use that, you might want to mention that the knight has been called to be tried by his peers, or you might want to make sure we learn how he felt that he need to kill in order to save innocents. Of course, it's also possible the Knights do things differently in *your* universe . . ."

I know there are many different ways to GM, but for the most part I've been firmly in the "collaborative storytelling" camp. I figure, we're all in this together, and if you have a good idea for making the game better then I'd be a fool to ignore it. As such, players who use their knowledge to enhance the experience are (as I see it) enabling us all to exceed the sum of our parts. Of course, this is easiest when the players are forces for good, and not using their knowledge as a weapon against me.

Speaking of being in this together . . .

Players who make it clear what parts of their characters are off-limits and what parts are open game. I love it when players give me good character descriptions and backgrounds. These don't need to be 80-page magnum penguins, but even a bit of information can make a world of difference, whether it's providing a strong sense of where the character came from, how his life was shaped, and what forces continue to work on him. The reason I love this information is because, when possible, I try to tie adventures and subplots into the histories of the PCs. After all, the

game and universe revolves around them, and practically every character is an accumulation of the elements of their past that brought them to that point today.

However, some players react more negatively than others when certain elements from their characters' pasts are brought back; this can be especially true if the element that is introduced is (or seems to be) detrimental to the PC . . . and, of course, since most plots develop through adversity, such detrimental developments are somewhat common. For example, if a player writes in a long-lost father into his backstory, then I might have that father just show up one day, preferably on the player's [front door]. But I've had some players in this situation who are just unwilling to accept this new development, because I have -- for some unknown reason -- touched something in that backstory that was off-limits. They'll say things like, "My father wouldn't act this way" or "I'm finding this plot development too unbelievable" or the like.

In discussing the matter further with these players, what's usually happened is that I've accidentally stumbled across some aspect of their backstory that they don't want messed with, only they didn't let me know that fact. (This has even happened after I've specifically said, "Is there any aspect of this history that you don't want me touching on, dealing with, or incorporating into the story?")

However, some players are *very* good about informing me what they would and would not like to deal with from their backstories. For example, one player in a Supers campaign made it clear that he didn't want his character's parents to be killed, maimed, or otherwise turn out to be evil. "What about threatened, or harmed indirectly?" I asked. The player was fine with that, and so I got to run a subplot where someone deduced there was a connection between the PC's heroic and secret identity (although he didn't make the logical leap of "same person"), and was attempting to get at the heroic PC by affecting the secret ID's parents, driving them to bankruptcy. The player, knowing that I'd promised I wouldn't kill or maim the NPC parents, had a great time, getting to serve first as a provider for the parents and then as the righter of their wrongs. But this was only possible because the player made his expectations known ahead of time.

So for all you players who let the GM know what elements of the character are off-limits . . . I raise a glass to you. Keep it up.

Players who bring props. For some reason, many gamers have concluded that props are only the province of GMs, and seldom do anything tangible themselves (despite the fact that most players seem to love it when I bring props into the game). A few players have bucked this trend, though, crafting actual letters they give to NPCs, devising newspaper clippings, finding photographs of "their characters and NPCs," and so on. Even a slight bit of costuming -- such as a headband worn by the player of a martial arts character or a fedora for a pulp detective -- can go a long way toward helping to establish that world.

* * *

Well, that's it for this installment. As ever, feel free to send your thoughts to me via [e-mail] or over on the [discussion boards]. Next week we should be finishing up our latest go-around on the love train, unless we don't.

Mutants & Masterminds Second Edition

Published by [Green Ronin](#)

Designed by Steve Kenson

Edited by Jon Leitheusser, Evan Sass, Marc Schmalz, & Chris Pramas

Art & graphics by Hal Mangold, Ramón Pérez, Attila Adorjany, Balaskas, Brett Barkley, Greg Boychuk, Eric Canete, Jeff Carlisle, Sean Chen, Steve Conley, Storn A. Cook, Talon Dunning, Tom Fowler, Tariq Hassan, Cully Hamner, Scott James, Georges Jeanty, Christopher Jones, "Rey" Lewis, Axel Ortiz, Tony Parker, Ramon k Perez, Conley Philpott, Steve Scott, Kevin Stokes, Craig Taillifer, Udon with Chris Stevens, Dexter Vines, Eric Wight, Marc Schmalz, & Rick Achberger

256-page full-color hardcover; $39.95

[*Mutants and Masterminds*](#) took the game world by storm four years ago. With everyone scrambling for *d20 System*-compatible works to score a coveted *d20 System* cover logo, Green Ronin decided to test looser waters -- so long as you stuck to the OGL and forewent the ***Dungeons & Dragons***-suggestive insignia, you had free rein in your book. As with any second edition, the two questions on everyone's mind are, "Do I have to buy this thing again?" and "Well . . . is it worth it?"

Some cosmetics: 192 pages became 256 cheaper, gloriously full-color pages. The artwork is by many of the same names, and the style has even matured. It still follows the "one chapter per subject" format, even for brief topics, but with fewer full-page indulgences. Major ideas like how rolls and saving throws work are summarized neatly. The paper miniatures and reference pages are gone (look for them at the website or in the upcoming screen).

There are more villains (and minions, monsters, animals . . .), but they and the hero templates are generic ("super simians" replace Dr. Simian) and stats are boxed out of the text body so they're easier to digest. The GM section is much longer, including plenty of comic genre conventions, but for a textbook it's fun reading. One introductory adventure has split into two . . . a bank heist to get the heroes' booted feet wet, and a training exercise with the Freedom League that (of course) turns into something else. The simplicity of the first is understandable, but the second has needlessly predictable twists.

The mechanical changes are worth noting (*and* were worth making). In the first edition you bought an ability (say, Strength) and the concomitant super-ability (Super-Strength). Both gave you bonuses and they were added together. Now you may be limited to certain levels or bonuses, but it's all pretty linear -- just buy what you need.

The powers (that's what everyone showed up for, right?) are very streamlined. Similar effects have become one (Super-Senses offers a big list); improving abilities is mostly nonspecific (ability X goes up Y points); and some forms of movement are also grouped, getting a little strange sometimes. Super-Speed combines Speed (going 20 mph instead of 10) and Quickness (doing crosswords instantly), for example. Granted, that's popular, but crawling up walls? You

have to buy that from Super-Movement. Why not a movement-related data dump like Super-Senses? The powers list is longer now, but . . .

A similar quirk is X Control (Time Control, Vibration Control, Electrical, ad nausea). They're now more like a player's guide to possibilities. Time Control could Snare someone (frozen in time) or allow Super-Speed (increase the flow of time). The power's description isn't the definition. While it's a good way to show off the system's versatility, these entries (more than two dozen of them) could have been one section of advice at the chapter's outset. Lots of little bookkeeping items too numerous to list don't help (Power Stunts are now Alternate Powers, the Doubling Values Table is the Time and Value Progression Table, etc.).

Skills and feats are cheaper (one PP buys you four skill ranks), which the Batman will find gratifying. The power level still limits you but can be tweaked. In a PL 10 game, your Attack Bonus maxes at +10 (Attack and Defense are now their own stats, incidentally). You can raise that by lowering the DC Save (how hard it is for your enemies to resist your powers); your Defense Bonus and Toughness are also paired. These links let you make a ninja who moves and strikes impossibly fast but, if tagged in combat, drops like a VCR price tag.

Hero Points. You know 'em, you love 'em, most games have 'em. They let you break the rules, change die rolls, add bonuses, etc. They used to be added every other power level; now you start every session with just one. But . . .

Time was, a weakness to irradiated bats or the tendency to become Lou Ferrigno when upset added Power Points to your character. Weaknesses are old news, replaced by drawbacks and complications. Drawbacks, like harder-to-control powers, are game mechanics you fine-tune by severity and frequency to suit your PP needs. Complications are storytelling devices. If your aged Aunt Gertrude inconveniently shows up, her intrusion is worth points. Villain Points are gone; if players suffer the sort of curveball that irks the average gamer like the bad guy escaping (a GM "fiat"), you again get a point. Hero Points are the result of the adventure and roleplaying, not some predictable horde of magic power, and accumulating them throughout the session lets you satisfyingly let loose at the climax.

There are other complaints to be leveled, mostly minor. Only fairly big sections of text get a different font color or size -- smaller subheadings may run together. The editing slacks off the last couple of chapters. The real problems? Combat -- it's only increased a couple of pages, but the formulae are scattered throughout. They desperately need to be grouped and, in the upcoming screen, soon will be. The other irritation is the power level limits. There's a ceiling on, say, damage (to prevent powers that level a city block), but there are exceptions to those limits and a definitive list would be handy. Things like Strength can be bumped up for pushing buildings back into place, but they don't want you using it to puree villains.

Mutants and Masterminds: Second Edition is the rare animal that improves upon the original in a meaningful way. Your old copy may be useful as reference in some ways, but there are enough changes that going to the new book is the only way to keep some of the ideas and changes straight in your mind. It's not an instance of a company making more money with a new version; this is palpably worthwhile as a fresh purchase, because if you enjoyed the first you'll love the second.

Pyramid Review

Kablamo: A Fast-Spinning Game Of Russian Roulette

Published by [Gigantoskop](#)

Designed by Christoffer Krämer & Jesper Moberg

Five Revolver boards, 20 Live Bullet tiles, 67 Action Bullet tiles, 13 High Velocity Bullet tiles, Ammunition Bag, & Rules folder; $30

My gaming group's favorite game is GDW's **Red Empire: The Card Game of Soviet Power Politics.** It is almost our default game, which lets us do the nasty on each as we work to denounce and purge members of rival factions within the Politburo. The aim being to politick our way into the position of President of the Soviet Union, and once there, try to survive more crisis than previous incumbents. Silly accents are of course, mandatory. Orbital Mind Control Laser receptors under very large hats (actually Ushankas) have proven to be a recurring motive when it comes to denouncing rivals. At the other end of the gaming scale and also at the other end of Soviet history is **Kablamo: A Fast-Spinning Game Of Russian Roulette.**

It comes from Gigantoskop, the Swedish publisher of the delightfully playable, yet titled in poor taste, **_Spank the Monkey_**. Where that game's title was potentially beyond the pale, it is this new game's subject matter that may be so. The situation is simple. The second and Bolshevik Revolution of 1917 has spelled the end of the good life for the Tsarist nobility. A year later and they are landless, enemies of the state, and likely to face a firing squad in the very near future. Which forlorn situation leaves the nobility ready and willing to entertain themselves with the country's number one game with a bullet, Russian Roulette. The problem of course, is that while any other game that lets you blow up, put to the sword, and generally kill the enemy is perfectly all acceptable, the idea of having a game in which could put a bullet in your brain . . . Well, that is just _soooo_ wrong. Alternatively, and after a five-second-reality check, this is _just_ a game.

Actually what **Kablamo** turns out to be is a game of memory and chaos in which the players load their revolvers, take aim, and then pull the triggers to unleash a range of surprising effects beyond the expected "click" or "kaboom!" (to be followed by a splatter, splurgle, and other noises beginning with the letters "S" and "P"). The aim is manipulate the various effects to your advantage, swapping bullets hither and thither so that your opponents blow their brains out while you are left standing.

Designed for two to five players, **Kablamo** comes well-appointed with five Revolver Boards, over 100 Bullet Tiles -- cardboard disks that sit neatly on the chamber spaces in each Revolver, a cloth bag for the ammunition, and a clearly presented rules folder. Some assembly is required, but this is easy enough with the aid of a screwdriver, the plastic nuts and bolts provided being a little stiff for the fingers.

The game is played via the Revolver Boards, one per player. Naturally, it has six chambers ready to be loaded, with the top chamber marked with the weapon's hammer. It is from this chamber that the rounds are discharged. To the immediate left of the Hammer Position is the Safe Position, the contents of which can only be manipulated by the Revolver's owner.

A player begins the game with eight Bullets, six of which have to be loaded into his Revolver. The remaining two are kept as spares. On a turn, all of the players rotate the cylinders of their Revolvers simultaneously and then turn over the new Bullet under the Hammer to resolve its effect. The yellow colored Live Bullets are Instants that go off immediately with one of two effects. "Kablamo" Bullets kill you stone dead immediately, while "Click" Bullets indicate a dud that lets a participant keep on playing. Both of the white-colored Action Bullets and red-colored High

Velocity Bullets come in 13 varieties, and both types can be aimed at your opponents rather than your own temple. High Velocity Bullets can also be played directly from your hand and not just from your weapon. Every Bullet Tile (except for Live Bullets) is marked with a timing number on it, the lowest numbered rounds being resolved first.

So what can Action Bullets and High Velocity Bullets actually do? Action Bullets include effects like "Hammer Malfunction" that prevents another player from revealing his next Bullet; "Cylinder Malfunction" which forces a Cylinder to rotate counter-clockwise rather than clockwise; "Slight of Hand" lets you swap one of Bullets with another player's random Bullet; "Test of Honor" lets you reload another player's Revolver on his next turn; and "Trigger Malfunction," which forces another Bullet to be discharged rather than the one under the Hammer.

While there is more than one of any type of Action Bullet, there is only one of each of the High Velocity Bullets. They include the amusingly named "Bolshevik Rules," which causes any "Kablamo" Bullet revealed on the next turn to eliminate the player on the revealing player's left; "Ricochet" enables a player to duplicate the effect of any just-played Action or High Velocity Bullet; and "Lights Out" that lets a player swap his Revolver with another player!

After all Bullets have been revealed and resolved, each player draws as many new Bullets as he has empty chambers in his Revolver. All resolved Bullets are discarded, except for Live Bullets, which are returned to the Ammunition Bag to be drawn in subsequent rounds.

This is very much a game of memory that quickly descends into chaos, as players manipulate the contents of their Revolvers while trying to remember what was loaded and where. It plays as long as there are players, the last one left standing with a Revolver in his hand being the winner. A game should not last much longer than the suggested minimum of 15 minutes, and rarely should it long as last as 45! Learning the game is very easy, and helped by the clearly written rules (which include a couple of variants), and the solidly produced components.

Yet when I tried **Kablamo** with my players, they were less than impressed. They deemed it too chaotic and disliked the knockout quality of the game, which despite being designed to be quick, left them waiting while each player fiddled around with the contents of his Revolver. That said, I am more pragmatic about the game, feeling that **Kablamo** will work better with groups that might appreciate better its chaotic charms. If you can live with the chaos, then **Kablamo: A fast-spinning game of Russian roulette** is a well appointed, light, beer 'n' pretzels (self-)shoot 'em up.

Return To The War Of Dominia

by K. David Ladage

Author's Notes

Back on April 2, 1999, I had my first article for *Pyramid* published. This article, "[The War of Dominia](#)," was a moderate success. The idea was sound, the concepts interesting, but the reaction to having an article about one of those games in Pyramid was a bit underwhelming. Despite all of that, it managed to get a slightly above average rating, and got me hooked on writing things for *Pyramid.*

Now, in the nearly seven years since that article was published, **Magic: The Gathering** has changed. A lot. In fact, the rules have gone through a major overhaul, and some minor tweaks since then. Many of the abilities and things I reference in the original article have been phased out of the game entirely (pardon the pun). So, I wrote to our esteemed editor and asked if it would be possible to allow me to revisit the article and bring it up to the modern rules. The fact that you are reading this should give you an idea as to what answer I received.

Introduction

Have you ever noticed that a pair of 2/3 creatures in **Magic: The Gathering,** outside of magical intervention, cannot kill one another? Or that neither creature in a pair with first strike can get the upper hand? Or that every plane that the writers of the back-stories for the world's most popular Collectible Card Game is essentially the same -- the players change, the cards change, but the meta-physics (a.k.a.: the rules of the duel) remain constant? Have you ever wondered why one duel has little or no effect on the next duel?

In this variation, each of these assumptions might not be true. Things can get a little odd and the various planes are as varied as the cards themselves.

Tournaments

In the original version of "The War of Dominia," their was a disclaimer stating that the structure of the tournament rules were not for the faint of heart. The structure was set up such that it was a set of alternate rules, as well as an actually war for the control over a multiverse. The problem with this structure is that it limits the ability of players to experience the more interesting aspects of this variation on the game, unless they are willing to invest several weeks (or even months) to the act of playing out the tournament.

Thus, in this new vision of the rules, the structure is set up such that it affects the individual games, but allows the players or tournament organizers to the use any of the popular structures they wish -- from sealed to constructed, single elimination or double elimination, fixed tree or Swiss pairings. For those that would like to have a true mapped multiverse, please refer to the original article. That structure can be a lot of fun in small groups. The rest of you, please keep reading.

The Duels Of Dominia

A match (being a best two-out-of-three or three-out-of-five duels) in a War of Dominia game is played much the same as a standard match of *Magic: The Gathering.* There are a few other things to keep in mind, but they are outlined below.

1. Calculate the life values for each player.
2. Draw the faux-ante cards.
3. Generate the Planar Constant(s) for the duel, if any.
4. Play the duel.
5. Repeat steps 1 through 4 until the match is over.

1. Calculate Starting Life For Each Player

For the first duel in any match, each player stars with 20 life. Each duel after that, each player loses 5 life for each duel that they have lost in the current match.

Example

Andy and Betty sit down to play. This is the first game of a best three-out-of-five match, so they each start with 20 life. Betty wins the first duel. Since Betty won, in the second duel of the match, she will start the game with 20 life, but Andy will start the game with 15 life. Still, he manages to win the second duel.

Since each player has lost a duel, they will both start the third game with 15 life. Andy wins the third duel.

Betty has won one duel, Andy has won two duels. As this is a best three-out-of-five match, the games continue. In this round, Andy starts the game with 15 life and Betty starts the game with 10 life. If Andy wins this round, then Betty has been defeated and the match is over; otherwise, they will both start the fifth duel of the match with 10 life and play it out from there.

Note: In the case of a duel that ends up a draw, the duel is considered nullified for purposes of determining the number of victories needed to win the match; and neither player will lose any additional life in the next duel of that match.

2. Draw The Faux Ante Cards

Ante is a concept that existed in the original release of *Magic: The Gathering.* The idea was that each player would put one card (at random) from their deck at risk in each duel. It added a sense of uncertainty and tension to the game, as well as acted as a universal balancing tool. After all, the Black Lotus may be an awe inspiring card, but if you want to play with that bad boy, you had to put it at risk in every single game.

So why did ante go away?

Consider that, at its peak, a mint condition Black Lotus could easily pull $2,500 if one was willing to sell it. This means that 10-year-old kids were in violation of many State's gambling laws each time they played! So ante had to go away, and with it that sense of uncertainty and tension (not to mention some of the most interesting -- and frustrating -- cards to have ever be created!). The War of Dominia aims to bring back to the game some of that uncertainty and tension, only without the whole going-to-jail-for-breaking-the-law part. We do this with a faux ante and the resulting possibility of a Planar Constant.

After each player has shuffled their deck, and the opponent has been given an opportunity to cut, the top card of each deck is removed and set aside, face up. If the card you ante up is anything other than a land card, then this card will have no further effect on the game. If, however, the card you ante up is a land card, please see Step 3, below.

3. Generate The Planar Constant For The Duel

A Planar Constant is a rule that is in effect for the duration of a duel. This rule cannot be ignored, turned off, canceled or affected in any way. It represents the meta-physics of the plane on which the duel is taking place. After each player antes up a card in Step 2, above, check to see if either of these cards is a land card. If it is, then a planar constant needs to be generated for each land card in the ante. To apply this rule, the player that anted the land card rolls a d66 (see below) on the chart that corresponds to the land type they have anted.

If neither player antes up a land card, then no planar constants are generated; if both players ante up a land card, then the duel will have (at least) two planar constants generated.

Example

Andy and Betty sit down to play. Andy is playing a Red-White Boros deck (from the Ravnica set). Betty is playing a Green-Black spirit deck (from the Kamigawa set). Andy ante's up a Boros Guildmage. This is not a land card, so he will not be rolling up a planar constant in this duel. Betty antes up a forest; thus, she will be rolling on the forest planar constant chart to see what this particular plane of Dominia happens to be like.

4. Play The Duel

Play the duel as normal, taking into account the variable of starting life and any Planar Constants. If sideboards are allowed, cards may be swapped out after the Planar Constant is set for that duel.

5. Repeat Steps 1 Through 4 . . .

When one player has accumulated enough victories, the match is over.

Planar Constant Charts

Notes And Symbol Key

- A T in brackets, i.e.: {T}, indicates the tap symbol.
- A number in brackets, i.e.: {1}, indicates an amount of generic mana.
- An X in brackets, i.e.: {X}, indicates a variable amount of generic mana.
- A dice code in brackets, i.e.: {1d6}, indicates a fixed amount of generic mana that is determined by a die roll prior to the duel beginning.

  For example: if a Planar Constant indicates that All activated abilities cost {1d6}, in addition to any other activation costs, then, prior the duel beginning, one player rolls a six-sided die; this sets the fixed amount of additional generic mana that all activated abilities will cost.

- A dice code outside of brackets, i.e. 1d6, indicates a fixed amount that is determined by a die roll prior to the duel beginning. For example: if a Planar Constant indicates that Whenever a player puts a permanent into play, he or she gains 1d6 life. , then, prior the duel beginning, one player rolls a six-sided die; this sets the fixed amount of life that is gained for each permanent that is put into play.
- A letter other than X or T in brackets, i.e.: {W}, {U}, {B}, {R}, and {G}, indicates a point of mana of a specific color -- WHITE, BLUE, BLACK, RED, and GREEN, respectively.
- For purposes of these rules, the term keyword ability refers to all abilities listed in Section 502 of the Comprehensive Rules with the exceptions of Enchant, and Substance. Additionally, it includes the terms: Indestructible, and Unblockable.
- As of this writing, the keyword abilities that fall under this heading are: Affinity, Amplify, Banding (Bands, Bands With Other), Bloodthirst, Bushido, Buyback, Convoke, Cumulative Upkeep, Cycling, Defender, Desertwalk, Double Strike, Dredge, Echo, Entwine, Epic, Equip, Fading, Fear, First Strike, Flanking, Flashback, Flying, Forestwalk, Haste, Haunt, Horsemanship, Imprint, Indestructible, Islandwalk, Kicker, Legendary

Landwalk, Madness, Modular, Morph, Mountainwalk, Ninjutsu, Non-Basic Landwalk, Offering, Phasing, Plainswalk, Protection, Provoke, Rampage, Replicate, Scry, Shadow, Soulshift, Splice, Storm, Sunburst, Swampwalk, Threshold, Trample, Transmute, Unblockable, and Vigilance.

Basic Land -- Plain

11	All white spells cost {1} less to cast.
12	All white spells cost {1d6} less to cast.

65	Any card that would normally go to the Graveyard, is removed from the game instead.
66	Roll twice on the Radical chart.

Blood, Heart, and Node Tokens

Items 31 through 36 on the Radical chart involve special tokens that players accumulate called Blood Tokens, Heart Tokens, and Node Tokens. These tokens are meta-game items that cannot be targeted by any spell or effect (i.e.: they are not artifacts, creatures, enchantments, land, or permanents of any kind). Each type of token has a special set of rules for its use.

- **Blood Tokens:** Players may sacrifice three Blood Tokens to deal one damage to a target creature. Damage dealt this way cannot be prevented or redirected.
- **Heart Tokens:** Players may sacrifice three Heart Tokens to prevent the next one damage that will be dealt to target creature.
- **Node Tokens:** Players may sacrifice three Node Tokens to add {1} to their mana pool.

Playtesting

by Joseph L. Babinsack

What makes a good playtester?

Is it knowing the mechanics or simply the observation? Is it the note taking or the innovation? Is it knowing the industry or knowing the genre? Is it arrogance or humility? Is it saying yes or saying no? Is it practice or theory? Is it all of the above, or all that and more?

Even the greatest concept is worthless if the game cannot be understood. The best materials cannot make up for the worst wording, nor can advertising overcome poorly conceived mechanics, nor can the most marketable licenses mean automatic success if something fundamental is overlooked. Theories are simply that: notions that look brilliant on the thought level, but remain unproven. Playtesting takes those unproven aspects and helps to shape the game into something that can be enjoyed out of the package.

Playtesting is not what makes the game, it's what makes the game meaningful.

Rules can be made to be broken, but broken rules are what the playtester sifts out of the finished product. Playtesters must be able identify the trouble spots in written rules. Even more, the playtester must be able to communicate those troubles, show where in the game process the issues lie, and clearly explain the situation.

What a playtester must do is take the game apart, examining each aspect individually, and then observe the connections (or lack thereof) throughout the play of dozens of games. What a playtester cannot do is play the game once, learn from anything other than the written rules, nor simply go through the motions and expect to be a meaningful part of the process.

A worthwhile playtester writes coherently. In describing the positive and negative aspects of confusions, the playtester provides the development team with options, reactions and the game's potential. To that end, the playtester must be able to describe the problem. Pointing out the issue is a part of that, but a good playtester goes beyond the level of a proofreader. The playtester is playing the game, making sense out of it, and must be able to define the problem, not just identify it.

If possible, the playtester is charged with whittling down the problem to the core. This does not mean rewriting. This can be a presentation of the argument pro and con, but more importantly, taking the problem down to the phrase or comment or word that is troublesome. Sometimes it involves the entire concept or the mechanic, and if so, then going into details is more important than reporting that "this isn't working." If the game seems smooth and well defined, but this one situation seems to create a burden, then why is it a burden? Why is it confusing? What aspect of the situation is not addressed? What can be provided to address it, or what can be removed to remedy the situation?

Hit It With a Stick

Playtesters must be the ultimate rules lawyers. By bending and stretching the rules to see what happens, challenging the game's limitations, attempting to cheat, and more than anything, striving to win, the playtester must act as the worst type of gamer and identify the weaknesses. Even the best of games have hidden options and troublesome issues of trust. Who has ever played the Avalon Hill *Civilization* board game without wondering if the lead player made a simple mathematical mistake to get so many advancements?

But a concentration on winning does not make a solid playtester. Mastering the game does not either. In fact, learning the game faster and deeper does no good if the playtester skips the nuts and bolts of the matter: detailing the obstacles, knowing what is wanted, and focusing, in turn, on all aspects of the game.

The single most important thing a playtester must do is note the obvious. Nothing can be overlooked, from typos to a lack of consistency. One of the worst things a playtester can do is assume that either a) someone else will surely see it, or b) its not that important.

Keep in mind that the root of playtesting is quality assurance. The function of the playtester is to identify potential problems, whether that problem is syntax and grammar, or a lack of clarity, detail or examples. When any playtester assumes that a word is not spelled correctly, chances are that a dozen others have made the same assumption. And they are all wrong.

I realize that many game companies will state that the playtest rules "are a work in progress." This is part and parcel of the playtest procedures. But that statement also invites an attitude that "It'll be fixed" and that mentality is bad for good playtesting. Okay, making note of every time the word "the" is spelled "teh" is a waste of everyone's time. But sometimes the wrong word, the wrong placement of a comma or the pasting of rules (in the wrong order) can make a tremendous difference in appearance.

To that end, nothing should be glossed over. For example, on the title page of the rules of the game I was working on, the name of the game was incorrect! A dozen people poured over that document, in paste-up form, but no one saw this glaring and embarrassing snafu. Did a dozen people simple ignore the mistake, or did a dozen people simply rush through the "meaningless" sections of the preparation of the rule book?

With the same game, a rather common mythical name was used, "Minotaur." However, on the playtest cards, it was listed as "Minataur." This spelling was generally considered an attempt to be unique, but when the playtest cards were matched up to lists of the cards, the inconsistency was seen and questioned. There was no attempt to be cute; it was merely a typo. Such is a perfect example of "reading too much into" the presentation of the games. Sometimes game designers and production people are trying to do things differently. Most of the time, the assumption of the playtester is incorrect.

But keep this in mind: even if the intent is there, unless the playtester addresses it, the manufacturing process, with multiple departments and various responsibilities, can be blissfully ignorant of the meaning. This can mean that the joke either went over everyone's head, or something glaringly obvious can be routed through one department after another, never raising a flag; either the primary assumption masks a mistake, or quite likely that the assumption is that the playtest process will correct all the flaws. Meanwhile, if the playtesters make the same assumption, the cycle persists and the flaw is set in publishing.

Avoiding the Link Between "U" and "Me"

The first and foremost rule in playtesting: never assume anything!

This flows into the second rule: note the obvious. The platesting process often breaks down into this flow of information: rules writing, playtesting, reporting, rewriting according to the reports, more playtesting, organizing of playtest reports, rewriting according the reports, final reviews, rewriting according to the reports, editorial process, print rules. If you assume that the rules are written front to back at every stage of the process, you are mistaken. A rules writer should, would, could, and does review the entire document many, many times, but the problem is the same problem that dogs playtesters: Assumptions are made, and things get overlooked.

The nature of the process is such that reports are often read, the sections that need addressed are rewritten or reconfigured, and the revised rules are distributed. This process is prone to the whims of the playtesters. If playtesting avoids sections of the rules, the management and rules drafters can only assume that the wording is accurate, clear and meaningful. Thus as the process continues, the design team tends to concentrate more and more on the sticky situations, and less and less time on the document as a whole. Over the course of months of time and hundreds of hours of playtesting, if sections are consistently overlooked by the playtesters, then they will be automatically overlooked in the normal process of playtesting.

At any point a playtester encounters an obstacle, he needs to figure out why there is a difficulty. Obstacles are

anything that hinders the flow of the game, from a single word to clumsily described mechanics, any parts of the rules that are not clear are not worthwhile for the product's release. Playtesting at the foremost is necessary for cleaning up the rules writing and making sure there is a flow to the game. Focusing on the why and the what is the way a good playtester addresses this aspect.

The "why" is subjective. Opinions are necessary and helpful. Perhaps the game is too similar to another. Perhaps the mindset of the gamer is too entrenched in following established patterns. Perhaps there is confusion between similar sections or contradictions implied within a page or a paragraph.

What expands upon the why. Note the specifics. Get down to the word or the phrase. Highlight the word in a quote, notate the page number (if possible) and be sure to avoid confusing the issue. If the specifics are not forthcoming, then keep it vague, but keep in mind that boiling down the specifics is the task assigned in playtesting, not just guessing and fumbling around for a explanation.

It is not recommended that the playtester outright rewrite rules. There may be a time and place for that, but never start out putting that level of input into the process. Mostly, there are people contracted to do the design, development and writing, and they are being paid to do so. So why do it for free? Also consider that reporting problems and noting difficulties are the responsibility expected from the playtesting. Trying to rewrite rules is a hopeless cause: without the benefit of the vast input and perspectives of the collected playtest materials, without direct interaction with the management and/or game design team, and without regard to the intent of the game as a whole.

What playtesting *should* provide is a combination of variables that can only be provided by experienced gamers, in the process of learning the game, and by repetitive play of the game in development. Opinions, theories, formations of styles, comparisons, observation, details, variations, and commentary are all notable expectations of the playtesters.

The ability of the playtesters to communicate these facets of the game is the most important aspect. So what should the playtester focus upon once the game has been learned and the rules reviewed for clarity, semantics, and flow? Three avenues of exploration will take the playtesters in right directions: interactivity, variation, and the spirit of the game.

Interactivity

Interactivity is the nature of all games, especially in player-to-player competition. Game design is often forged in theory and solitude. The way players actually confront the game, use its rules, and construct a style of play are not always easy to identify by the game design team. Designers can fall prey to influencing their audience, and can quickly focus upon their favorite means of playing the game. Playtesting diffuses the direct influence, and provides input from numerous points of view. It is the observation of clashing points of view and the unforeseen interactions that can either blow up the core concepts of the game design, or prove to forge a solid understanding of the game itself.

Variation

In a gaming industry dominated by chasing various deck colors and pieces of cardboard, variation has become more of a necessity for game viability. If the game cannot be played four or five different ways by a group of gamers (merely changing the size and shape of pawns no longer cuts it), then why bother? To this end, playtesting mostly assumes that different people will choose different aspects of the game play to work upon. If a game has various elements, but many are undeveloped, the playtester needs to comment and drive the development.

Spirit

One of the aspects of game development that needs commentary and opinion is the internal consistency of the game. This is often called the spirit of the game, and should be identifiable by an experienced playtester after some investment of time in the game. Rewrites of the game, and especially new additions to the mechanics, need to be in line with the expectations of the rules and the victory conditions. Nothing should stand out, whether the situation is a clash with other mechanics, a drastic imbalance in power, or something that just "doesn't feel right." Playtesters should

also hold true to the game, not the design or development team or the company itself. Being a playtester means being asked to make sure the game is worthwhile, not a popularity contest. The best playtesters are those that stubbornly maintain the integrity of the game against all other interests.

Dos and Don'ts

Ask questions: Nothing is so insightful as being able to formulate meaningful questions of the design team. Ask about the intent, the reason for changes, the meaning of word or words, the direction, the order of rules, the importance of various aspects. In terms of observation, no question can be meaningless. In fact, asking the obvious means that the obvious was assumed and not stated. This might also avoid the company's embarrassment of publishing a rulebook that contains glaring omissions.

"This game sucks!" Oh yeah? Maybe it does. But if you take playtesting seriously, you need to expand that sentiment. If you cannot, you aren't capable of the job. Many times I've seen a wretched presentation of rules and presented a commentary of a number of pages equal to, or greater than, the pages of the rules. If a playtester can hammer the details, then it's constructive criticism. If a playtester can only knee-jerk, then what's the use?

Play "mock" games: An experienced playtester can and will play two or more positions and run through the game, taking each side in turn. Hopefully, the playtester will maintain a consistent stance from each particular side, but regardless, the constant shifts in point of view are quite worthwhile to the process. Playing game after game against a set of consistent players tends to lock everyone into habits. Those habits mean that you end up playing your favorite styles and your favorite mechanics. Breaking up the patterns by forcing yourself to play all sides and confronting often overlooked cards is a fresh and jarring experience.

Presume you have the whole game: A good operation breaks up the game, doling out portions and expecting intense review by revolving the portions amongst established playtest groups. If, as a playtester, you think you know the whole picture, you probably don't. For the sake of protecting information and keeping the whole package under wraps, especially in this era of Internet driven fandom, a playtester simply cannot assume that a company would allow all the information to be concentrated and then left out of direct control.

Opinionate: Your insight is worth its weight in gold. Maintaining an objective stance on the process might be good for the blood pressure, but passion is what drives a good game, and if things are not being heard, if rewrites are making the situation worse, if the game has so much potential but so little of it being realized, then scream and shout (in writing). More than a few people are going to read your reports, and all it takes is one person who respects your opinion to either make things happen, or keep you in mind for future projects.

"This game is great!" And the point is what? Sucking up to the game designer won't win you any points if the game is an outright failure after release. If you can boil down the strong points, great! but chances are that the company, the management, the designer and the development team all already know that. The playtesters know that as well. No matter how "great" the game is, the accumulation of minor flaws can grow, the persistence of an inability to communicate the "greatness" can doom it, and the reality of one overlooked aspect can ruin the perception to others.

Think along the retail chain: The playtester's first focus is the game and the reception of the gaming community. But that community includes the industry as a whole, and the mainstream as a potential. Retailers, manufacturers and other game companies may see the game in a different light. Perhaps the concept of the game is not in the proper format. Perhaps it is unwieldy for a retailer to display. Perhaps it will impact another game company and create ill will (over some slight but significant similarity.) Perhaps a tweak in the rules, the materials or the packaging can save the company loads of money.

Questioning the publication: If the game still sucks, its time to either put up or shut up. If you absolutely know how to fix the problem, now's the time to go out on a limb and write some new rules, fix some glaring problems, or take your complaints to a higher level. What isn't cool is airing problems publicly, and especially an outright questioning of why the game is being made. Playtesting is a commitment to better the game, not to torpedo it. Constructive criticism is the way to go. Politely resigning is another option: if it's not worth the effort, don't waste your time. And don't forget

that nondisclosure agreement you probably signed to start the process.

Why Manticores Make Bad Mounts

for the *d20 System*

by Michael Tresca

In a wide variety of fantasy games, it's common for just about anything on four legs to be turned into a mount of some sort. Muscle-bound heroes ride dire tigers, dastardly villains ride dire hyenas, and armies fire arrows from elephants. But reality dictates there are certain characteristics that make animals more valuable for domestication than others.

While there are always exceptions to these rules, the qualifications of each creature ultimately dictate if it is worth the time and energy to domesticate. Some monsters are too big, others too ornery, and still others are not worth the trouble. Think having a dragon for a mount is a good idea? Read on and you might change your mind . . .

Horses are the modern equivalents of tanks in historical warfare. Their sheer power and speed turned a slow-moving armored warrior into a killing machine. The nation with mastery over cavalry is a nation who owns the battlefield. Any fantasy mount could do the same, if it meets the criteria.

Each magical beast or animal can be quantified by a variety of attributes, including alignment, breeding, diet, maturity, will save.

In addition to making the creature more or less likely as a mount, these attributes can also be used to modify the Handle Animal skills as a Domesticity Modifier. Rearing a wild animal for domestication requires a Handle Animal check (DC 15 + creature's HD). With these rules, replace the creature's HD with the Domestication Modifier, detailed below. Creatures that fit the criteria are easier to handle and groom, while those that do not are much more challenging.

Conversely, the Domesticity Modifier can be flipped to apply to Ride checks instead of the -5 applied to "creatures that are ill-suited as a mount." Thus, a +8 Domesticity Modifier added to a creature's Handle Animal DC has a -8 penalty to Ride checks.

The Domesticity Modifier can also be used to determine a druid or ranger's ability to influence animals with a Diplomacy check. Instead of the flat -4 penalty for magical beasts, use the creature's Handle Animal modifier.

Alignment

Creatures that are spirited, violent, or generally hostile to humanoids will make them less likely to be domesticated for obvious reasons. A creature's disposition varies, but its alignment is a major influence on its behavior. Creatures that are known to be aggressive (e.g., boars and predators that are the dominant hunters in their area) are also difficult to tame.

Domesticity Modifier

- **Neutral:** 0
- **Evil:** +1
- **Chaotic:** +2
- **Good:** -1
- **Lawful:** -2
- **Aggressive:** +4

Diet

Creatures need to eat. For most beasts, the ratio of food to biomass required to grow an animal to maturity is about 10 percent. Thus, it takes 10,000 pounds of grass to grow a 1,000-pound cow. If an animal is too finicky in its dietary requirements, it becomes difficult to domesticate. Creatures with limited diets can't travel far and, more importantly, can't travel with their masters. Plants are fundamentally more prevalent than other animals, so carnivores lose out in this regard. A carnivore must expend energy to pursue other prey, but grass doesn't run away from cows.

Domesticity Modifiers

- **Herbivore:** -2
- **Omnivore:** +0
- **Corpophage (corpse eater):** +1
- **Carnivore:** +2
- **Small:** -2
- **Medium:** -1
- **Large:** 0
- **Huge:** +4
- **Gargantuan:** +6
- **Colossal:** +8

Maturity

Animals that take a long time to grow to full size are less appealing. Dragons are particularly troublesome in this regard, because a human waiting for them to reach maturity might die of old age.

Of course, this growth rate ratio varies according to the race attempting to domesticate the beast. Elves may have plenty of time to wait around for a dragon to mature but half-orcs probably do not.

Domesticity Modifiers

* Divide the herder race's adulthood age by 10. This is the maximum number of years it must take for a creature to reach maturity in order for it be considered worth domesticating. For every year below that number, subtract a -1 Domesticity Modifier. For every year above that total, add a +1 Domesticity Modifier. This means that elves are willing to breed creatures that can take up to 11 years to mature, where as humans are willing to wait up to 1.5 years (the age of the average cow).

Organization

Not all animals will breed in captivity. In game terms, this is difficult to quantify, as not all descriptions quantify a particular creature as more or less likely to breed in captivity. One possible way to determine a creature's ability to breed is its numbers - creatures encountered in large numbers are more likely to breed than those that travel in groups of three.

Organizations that involve a single leader help make a creature more pliable for domestication. Herds work well because one herd member follows the next, with clear ranking throughout the herd. Herds are less like to fight as a result of this social structure and thus can coexist peacefully in restricted spaces. Packs have the same structure. Solitary animals, on the other hand, are much more territorial and will not tolerate others of their kind.

Domesticity Modifier

- Determine the maximum number of creatures likely to be encountered (under "Organization"). For every five creatures below 30 (rounded down), add a +1 Domesticity Modifier. For every five creatures over 30 (rounded down), subtract a -1 from its Domesticity Modifier.
- **Largest organization type (herd):** -4
- **Largest organization type (pack):** -2
- **Largest organization type (pair):** +1
- **Largest organization type (solitary):** +2

Will Save

A creature prone to panic can describe a variety of states, including nervousness around humanoids or single-minded attempts to escape all captivity, even if it means the death of the beast. Bison are less desirable for this reason.

Domesticity Modifier

- If the creature has a Will save over 2, decrease the Domesticity Modifier by -1. For every point of Will save under 2, increase the Domesticity Modifier by +1.

Domesticated Monsters

With these rules in mind, we can examine some popular monsters and their feasibility for domestication. Only creatures that are naturally occurring on the Prime Material plane are reviewed here, although the domestication rules can be applied to any being. Note that none of these modifiers take into account maturity, as that is determined by the race domesticating the creature.

Pedaling to the Clouds

for *GURPS*

by R. West

Throughout the modern era, human beings (and many others) have enjoyed the pleasures of a simple journey under their own power: bicycling, rowing a boat, hiking, and similar forms of recreation. In a high tech society, there's no reason that this would change, although the vehicles might. By TL12, contragrav is reasonably inexpensive, and can be turned to recreational use. The Gaelic Enterprises "Revolution" presented here is once such recreational vehicle. Using a low-powered contragrav generator and advanced fuel cells to power it (and any electronics), the propulsion is generated solely by the rider's pedaling a ducted airscrew.

A *GURPS Vehicle Builder* file for this article is available HERE.

The "Revolution" was one of the first mass market air bikes produced, hence its name, showing that it's intended to revolutionize outdoor recreation and exercise. The bike is just over four feet long, and narrow enough to allow for comfortable riding, with a shrouded airscrew in the rear. There are two cycle seats, but, on the basic model, only the front seat has pedals or controls.

On many worlds, the cycle doesn't require the vast array of electronics and safety features that powered contragrav vehicles must carry. This is because it is a human propelled recreational vehicle, rather than a grav car. (This is similar to the difference between 20th-century Earth's differing regulations for automobiles and bicycles.) The .075 cubic foot electronics bay allows the easy addition of a transponder, with room for extras as a stereo system for the musically inclined rider. The contra-grav unit is overpowered by 25% for safety.

The computer is a small, unsophisticated, and cheap model, but easily upgraded if needed. No software is provided, and there is no terminal, only an access port for a rider's portable computer.

The muscle engine and airscrew are capable of handling riders with a Strength of 20, although the performance stats provided are for a rider with a Strength of 10. The effects of higher strength are delineated in the vehicle statistics.

TL 12 Contragrav bicycle

Crew: 1 total. 1 crew station covering vehicle maneuvering system, communicator, 2 navigation aids. 1 passenger.

Subassemblies: Vehicle -1, Body -1.

P&P: muscle engine (1-man, avg. ST: 20, no access space), 46,000-kWs rechargeable power cell, 0.4-kW ducted fan (no access space), 625 lbs. lift contragrav generator.

Fuel: None.

Occ: cycle crew station, cycle passenger seat Cargo: 0.075-cf Electronics Bay, 0.5-cf cargo hold

Armor F RL B T U
Body   3/5 3/5 3/5 3/5 3/5

Equipment

Body: medium range radio communicator (5,000-mile range); GPS; inertial compass; small computer (complexity 5;

dumb).

Statistics

Size: [L×W×H] 5'×0.2'×1.3' **Payload:** 412 lbs. **Lwt.:** 466 lbs.
Volume: 1.38 cf **Maint.:** 222 hours (0.433 mh/day) **Price:** $2,036

HT: 9 **HP:** 11 [Body].

Aerial Performance: Stall Speed 0 mph, Drag 4.52, Top Speed 35 mph with strength 10, aAccel 0.07 mph/s, aMR 7, aSR 3, aDecel 30 mph/s.

Additional strength within the capabilities of the muscle engine adds speed as follows:

- Strength 11 allows a speed of 40 mph.
- Strength 14 allows a speed of 45 mph.
- Strength 17 and higher allows a speed of 50 mph.

Design Notes:

- TL12 medium frame standard materials [Vehicle].TL12 DR 5 standard metal [Vehicle].
- Operating Duration: 20 H 5 M 27 S.
- Vehicle Features: electronic controls, fair streamlining, cheaply made.
- Volume: 1.38 cf [Body].
- Area: 7.44 sf [Body].
- Aerial Performance: external item drag 1, payload 0, sweep none.

Other models are lighter in weight, and better streamlined; most of these are hideously expensive racing machines. Others, intended for longer-distance recreational activity, have a larger contragrav unit and a hardpoint, allowing additional cargo to be carried externally. Campers can then carry a tent, provisions, and a solar cell for recharging. Higher end models also need less maintenance; the basic "Revolution" is cheaply made, but requires only infrequent tune-ups regardless.

Uses

- "Revolution" airbikes have very little EM emissions, and so would be ideal for sneaking into any place the player characters would not be welcome. A simple EM Emissions mask would reduce the already low signature. The craft is ideal for low, under the radar, travelling into places that do not welcome guests.
- A collection of airbikes could also be the only available transportation on an extended journey . . . or at least the only transportation the group can afford.
- These and similar vehicles are common sites in some hi-tech worlds.

Legacies of the Renaissance (for *Call of Cthulhu*)

Published by [Chaosium, Inc.](#)

Written by Alan Kissane & Dr. Robert Francis

62-page tape-bound b&w softcover; $15

Legacies of the Renaissance is a scenario for [*Call of Cthulhu*](#) set firmly in the game's classic period of the 1920s. It has been released as part of Chaosium's Miskatonic University Library Association series of Monographs, and is only available direct from the publisher's website. All entries in the series are considered to be of special interest by Chaosium, popular enough to be made available, but the publisher leaves the production values, layout, and editing up to the authors. The intent is that, should any one title prove popular enough, it will undergo proper editing and be released via the normal distribution channels. To date, with over 20 Monographs published, for the *Basic Role Play System* and *Stormbringer* as well as *Call of Cthulhu,* none seems to have proved popular enough.

Legacies of the Renaissance is actually the first of a trilogy set in the late 1920s dealing with Mythos-related artifacts and events that are still having an effect centuries after they first came to prominence. For this scenario, subtitled *The Stone of Concordance,* the strange artifact is a piece of jewelry, said to have links to England's foremost alchemist and astrologer of the 16th century, and the leading romance poets of the early 19th. The scenario will see the investigators blackmailed into traveling from England across Europe and back again by a desperate man. Only by making this journey will they save the lives of their friends and reveal both the true nature and the dark history of the stone.

[SPOILER ALERT!]

The scenario opens in 1928 with a telegram from a friend of the investigators, one William Tanislow, asking for their help. His future father-in-law, the British Foreign Minister Wilfred Forbes, has been murdered, and his fiancée Valerie is missing. Coming to his aid, William further reveals that she is still alive, but for some reason remains in hiding, and that he possesses little faith in the police investigation. This is the beginning of a trail that leads the characters through the foggy streets of London, hampered by a police inspector who objects to amateur interference, and monitored by at least one individual of a murderous bent. As the investigation pulls them into the histories of Doctor John Dee, the artist Godfrey Kneller, and Lord Byron, the characters must visit in turn, the British Museum, the dark allies of Soho, and West Minster Abbey, before going North to Nottingham, and Lord Byron's last resting place.

Researches reveal that the Stone of Concordance consists of two halves, and that one half is missing. To locate it, the second half of the scenario takes the investigators across Europe to Venice -- via the Simplon-Orient Express, no less -- and from there over the Aegean to Crete. Just off the island's coast is another smaller island, once a refuge for incapacitated soldiers during the Greek war of independence, and now a Leper colony. This is the last known location of the person who owned the missing half. Actually finding the missing half is not that difficult, but obtaining it is, as a pestilent avatar of a Great Old One protects it. Once in their hands, it is a simple matter of returning to England to face the blackmailer and free the hostages.

Legacies of the Renaissance is heavily plotted and certainly gives plenty for the investigators to do. That said, in places it is overly plotted. What is revealed over the course of the scenario is that the Stone of Concordance was created through a ritual that the investigators are encouraged to perform in order to gain more information. The problem here is that would an experienced group of players have their investigators perform such a ritual? There is also the matter of the exhumation of Lord Byron's burial vault, an event that did not actually take place until 1934. The characters have to be present in order to obtain vital information, but what happens if they are unable to be there?

Neither eventuality is really addressed in the scenario, but an experienced Keeper should be able to handle such a problem. Thankfully, other scenes are less heavy handed, and are more effective at moving the adventure along.

[END SPOILER ALERT]

The scenario has a few requirements. First it is not designed for inexperienced characters, who need some Mythos knowledge. That, and knowledge of several languages. Not just the traditional Latin, but also some German, and perhaps a little Greek and Italian. The time and place is also quite specific: England in 1928. There are notes included on Great Britain during this period, but access to either ***Green & Pleasant Land*** or ***The London Guidebook*** would prove useful. Taking the adventure out of the 1920s would be difficult due to historical constraints, but with a tweak here and there, it could be run in the 1890s of ***Cthulhu By Gaslight.*** Running ***Legacies of the Renaissance*** in the modern era is more problematic and a doubtful prospect.

Physically, this Monograph is up to the standards of the series. Naturally it requires a further edit, but it is illustrated with a reasonable selection of period photographs and serviceable maps. In places the writing does not flow as willingly as one would hope, but this is only a small hurdle to overcome.

Like the majority of the Monographs released to date, ***Legacies of the Renaissance*** needs some development. In this case to make the Keeper's task easier and the scenario smoother to run. What problems it has are relatively easy to overcome, particularly for the experienced Keeper. Where the scenario shines is in the plotting and in showcasing the depth of the authors' research, as evidenced by the bibliography. It also contains links to the second adventure in the trilogy, set in Venice following the uncovering of the bones of a new dinosaur species during a canal cleaning. If the authors can work in a little more flexibility into the writing, this first scenario bodes well for the sequels. If that fails to appear, then ***Legacies of the Renaissance*** is at least solid support for a British-based ***Call of Cthulhu*** campaign.

Blood Mansion CD

Published by [Midnight Cathedral](#)

Audio CD, 13 tracks, 38 minutes; $12

It still seems there isn't enough game-specific music to set the mood. *Blood Mansion* tries hard, and succeeds to an extent, though even it has too much variation to fit its own themes comfortably, never mind being a perfect accompaniment to your game.

The back-story to the score is the old Hodges mansion. Originally a plantation in the South, the property's owner had a liberal view of slaves' rights that made him popular among his staff. This loyalty left his lands mostly untouched by Sherman on his march through Georgia -- the occupants stood together to protect it. Carpetbaggers attempted a takeover during Reconstruction, and John Hodges and his workers were mysteriously butchered when they refused all offers. Through the last 140 years it has repelled several potential owners, and the massacre has passed into legend. Now it has a soundtrack.

The first track, "Oooh Choir," drones a bit, but its slow tempo and unremarkable nature makes a good lead-in to the dramatic or creepy (it's oddly good for denouement, too). "Cemetery Talk" also has few highs and lows and fits slow action better, like investigation, while "Night Terror" suits level action: pursuit, or cruising the mean streets. It has the distant suggestion of something feral, too, so that's handy. When everyone sickens of "Cemetery"'s one-minute repetitions (about the third go-round), they'll welcome this.

"Midnight Cathedral" (we have a title!) is a meandering journey on which even the artist seems lost. Tinkling strains of "Rock-a-Bye Baby," followed by tolling church bells, let a choir take over. It's the sort of Peer-Gynt chorus that says the Prince of Lies (or his daughter) is about to get screen-time, though it's not as sonorous or terrifying even with ravens and more storms to end it. With everything up to and including the dongs of a broken calliope, this seven-minute opus never quite settles into a single groove. By contrast, "Ghost Story" is about 30 seconds -- this one plays you out to commercial break after something creepy occurs. It's good, though, so put that on repeat too for those moments of revelation.

Every story has that scene where some wizened old hag tells everyone her hideous life story, full of tragic lost love, and that's where "Haunted Piano" comes in. Play this as you narrate to the players and they'll know the next scene involves a doll with life-like eyes killing them in their sleep. It's easily the most effective piece on the disc.

"Echoes Downward" reverberates through sewers and tunnels. Something big hums in the background, so be sure the PCs have stumbled onto the government's Area 51 project when you cue it. It suits cyberpunk better than horror with its vaguely alien lasers or scratchings (it doesn't fade, though, it just cuts out -- careful you don't spoil the mood). Once they've found the secret, "The Abyss" means they've been discovered…there's not so much music here as a cacophony of sound collapsing around them, so torture someone for effect. It's a Saturday night gone south, so if the torment is in Hell's mosh pit all the better. The DJ must've died, because "Bass Ackward" sounds like a scratch session cut short (that, or it's a faulty copy of the album). The reversed music (get it?) might be nice for time travel or warping reality.

The titles then become a bit more baffling. A needless pairing of Bobby McFerrin mouth pops and the vibrating whistle of a UFO landing in 1950 somehow gets named "Voodoo Call" -- use the first part for your early 80s crime dramas. The second half, you get the feeling you're traveling with the same thumps and hums as when the Terminator grabs John Connor. The cyber-future of the autobahn or subway would be well represented by this track. Voodoo doesn't enter into it.

Someone goes over the edge in "Cliff House": Your story has been told and someone must perish in positively Dickensian fashion (you can feel the water below beckon to you). Good stuff, but like "Haunted Piano," it demands the right moment. Once you've plummeted into the drink, the "Sea at Night" fails to give up its dead and the camera and the stringed instruments pull back rapidly across the waves. Good for foot pursuits, trips to the next destination, and the not-quite-shaking of the feeling of being followed. "Til' Next Time": more thunder, more piano, and a creepy laugh that's, sadly, not at all subtle. It's lightweight electronica, as though the piano was replaced at the last moment to finish the score. It, too, ends abruptly.

Some tracks are so long as to be intolerable, others so short as to add doubt to the merits of their inclusion. The work shows the telltale signs of independent production -- murky printing, spelling errors in the jacket, and grainy shots for the cover -- but the music itself is competently produced and the price isn't bad. It's inconvenient to have titles on the disc itself (print them from the website or pop the drive to read them), it's not as smooth as similar offerings, and a lot of it sounds awfully alike. It isn't dedicated music like a **Deadlands** collection (it has its own story to tell), so it may serve several games only in part. There's enough incongruity to keep it from being all things to any one genre (including its own tale), but it shows enough depth of composition to beat out those haunted house soundtracks. Used properly, **Blood Mansion** can be a positive boon to your more dramatic or morbid roleplaying sessions.

--Andy Vetromile

Lamia: You've Got Me On My Knees

"Her head was serpent, but ah, bitter-sweet!
She had a woman's mouth with all its pearls complete:
And for her eyes: what could such eyes do there
But weep, and weep, that they were born so fair?"
-- John Keats, "Lamia," I:59-62

This is a story about a monster, one we've met before, or at least named before. Actually, it's two stories, at least, and perhaps two monsters, though two with the same name. One story's reflection becomes the other story's concern, twisted like the serpent and mirrored like an eye. It's hard to follow the trail, twisting back as it does, ducking underwater and splitting its tracks in a sinuous maze, the monster all the while watching for her chance. Blink, and you'll miss it -- don't blink, and, well -- that's the story. One of them, anyway.

"The maid, alas! Her thoughts are gone,
She nothing sees -- no sight but one!
The maid, devoid of guile and sin,
I know not how, in fearful wise,
So deeply had she drunken in
That look, those shrunken serpent eyes,
That all her features were resigned
To this sole image in her mind . . ."
-- Samuel Taylor Coleridge, "Christabel"

Once upon a time, Joan went to visit her friend Betty and her husband Tom, to see if they would go Christmas shopping at Penzance. As she approached their house, she spied through the window and saw Betty smearing Tom's eyes with an ointment, so that they shone like dark stars. As she knocked, she heard a sound as of something being quickly hidden, and then Betty came to the door. Joan explained her errand, and Betty demurred, saying she and Tom were unwell, and were staying indoors that night. But Betty went to get Joan a refreshing drop to warm her.

While Betty was gone, Joan found the ointment box where it had been hastily put aside. Joan rubbed a little ointment on her right eye, and could see nothing but tears for a while. She barely hid the box again before Betty returned with her drink, and the two friends chatted for awhile. Finally, Joan left and did her shopping at Penzance. While at the market, she noticed that her right eye saw goblins and boggarts stealing from the stalls, but her left eye saw nothing unusual. The ointment, it seemed, had granted fairy-sight! On the way back to her own house that night, Joan met a richly dressed lady of noble carriage and haughty mien in the road. Being well brought up, she curtsied, and the strange lady stopped, evidently shocked at the attention. "What eye did you see me with?" the woman asked. Frightened, she gasped, "With my right eye, ma'am." And with that, the lady reached over and plucked Joan's right eye out, and Joan never saw a fairy again.

"These [Dracs], they say, have their abode in the caverns of rivers, and occasionally, floating along the stream in the form of gold rings or cups, entice women or boys who are bathing on the banks of the river; for, while they endeavour to grasp what they see, they are suddenly seized and dragged down to the bottom: and this, they say, happens to none more than to suckling women, who are taken by the Dracs to rear their unlucky offspring; and sometimes, after they have spent seven years there, they return to our hemisphere."
-- Gervase of Tilbury, *Otis Imperialia*

This story is my recollection of the fairy tale "How Joan Lost Her Sight In One Eye," which I read long ago in some anthology or other. Upon beginning the research for this column, I discovered a slightly different version, collected from Cornwall in 1870. An earlier version is called "The Fairy Ointment," and it comes from a late-18th century Welsh story called "The Midwife to the Fairies." In this story, "Joan" is an old woman brought in to midwife a fairy birth. The fairies give her an ointment to anoint the baby's eyes, and she accidentally gets some in her own eye, with the eventual gruesome consequences. An Irish version, collected in 1844 (so likely at least as old as "The Midwife to

the Fairies") is called "The Fairy Nurse," about a woman kidnapped to wet-nurse the fairy child. Which, as it happens, is the version told to Gervase of Tilbury, the Marshal of Arles, who wrote it down in 1214 as eyewitness testimony to the habits of the Dracae, or Dracs.

What are Dracs? Per Gervase, the Drac is a shapeshifter, so the answer may be unclear. *Drac* is simply the Occitan word for "dragon," and to this day there is a Fête de la Drac in Beaucaire, France on the Rhône River opposite Tarascon. That's right, we have yet another serpentine monster in that particularly haunted stretch of river, to go with the [Tarrasque](#) and the [Vouivre](#). Like dragons, the Drac are associated with gold, even -- shades of Fafnir -- shifting into a golden Ring to tempt women by the river. Like water-fairies such as Peg Powler and Jenny Greenteeth, the Dracs live underwater and snatch people -- though Gervase claims that they prefer nursing mothers to young children. An interesting reversal of form, but as Diane Purkiss notes in *Troublesome Things,* there is perhaps only a river's surface of difference between a monster that preys on nursing mothers directly and one that preys on their children.

"They become such fables as nurses used to tell to children, both to frighten them into good behaviour and also to entertain them. . . . It was told that Lamia was a queen and ruled in Libya. Her cave was actually pointed out to visitors."
-- Karl Kerényi, *Gods of the Greeks*

So we're already tangled in a web of story, with at least three or four strands and any number of loose ends. Let's see what we can do to re-knit them. We need a child-stealing monster, ideally serpentine, strongly identified with eyes. Where do we find such a thing? In ancient Greece, as it happens, going under the name Lamia. The story of Lamia goes like this: Zeus fell in love with Lamia, queen of Libya, and had many children by her. But Hera, jealous, killed all of Lamia's children until Lamia was driven mad with grief. Hera further cursed Lamia with the inability to close her eyes, so that she could never sleep and forget her loss. Hence, Lamia roamed the earth by night, stealing other mothers' children and howling in pain. (The parallels with [La Llorona](#), who cries by water for her lost children, are self-evident.) Plutarch adds the odd detail that Lamia had the ability to remove her own eyes (possibly a merciful gift from Zeus) and replace them with others -- and in later stories, those eyes were freshly harvested from those unlucky enough to encounter her.

Lamia's snake form isn't mentioned in the earliest myths (Stesichoros merely names her the mother of the sea-monster Scylla) although she is often identified with Oinopole, "the one-legged" -- a description of a snake, sure enough. (This eventually becomes *onokle* -- "ass-legged," which reminds us of the hairy legs of the [Queen of Sheba](#).) The name *Lamia* means "shark," or "flatfish," possibly deriving from *laimos,* or "gullet." (There may also be a connection with Lamos, the king of the Laestrygonians, the cannibal giants of the *Odyssey.*) Again, here Lamia branches. If she's an archaic Greek coastal deity, she may descend from the [Snake Goddess](#) of Crete. On the other hand, if she's an import from the East (again, like the Queen of Sheba), her name may be a back-formation from Lamashtu, a Babylonian goddess who preyed on -- nursing mothers! Lamashtu gave [poisoned milk](#), and kidnapped children from their mothers, and killed them in their cribs. In favor of an Eastern heritage for Lamia are her depiction with a lion's head in some art (just as Lamashtu wears) and her descent from "Belos" in a later version of the story, Belos being the Greek version of the Semitic Baal, or Bel. And, of course, there's the fact that Lamia told her boyfriend she was from Phoenicia.

"[I]t was a woman who clasped his hand and declared that she had been long in love with him, and that she was a Phoenician woman and lived in a suburb of Korinthos, and she mentioned the name of the particular suburb, and said: 'When you reach the place this evening, you will hear my voice as I sing to you, and you shall have wine such as you never before drank, and there will be no rival to disturb you; and we two beautiful beings will live together.'"
-- Philostratus, *Life of Apollonius of Tyana*

Here's another story, from roughly 215 A.D. Menippus, a young philosopher in Corinth, meets a beautiful Phoenician girl and goes home with her night after night. Eventually, he meets the magus and philosopher Apollonius of Tyana, who suspects something amiss and tricks Menippus into proposing marriage to the girl. At the marriage feast, held at the girl's mansion, Apollonius shows up uninvited and identifies the girl as one of the "lamiae," at which point the entire house and its treasure vanishes, and the lamia (for so she is) is driven out of Corinth in defeat.

Our Lamia has become patron and namesake of the *lamiae,* a race of ghostly women who aim for something a little

meatier than children or even nursing mothers. The lamiae are essentially succubi, who seduce and devour men. Like Antony's Cleopatra, they live in Egypt (near Lamia's old Libyan slithering grounds) or similar foreign parts, and set their eyes on young men traveling or sleeping alone. Lamia has branched on us once more. By the fourth century B.C., Lamia is both a child-eating ogress and a byword for "prostitute," used as a joke by Aristophanes. By the late classical era, the lamiae are part ghost, part vampire, part serpent, and part seductress. The translators of the Vulgate Bible used *lamia* to translate "Lilith," in Isaiah 34:14, which brings yet another Middle Eastern demoness into things. And our old friend Gervase of Tilbury identifies the lamiae with *mascae,* or night-mares. (Which is to say, succubi without the fun part -- they just crush your chest, like a constricting snake.) By 1430, Nicolas of Jauer resolves the contradiction -- lamiae are night-hag succubus demons in the shape of witches, who steal children and roast them over fires.

"She was a gordian shape of dazzling hue,
Vermilion-spotted, golden, green, and blue;
Striped like a zebra, freckled like a pard,
Eyed like a peacock, and all crimson barr'd;
And full of silver moons, that, as she breathed,
Dissolv'd, or brighter shone, or interwreathed
Their lustres with the gloomier tapestries --
So rainbow-sided, touch'd with miseries,
She seem'd, at once, some penanced lady elf,
Some demon's mistress, or the demon's self."
-- John Keats, "Lamia," I:47-56

But there's yet more to Lamia. Pausanias notes that Lamia is one of the Sibyls, a prophetic demigoddess -- specifically the Sibyl of Libya. And what do we call the priestess of the Sibylline oracle? The Pythia, which is to say, the "pythoness." The snake-woman, who lives in a cave and sees the future with her glittering, never-closed eye. (Another Sibyl was Delphine, who explicitly had the body of a snake. Or maybe a dolphin.) The Lamia now draws men in, not with the promise of sex, but with the promise of knowledge. The gift she offers is that of the Sirens -- listen, and learn. Here we glimpse the "artistic Lamia," the Lamia of Inspiration celebrated by Keats, and combined by him with Apollonius' succubus and given the eye of the child-stealer. Keats' bargain (sealed in blood?) allows him to represent the Lamia in all her forms at once, a chaotic panoply of story and color (check out that nonlinear description above) who transforms from glory to serpent to faerie to woman and back again. The Lamia is bisociation given form, learning by pulling out your eyes and looking from new angles.

"Shut, shut those juggling eyes, thou ruthless man!
Turn them aside, wretch! or the righteous ban
Of all the Gods, whose dreadful images
Here represent their shadowy presences,
May pierce them on the sudden with the thorn
Of painful blindness; leaving thee forlorn."
-- John Keats, "Lamia," II:277-282

Once we've come this far, we see traces of Lamia everywhere, out of the corners of our eyes. Her widely separated coils emerge from the underground stream of legend. There is a Chinese legend of "The Confucian and the Snake Woman" that might well be Apollonius revived at the other end of the Silk Road. (Which has its own one-legged monster defeated by Apollonius, as we saw.) There is the Malayan langsuir, and the Basque lamiak, both child-stealing monster women, neither with a clear linguistic connection to either Greek or Babylonian. There are snakes and eyes and women in the form of the Gorgons, who we shall have to visit in another column. There is Lady Godiva, beautiful and naked beneath her shining coils of hair, who struck blind the man who saw her. There is Schliemann's quest for "flashing-eyed Athene" and the Trojan humiliation of the women of Locris (which, as it happened, also had a temple to Lamia). Lamia is all around us, drinking blood and poisoning artists and stealing children and offering her serpentine wisdom. Only Apollonius of Tyana can defeat her, by looking straight at her and resolving her contradictions with the light of pure reason, of cold philosophy, of boring reality. So look deep into the eyes of the Lamia -- and whatever you do, don't tell her which eye you see her with.

Things I Love as a Player (GM Edition)

And this week finishes up the now-eight-part series covering love-hate-GM-player interactions. In case the H1 header above this paragraph wasn't a big enough clue, this week's column is about things I love as a player from my GM.

Unfortunately, this has proven something of a challenging column. After all, most of the things I love as a player tend to break down into three categories: Things that exist as the flip side of stuff I've already written about ("GMs who use my character background info for plots"), things that are too self-aggrandizing ("I like GMs who GM like I GM"), and things that are too silly obvious ("I like GMs who give me large sacks of cash").

Fortunately, I'm paid the big bucks to rise above my limitations, and so I've come up with three that should fit the bill.

* * *

GMs who are better prepared than I am. In the past I've shared my campaign notes (or lack thereof). In that same article, I mentioned the amazed awe I held for one GM, whose preperation had led him to outline entire cities we hadn't visited, on the off-chance that we dropped by those areas.

Other GMs have gone to similar lengths, pulling crazy stunts like actually *reading* the books or coming up with stats ahead of time. Although I'm proof positive that it's not necessary to do a lick of work in order to run an adventure folks enjoy, it's certainly one of those things that seems like it *should* be done. After all, one of the downsides of the GM making up everything on the spot is that some plot points or happenings can seem awfully arbitrary:

GM: Uhhh . . . okay. You're walking along a dungeon corridor, and you see exits to the left or right. Which way do you want to go?
Player: Let's go left.
GM: Okie-doke. You encounter an old man who says, "I need you to locate my daughter; she is lost somewhere on the west side of the dungeon."
Player: Uh-huh. And what would've happened if I'd said "Let's go right"?
GM: Same thing . . . only I would've said she's lost on the east side.

I respect GMs who are able to build enough of a game world to ensure that the feeling of freedom -- one of the key draws of tabletop RPGs -- opens the possibilities of adventure, rather than feeling like you're going to tip over the facade sets at any moment.

GMs who mix things up. I don't have much to say here, except that it's very easy for GMs in most games to fall into ruts. Some of these are intrinsic to the genre or campaign style -- such as a dungeon-crawl campaign that dares to have a dungeon crawl -- but sometimes it's just a side effect of getting "stuck" at some point. For example, my female protagonists tend to be wise-cracking super-competent gals. (Curiously, my NPCs of all stripes generally have about a 90% chance of being wise-acres.) For a while, about half my plots revolved around the seemingly innocent minor character rising up to be revealed as the ultimate threat. And so on.

Good GMs are able to recognize their own tendency to repeat themselves, and take steps to shake the snowglobe a bit more vigorously. After all, while there's a certain amount of comfort in knowing that some elements of an adventure will be the same (there will probably be combat in many campaigns, for example), I suspect a fair bit of the appeal for many gamers is the sense of discovery, of the feeling of something new that might lurk around any corner. And, for me, I'm always much more interested in that Something New if I know it's nothing going to be just another iteration of Same Old, Same Old.

GMs who maintain the pace of the game. I'm guessing it's happened to most roleplaying gamers. The players and GM are all really into the game; the action's unfolding like the best movies or novels. The decision to use a skill to unlock the door results in a fast dice roll, enabling everyone to do the light banter that would normally be in such a scene: "We've got to get through there before the Stormnazis get is!" or the like. Players are interacting in character,

and things are great.

And then something happens that brings the entire flow of the game to screeching halt, as if the game's tracks had been laid out by Wile E. Coyote to lead right into the side of the mountain, and no one had the foresight to bring along a canister of Tunnel Paint.

In my experience, this problem with pacing can almost always be laid at the feet of combat; what would last a few minutes in a movie or a few pages in a book becomes an hour-long test of endurance. Part of this is the nature of the beast; most combat rounds are in the one- to 10-second range, all players (and the NPCs) get a chance to act (which will usually take at least 30 to 60 seconds), and combats generally last five to 10 rounds. Run those numbers through our [LEGO difference engine](), and we discover that a minute of in-game time can easily last an hour.

While such an elongation of time might be a natural side effect of combat, it can also have serious implications on everyone's fun. After all, if the bomb is set to go off in 30 seconds, or if an important character is bleeding to death, then it can be tough to remind folks of the impending gravity of the situation: "Okay; the villain released the deadman's switch on the nuclear device 45 minutes ago . . . is everyone still awake enough to respond?" (Admittedly, anyone who's ever watched a close American football game will be used to this phenomenon, since those last "two minutes" of gameplay are usually enough to raise a generation of lab rats from birth to venerable death, with 20 seconds to spare.)

But some GMs are better than others at keeping the pace strong and minimizing the jarring decompression of time; they prod along the slow players, respond quickly to even the most complex actions, and keep that bomb ticking. Curiously, I've seen at least three approaches to doing this well (with the possibility of overlap). First, some GMs just have a good enough handle on the rules to eliminate the uncertainty and time-sink that comes with needing to look up everything. Second, some GMs are good enough to "wing it," coming up with modifiers, decisions, and even systems that will work at least for the situation at hand. Finally, some GMs neatly sidestep this issue *before* the game even begins, by either choosing systems they can keep going at a rapid-pace, or by streamlining existing systems with enough house rules or modifications to speed things up. (One such example -- chosen at random from a pile of pulsing neurons -- is long-time-Pyramidian Bob Portnell's ***[EZFudge]()*** adaptation of the *Fudge* rules.)

Pacing is one of the most important jobs a GM has. If you keep the pace fast enough, your audience will forgive a *lot* of mistakes and creative sins; just witness the writings of Dan Brown . . . ideally through a piece of pinhole-poked cardboard, if your eyes are especially sensitive. And my hat's off to any GM who handles the job well.

* * *

Okay; I think that should well and truly wrap up this series for now. I won't say "for good," because who knows when next I'll be looking for some glue to bind together a random list of pet peeves or personal passions? In the meantime, feel free to offer your thoughts via [e-mail]() or over on the [discussion boards]().

Murphy's Rules

Modifying Enchantments

for *GURPS Fourth Edition*

by Demi Benson

"Did you find the famous enchanter you were looking for?" asked Meirkar.

"Oh, yes!" said Vahri, "You should see the devices he makes -- a magic cloak to keep the rain off, a fire-starting wand . . ."

"A normal cloak will keep the rain off, and I've seen dozens of fire-starting wands. There's nothing special about them."

Vahri gave her friend a piqued look, "But these were cheaper than any I've seen. Cheap enough for a tradesman to buy. Cheap enough that I bought a fire-starter on a whim. I don't know what this enchanter's secret is, but I bet the Mage's Guild would kill to find out."

* * *

The enchantment system as described in the *GURPS Basic Set* and *Magic* books does not allow for much variation -- GMs and players are limited to different Power levels and quirks. This article uses the enhancement and limitation system found in pages 102-116 of the *Basic Set* to add variation and customization options.

Many of the modifiers are suitable for changing the energy cost to create enchanted items. All these modifiers should be vetted by the GM as some combinations would not make sense either game mechanically or thematically.

Enhancements

Enhancements (pages 102-109 of the *Basic Set*) may be used to expand or improve the capabilities of an item for an increase in the energy cost. Such items would likely be of higher quality than the standard, or custom ordered. No enhancement may be taken that mimics another spell effect or enchantment. A Critical Success during the enchantment process may optionally add an enhancement worth 5% at no extra energy cost. Appropriate enhancements are:

- *Accurate:* +5%/level. [1]
- *Armor Divisor:* +50%, +100%, +150%, or +200%. [1]
- *Cone:* +50% +10%/yard of maximum width. [1][4]
- *Damage Modifiers:* Double Blunt Trauma (+20%), Double Knockback (+20%), Explosion (+50%/level), and Fragmentation (+15%/die) might be suitable. [1][4]
- *Delay:* +0%, +10%, +20%, or +50%. [3]
- *Drifting:* +20%. [3]
- *Guided or Homing:* Variable cost. If it requires a specific sense, the caster must naturally possess that sense or enchant the necessary sensory spell into the device. [1]
- *Increased Range:* +5%/level or +10%/level. [1]
- *Link:* +10% or +20%. Linked attack spells should be modified to have identical ranged attack stats.
- *Low or No Signature:* +10% or +20%. For non-attack spells these give penalties to magic analysis spells such as Identify Spell and Analyze Magic.
- *Overhead:* +30%. The attack either arcs to arrive on top, or it pops up at the very end. [1]
- *Ranged:* +40%. [3]

- *Underwater:* +20%.

Each enhancement must be learned as an Average Technique of the base spell with a default of -1 per 10% cost, round fractions away from zero. e.g. Damage Modifier (Explosion level 2) is a +100% enhancement -- as a Technique it defaults to the base spell -10; Damage Modifier (Fragmentation level 1) is a +15% enhancement, its separate Technique defaults to the base spell -2. All of these Techniques may be raised until the penalty is bought off.

For the final enchantment roll, add up all Technique differences associated with the desired enhancements and use that as a modifier for the enchantment. e.g. a device will have Explosion level 1 (+50%) and Overhead (+30%), and the enchanter knows the Techniques at base -2 and base -1 respectively, then the enchantment is at a -3 penalty.

Limitations

Limitations (pages 110-116 of the ***Basic Set***) may be applied to enchantments to reduce the energy cost. These must actually be limitations -- enchanted armor with Reduced Range is not really limiting -- as always, GM's call. Appropriate limitations are:

- *Accessibility:* Variable cost.
- *Always On:* Variable cost.
- *Armor Divisor:* -30%, -50%, or -70%. [1]
- *Bombardment:* -5%, -10%, -15%, or -20%. For direct-fire attacks, the effect is that the attack tends to spiral or veer off target. [1]
- *Costs Fatigue:* -5%. This represents an additional FP cost that is unrelated to the energy cost of casting a spell through the item. This is not a magical Fatigue cost and it may not be reduced with the Power enchantment (page 57 of ***Magic***).
- *Costs Hit Points:* -10%. A device fueled by life-force could consume HP instead of or in addition to FP.
- *Damage Limitations:* No Blunt Trauma (-20%), No Knockback (-10%), and No Wounding (-50%). Any of these are suitable for a weakened weapon, but not all of them are applicable to every magical attack item. [1] [4]
- *Dissipation:* -50%. For Area spells or Cone attacks, the spell's effect drops off with distance. [2]
- *Emanation:* -20%. Area spells or effects must always be centered directly on the item.
- *Emergencies Only:* -30%. Full Power in Emergencies Only (-20%) means the user pays the full FP or energy cost, but the effects are halved. [2]
- *Environmental:* Variable cost. Many spells' effects already require some level of this Limitation. To make it more restrictive, use the difference in modifiers' rarities. e.g. Common (-10%) to Rare (-40%) would net a -30% modifier.
- *Inaccurate:* -5%/level.
- *Limited Use:* Variable cost. Enchanted items that already have a "uses per day" as part of the enchantment cost (e.g. a Create Food pot, page 79 of ***Magic***) may not have this limitation intentionally. For any Temporary Enchantment, any level of this is only worth -10%, and it must be at least one fewer than the number of uses the item will possess.
- *Melee Attack:* Variable cost. [1]
- *Maximum Duration:* Variable cost.
- *Minimum Duration:* Variable cost.
- *Nuisance Effect:* Variable cost.

> ## Reverse Engineering Existing Devices
>
> Some enchanted devices already fit into the above scheme. For instance, a Fireball wand costs 800 energy and an Explosive Fireball wand costs 1,200 energy. From the description of Explosive Fireball, we see it is equivalent to a regular Fireball with the modifier Damage Modifier (Explosion level 1) for a +50% energy to create and use (the 2 energy per level of effect is 1 energy times 1.5, rounded up to 2). In cases like this, since the enhanced version fits perfectly into the base version plus modifiers, it should be possible to create an Explosive Fireball wand based on an enhanced version of the regular Fireball spell. This new wand could even have a different level of explosive effect.

- *Preparation Required:* Variable cost. This can represent fiddling with knobs, aligning crystals, mystically "tuning" the device, an activation procedure, or bending it to your will. Weakened Without Preparation is also suitable. [2]
- *Reduced Range:* -5%/level or -10%/level. For non-attack spells, such as Regular spells, multiply the actual distance by the Range Divisor before finding the skill penalty for casting at range.
- *Self-Only:* -25% or -50%. The device can only cast the spell on (or otherwise affect) its own contents. Must be a container of some sort. Use the smaller value (-25%) for items already specified as affecting only the wearer. [5]
- *Specific:* Variable cost.
- *Touch Only:* -40%. The effect occurs directly on the surface of the device and cannot be cast at any range. Not available for items already specified as affecting only the wearer or spells that require a direct touch. [5]
- *Takes Extra Time:* -10%/level.
- *Takes Recharge:* Variable cost.
- *Unreliable:* Variable cost. This is an extra activation roll. Any energy cost must be paid before this activation roll. If the second activation fails, the full energy is lost.
- *Visible:* -10% or -20%.

Any enchanter may choose to use limitations; it takes no special talent or study to make an inferior product.

Explanation of Notes

[1] These enhancements or limitations are only suitable for items that allow an attack spell to be cast, not for enchanted weapons. [2] For these limitations, the GM should be harsh with judging whether a spell can even have a reduced effect; if the effect cannot come in a reduced version, the GM decides whether the outcome is a trivial effect instead (e.g. a weak fizzle of sparks, a warm feeling) or nothing at all. [3] The GM should be especially careful when allowing these, as they have a strong potential for abuse. [4] Because they change the damaging effects of attack spells, these modifiers may be suitable for altering the energy cost to cast a spell in addition to the energy cost to enchant. For fractional energy costs, round up. [5] These limitations are new, but follow from the progression of Reduced Range and Melee Attack.

Example Devices

- An Ice Sphere wand (400 energy to create) enchanted with Damage Modifier (Fragmentation, 1d, +15%), Armor Divisor (0.5, -30%), and Inaccurate -1 (-5%) for a net -20% would cost 320 energy to create. The effect is a brittle icy ball that shatters into sharp fragments on impact. The wand would not be as good in single-combat, but might work well as massed suppressive fire.
- A Season spoon (150 energy to create) with Preparation Required (1 minute, must be dipped into several pots of spice, -20%) and Limited Use (once per day, -40%) gives a net -60%, for a final cost of 60 energy. This Seasoning spoon would be affordable by many more people.
- A Lightning staff (800 energy to create) with Homing (using regular vision, +50%), Reduced Range (1/2D range only, x1/10, -15%) for a net +35% for a final cost of 1080 energy to create. With a successful skill roll, the user would have a bolt that travels at 5 yards per turn for up to 20 turns and strikes with a skill of 13 (base 10 + Acc of 3). With such a low speed, the target might escape by moving faster than the attack.
- The Power enchantment may be given Limited Uses or Preparation Required. If the conditions are not met or the user elects not to use Power with a spell cast through a device, then Power does not modify the casting cost of the spell.

A fleshed-out example:

A Thunderblast staff made by linking together (using Link, +10% for each) the Concussion spell (1000 energy, 1/2D 20, Max 40, Acc 1) having Accurate +1 (+5%), Damage Modifiers (Double Knockback, +20%; No Blunt Trauma, -20%; and No Wounding, -50%) with the Thunderclap spell (300 energy) having Ranged (+40%, gives 1/2D 10, Max

100, Acc 3), Increased Range (1/2D only, ×5, +10%), Inaccurate -1 (-5%), Reduced Range (×½, -10%). So far the device costs 650 + 435 = 1,085 energy. The GM fiddles with the stats and decides that for an extra 115 energy to create there are slight synergistic effects -- the stunning and deafness effects have the same range (10 yards, or 20 yards in an enclosed space) and resistance number (HT -1/level of effect), and the resistance roll is +1 per yard further away. The final combined stats are:

- 1,200 energy and a $400 onyx to create.
- &fract12;D 20, Max 40, Acc 2.
- Energy cost per level of effect is only 1 instead of 2 because the total Damage Modifiers come to -50%. This is fair since the spell does no direct physical damage whatsoever.
- The stunning and deafness effects occur to anyone within 10 yards, or 20 yards in an enclosed space. Resistance rolls for these effects are at +3 beyond 1/2D range.
- Stunned people roll versus the same penalty every turn to recover, at +1 per turn. Protected Hearing grants +5 to HT.
- Deafened people roll versus the same penalty every hour to recover, at +1 per hour. Protected Hearing negates this effect.
- Energy cost to use is 2 points plus 1 per 1d×2 knockback damage and -1 to resist side-effects; the mage may add incremental levels up to Magery-level per second, for up to three seconds. Knockback damage is explosive (see page 414 of the ***Basic Set***).

This Thunderblast staff would have a terrifying effect -- bowling over animals or people and leaving them stunned and deafened, scattering equipment and detritus (see *Incidental Fragmentation* on page 415 of the ***Basic Set***), and might even knock out doors and windows. A wielder with Magery 3 could build the spell for three seconds and launch an attack doing 9d×2 explosive knockback and a HT-9 roll versus stunning and deafness for a cost of 11 points of energy!

Quirks

Quirks acquired during enchantment or in play may be selected from the limitations list or the effect may be the removal of an enhancement. A minor quirk could be a Nuisance Effect, any -5% limitation, or removal of 5% worth of enhancement. A more severe quirk would be worth a -10% limitation or removal of 10%. The addition of new quirks could either add new problems or increase the value of existing problems.

Optional Rule: Appropriate Materials

Enchanting a function into a device that already performs that function reduces the enchantment cost. This optional rule alters the "item" categories for many enchanted devices. The GM should only allow new items that are thematically related. This rule is intended to reduce the cost of common, everyday equipment -- devices that do not need a roll to use; it should never be used to reduce the cost of attack or defense devices, weapons, or resisted spells. If the players devise clever ways to use non-combat devices, that's good roleplaying.

Remember that Appropriate Materials give a discount for a reason. Discounted devices must be limited by their form; objects must be used in the mundane manner and limitations of the object apply to use of the spell.

For example:

- Umbrella (100 energy) cast upon a pendant costs the normal amount, but cast on a long coat gives a -10% reduction in cost, a physical umbrella would give -20%, and a fully waterproof, fur-lined ankle-length oilskin poncho with a hood would give -80% since the device provides nearly the entire benefit of the spell. The downside is that the enchantment is only effective on parts not covered by the material -- a ripped poncho would let rain through the rip.
- A tea kettle or samovar with Boil Water (200 energy) might be worth a -50% reduction for Self-Only; adding in an Accessibility (Only when heated) would be good for an extra -20%. Final cost is 60 energy. The reason to

have such an enchanted tea kettle is mainly convenience -- water is boiled in 10 seconds and produces enough steam to make tea for large groups.

- A microscope with Small Vision (400 energy). Since the spell's item specifies "only affects the wearer", the Self-Only (-50%) and Reduced Range limitations cannot be used. However, the spell only affects objects inside the microscope, so the -25% is allowed. Final cost is 300 energy.
- A cigarette lighter with Ignite Fire (100 energy). Touch Only would give -40% reduction, and appropriate materials (the mundane lighter) would add -20%. Final cost is 40 energy. The lighter would have to be lit since that action is part of the appropriate material, but when additionally casting the spell, the flame is windproof and can produce heat equivalent to burning magnesium.
- A feather duster with Clean (100 energy). Appropriate materials and dusting all surfaces would be good for -30%, Accessibility (only to remove dust) would give another -20%, and Limited Use (2 times/day) for another -30%. Final cost is 20 energy, low enough for Quick & Dirty enchantment. A set of cleaning instruments to polish, dust, scrub, and shine could be had piecemeal and cheaper than buying a single multi-use device.

Introducing Modifiers to an Ongoing Campaign

Bringing enchantment modifiers into a campaign can be as simple as the opening vignette -- the group finds a shop selling magic trinkets at bargain prices only to find that the trinkets are quite limited. Or any of these others:

- A magic weapon far more powerful than the standard versions is acquired, e.g. Armor Divisors or Increased Range. The device could be a family heirloom that someone inherits, a piece found in a ruined castle or ancient dungeon, loot from a defeated foe, or a cutting-edge new McGuffin to be kept from the enemy.
- A scouting force for an invading army has been defeated either by the heroes or defending soldiers. It comes out that all the invaders had magical gear: Umbrella cloaks, Create Water flasks, Ignite Fire wands, Preserve Food sacks, and so on. Regular enchantments of these types for this many would be very expensive but it seems nearly all of the invaders possess them. How can anyone afford so many? Once the secret -- Quick & Dirty casting of limited enchantments -- is discovered, the defending realm will try to supply their own soldiers with cheap magic goods. The ensuing arms race keeps enchanters too busy to deal with adventurers.

How to Build a Pantheon

A More Creative Approach to Religion in Fantasy Roleplaying Games

by Chris Drysdale

"Having just one religion is a failure of the imagination."
--P. Dunn

Although the approach to religion in many fantasy roleplaying games works for most dungeon crawls, it can lead to an oversimplification of the priestly classes, and often turns them from priests in their own right into a secondary type of magic-user. In order to rescue clerics from this fate, their relationships with religion can be explored and expanded. Those players looking for more out of these characters can roleplay a deeper and personal relationship between the PC and the deity or deities. For the populace of the created world, the gods are not myths, but facts. Keeping this in mind will help flesh out the character, and in the long run, the world in which he or she lives. For GMs interested in creating more complex cosmologies, mythologies, and pantheons, the process below provides a few ideas to help with development.

To begin creating more realistic religions in campaigns, the GM can inject a greater level of complexity into the pantheons. Traditionally in fantasy roleplaying games, pantheons are mechanistic in their approach. Deities have sharply defined spheres of influence which are usually based on modern Western ideas of what "goes together." This, when combined with a plot-driven need to create simple conflicts, can be useful for roleplaying games, especially short campaigns, single session "storm the wizard tower" games, or games that have very little to do with religion. On the down side, priests and clerics become simply another kind of mage, one with a specific dogma that is often negotiated outside the game or ignored in part or entirely. Priests are in contact with their deity or deities; they are given the ability to alter the world through clerical magic. It is "unrealistic" (as much as the word can be applied to fantasy roleplaying games) that they could ignore the strictures of their faith without consequences. Clerical spells are not inherent abilities; each and every one is a gift from the deity in question. To the character, clerical spells are not "spells." Each is a mystery of faith and an expression of the will and power of a deity within the world.

Actual pantheons and their associated mythologies are filled with complex patterns. There are no simple arrangements of powers associated with deities; these naturally evolved systems are idiosyncratic. No longer do we see a god of light associated only with fluffy bunnies and happy thoughts, or the overwhelming of darkness. Apollo of the Greek pantheon was associated with the sun, and with poetry, but also with plague. Athena was a goddess of wisdom, war, and weaving, and the city of Athens. The heroes and deities that we see are much more like people than they are like forces of nature or archetypes. The gods, at least as much as other characters in the game-world, are complex and dynamic. As such, not all aspects of their "personalities" hold together in neat categories. What follows are some ideas that will help a GM create pantheons that will mirror some of the richness of naturally evolved religious systems, as well as some ideas for players to capitalize on this for the development of their characters.

Discover a Model

The first step is to find a group of people to use as a model for your fictional pantheon. A family you know well and their friends would work, as would a group of friends or co-workers from your past. (It is strongly recommend against using any members of the gaming group as a model. Since you will be striving to mythologize, stereotype, and caricature these models in the process of creating the new pantheon, it is best to use people that will not be recognized to avoid cases of mistaken identity and hurt feelings.) Mirror the relationships among the people you have selected to create a rich web of relationships for both the deities and their priesthoods. Rather than the simple deities which almost seem to take their places on a neatly organized chess-board, create a series of complex and changing relationships that mirror those we have as people. Family, friendship, loyalty, love, betrayal, indifference, and more can all be used as fuel for the myths, relationships, and struggles of the deities and their followers. As far as spheres of influence go, try

to associate each of the people in your model as closely as possible with the areas in which they have an interest. Thus, you might model a goddess of law, motherhood, and inspiration after a friend who is a lawyer, a mother, and a visual artist. You might end up with overlap as well, with several gods and goddesses associated with hunting, for instance.

It is not necessary to define smaller areas of influence for each (such as hunting for sustenance, or maintaining ecological balance) because the reasons each character might pray to one deity or another will vary in more ways than just the type of spell. As an example, if the character is hunting someone to bring them to justice, the goddess of law may well grant a spell to help find them, even though at first blush it will not seem like a spell that would come from a goddess of law. For color, and to add a bit of mystery to the world, each deity might change how the spell appears. If a spell were used to track a murderous villain through a forest, then a wilderness deity might simply make the tracks appear more obvious to the priest, while a law-deity might make the footprints glow with a ghostly, bloody light for all to see. Nor does the spell have to look the same every time. As the GM, just think how the person from the model might think to do it. Is he a hard-nosed rationalist? Then perhaps the event will look like a coincidence. Is he more spiritual? Then perhaps it will look more like a miracle. The priest, however, will know the nature of the event.

You might also consider using characters from a piece of fiction you have read or watched, but isn't as advisable. The main advantage of this method for creating a pantheon is that it reflects natural patterns of interaction rather than fictional conventions. "Truth is stranger than fiction," and taking advantage of this will make the pantheons, and the worlds they have spawned or are lords over, richer and more entertaining.

Translate the Model

Take advantage of stories you have heard to create mythologies that have the depth of experience of real life. Stories of trips that the "model" people took, or experiences they had, can become legends with just a little bit of exaggeration and a change of setting. Keep the elements of the story the same, flatten out the side-characters, cut or change the anachronisms, and try to adhere to a story-arc that will entertain the audience. A demanding professor might become a frightening giant, and an employer might become a king who assigns near-impossible tasks to a hero. A suitor for the same girlfriend might be interpreted as an evil prince, a famous pirate, or even dragon! In this way, a mythology can be built up around any deity quickly and easily. This method can also be used to create new myths on the spur of the moment. Not all of these myths need to hold together, nor do the myths have to be unique to each deity. Myth-borrowing within and between pantheons happened even with historical cultures. Certainly a GM should feel free to do so in his own campaign!

While myths are often told and interpreted in very literal ways, this is a modern understanding of how myths were understood. For those people who related and retold them, multiple levels of interpretation would go on simultaneously. As an example, let's look at a myth about a deity named Gerril, a hero in a created pantheon. We might tell a story about how he traveled across the seas to bring back a branch of a tree to help with the beginning of farming (or fire, or what-have-you). This motif of branches as symbols of creation might be carried on in other myths heard from different sources. Alina, Goddess of the Golden City, might have a similar myth in which she goes to find a branch which becomes the foundation of the city. Now, did the deities actually go on such a journey? Or did they, as deities, do something so far beyond the scope of human understanding that the only way to talk about it is describe a hero going on a quest and returning with a branch? The first interpretation takes all the mystery from the myth, and the player characters will eventually end up on a quest to gather all of these branches. The second interpretation allows for a certain amount of metaphor. The branches may be symbolic of the deities' creative abilities, or perhaps certain families important in the discovering of knowledge or the founding of the cities. The quest upon which the players embark may be to find out the nature of the "branch," eventually involving them in an attempt to restore the throne for the bloodline in question. Rather than simply encountering rational (or random) monsters thrown in the way, blocks to the quest may be part of an overall scheme by the deities in question, with some hindering and some helping. This will color both the nature of these encounters and the players' reactions to them, turning a chance encounter into one fraught with meaning. This is especially important if the players can never be quite sure if their interpretations are correct, with hints and disinformation mixed together, both also influenced by the nature of the priesthoods and deities in question.

Once you have a basic mythology, or at least a few myths (a creation myth is usually pretty important and a good place to start) and an understanding of the world they portray, it is time to go on to the next phase. Take the characters out of the myths and begin to turn them into the "deities" that we usually see in games. Keep the associations from the new myths, however. For example, you might have Gerril: god of fire, farming, travel, and the magic of creation. Or Alina: goddess of anything that happens in the Golden City (who might also be invoked outside of the city by citizens). Note that those spheres overlap. That does not mean they have to conflict. A citizen of the Golden City might call upon both Gerril and Alina to protect crops to feed the city.

Integrate the Pantheon into the World

Rather than deciding on themes from the start, see what themes can be pulled from the mythology you have created. If the mythology centers on the triumph of the underdog, this theme can be interlaced into the entire campaign. If it centers on the forces of love and loyalty to overcome evil, then this might be used as well. If it centers on the decay and dissolution of the human spirit and the fragmentation of relationships, then these relationships should be reflected in the religion and politics of the world. In a fantasy campaign, it is usual that either the deities are reflections of the world, or the creators of it. Either way, the same themes that run through the mythology should also run through the world in which it exists. The overall structure of the world need not be changed, but the themes that are part of the created mythology should be given special emphasis in the campaign. Conflicts in the world that match the conflicts of the gods will attract their attention. The gods, and their priesthoods, will become involved. If a prince decides to depose his father and take the throne, a god who did the same might offer help in some way, because to the god this is a reflection and justification of the world.

Some cultures contain mythologies with two pantheons layered one atop another. What happens when people with one religion invade or migrate to a land where there is already a different religion? One, or the other, might become dominant, but more commonly the two are melded, stories are swapped, and the overall number of gods increases. In addition, religions often reflect the cultures in which they exist, and a world in which the pantheons are limited by geography, by language, or by culture will certainly be more complex and interesting than one in which only one set of gods is "true."

What do these changes mean for priests? Rather than "spells" for the priests, the gifts should be a response to the prayers of the character. Some GMs might be interested in having the player actually give the prayer, or at least part of it. This requires more effort, but if the GM gives bonuses to the effects, it is amazing how creative the players will become. One advantage of this process is that it forces the players to examine the motivations of their characters. Priests are not just members of the party, but representatives of their religions as well:

Stepping away from his friend on the bloodied bed, the gold-and-white robed man moved to the candle-lit shrine in the corner of the room. Raising his open hands over his head as a faraway look came into his eyes, Priest-Guardsman Masak intoned, "Alina, Patron Goddess of the Golden City, I pray to you in this time of need. My companion, Vernolph, is a citizen of yours. He has fallen at the hands of the bandits who have plagued your lands. I, your servant and Watcher of the Gate of Norr, ask for your blessing that he may rise again to defend your city. By the Sword and the Key, I ask this gift!"

Compare this to "I cast Restore Life on Frank's character." No, it's not great literature, but it adds more color to the campaign, some depth to the character, and makes it very difficult for a priest to abuse his powers for his own gain. With some improvisational skills and a deep understanding of the character, a player might find himself collaborating with the GM to create further myths, simply spinning tales on the spot.

Just as much as books, movies, and other media, roleplaying is myth-making. The stories that we tell have relevance and meaning. The myth-within-a-myth that is religion is important for evoking a deeper experience of the game-world. When priests take the reins of their own destinies, working to best serve their deities, they take their places as both servants and leaders. When gods are no longer simply archetypes, but complex "characters" with histories, motivations, and ambiguities of their own, the priests and worshippers who follow them will no longer be straight-jacketed into flat-feeling religions that are no more than a set of rules. There will always be worshippers who insist on

literal meanings for their myths, but there is no reason the gods must be trapped in the same interpretation. Finding a model for a pantheon that assists in developing complexity, and working with its myths on both literal and symbolic levels, will free the gods and their followers to be full individuals in their own right.

Silisia

for *GURPS* and *d20 System*

by Wayne Ligon

Silisia is a petite young woman, about 20 years old. She's pretty, but could never be called beautiful. She has short black hair, warm dark brown eyes, and a dusky-olive skin tone. She carries herself well, and has kept herself in reasonably fit condition. Silisia is, however, a master of disguise and deception. She can appear slightly shorter or taller, a little older or younger; change her hair color and style, and use any of a hundred small stage tricks meant to distract the eye. She is as much actor as make-up artist; she knows that the proper inflection in her voice, the way she carries herself, her attitude and demeanor are as effective in concealing her features and intentions as any pot of greasepaint.

Silisia is a con artist of a particularly low and despicable breed. She delights in causing trouble for trouble's sake and has no conscience at all. She will practice her art on the elderly, upon young children, upon anyone she thinks can feel pain. The pain of others is a sweet balm to her, and she takes great pride in the string of ruined lives and broken homes she's left in her wake. Silisia has several con games she plays but, like all artists, she has her favorites.

Silisia's preferred con is to pretend to be a priestess of the agricultural goddess, who are known and trusted throughout the land for their good works and wise advice. (Substitute an appropriate deity for the campaign. Her favorite disguise involves any priesthood that is especially trusted and beyond reproach.) She's made a study of them, and can fool most of the laity and low-ranking members of the actual priesthood. She will arrive as a simple traveling player and sit in a tavern, gather the gossip, and form character sketches of the locals. She'll buy drinks and assimilate for a few days, using her skills to gather and confirm any useful information.

After she has learned several dark or embarrassing secrets, then it's time for the "priestess" to make an appearance. Her garb and goods are simple; she's portraying a simple wandering healer, after all. Her healing magic makes the disguise extremely plausible and she will make it a point to heal someone in public view as soon as possible, accepting no fee for her services. From that point on, she will talk to and advice the people as if she was a trusted priestess, but soon she begins to manipulate those who come to her for help. She weaves truth and lies to best effect, and seldom needs what magic she's learned. Using the information she gained before, she will then sow chaos and mistrust through the small town. She will fake curing diseases, "drive out evil spirits," perform marriages, provide witness, or serve as an impartial judge, all for a fee. She will take no reward for herself, of course, but is glad to take any coin offered "for the grand temple in the big city" or "the poor."

She'll leave after she has turned friend against friend, ruined true love, destroyed marriages that have lasted for decades, and caused at least a couple of deaths. So many people in these outlying settlements have nothing but the love of the gods and she uses that belief to her own ends. She will subtly blackmail people who have especially interesting secrets: "Brother Theodore, I would have you know that the Goddess does not look favorably upon those who feel the way you feel about your nephew. Such a handsome lad, is he not? If I had the silver, though, I could make certain that the High Priest in the city includes you in his prayers for salvation and that no undue investigation is needed here."

Silisia in the Campaign

Silisia is a sadistic rogue who can be encountered any place but most often in small outlying villages where news cannot spread very fast. She can be a chance encounter on the road, or be met in one of her major guises in a tavern or market. She will try to extract any interesting information out of anyone she spends time with and use it to her own best advantage later. She won't have any dealings with the authorities if she can help it, and she will avoid contact with anyone who looks like they might be "the law," or a real priest of whatever religion she's pretending to be.

The *effects* of Silisia's passage can also be encountered. A town that has recently hosted her will be full of shouting matches, crying, glares, embarrassed looks, and perhaps a suicide or two. Many people will be on edge, and tempers can easily run hotter than normal. If the townspeople have reason to believe they've been swindled or manipulated, newcomers will find it very hard to talk to anyone. Priests will be especially distrusted.

Silisia in *GURPS*

Silisia   *152 points*

Age 20; Human; nondescript appearance, black hair, brown eyes (Hair may be dyed, or a wig used)

ST 10 [0]; **DX** 11 [20]; **IQ** 12 [40]; **HT** 11 [10].
Damage 1d-2/1d; BL 20 lbs.; HP 10 [0]; Will 14 [10]; Per 12 [0]; FP 13 [6].
Basic Speed 5.5 [0]; Basic Move 5 [0]; Block 0; Dodge 8; Parry 8 (Rapier).

Social Background

TL: 3 [0].
CF: Same as the campaign setting.
Languages: The campaign's common language (Native) [0]

Advantages

Charisma 3 [15]; Magery 1 (Song) [6]; Magery 0 [5]; Musical Ability 1 [5]; Voice [10].

Perks

Honest Face [1].

Disadvantages

Sadism (12 or less) [-15]; Secret Identity (Possible Death) [-30]; Selfish (12 or less) [-5].

Skills

Acting-15 (IQ+3) [12]; Carousing-11 (HT+0) [1]; Detect Lies-12 (Per+0) [4]; Diplomacy-13 (IQ+1) [2]; Disguise/TL3 (Human)-13 (IQ+1) [6]; Enthrallment (Persuade)-15 (Will+1) [8]; Enthrallment (Sway Emotions)-13 (Will-1) [2]; Escape-10 (DX-1) [2]; Fast-Talk-14 (IQ+2) [2]; Fortune-Telling (Augury)-12 (IQ+0) [0]; Fortune-Telling (Dream Interpretation)-12 (IQ+0) [0]; Intimidation-13 (Will-1) [1]; Lockpicking/TL3-11 (IQ-1) [1]; Makeup/TL3-14 (IQ+2) [4]; Musical Instrument (Mandolin)-13 (IQ+1) [4]; Public Speaking-16 (IQ+4) [1]; Rapier-10 (DX-1) [1]; Savoir-Faire (Religion)-12 (IQ+0) [1]; Sex Appeal-12 (HT+1) [1].

Spells

Blur-11 [1]; Continual Light-11 [1]; Darkness-11 [1]; Detect Magic-11 [1]; Lend Energy-11 [1]; Lend Vitality-11 [1]; Light-11 [1]; Mind-Reading-13 [4]; Minor Healing-13 [4]; Sense Emotion-11 [1]; Sense Foes-11 [1]; Truthsayer-13 [4].

Silisia in the *d20 System*

Silisia: Female Human Brd5; Medium Humanoid ; HD 5d6+5 (Bard); hp 23; Init +2; Spd 30; AC 14; Atk +3 base melee, +5 base ranged; +3 (1d6, Sword, short); +3 (1d4, Dagger); AL CE; SV Fort +2, Ref +6, Will +7; STR 10, DEX 14, CON 12, INT 13, WIS 16, CHA 17.

Possessions: Dagger; Short sword; Leather armor

Skills: Alchemy +3, Bluff +13, Concentration +4, Diplomacy +6, Disguise +9, Escape Artist +4, Gather Information +7, Intimidate +4, Knowledge (religion) +6, Perform (Stringed Instrument) +11, Sense Motive +7, Spellcraft +2.

Feats: Brew Potion, Quick Draw, Skill Focus: Bluff.

Spells Known (Brd 3/4/2): 0 -- Daze, Detect Magic, Mage Hand, Prestidigitation, Read Magic, Resistance; 1st -- Alarm, Charm Person, Cure Light Wounds, Sleep; 2nd -- Detect Thoughts, Invisibility, Suggestion.

Spice Up Your Setting

by Sean Miner

Fred: Ragnor's gonna show these foreigners how a northern barbarian can eat. What's on the menu?
GM: Rabbit stew, roast venison, wildflower salad for the elves. To drink there's house wine, fine wine and elven wine.
Fred: What, again? That's like all he ever eats! We came hundreds of miles through the Desert of Turmoil for this?
GM: Oh, wait, I was, um, looking at the wrong thing, No, they have . . . curried lamb with couscous, chicken in curry sauce and, um, mint tea.
Fred: Wait. Isn't that what we ordered at that Moroccan place with your brother last week?
GM: Um. So? It's like Morocco. It's got sand and stuff.
Fred: That's it. I bust out the ring of teleportation and go to Khazad-Durk for dwarven food.
*GM: What, for **lunch?** Dude, that's like 5,000 miles away!*
*Fred: Yeah, so it should be around noon there; I'm getting the lunch special! **GM:** (Irritably) Yeah, yeah . . . okay, they've got . . . (inventing madly) . . . goat stew, roast pork and fresh-baked brickbread. And to drink there's dwarven spirits . . . fine dwarven spirits . . . and, uh . . . house . . . dwarven . . . spirits.*
Fred: I start to rage.

Historically, one of the defining characteristics of voyages to exotic lands was the discovery of strange new foods. Often, however, different lands in fantasy worlds tend to have more or less the same cuisine, sometimes distinguished by varieties of wine and cheese. People everywhere seem to raise the same apples, potatoes, beef, mutton and chicken, even when the natural flora and fauna include such curiosities six-legged, fire-breathing lizards and sentient, man-eating plants.

Even when such cuisines are distinct, they tend to mirror those of existing cultures. Thus, ninja and samurai characters eat rice, bean curd and raw fish, while desert chieftains eat couscous and lamb kebobs. Making the problem worse, most players -- living in a world of ethnic restaurants on every corner -- are familiar with these. It can be difficult for a player to get excited at his explorer character's discovery of the noodle when he has a pantry full of pasta. Indeed, each year seems to be a competition among culinary magazines and gourmet restaurants to discover the newest ingredients, which quickly become standard grocery store items.

Here, therefore, are several foods guaranteed to be unfamiliar to the average player. None requires magic or any advanced scientific process, so they are suitable for most campaigns, whether found in a fantasy realm or on an alien planet.

Butterpats

You see someone eating a round, greenish-yellow fruit with evident enthusiasm. He has peeled back the thick, citrus-like rind and occasionally bites the fruit, occasionally picks out a section of the yellow pulp with his fingers and pop it into his mouth. Your curiosity is piqued until one of the yellow sections falls on the floor without his notice . . . and begins to slowly crawl way.

Butterpats are usually sold by the fruit -- but they are not fruit themselves. They are, in fact, the larvae of a wasplike insect. They are injected beneath the rind of immature *pouspous* fruits as eggs and grow to maturity eating away at the pulp -- which is bitter and unpalatable to humans. The butterpats transform the pulp, including the bitter tannins, into fats and proteins which they store up for their metamorphosis into adults. If allowed to remain until the fruit would be ripe, 15-25 larvae (depending on the size of the fruit) generally will have displaced all pulp; this is the peak of their flavor, just before they pupate. Once they have pupated, they become crunchy and take on a less pleasant flavor, though they are still edible. Two weeks later, they hatch as adults and fly away. Adults are not toxic, but are not particuarly palatable, losing the last of their pleasant flavor and consisting largely of inedible legs and wings.

Butterpats can look intimidating and even repulsive to the first-time eater. They are flattened, ¾" to 1" long and

slightly less wide, matte yellow, and are soft-bodied. They are dry to the touch, unless found in rotting fruit (in which case they are usually not eaten) and their skin has a texture like that of a newborn, hairless mouse.

Butterpats are typically eaten live, from the rind, though they are sometimes fried. They are named for their rich, sweetish oily taste as well as their yellow color. They sometimes have a nutty flavor, but this depends more on the fruit on which they fed than on any strain of butterpat. Several strains of pouspous fruit have been bred, and all are cultivated solely for butterpat propagation.

Klaash

Your host sets a generous table. You covertly check to see that nothing is moving, then smile at your hosts. The food bears little resemblance to what you expected. Not that this is bad . . . just very, very different. A small glass of spirits is set before you; exactly what you need to settle your nerves. Following your host's example, you knock it back at once. Then the world turns into fire. Behind the red veil of your vision, you think you may be screaming.

An everyday aperitif in its land, klaash has given the region a greater reputation for spicy foods than it deserves. In fact, much of the cuisine is rather bland . . . until a draught of klaash remedies this.

To prepare klaash, select varieties of very hot peppers are ground into paste, and partly dried so the paste thickens. Sometimes hot seeds and other, more mundane spices are added at this point. This mixture is then buried and allowed to ferment for a few weeks.

The resulting fermented paste is mixed in small amount with fruit juice, broth, water or wine, depending on the meal and local tastes. After settling for a few hours, the clear liquid at the top is poured off and served in very small cups or glasses. It is served immediately before a meal and quaffed in one pull.

Foreigners are apt to find this overwhelming, sometimes suffering shivers and excessive sweating for hours afterward. Even those accustomed to it feel significant effects -- traditionally, it should bring a single tear to the eye. While outsiders have reported an inability to properly taste anything for days, native drinkers insist klaash has a flavor-enhancing effect on the meal. To those used to it, "cool" flavors, such as mints, are enhanced, and otherwise hot flavors are tamed so that their subtler flavors can be tasted more clearly. Some other nuances, however, are lost completely.

Klaash is also reputed to be a digestive aid, and larger doses are of medical use in stimulating perspiration. For those who wish to use it as such, klaash is indeed a severe eye irritant, about on par with any other hot sauce. (This is true regardless of one's experience drinking it.)

Harvalya

*You are running late for your meeting with the merchant who you've sailed so many weeks to see. You're still bleary-eyed from last night's **klaash** and you don't know the language as well as you thought. You decide to grab something that looks safe, and see something like a greenish potato. Tossing some coins to the vendor, you run off, eating as you go. The world blurs behind your tears as your first bite fills your mouth with stewed, spiced peppers.*

The *harvalya* is considered a humble enough food, but is very popular. It is an ovoid tuber resembling a potato; depending on the variety, there range from two inches to nearly a foot in length and are reddish-brown to greenish-brown in color.

Unlike the potato, the harvalya is hollow beneath its skin and a thin, starchy layer. This hollow was used to store water in the dry lands of its wild ancestor, but in the more humid lands where it is now grown, the flooding rains never come, so it remains empty. Now the hollow is almost universally used for stuffing; baked or steamed, the harvalya makes a convenient casing for almost any food, being the sandwich bun equivalent of its land. Such *harvu* are very common street foods, easy to eat on the run and less attractive to insects than the fillings alone.

The sweeter varieties (particularly the tiny purple-black harvalya of the highlands) are excellent filled with fresh or stewed fruits and glazed for desserts, while a larger green-brown variety has a chestnut flavor that goes well with meats.

Honeypods

On your last day before returning home, you find yourself wondering why you came. After the debacle of your meeting, your pride hurts almost as badly as the throbbing behind your eyes. It's been two days since you last dared try the local foods, and you are hungrier than someone of your station should ever be. Your stomach growls as you see a small child happily popping small, rounded pods into his mouth, and you look away, embarrassed, as you catch his eye. A moment later, you feel a tug on your clothing, and look down to find the smiling child offering you the bowl of green pods. Cautiously, you pick up one of the sticky balls and place it between your teeth. You bite down gingerly and cool sweetness fills your mouth. You find that you are weeping tears of joy.

Honeypods are the syrupy seedpods found on a certain climbing plant. In the wild, the pods contain many hard seeds, which make them less useful, as they must be mashed and strained, and much of the weight is waste. Cultivation, however, includes burning or snipping the young flowers, so the pods remain sterile and never develop seeds. Other than being sweet, they taste nothing like honey, being slightly lemony.

Honeypods have different uses in different stages of development. The immature pods, about 1" round, are sweet but still solid vegetable matter, similar to sweet cucumber or apple flesh. These can be eaten raw or candied. Mature pods are three to five inches long, and sticky with exuded syrup unless washed (this is usually done lest they attract insects), and are filled with sugary syrup. At this stage, children enjoy sucking the syrup out, but the pods are more often pressed for their syrup, or mashed and mixed into recipes. If not used fresh, the pods crystallize and dehydrate, becoming much lighter and more stable, and it is in this form that they are usually shipped. The dried husks become papery but tough enough to endure handling, and keep out insects. They can keep indefinitely in this form if they stay dry, but may grow moldy in humid environments.

In some dishes, pods are steeped in wine or spirits to somewhat reconstitute them. More often, aged pods are pounded into a granular sugar, either to sweeten dishes or to be fermented. The pods do not ferment well on their own, but make an excellent addition to grain-based fermentation, having natural acids that aid the aging process.

Wr0ng Numb3rs

Anecdote the First: In one episode of the classic 1966 *Batman* television show, Batman attempts to coax out some criminal goons from a van by activating the Ultrasonic Batray, which emits a loud sound designed to stun and immobilize. Oh, and -- according to the Batman -- this device operates at 12,000 decibels. Now, in watching the episode, this number immediately trigger my "What the heck?!" instinct.

So I did some research. According to Wikipedia, a rocket engine at 30 meters is 150 decibels, and the theoretical decibel limit of a sound at one atmosphere environmental pressure is 194. Meanwhile, on the Decibel Level Chart (at the appropriately named makeitlouder.com), the highest entry on their chart is 320, which would be the equivilant of a 14-gigaton bomb which, if nuclear, would create a crater 12.4 miles wide and 1.33 miles deep.

Oh, and remember that decibels are logarithmic, so that 12,000-decibel figure represents a **_REALLY_** flippin' huge number. I suspect his willingness to even consider using the Ultrasonic Batray in the first place is further evidence of the Batman's ruthless vigilance against the forces of crime: "Cover your ears, Robin; I'm going to flush out the criminals by *destroying the universe!*"

Anecdote the Second: In a nonfiction book I read recently, I encountered the following sentence: "As a guy in his fifties, I've eaten well over 75,000 lunches in my lifetime." (He uses the word "lunches" again and again, and it's clear he's not talking about mere meals.) Again, doing some back-of-the-envelope calculations, and going with the most generous assumptions (eating lunches from out of the womb, being 59.99 years old, calculating a year with 365.25 days), the writer still eats about 3.5 lunches a day . . . a rate that makes hobbits look like supermodels and which has only been matched by Orson Welles' dietary regimen when he was bulking up for his role as the planet-sized Transformer Unicron.

Anecdote the Third: The *Star Wars* movies. I frequently impress my peers by my ability to make grocery runs in less than 12 parsecs yet find myself awakening in sheets soaked with sweat at the thought of picking off womp rats that aren't "much bigger than two meters." Hint to all parents: Once your children learn to drive, teach them *not* to take pot-shots at creatures that are larger than a bull elk from the moving vehicle.

In RPGs, it's easy to "wing it" with many different disciplines; a player can say things like, "Look, I'm a skilled doctor and I say that this man is suffering from internal hemorrhaging; if we don't treat him now, he's dead!" and have a reasonably certain chance that it could be true. Likewise a GM might say, "Okay; this building is on fire and it will burn down in less than an hour unless you're able to stop it" and have a reasonable chance of it being right.

But there's one area where all the helpings of GM fiat or emphatic player acting won't help one lick, and that's where you use hard numbers . . . and those numbers are wrong. If you use units without knowing what they mean, or make up numbers, it's entirely possible for them to be wrong. And it only takes one player at a table to know that a number or unit is wrong for the game world to shudder; if you get enough of them, the suspension of disbelief might snap entirely.

So, in an effort to avoid the dread fate of any campaign degenerating to *Batman* levels of wrongness (at least, those that don't want to start out there in the first place), here are some tips I have for dealing with units.

If at all possible, avoid specifics by using comparisons. For example, if Han Solo had said, "Of course my ship's fast. It holds the current record speed on the Kesel run," no one would have batted an eye. Likewise if Batman has referred to his device as "the loudest device known to humanity that doesn't cause permanent hearing loss," then that would have been fine. If you don't know the units, it's perfectly acceptable to describe the effects in terms that people *do* know, and this most often involves the use of comparisons.

Likewise, if a rocket is able to make the trip from Utah to Antarctica in 25 minutes, you can just say that rather than making up some "million miles a minute" number that will almost certainly be incorrect. Remember that in gaming, much like the real world, knowing exact units is nowhere as important as knowing the effects of the item being

measured.

Do research. For adventures that will be plotted and paced out ahead of time, there's no reason for the GM not to look up and scientific terms he's not familiar with, and do research as necessary. This will enable you to both make sure your numbers are right and give you the opportunity to put the numbers in terms the players will understand, since there's a good chance they won't have researched that info as recently as you. (In addition to my own unending supply of brainy science-minded pals, the folks over on various *Pyramid* message boards have been instrumental in helping me with fiddly science bits that I may not have known before.)

As a player, it's a bit more difficult, but it should be possible to make up a "cheat sheet" of information your character is likely to know. For example, the player of an astronomer might make a cheat sheet of parsecs, light years (which is a measure of distance, not time), degrees kelvin, and the like, while a chemist might jot down what a mole is.

Make up units. Whether fantasy or science fiction, it's entirely possible for no real-world units to be involved at all, and all named units to be referenced only by broad names that give a sense of the overall information without being anything that can be reverse-engineered easily. From "warp factors" and "stardates" to "clicks" and "horse-leagues," these units have a long history with many different fictional universes. In fact, the inexactness of these units fits in with many genres; it can be incongrous for a fantasy elf to talk about centimeters, but it might be very appropriate for him to mention that something is "three fingers." It can even be applicable to more modern settings, such as the time noted American imagineer Jimmy Carter pulled his famous hoax of inventing the "metric system," then managed to convince the rest of the world that the United States would be using this whimsical measurement system.

In the real world -- jobs, school, and the like -- we're rewarded with being able to pinpoint exact numbers. However, in fiction and gaming, numbers are often a lot more difficult to come by, and attempts at fabrication may well cause cracks in the game. With a few simple steps, it should be possible to sidestep this thorny problem without creating a lot of additional work. The alternative will encourage Batman to pull out some device and inflict it on evil . . . and the universe might not survive if that happens.

--Steven Marsh

Pyramid Review

GURPS for Dummies

Written by Adam Griffith, Bjoern-Erik Hartsfvang, & Stuart J. Stuple

Edited by Christopher Morris, Andy Hollandbeck, Sean Punch, Jessica Kramer, & TECHBOOKS Production Services

Layout & graphics by Carl Byers, Andrea Dahl, Lauren Goddard, Denny Hager, Joyce Haughey, & Heather Ryan

Cartoons by Rich Tennant

432 pages & miniature reference "screen"; $21.00

Perhaps it's the status symbol for the new millennium: you know you've really arrived when someone writes a *. . . for Dummies* book about your corner of the world. *Dungeons & Dragons* has its book (two of them, actually), and now there's *GURPS for Dummies*. The series has allowed increasingly nebulous definitions of its products. This one says its purpose is not to explain *GURPS* but to give you a better handle on playing it. If you find the core *GURPS Basic Set* baffling, this won't clear anything up. More accurately, the same material presented in a different way may help but it would be accidental.

The authors claim it's useful for both new and experienced players, and this seems to be true to a point. The building blocks for a character, the development of the campaign, the world-building, assigning character points, even the use of technology . . . if it's in the game book it has a mirror image here. The effect is scattershot, though. In one part, you'll get good insight into why Enemy is an awful disadvantage for your player, but elsewhere you get a laundry list of advantages about accessing the "other world." Having them all in one place is a convenience, true, but does it make *GURPS* more accessible in a substantial way? Skills and disadvantages fall into a similar pattern, and choosing what kind of character to play isn't breaking new ground.

They mention ways to spend points with greater thrift (such as buying up the attribute instead of all the little skills based on it), but the "more bang for your buck" thing has been done before and done better in other *GURPS* books (notably *[Who's Who 2](#)* and *[Wizards](#)*). This is another case of convenience with questionable lasting value. Making a survivable character and how to approach various combat scenarios is really the only thing this section does well, so as long as fighting's your thing . . .

Like a game screen, the book splits evenly between the players and the GM, and the referee's is easily the worthier half. Anyone's game manual will envy some of their organic game-construction tips. Where the front of the book breezes past advantages and disadvantages, this part shows exactly how to grab (or force) players' attention where you want it using those same character stats. (And note, it's all kosher -- they suggest nothing that creates an adversarial system between GM and party.)

The last part does have its troubles. Not all the gamemaster nods are *GURPS*-specific (do you want another "how to GM" book or did you come for the *GURPS?*). The authors' own campaign provides several good examples, but oddly confusing bits arise as well. Sure, Excel is handy, but there's a whole other *. . . for Dummies* book about it for a reason; if you lack familiarity, making a combat grid with it is of limited utility. Too short to really educate you and too long to ignore as a simple sidebar, Excel ideas pop up elsewhere. Making maps with it is a nifty idea, and those

tips should be within most folks' grasp. Still other thoughts are truly incongruous: You can milk atmosphere from descriptions of clothes and interior design, but that section isn't part of the culture section from 60 pages ago, it's in with campaign flavor. Too many tangents stand out as little islands drifting apart from the whole, whether from organizational choices or just a lack of any decent place to put them.

The editing, sad to say, is also badly off (and this isn't small-press publishing). Putting aside grammar and typos, the authors fall back on reusing the same words and phrases. "Unarmed Combat Skills" mentions those proficiencies *and* non-combat skills that help (like throwing and acrobatics). Not only does pairing these under one title do the second category a disservice; *not only* is the latter set not produced for another 10+ pages; the two are separated by damage, defense, maneuvers, and techniques. Worst of all, the text mentions two chapters in the famous "part of tens" that don't exist (at least the table of contents omits them). The website doesn't help here.

. . . for Dummies puts a lot of little yellow reference screens and sheets into their books, so it's disappointing this one doesn't feel up to snuff. It's a bit on the papery side. It's almost entirely given over to combat, including critical hit and miss tables; attack and defense modifiers for ranged and melee combat; hit locations; and maneuvers ("Reactions" is the odd man out). It's odd since combat doesn't get any more play in the book than other subjects (and therefore it's not much use as a reference), but it may have made the most sense since it's the central process in any RPG. The artwork is mostly combed from **GURPS Basic Set,** save Rich Tennant's *Fifth Wave* comics. While they seem strained, they're still quite funny, and his style continues to please.

It's hard to imagine any one demographic for which **GURPS for Dummies** would be a perfect fit. It's not a bad book -- it has good ideas peppered throughout -- but it may be more like a GM's reference guide than a player's in that a gaming group could buy a single copy and it would cure all manner of ills one participant at a time. Hardly all things to all players, this hit-or-miss volume fails to make a lasting impression, but is worth browsing to find the gems you need.

--Andy Vetromile

Pyramid Review

Tsuro: The Game of the Path

Published by WizKids, Inc.

Designed by Tom McMurchie

Illustrated by Shane Small

9-inch Square Full Color Fold Out Board, 35 2½-inch squares Tiles, One 2½-inch square Dragon Tile, Eight Colored Markers, 9-by-18-inch Full color card Rules Sheet, & One 5-by-7-inch 16-Page B&W Foreign Language saddlestitched Rules Booklet; $24.99

Better known for their collectible miniatures games such as *MechWarrior: Dark Age* and *Heroclix* and their constructable strategy games like *Pirates of the Caribbean* and *Rocketmen: Axis of Evil,* WizKids step away from all that to give us something both complete and self-contained. *Tsuro: The Game of the Path* is the publisher's first board game, one that matches the European model in terms of quality, and matches its simplicity of concept with a simplicity of play.

The concept is that the Dragon and the Phoenix share the guardianship of the paths of life, maintaining a careful equilibrium between the two forces of luck and destiny. Only by finding a balance between the two can you find the path to enlightenment. In *Tsuro,* this is reflected in the players having to find their way across the board, but curiously not to the other side. Indeed, a player does not want to find a path to the other or edge of the board, but rather he wants his opponents to do so. This will lose them the game, and if he can force this to happen by putting a path in front of them in front of an opponent -- which he *must* take -- then so much the better.

What strikes you first about *Tsuro* are the quality of its components, and the obvious thought that has gone into both its look and feel, all done in rich earthy shades of brown and following an Asian theme. The rules are beautifully presented on a fold out card sheet, a cover sheet sits below that on top of the fully mounted board, and below that are the nicely shaped playing markers, and the glossy, hardy tiles. The only downside to the components are the plainly presented rules given in Dutch, French, German, Italian, Portuguese, and Spanish, and the playing markers. These eight, each in a different color and with a dragon motif stamped into them, are of cheap plastic. They just do not feel as if they match the quality of the rest of the game.

The board consists of a six-by-six grid of 2½-inch squares, the same size as the tiles. Each of the edge squares is marked with a pair of starting marks on the very edge. These starting marks align with the lines or paths that run across the tiles. Each tile is marked with four of these lines running to the sides of a tile to create a total of eight entry and exit points. Although the paths cross, they never connect across a tile, only from one tile to the next. The effect, as the tiles are laid out on the board, is to create a series of separate paths on which the players will never meet unless their paths are connected. It is important to note that each of the 35 tiles is different, but that they can all be laid out on the board to create a variety of paths and patterns. The 36th tile is an exception. The Dragon tile is used to indicate who draws the first after the draw pile is reshuffled.

Designed for two to eight players, a game begins with each player placing his marker on a starting mark and receiving a hand of three tiles. On his turn, a player selects one of these three and puts the tile down on a square next to his marker so that it increases the length of the path his marker is on. He then moves his marker along the new section of path to its open end. If another player has his marker on a path that is connected to and extended by the addition of this newly placed tile, then the marker is also moved along the path to its open end. In doing so, should a player's marker

be connected to a path that leads all the way off the board, then he must still follow it to the end. When his marker leaves the board, a player also leaves the game. The aim of the game then, is to force your opponents' markers off the board, while you try to stay on.

And that really is it. To win you must be the last player with a marker on the board. It is possible to have two winners, but only if everyone else has been eliminated and all of the tiles have been placed. There are enough tiles to fill the board bar a single square. Players can also be eliminated simultaneously, when their respective paths are connected, forcing their markers to follow each other's path back to the starting point and off the board. Of course, a player does not have to play a tile that will force him from the board unless no other move is possible, but when players' paths grow closer, it is highly probable. It is possible for there to be no winner, having played games in which every player is eliminated on a single turn leaving the board empty. This is more common with only a few players.

Tsuro is both easy to learn and understand. Although two can play, it is definitely a better game the more players are involved as there are more opportunities for rival paths to connect. A greater number of players also increases the playing time, but to no more than half an hour. Nor is it an easy game to win despite the simplicity. Rather it is an easier game to lose than it is to win, and to be fair, *Tsuro* is very, very light in terms of strategy. Which probably makes it too light for more than an occasional play by the serious gamer, being more of a side dish than a main course, making it better suited to a family audience. Even so, *Tsuro: The Game of the Path* is an enjoyable, attractive game that has been ably executed from concept to completion.

Magi, Madmen, and Monsters

for *GURPS Cabal*

by Bevan Thomas

The Cabal is an ancient and mighty organization dealt with in the aptly named *GURPS Cabal.* It is a coalition of sorcerers, fringe mystics, and supernatural creatures dedicated to mutual support, the acquisition of power, and the exploration and mastery of the spiritual planes. The leaders of this august and monstrous society are the Grand Masters, beings of almost unspeakable cunning, power, and ruthlessness. *GURPS Cabal* deals with 13 of them, ranging from the calm and erudite John Dee to the vile and bloodthirsty Erzsebet Bathori and the darkly enigmatic Garravin. This article introduces nine more individuals who have managed to claw and fight their way up the hierarchy to become lords of the night. Though created for the Cabal, they can easily be incorporated into other horror settings as patrons or adversaries.

These Grand Masters were created with variety in mind. Figures from history rub shoulders with entirely new creations, relatively moral scholars feature alongside depraved monsters. The GM is expected to pick and choose which ones are right for his campaign, and of course even the ones he selects should be modified to serve the best purpose in his setting that they can. It is his Cabal, after all.

Adave

Adave ("Adam" + "Eve") is a peculiar Grand Master. It is the gestalt product of a pair of alchemists: William Trent and his sister Josephine. The twin siblings were minor nobility who lived in 17th-century England and devoted almost all of their time to hunting for the secrets of immortality.

They eventually devised a strange ritual that would result in a physical enactment of the alchemical marriage. If properly performed on a brother and his twin sister, it would transform the two into a single immortal being. Though the two were disturbed by the ramifications of such a ritual, they were too excited by the promise of immortality to pass it up. Therefore they brew the two elixirs, and when the time came, they linked their hands, clinked glasses as they toasted to the hope of immortality, and drank in unison.

And then what once was two suddenly became one.

Adave was born: Adam Kadamon incarnate, the holy hermaphrodite, the perfect union of the masculine and feminine. As soon as the transformation was complete, Adave destroyed all of its notes so that no one would be able to use the information to figure out how to separate the being into its original two forms. After this was done, it packed up its things and left to begin its new life.

It was soon located, contacted, and recruited by the Cabal. Many within the organization would do anything to find out exactly what ritual created Adave. However, the hermaphrodite's unique gestalt brain is virtually immune to any attempts to read, control, or otherwise manipulate it. Furthermore, its complete mastery over all conscious and unconscious bodily functions means that Adave can choose to temporarily "turn off" pain receptors in different parts of its body, making it immune to torture. It claims to have forgotten exactly what the ritual was, and the Cabal has no way of verifying that (something that frustrates Cabalists to no end).

Adave's existence as a transfigured being, its promise that if it ever remembers the ritual "the Cabal will be the first to know," and the insight its alleviated consciousness can give on a wide variety of situations allowed the being to rise within the Cabal's ranks and attain the position of Grand Master. Now it spends most of its time in research and quiet contemplation. Adave is a tranquil being, all the aspects of its body and mind having become perfectly balanced through the consumption of the elixir. It always responds to threats in a quiet and calm manner, which often makes it

pivotal in crisis situations.

Coaxoch

Coaxoch ("Serpent Flower") was an Aztec priestess who lived hundreds of years ago. She worshipped Tlazolteotl, "The Eater of Filth," goddess of sex and birth, and through her connected with Naber, aethyr of Akton. Believing Naber to be the "true Tlazolteotl," the priestess devoted herself to the aethyr's dogma of debauchery and self-mutilation of the soul.

However, the other priests declared Coaxoch's rituals to be an abomination, and they sealed her up in a cave as punishment. The priestess clawed at the rocks to no avail, and then pleaded with "Tlazolteotl" to save her. Naber appeared to Coaxoch in the form of the goddess and copulated with the woman in the darkness. Then for centuries, Coaxoch hung between life and death. Her body became mummified, preserved yet desiccated, and outside the Aztec Empire fell and the modern world grew up where the ziggurats and temples once stood.

Then, in 1920, a group of archaeologists uncovered the cave. As the sunlight hit Coaxoch's body, the priestess awoke into her undead existence and the mummy slowly rose from the ground. The archaeologists were destroyed in an orgy of blood and agony, and then Coaxoch walked down the mountain and into the new world.

It was not long before the Cabal snapped her up, recognizing that such a powerful and unstable sorceress should not be allowed to operate on her own. She soon found her niche exploring the darker areas of the occult, and has taken to Erzsbet Bathori, finding a kindred spirit in the Blood Countess. When not exploring the Four Realms with Naber as her guide, Coaxoch indulges her love of parties in which she seeks to outdo Marie Laveau for extravagance, Cagliostro for decadence, and Erzsbet for monstrosity. Though the priestess' true appearance is that of a leathery corpse, she usually employs her magic to change her body into a more pleasant form. However, it is rumored that certain people, such as the Countess, enjoy the mummy's true appearance, finding it . . . intense.

Crow

Perhaps the youngest Grand Master, Crow was born on November 7, 1981, in Vancouver, British Columbia, Canada. His name was Brandon MacKay, and for the first part of his life, he was a normal boy with a passing interest in literature and nature. All that changed in the nineteenth year when he decided to go camping on his own deep in the lush rainforests of BC.

It was on his third night that MacKay was found by the great eikone of hunger, a manifestation of Atrax's shadow, [Baxbakwalanuxsiwae](). This Northern spirit possessed MacKay, driving him mad and causing him to run screaming through the wilderness, hungry for blood. A month later, MacKay regained control. He was lying naked by a stream, his body covered in blood. He was not sure what exactly had happened to him during his insanity, but what he did know was that now he had become touched by the Cannibal and filled with its power. MacKay realized that he came from a long line of Kwakiutl shamans (or pepaxalai) on his mother's side, that the Cannibal had responded to his blood, and that he had been initiated into the way of the Hamatsa.

The new sorcerer named himself "Crow," and began to gather to himself all the occult forces of the Pacific Northwest Coast. As this is one of the parts of the world with little Cabal presence (not considered important enough by most Cabalists), it was relatively easy. Soon he had created treaties with the Sasquatch families, forced the obedience of the most prominent water monsters, made pacts with the various eikones, eidolons, and ultraterrestrials that frequent the area, and gained control over the province's ley-lines and places of power.

Then, three short years after his first encounter with the Cannibal, Crow announced himself to the powers that be. He showed up at a Cabal chapter-house and convinced a group of Grand Masters to meet with him behind closed doors. Few people know what was said, but what is known is that when Crow stepped out again, he had been declared one of them.

Crow has become the wild card amongst the politicking of the Cabal's Inner Circle. He is a maverick, a new recruit who's goals are either unknown or unestablished. This means that most of the other Grand Masters are trying to sway Crow to their side, taking advantage of what they perceive to be raw power directed by a naive and inexperienced mind. His eikone, the Cannibal, makes a lot of Cabalists uneasy, and some believe it might even be a demon in disguise. Many are nervously waiting to see what the pepaxalai's exact agenda is.

His "nest" is at the center of a winding labyrinth located underneath the city of Victoria. The length of the labyrinth is cared with runes from a multitude of different occult languages, and it adjoins Binah, Baxbakwalanuxsiwae's own realm, and some say the Abyss. It is strongly connected to Atrax, though here the decan has particularly dark overtones (hunger, gluttony, and the will to devour). Crow is often found meditating here, link to the paranormal energy of the Northwest Coast like a spider at the center of his mystic web.

Marlowe

Christopher "Kit" Marlowe was born on February 26, 1564 and said to die on May 30, 1593. The following centuries did not improve his temper. He was the most popular playwright of his day, one of his most famous pieces being the occult-heavy *Doctor Faustus,* and was secretly one of the most trusted Cabalists in the service of John Dee.

In order to increase his effectiveness as one of Dee's agents (and to deal with the various elements of Marlowe's "controversial" personal life which had been revealed), Marlowe faked his own [death], and left an inert homunculus in his place. Then he wandered around Europe, using his talents for subterfuge and art in the Cabal's service while indulging in his love of wine, men, and tobacco.

It was in 1610 when he encountered Erzsbet Bathori while investigating reports of vampirism in Hungary. The Blood Countess fell in love with the middle-aged rake, an attraction that Marlowe in no way returned. In an attempt to gain his fealty, Erzsbet turned Marlowe into a vampire and trapped him in her castle. However, he used his magic to escape and convince the King of Hungary to order he imprisoned.

Ever since, Marlowe has continued to do the Cabal's dirty work, and eventually became a Grand Master. For one of such a rank, he is incredibly "hands on," preferring to do the job himself if at all possible. He dislikes his vampiric state, though admits that it has certain advantages.

He is a consummate liar, rogue, and con-man. Only the following things are certain about him: he is loyal to John Dee, he hates Erzsbet Bathori, and he dislikes drinking female blood. Marlowe claims to have no ulterior motives, and is simply doing his best to "serve the Cabal's needs."

He's probably lying.

Myrddin

In 1941, during the Battle of Britain, a German bomber suffered a mechanical anomaly and accidentally dropped a bomb on a grove of trees near the town of Selkirk on the Scottish border. The bomb awoke the entity who had been slumbering under the grove for more than a thousand years. After the planes were gone, he walked out of his cave and came to the nearest Cabal chapter house to announce himself. Grand Master Myrddin, more commonly known as Merlin, had returned.

Few Grand Masters have as many contradictory legends around them. There was an Emrys Myrddin who was a member of the Cabal in the 6th century, and served as an advisor to the brother kings Ambrosius Aurelianus and Uther Pendragon, and to Uther's son Arthur. However, there was another Cabalist mage known as Myrddin Wyllt who lived a hundred years later in Wales, and wrote a series of prophesies while living as a hermit in the forest. At different times, the "modern" Myrddin has claimed to be either of these or both or none, and no one can figure out the truth of the matter.

Whatever his past, Myrddin is one of the Cabal's mightiest mages and famous for his ability to take on any form. He is strongly attuned to the decans Bianakith and Charchnoumis, and his favorite forms include an old man with a gray beard, a beautiful boy with golden hair, a large raven, a dark youth dressed entirely in black, and a huge, black mastiff. He is also a prophet, known for spouting cryptic predictions at odd moments.

Myrddin is obsessed with acquiring the "Four Artifacts of Britain," four magical items that correspond to the four suits of the Tarot deck. They are the Holy Grail (the cup), the Spear of Longinus (the wand), the sword Excalibur (the sword), and the Round Table (the disk). Myrddin's search for these artifacts, as well as his frequent visits to the realm of Camelot in Briah, might suggest that he is Emrys, but some people feel all this is misdirection, serving as a smokescreen for Myrddin's true goals. Besides, it's such a cliché for Cabalists, especially British ones, to quest for the Grail and the Spear that many feel doesn't add much to the "Emrys Myrddin" argument anyway.

Myrddin is a British nationalist, especially with regards to occultism. He is obsessed with "returning the flower of English sorcery," and makes no secret of his distaste for "foreign magic." He is on excellent terms with Adave, John Dee, and strangely enough, Garravin, as well as tolerating Erasmus Rooke, but has a talent for rubbing other Grand Masters the wrong way. There is especially bad blood between Myrddin and Dr. Fang, and neither Cabalist makes any secret of the scorn he feels for the other's methods.

Back in King Arthur's day, Emrys Myrddin had numerous contacts with Faerie. In fact, the trials and tribulations of the kingdom had been shaped by a shadow war between fae-attuned Cabalists, cumulating in Morgan the Fay's pact with the Unseelie Court and eventually overthrow of Arthur. This has caused many people to speculate on the exact reasons behind Myrddin's close friendship with Garravin. Some believe that Myrddin was friends with Garravin's father, or that the old fairy was Myrddin's father too, making Garravin and him half-brothers (after all, many people have claimed that Myrddin's father was a fairy or the Devil). Others have suggested that the two might actually be lovers. As both Myrddin and Garravin are infamous for their short tempers and imaginative punishments, most people only speculate well out of earshot.

Poe

He is the creator of modern detective fiction and the master of the gothic short story, his life read like one of his own horror yarns, and his death was wrought with confusion and mystery. And yet, his waking life paled in comparison to the life Edgar Alan Poe lived when he slept, for he was a member of the ancient sect of dream-warriors known as the Benandanti.

Born on January 19, 1809, with his birth caul still on his face, Poe was blessed with psionic powers, particularly the "Sight" (detecting and communicating with spirits) and the ability to Dream Travel (p. CB99). With these powers came the responsibility of doing battle in the Dreamworlds against the Malandanti, dark witches in the service of demons who wish to gain control over the dreams of humanity. By night Edgar Allan Poe fought them, and by day he wrote stories of madness and terror as a form of catharsis. He hoped that by expressing in fiction the insanity he constantly faced, he would be able to purge it from his mind, and remain sane himself.

For a while it worked, but Poe earned many enemies. Chief among them was Loruhamah, prince of the howling night, chief among the demons who feed on nightmares. Eventually Loruhamah's agents managed to enter the waking world and target Poe while he was at his most vulnerable. It was on October 7, 1849 that the author and dream warrior was found dead. Though the medical verdict was alcohol poisoning, he was in fact struck down by demons. While they killed his body, they did not kill his soul, for just before death Poe's dream self was able to flee to Nod, and from there into Atziluth.

It was 40 years later when Poe was next seen. An Italian Cabalist dreamed that Poe warned him of an upcoming invasion of nightmare demons. Fortunately, the Cabalist believed him, and contacted his superiors, and the threat was averted.

And so Poe became part of the Cabal, and so pivotal has he become that the dream warrior is now a Grand Master. He also still remains in contact with the Benandanti, and makes no secret of his disgust of much the Cabal's activities. Poe

only associates with the Cabal because he feels that only the resources of this vast organization are able to hold back Loruhamah and his minions, it is the lesser of two evils.

Poe has no real existence outside Nod and the Dreamworlds. He is one of the few people able to navigate the various Dreamworlds successfully, and can jump from dreamer to dreamer with surprising ease. He is generally in Nod when not communicating with his associates. For communication, he prefers to speak to them while they dream, though the Cabal has devised special crystals that Poe can "possess" and speak out of if necessary.

Rasputin

Few Grand Masters are viewed with more fear and awe than Grigori Yefimovich Rasputin, known as the "Mad Monk" and the "Holy Devil." He was born in a small Siberian village on January 10th, 1869, and had a relatively uneventful existence for the first 30 years of his life. However, while on a pilgrimage to Jerusalem, he gained various supernatural powers, particularly in the realms of prophecy and healing. Most occultists believe that these powers were psionic in nature, but to Rasputin they were always gifts from God.

It was in 1903 that he returned to his homeland, becoming a famous healer. In 1905, Rasputin was brought to the court of the Tsar in order to heal his son's hemophilia, and though Rasputin did not completely cure Tsarevich Alexei, he was able to sooth the boy's suffering. He became part of the court, and eventually was appointed the person advisor to Alexei's mother, Tsarina Alexandra.

In 1916, a group of nobles became disgusted with Rasputin's prominence at court and sought to assassinate him. They invited the mystic for dinner, and fed him cakes and wine laced with cyanide. Unaffected by the poison, Rasputin was than shot many times by the conspirators. Rasputin's healing powers allowed him to withstand much of the attack, and he fled, intending to go to the Tsarina. In desperation, the assassins clubbed Rasputin into unconsciousness, cut a hole in the ice of the Neva River, and stuffed him into the freezing waters.

Three days later, the body was recovered and buried. However, that was not the end of Grigori Yefimovich Rasputin. While his body languished in the hole, Rasputin's ka was thrust into the realms of the spirit, and Rasputin's body toppled to the ground. Like a shooting star, his ka fell towards the Abyss, and Rasputin claims that there he confronted Choronzon, Breaker of Thought and Form. It is said that the Mad Monk defeated the powerful demon guardian and entered Daath, the hidden 11th sephirah, the "worm that gnaws." It is said that the Mad Monk learned the secrets of Daath and used them to enter Atziluth and stand naked before the Godhead. It is said that Rasputin then returned to his body as an enlightened and mighty soul. Many people say these things, primarily Rasputin and his followers, but other Cabalists are less sure. Some believe that the man fell into the Abyss, where his soul was devoured, and it was a demon that returned and dressed itself in Rasputin's skin.

Rasputin, if it was Rasputin, awoke exactly three weeks, three days, and three hours after his "death," his body having completely repaired itself. Then he clawed his way to the surface and walked off.

After his betrayal and "murder," the Holy Devil decided to devote all his time to the Cabal. He soon became a Grand Master, and attracted to him a large body of supporters. When not slaking his legendary lusts on female disciples, Rasputin devotes virtually all of his time to exploring the Spirit Realms, particularly the Abyss and the hypothetical sephirah Daath. If Daath does not exist, as many Cabalists believe, then Rasputin is simply continually sending his ka into the realm of demons, an image that horrifies many fellow occultists. In fact, a group is being formed, a cabal within the Cabal, that believes Rasputin needs to be destroyed before he drags all of the order into the Abyss with him, and they are currently trying to figure out how to destroy Rasputin before it is too late.

Rasputin claims to have taken Shaliah, Lady of Material Happiness and aethyr of Phthenoth, as a lover, and it is at least true that Rasputin seems able to regenerate from virtually any wound. Some people claim that the Mad Monk was once completely burnt and his ashes scattered, but that the ashes eventually drifted together and reformed into his body. This may be an exaggeration, but certainly he has been shot, burnt, poisoned, and cursed numerous times, but has always recovered. Many people once witnessed him being decapitated, but then his body calmly reached down to his fallen head, placed it back on his neck, and he was then good as new. As most Cabalists are obsessed with

immortality, many are desperate to know how Rasputin has achieved this, and this is one of the reasons why he has so many initiates pledging loyalty to him. However, so far Rasputin has told no one his secrets.

Though Rasputin is a fairly solitary individual (when not making appearances to his supporters), he has developed connections with Grand Masters from his area of the world. He has at least a working relationship with the demigod Koschei the Deathless, and is known to have occasionally been "intimate" with Oleupata Horsekiller. Thanks to his regeneration, the Mad Monk is one of the few people who can cope with the Scythian priestess' rages.

Sophia

It is well known by occultists that the great alchemist and theologian Albertus Magnus once created a homunculus that so disturbed his pupil, Thomas Aquinas, that the young man eventually smashed the creature to pieces. What is less well known is that in 1255, Albertus constructed a new homunculus, a female that he named Sophia.

When Sophia heard what had happened to her "brother," she was filled with fear and fled the alchemist's house. She wandered over Europe, hunting for a place where she could feel safe, where she would be treated not as an abomination or an object but as a real being. She was eventually found by the Cabalistic lodge known as the Brethren of the Lambent Flame, and was inducted into the group.

Now, after hundreds of years, Sophia has become a force to be reckoned with within the Cabal. Unlike many other Grand Masters, her goals are entirely material. She has no interest in occult study or exploration of the Realms. All she wants is to create a world safe for nonhumans.

Sophia is by far the most vocal nonhuman activist within the Cabal. And by her definition, someone is only a nonhuman if he or she was never part of humanity. Sophia couldn't care less about undead like Elzsbet Bathori, and even shapeshifters like Athene du Sarrazin are a little too human for her taste. Instead she associates with such creatures as the Serpent-Lord Kaas'sth'raa, the fae noble Garravin, and other even stranger beings.

She often demands that various creatures be reclassified as "people" and champions for members of numerous species to be accepted into the Cabal. Her current pet goal is the appointment of a troll Grand Master, which she feels is necessary for the "protection and recognition of a wise and noble species which has suffered much from human bigotry and hate." Certain Cabalists feel that Sophia intends to eventually perform a coup against the Cabal, purging it of all its human members. Sophia dismisses such claims as "attempts at fearmongering by the speciest status quo."

Dr. Taylor

Susan Taylor is perhaps the greatest purely scientific mind the Cabal has to offer. Openly disdainful of what she perceives as the randomness and unreliability of magic, she is determined to prove that science and mathematics have the power to analyze, measure, and define the metaphysical as well as they do the physical.

Her studies and inventions have helped the Cabal immensely, and it is a testament to her genius that she has managed to rise so high in an organization while simultaneously deriding the philosophy on which the organization was formed.

A year ago, she was a Philosopher happily going about her work, but then disaster struck. Dr. Taylor had developed a device that she felt would allow her to look deep into Briah, and possibly even gaze upon Atziluth itself. Unfortunately, she must have made an error in her calculations somewhere, for when the machine was turned on, it ripped a hole in reality and from that gash flew a qlippothic swarm. Two of Taylor's assistants were torn to pieces before the monsters were driven back and the hole was closed. Before the swarm was banished, one of the monsters stung Taylor's left hand and injected something into her skin.

Susan Taylor was unconscious for three weeks, entrapped by visions of destruction and chaos, of the Vale of Hinnom, of a possible Apocalypse, and of what she thinks might be the "first draft" of Creation. When she awoke, Taylor discovered that the wound left by the qlippoth had developed a gray-green growth. After some intense study, she

realized that it was qlippothic matter, that a piece of "God's garbage pit" was growing on her body.

Taylor is both fascinated and repulsed by the situation. After various attempts to banish the qlippothic material failed, Taylor convinced her superiors that this may be a blessing in disguise. This growth and the accompanied visions permit a unique analysis of qlippothic matter and the First Creation, information that could prove invaluable to the Cabal. Having appealed to the organization's lust for knowledge, Taylor was allowed to embark on her study of the growth. However, she was warned that if she ever appeared a threat, she would be treated without mercy.

Over the last year, Dr. Taylor's studies have added much to the study of the qlippoth, and her visions have helped counteract attempted invasions from the Vale of Hinnom. Susan Taylor has become so pivotal to the Cabal that she now holds the position of Grand Master, and continues with her studies to use science to map the Realms and plump the depths of the Abyss.

The growth has now spread over Susan Taylor's entire left arm, covering it in a gray-green chitinous shell, and is starting to spread over her body. When Taylor isn't paying attention, the arm sometimes does things of its own according, such as the fingers clenching and unclenching or moving in a way that certain Cabalists feel is some indecipherable alien sign-language. She generally hides the arm with a long sleeve and glove, and it has greatly disturbed many Cabalists. There are those that fear she has become a sleeper agent for the qlippoth, and needs to be destroyed before she destroys the Cabal and perhaps even the world.

The Last Resort of Kings

Violence as a Storytelling Tool

by Michael Dewar

The less historically hip reader may be forgiven for thinking that the above title refers to a little island paradise just south of Mauritius, favored by royalty from around the world, but it doesn't. This is about violence -- the roleplaying equivalent, not the kind with real blood and real prison sentences.

This isn't about combat. There are millions of pages in official rulebooks and outside them detailing the correct modifier for a sharpshooter standing on a wet elephant with a toy catapult, trying to hit a dragon's left nostril. The stats have been done.

This is about violence in the context of a *story,* a few comments and tips to players and DMs about how it can be used to further the plot, or enhance themes, or other Poncy Literary Things.

Aggressive Self-Defense: Reactive Violence

An awful lot of roleplaying violence falls into this category. Your PCs are mincing along through a forest, with nothing more aggressive planned than flower-arranging or writing poetry, and they are suddenly attacked by 1d6 Orc Bandits, who they brutally kill, loot and use the gained XP to level up in preparation for the 1d8 Dire Wolves waiting around the bend. They probably eat a pie or two afterwards.

Or a Crazed Evil Genius tries to blow up New York/Paris/The World/Texas, and our heroes stomp him. Or Texas (depending on your definition of "heroic"). There's nothing intrinsically wrong with the scenario, mind you. Players don't usually want to play total bastards who perform random, unprovoked acts of violence on the relatively innocent (although there are exceptions). They want someone else to throw the first punch, snarl "Draw!" through gritted teeth, or kidnap Fair Marion.

Unfortunately, this can turn fighting into that formulaic, 1d6-Orcs scenario discussed above. Unless the characters are in a literal war zone, they shouldn't be used to being periodically attacked for no immediate reason. If it does happen, it should be panicked and tense and unexpected. This is not the time to lay out a hex map and advance your fighters to attack while the party mage readies a fireball. It's time to grab your sword and attack the nearest foe, probably shouting, "What the hell is going on? Die you bastard, die!" Hopefully that last line refers to the enemy you're fighting, though it might also refer to the moron who was supposed to be on watch.

Unfortunately, as characters get tougher, it gets harder to shake them up. 1d6 Red Dragons launching a sneak-attack is somewhat less common, not to mention a little hard to miss. It is, however, still possible to shake them up without bringing in ever-tougher foes.

Think about it in terms of comfort zones. If the characters are comfortable facing down a gang of Orcs or Ventrue Ghouls in combat when well-armed and expecting it, then what about when they're unarmed? Asleep? On their way to the privy? Of course, this can get overused. Players can feel taken advantage of or -- even worse -- end up going to the bathroom armed.

Fortunately, you can always play up the opposite extreme. If a high-powered group gets attacked by those 1d6 Orcs, it doesn't have to be a boring event. You can play up how effortless it is, how two of the Orcs realize what a bad mistake they've made and try to run away, how the characters switch swords to their off-hands for more of a challenge, and similar nonsense. It's a fun interlude from more serious combats with The World At Stake. The same might apply to a drunken cowboy who gets his gun blown out of his hands by your seasoned Wild West quick-draw artist. The fight

remains memorable, even if it wasn't tough.

Ideally, that's what you want to aim for. Most people who've been in a fight (even in a large number of them), will remember every moment for the rest of their lives. That's what you want every time blood is spilled.

The Lone Gunman: Premeditated Violence

On the other hand, sometimes the PCs land the first punch. They raid a facility, plan an assassination, or creep up on a camp of Orcs.

Now is the time that the hex grid becomes a bit more helpful. The problem with combat maps is that they tend to turn even the most mild-mannered unaggressive PC into a rogue SWAT officer. ("You lay down suppressing fire across C11-15, and I'll move around behind him to A5. Everyone else, get ready for the Pincer Maneuver next round!") Sometimes that is appropriate, but often it isn't.

A nice trick is to let PCs use the map to plan their attack, and then take it away as soon as the first die is rolled. As many military types have commented, no plan survives first contact with the enemy. Even if players complain that they're not sure what's going on from your descriptions, remember that real fights are *disorientating.* If some psycho is trying to carve his name on your forehead with an icepick, little details like the furniture around you fade away by comparison. If players start saying, "Hang on. So I'm at the door, and Jeff is to my left, and the gunman is behind a barrel to *his* left . . ." then tell them they're taking a round to survey the scene and *then* let them get a more detailed description, assuming they're still alive.

Besides the mechanics of planning and structure versus the ugly reality of battle, the other important issue with premeditated violence is that it is just that: premeditated. Carefully planning to kill someone or something is far colder and nastier than, say, hitting back because this guy's coming at you with a knife . . . and suddenly the knife is in your hands and there's arterial spray all down the wall . . . gain 10 XP. Some characters might be able to cope with murder for self defense, but not to further their own goals. Others might happily cap their enemy with a hunting rifle from 500 meters and then go out for a burger.

While some systems try to model this (***Vampire's*** Humanity, ***Unknown Armies'*** Violence Checks and similar Bad-O-Meters), a handy little exercise to measure your character's tolerance for carnage runs as follows. First off, has the character ever killed someone? If it's happened in game, this is a matter of history, not roleplaying. However, this is not necessarily the case with newer characters. Remember, even professionals seen traditionally as violent or aggressive (such as the police or military) may never have taken a life. Hundreds of soldiers retire without ever having fired a shot in anger. Obviously if your character hasn't killed before, then the first death is a major roleplaying opportunity. This doesn't have to mean screaming "Wwwhhhy?!" at the heavens as the violins reach crescendo -- it might be shaky hands, or dry heaves, or just insisting that, "We should bury him. You're supposed to bury people."

Secondly, there's a little roleplaying exercise you can try: Imagine your character is confronted by his worst enemy -- the major antagonist of the campaign, or perhaps a less important NPC who has just pushed *all* the wrong buttons. The enemy hands him a gun and says, "Shoot me. You won't get in trouble. The cops will never find out. If you don't, things will continue exactly as they are." How your character might act can give you a good idea about their overall attitude to violence.

You Wouldn't Like Me When I'm Angry: Frenzied, Unplanned Violence

Of course, not all violence is so calculated. Sometimes you just spring a brain leak and start hitting until you can't hit any more. Some systems allow for this with frenzy checks or berserking or something similar. The problem is that a die roll then dominates what could be a seriously intense and interesting piece of roleplaying. It's very easy to say, "Oh, I failed," and let the GM turn you into a NPC for a few rounds until the red mist parts, or to say, "Oh, I passed," and continue on your way, emotionally vapor-locked.

The dice shouldn't be law. If you fail and there's a decent amount of player-DM trust, then you should play out your own panic or frenzy, so long as you play to character as opposed to achieving your party goals ("But I'm really *angry* as I do it!"). If you pass, that doesn't mean your character can't freak out to a lesser degree, or wrestle with his/her emotions for a moment. The same can also apply for fear and sanity-related checks: if you pass a SAN check in *Call of Cthulhu* as a human head slithers down a corridor towards you, riding a wave of slimy tentacles, it means you don't go totally barmy. It doesn't mean that you just go, "Oh. How weird," and reach for the dynamite.

The dice should assist in roleplaying your character's emotions, not trap you into a binary situation of "freaked" or "unfreaked."

Guns, Lots of Guns: Weapons and Violence

Often in campaigns, there's a point when the DM has laid out an objective and asked how you prepare to deal with it. You've got to infiltrate the spy base, burn down the elder's haven, or pillage the dungeon.

But first, you go shopping. It's roleplaying fact that if players get presented with a suitable array of weapons and tools and a clear objective, then in-character gaming goes out the window and is replaced by the Grocery List From Hell: "I'll take a shotgun, with Dragonsbreath ammo, and an Uzi . . . no, two Uzis . . . and a Beretta, and a katana . . . and can we get Semtex?"

Once the first thrill of "Oh! I've got so many guns!" wears off, it gets boring. After all, this is a fantasy world (as in make-believe, not necessarily sword-and-sorcery). You can have as large and distressingly phallic a selection of weapons as your DM can imagine, but in the end, it's just boys with toys (though let the record reflect, some girls go just as completely overboard when gun-shopping' it's not just about shoes any more . . .).

How much cooler is it to pull off a big robbery or assault with *limited* resources, where every bullet or arrow counts, then when you're strapped like Arnie in any movie you choose to name (Except *Twins, Jingle All The Away,* and the awful one where he's pregnant). Even the army doesn't hand out guns like candy, so why should your NPCs?

Even if it makes sense to have a wide selection, or if you're playing *Feng Shui* (in which case about 20 guns per person is the average load), at least try to go shopping in-character. Think of the cool "lock and load" movie moments you've seen, and then filter that through your character. Maybe that means picking up weapons with cool precision, test-firing and loading and re-loading them before shoving them into your trenchcoat, or maybe it means picking up a gun and complaining that it doesn't work ("It's called a safety, sir.").

I've Got a Secret, Beat Me 'Til I Talk: Violence as Torture

Every now and again, the characters take one alive. Maybe it's a minor NPC who survived by sheer luck, or maybe they charged in with tranq rifles and attitude, but now there's a prisoner. Sometimes, it's just a random NPC who you didn't even bother to name, and sometimes it's a major antagonist who is just too damn tough to crack (since he knows too much and would spoil your plot if he blabbed). But every once in a while, an interrogation can be part of the plot and prove to be a powerful dramatic device.

In that case, it all comes down to personal taste. First off, a morality comment. Torture is every bit as nasty, if not nastier than premeditated murder -- not only are you committing acts of sadism, but the victim is left alive to scream about how much it hurts afterwards. There's a reason why the *Unknown Armies* stress system ranks torture as only slightly less traumatizing than point-blanking a bound, helpless person in the back of the head. This is stuff for very desperate or very ruthless characters. Which doesn't mean it's not fun . . . in a game, that is.

Anyway, torture can swing between two extremes. In the first, as typified by most noir movies, the character grabs his snitch and basically slams him against the wall until he confesses. It's pretty bloodless, though it can make for good drama. Another favorite is the inevitable Russian Roulette gambit. This isn't advisable unless you're playing one of the more "cinematic" systems, or you're actually comfortable that there's a 1-in-6 chance that you're going to lose all the

valuable plot points in the snitch's brain as it splatters across the floor.

In the second extreme, it's time to bring on the long painful hours, the needle-nose pliers, the vat of acid and collection of sandpaper . . . you sick puppy. Arguably more realistic and certainly bloodier, this can still go badly wrong. The main problem is that players get carried away. Not necessarily in a bad, sweat-stained psychopathic way, but the torturing of an NPC (or PC, maybe) becomes a logical puzzle as opposed to a gutwrenching experience ("Okay, so I break his wrist. He doesn't talk. Then I break the other wrist. Still nothing. Okay, so I pick up a big knife and start peeling the skin off his neck. And then I pour chili sauce over it.")

For some characters that kind of extremism and clinical detachment can fit well (Sabbat characters in *Vampire,* raise your hands now!), but for most, that kind of sadism just isn't fun. Unless they're . . . well, sadists.

Ideally, you want to strike a balance between a few scary and/or gruesome moments and over-the-top anatomy lessons. Obviously if you just turn it into an Intimidation roll, you're short-changing the chance for characters to show their darker side and menace a little, but if the game starts to get sucked into a careful list of brutal acts (possibly numbered), it's best to say, "Okay. You torture him for a few hours with the ferret, sandpaper and jelly mould. He screams an awful lot, but doesn't talk. Let's move on."

Unnecessary Evils: Inappropriate Violence

Something to watch, particularly with new roleplayers, is the tendency to escalate matters into violence far too quickly. This isn't that surprising . . . after all, this is a made-up game. These random NPCs exist only as fragments of description and stats on paper. Why not waste the bastards if you're irritable/tired/bored/frustrated?

At the end of the day, it comes down to considering what a reasonable person might do. Most reasonable people wouldn't respond to minor irritation, like having a drink spilled on them or being ignored in a conversation, with violence. Neither should your characters. It's helpful to imagine a few bystanders who are outside the potential conflict. What is their reaction? Are they shocked? Do they feel you're justified? Maybe they would even join in . . .

Of course, that assumes that you're playing *reasonable* characters. If your character has a hair-trigger temper or is a stone-cold sociopath, then he might well respond to a casual insult by breaking someone's nose. But in that case, the DM and other players are probably expecting (because of your character's general concept and demeanor), to deal with circumstances where ripping someone's arm *is* the last word in an argument. Except for "Aaarrrgh! My arm! My arm!", of course.

I Am The Law: Violence and Law

Last, not least, violence is illegal in most societies. Of course, the degree of illegality varies: Sometimes you get life in prison, sometimes you can get off with, "The dirty varmint dealt five aces, sheriff!"

Generally, in a modern world, violence leads to police and jail time. Covering it up or running away after the fact may be even more challenging than winning the damn fight was. As you go further back in time, violence becomes more and more acceptable, and the margin for "justifiable homicide" gets wider and wider.

Still, even in a virtually lawless society, violence should not be without consequences. If you slaughter a rival in a fair duel in the town square, people who hear about it will react to you. They may respect your fighting mettle, or they may cross the street to avoid you, or even demand you recount every adrenalin-soaked moment at the local tavern.

They're not going to look at you in the same light as they did before the fight, though.

Conclusion

Earlier, the idea of a comfort zone was mentioned. Serious violence should almost never be inside your characters'

comfort zones. They might be able to deal with it, to respond calmly and practically, but they're still not going to be blasé about it.

In essence, violence changes lives. Sometimes, of course, it ends them. Other times, it may change the way the characters view the world. Maybe they're less naïve or more battle-hardened, or maybe they wake up from screaming nightmares and suffer Post-Traumatic Stress Disorder. What it doesn't do is get glossed over into part of everyday existence.

Adventurous Professions: The Merchant

for *GURPS*

by Matt Riggsby

In Medieval Europe, society was divided into those who worked (peasant farmers and other food producers), those who fought (knights and other professional warriors, who were inevitably temporal authorities as well), and those who prayed (priests and monks). A number of societies farther east recognized very similar categories, but they added one more very important one: those who bought and sold.

In those days, the simple act of taking goods from one place to another was itself an adventure. Merchants have historically been the world's greatest travelers. Missionaries, pilgrims, and soldiers might visit distant lands, but few adopted travel as a lifestyle. It was the merchants who would go somewhere, return home, and go there again if there was profit in it. And if there wasn't, they'd just go somewhere else instead. Consequently, merchants saw -- and had to fight or talk their way through -- more of the strange and exotic than anyone else. They were also a potential threat to entrench elites. They could bring disruptive ideas from abroad or come up with them on their own, and use their immense wealth, sometimes rivaling that of the traditional landowning nobility, to promote their own goals. To sum up: a class of potentially intellectually dangerous wealthy people who traveled great distances usually only covered by fanatical pilgrims and large armies in search of unusual things to bring back home. If you can't make interesting characters out of that, you're just not trying. It's not just an adventure; it's a job!

Buying

On the surface, what merchants do is simple: get things which people who live elsewhere don't have, go there, trade them for different things which people who live where you do don't have, go home, sell (for a healthy profit, with any luck), and repeat. Simple to say, but hard to do, and that's where the adventure lies.

Getting together a cargo large or valuable enough to make it worthwhile to transport is no mean feat. Large landlords might produce enough wine or fine ale to fill a ship's hold, but beyond that, few individuals can produce enough by themselves to make regular trading expeditions worthwhile. Merchants buy from craftsmen and producers of raw materials to amass stockpiles for trading. That in itself is difficult enough, since cash was in relatively short supply for much of history. It would take a vast fortune for one person to fill a ship or a caravan by himself.

However, traveling merchants rarely work entirely with their own money. Most form some kind of partnership, with the traveling merchant taking most of the physical risks (and getting a larger share of the profits) and one or more investors putting up most of the capital for the expedition. For example, a young, vigorous, and merely Wealthy merchant might put up as large a sum of money as he can come up with while a Filthy Rich Patron provides three times as much. The poorer merchant would make the trip away and back, and at the end he and his wealthier partner would split the profits equally. Such arrangements go as far back as the Bronze Age; the rulers of Mesopotamian city-states commissioned merchants to engage in trade on their behalf using royal wealth. The merchants got the funding they needed, while the aristocrats could make money without dirtying their hands with trade.

Traveling merchants often band together to outfit trading expeditions. For example, a group of merchants might share the cost of hiring a ship or organize an itinerary for a caravan, with the major players electing a leader, paying for guards, and setting a schedule to suit their needs and the weather. The contribution a merchant makes to a common fund is reflected in his authority and the resources he gets to use. For example, merchants engaging a ship typically divide its cargo capacity by the number of sailors the vessel requires. Each merchant gets a number of shares of cargo space equal to the number of sailors he supports (more or less; the owner of the ship retains a share, and the sailors themselves are allowed small allotments).

Shipping

When planning a journey, merchants must balance the mode of transport, distance to travel, how self-sufficient the expedition must be, and potential dangers and delays, both natural and human, along the way. Although some clear preferences can arise, this can become a very complex equation.

Under reasonably good conditions, a TL3 ship on the sea travels on average 30 to 40 miles a day. A vessel on the river is a bit slower, going about 20-30 miles per day. Larger ships require less labor per ton of cargo than smaller ones. As a rule of thumb, a small ship (under 50 tons cargo capacity), suitable for traveling most rivers and short-range coastal tradem requires one sailor per half-ton of capacity. Larger, ocean-going vessels (over 50 tons capacity) require one sailor per ton of cargo. Large vessels can often reach 150 tons of capacity, not counting space for passengers. Crewmen, both sailors and any additional men-at-arms merchants might want to bring along, are paid about $23 a day.

A caravan might cover eight to 10 miles a day; 11 or 12 would be a notably good pace. A smaller expedition on which discipline could be more tightly enforced might make as many as 15. Larger beasts of burden (camels, oxen, and large donkeys) carry about 500 pounds each and require a handler for every four or five animals, with each handler and animal likewise costing about $23 a day.

An important complicating factor is that these *average* speeds aren't necessarily *typical* speeds. Travel at low TLs is notoriously unpredictable, often interrupted by starts and stops. Any number of things can (and often do) slow an expedition down, and absolutely perfect conditions can speed sea-going vessels up enormously. A few fast galleys have gone as far as 130 miles in a single day, but that's very much an exception. The only thing a merchant can count on is being unable to predict how long a journey will take.

Self-sufficiency can be another factor. All those sailors, guards, and animals have to eat and drink, and carrying those provisions can put a serious dent in a ship's cargo capacity. Including packing material such as wine bottles and water barrels, a day's food and water weigh six to eight pounds per person, and up to 100 pounds for each beast of burden (although about 30 pounds is more likely if water and grass are available along the way). If that ship with 100 sailors was also carrying 50 merchants, servants, and other assistants for a total complement of 150, it could carry all the provisions it needed, but those would take up nearly a quarter of its cargo capacity. Seagoing merchants, therefore, often stay fairly close to the coast both for ease of navigation and so that they can resupply frequently. Merchants traveling overland may travel roundabout routes through more-or-less civilized areas where they can get provisions rather than take short-cuts through uninhabited wastelands. Of course, adventurers may decide to take riskier, less-traveled paths, hoping to shave time off of their journey and get first pick at market.

Physical dangers of travel are fairly obvious. Although major trading expeditions are planned for calm months, weather is inherently unpredictable, so droughts, storms, unseasonable heat and cold, and, for sea travel, poor winds are always possibilities, with other natural hazards such as mosquitoes and disease as complicating factors. They might not wipe out an expedition (although they can and do from time to time), but they can certainly slow it down.

Bandits on land and pirates at sea are always possible, and downright likely in regions experiencing war or economic problems. Strength in numbers is the best way to reduce the danger, providing yet another reason to band together. Pirates and bandits only attack merchants they think they can beat, so the larger the caravan or the more heavily manned the ship, the less likely it is to be attacked. Smaller, faster caravans and ships are certainly options for a daring international merchant merchant, but they practically invite an attack.

Less obvious are the legal and political dangers. In most places, foreigners have few if any legal rights. They can be heavily taxed, robbed, beaten, and possibly even killed with impunity unless they arrange legal protection beforehand, or at least hire enough local protection to keep anyone from trying anything funny. Considerable diplomatic effort is expended to secure protection for visiting merchants along their routes and at their destinations, with merchants themselves often acting as diplomats. A hostile ruler can seriously damage a merchant's career simply by refusing him safe passage through his realm, or merely postponing an audience with him to discuss the issue. Of course, a clever merchant might want to persuade a ruler to give that treatment to his rivals.

Selling

Once the merchant arrives at his destination, the work of buying and selling began. Because of the size and value of the cargoes involved, this is not a quick process. It's unlikely that any single buyer can purchase a merchant's entire cargo, and even if he did, it might take quite some time for him to raise the money to pay for it. A merchant will spend weeks or months at his destination, feeling out the market, finding customers, and negotiating with both buyers of his goods and sellers of goods to take back with him.

This may require far more than just skills for buying and selling. In most societies, people strongly prefer to have a relationship with the people they do business with, so the merchant needs be able to operate in an alien environment and make and keep new friends. This may require cultural familiarity, language skills, and any number of social skills. A merchant's local contacts are most likely other merchants, but will also include clergy, aristocrats, and government officials, who are both potential customers and people who may need to be negotiated with in order to get permission to import and export goods. However, he might also cultivate the acquaintance of porters, gossips, harlots, and other people who can provide street-level assistance and unfiltered news on local conditions.

In a merchant-centric campaign, the GM may want to adopt a more detailed procedure than described in the Merchant skill description. Instead of a flat 10% adjustment to "fair value" in favor of the winner, modify the price by 2% for every point by which the winner succeeds.

It's not impossible to sell large quantities of goods quickly or in an unfamiliar place. It is, though, difficult to get a good price for them. Cultural familiarity penalties apply to Merchant skill, but some advantages may help offset that, to reflect the aid of local intermediaries and advice. Reduce the cultural unfamiliarity penalty by one if the merchant has a Claim to Hospitality in the area or by two if he has an appropriate Contact or Ally available (a local nobleman or merchant would qualify; a beggar or soldier would not).

Large transactions take time, so a merchant may want to try to sell his goods in small lots rather than all at once. For every full five times the campaign world's starting wealth in goods a merchant wants to sell, he's at -1 to Merchant skill. For example, if starting wealth is $1,000 and a merchant is trying to sell a chest containing $12,000 of saffron, he's at -2. This penalty can be partially offset if the merchant takes more time to coax his customer into a large transaction and wait for him to gather the cash. For every week he continues negotiation, reduce the penalty for the size of the transaction by one. The GM may require rolls against other social skills to reflect the merchant's attempts to keep in touch with his potential customer, or simply require that any social interaction leading up to continued bargaining be played out.

While he is away from home, the merchant has to find a place to live. If merchants from one city regularly trade in another, they might establish a permanent enclave as part of the arrangements which provide them with legal protections. They might then employ locals as permanent factors or even station their own people as long-term residents.

However, such arrangements might not always be available; it takes a lot of trade to make permanent agents feasible. Total strangers to the region might have to rely on inns (which some historical societies don't have) and charitable hostels. Travelers might also look for expatriate members of their religion or ethnic group. A Christian merchant from, say, 9th-century Constantinople might find a place to stay among the Christian enclave in predominantly Muslim Basra.

Eventually, the merchant packs his bags and go home, repeating the process of the previous months: gather up a bunch of goods, undertake a risky journey, and find customers at the other end of the journey. A merchant typically carries goods rather than sacks of cash on both legs of the journey. After all, why carry gold when you can carry merchandise of equivalent value which might be traded for even *more* gold? Instead, imported goods are exchanged directly for other goods or sold for money which goes to pay for more goods for the return trip.

And what eventually happens to all of the money? Profits that don't go back into the business are probably spent on the trappings of high living: fine clothes, large houses, excellent wine, books, jewelry, and so on. Even if they don't

formally have high status, merchants will -- if they can afford it -- live like they do and associate with those who do. In time, the wealthiest merchants tended to attempt a transition away from trade. Though lucrative, it was nevertheless risky and often not socially respectable. The wealthiest of the wealthy, therefore, might leave the dirty work to others and quietly try to become the sort of landed aristocrat whom they would someday come to replace.

Building A Merchant

A universal feature of merchants is that they have a practical education. They may not all be intellectuals and philosophers, but they're certainly literate and numerate, and therefore probably smarter than average. They're also relatively well-off. They have to be, after all, in order to buy and sell, although because of the risks of trade, it's easy for a merchant to overextend himself and run up debts.

But despite their wealth, merchants have usually been in a socially disadvantaged position. In many societies, exchange has been seen as a zero-sum game. Someone capable of turning a profit off of what should be an exchange of equal values would therefore seem at least a little shifty, if not downright dishonest. In such societies, including ancient Rome and many Asian societies, merchants could be rich and even powerful, but remain disreputable (probably the case for merchants in Sahud). It's by no means universal (Venice's Medicis made a smooth transition from merchant bankers to nobility), but it is quite common.

A merchant's most important skills are people skills. Merchant is the obvious skill to have, but that alone won't do it. Merchants must also be able to make and maintain social relationships which will enable them to create commercial relationships as well, make their way around the foreign ports they trade in, favorably impress the authorities by whose sufferance they were allowed to trade, and allay fears of foreign counterparts who would probably prefer to deal with people who shared their language, religion, and ethnicity.

Finally, a merchant will have the skills of the trail. Most merchants have spent a little time on the road. While they may have a taste for finer things, but just about all of them have spent days walking though trackless wastes or on the decks of ships and nights at inns or relatives' houses far from home. They are nothing if not worldly.

Templates

Merchant   *50 points*

This template is appropriate for a relatively minor merchant, the next step up from a mere craftsman or shopkeeper. Your travel is limited to areas in your social and linguistic "comfort zone." For example, a merchant like this in al-Haz would stay in al-Haz, probably shuttling around a regular circuit of cities. He *might* cross into another Muslim country if he happened to be close to a border, but not in to non-Arabic-speaking areas. Though this template does not itself provide a great adventurer, it does provide a reasonable occupational template while leaving enough points left over in most campaigns to add in other adventuring abilities.

Attributes: **ST** 10 [0]; **DX** 10 [0]; **IQ** 11 [20]; **HT** 10 [0]

Secondary Characteristics: Dmg 1d-2/1d; BL 20 lbs.; HP 10 [0]; Will 11 [0]; Per 11 [0]; FP 10 [0]; Basic Speed 5.00 [0]; Basic Move 5 [0].

Advantages: Business Acumen +1 [10]; Claim To Hospitality (friends and relatives in a few nearby cities) [3]; Comfortable [10]

Disadvantages: Fifteen points chosen from among Callous [-5], Debt [variable], Duty [variable], Gluttony [-5*], Greed [-15*], Miserliness [-10*], Social Stigma (next best thing to a con man, -1 reaction) [-5]

Primary Skills: Merchant (A) IQ+2 [8]-14 †

Secondary Skills: Accounting (H) IQ [4]-12 †; Area Knowledge (regular trading area) (E) IQ [1]-11; Current Affairs (business affairs) (E) IQ [1]-11; Carousing (E) HT+1 [2]-11 or Fast Talk (A) IQ [2]-11; either Packing (A) IQ [2]-11 and Animal Handling (appropriate beast of burden) (A) IQ [2]-11 or Crewman: Sailing ship (A) IQ+1 [4]-12

Background Skills: Two skills chosen from among Administration (H) IQ-2 [1]-10 †, Savior-Faire (E) IQ [1]-11, Smuggling (A) IQ-1 [1]-10, Streetwise (A) IQ-1 [1]-10, and any weapon skill of Average difficulty (A) DX [2]-10

   † Includes +1 for Business Acumen.

Junior/Subject Merchant   *138 points*

You are a junior member of a merchant house or a merchant working for a royal or noble household. You're responsible for doing a great deal of trade, although most of the money isn't actually yours. This sort of merchant is best suited for adventuring.

Attributes: **ST** 10 [0]; **DX** 10 [0]; **IQ** 12 [40]; **HT** 10 [0]

Secondary Characteristics: Dmg 1d-2/1d; BL 20 lbs.; HP 10 [0]; Will 12 [0]; Per 12 [0]; FP 10 [0]; Basic Speed 5.00 [0]; Basic Move 5 [0].

Advantages: Business Acumen +2 [20]; Claim To Hospitality (friends, relatives, and allies at a wide range of cities) [5]; Contact or Contact Group [4]; Merchant Rank 1 [5]; Patron [10]; Wealthy [30]; one Accented/Literate or two Broken/Semiliterate foreign languages [4].

Disadvantages: Duty (travel to foreign lands and trade there) [5]; fifteen points chosen from among Callous [-5], Debt [variable], Duty [variable], Gluttony [-5*], Greed [-15*], Miserliness [-10*], Social Stigma (next best thing to a con man, -1 reaction) [-5]

Primary Skills: Accounting (H) IQ [4]-14 †; Merchant (A) IQ+3 [12]-17 †

Secondary Skills: Area Knowledge (large trading region) (E) IQ+1 [2]-13; Carousing (E) HT [1]-10; Current Affairs (business affairs) (E) IQ+1 [2]-13; Diplomacy (H) IQ [4]-12; Economics (H) IQ-1 [2]-13 †; Fast Talk (A) IQ+1 [4]-13; either Packing (A) IQ [2]-12 and Animal Handling (appropriate beast of burden) (A) IQ [2]-12 or Crewman: Sailing ship (A) IQ+1 [4]-13

Background Skills: Five skills chosen from among Administration (H) IQ-2 [1]-12 †, Finance (H) IQ-2 [1]-12 †, Law (H) IQ-2 [1]-10, Navigation (A) IQ-1 [1]-11, Leadership (A) IQ-1 [1]-11; Politics (A) IQ-1 [1]-11, Savior-Faire (E) IQ [1]-12, Smuggling (A) IQ-1 [1]-11, Streetwise (A) IQ-1 [1]-11, and any weapon skill of Average difficulty (A) DX [2]-10.

   † Includes +2 for Business Acumen.

Merchant Prince   *274 points*

You are the head of a merchant house, coordinating and financing the activities of a number of junior family members and allies who travel to distant lands to trade for you. If you aren't actively in politics, you at least have an interest in lobbying your government to keep your tariffs low. Although perhaps not the best adventurer, a merchant prince makes an excellent patron.

Attributes: **ST** 10 [0]; **DX** 10 [0]; **IQ** 13 [60]; **HT** 10 [0]

Secondary Characteristics: Dmg 1d-2/1d; BL 20 lbs.; HP 10 [0]; Will 13 [0]; Per 13 [0]; FP 10 [0]; Basic Speed 5.00 [0]; Basic Move 5 [0].

Advantages: Business Acumen +3 [30]; Claim To Hospitality (friends, relatives, and allies at a wide range of cities) [5]; Ally Group (other adult members of family) [5]; Contacts or Contact Groups [10]; Merchant Rank 2 [20]; Filthy Rich [100]; one Accented/Literate or two Broken/Semiliterate foreign languages [4].

Disadvantages: Dependents (very junior members of family) [-5]; fifteen points chosen from among Callous [-5], Debt [variable], Duty [variable], Gluttony [-5*], Greed [-15*], Miserliness [-10*], Social Stigma (next best thing to a con man, -1 reaction) [-5]

Primary Skills: Accounting (H) IQ [4]-16 †; Finance (H) IQ+1 [8]-17 †; Merchant (A) IQ+4 [16]-20 †.

Secondary Skills: Administration (H) IQ [2]-16 †; Area Knowledge (large trading region) (E) IQ+1 [2]-13; Carousing (E) HT+1 [2]-11; Current Affairs (business affairs) (E) IQ [4]-15; Diplomacy (H) IQ [4]-13; Economics (H) IQ [4]-15 †; Fast Talk (A) IQ+2 [8]-14; Law (H) IQ-1 [2]-12; Politics (A) IQ [2]-13; Savior-Faire (E) IQ [1]-13; either Packing (A) IQ-1 [1]-12 and Animal Handling (appropriate beast of burden) (A) IQ-1 [1]-12 or Crewman: Sailing ship (A) IQ [2]-13.

Background Skills: Two skills chosen from among Navigation (A) IQ-1 [1]-12, Leadership (A) IQ-1 [1]-12, Smuggling (A) IQ-1 [1]-12, Streetwise (A) IQ-1 [1]-12, and any weapon skill of Average difficulty (A) DX [2]-10.

   † Includes +3 for Business Acumen.

Savage Worlds Customizeable GM Screen

Published by [Great White Games](#)

three-panel customizable screen; $24.99

I'm not sure where the GM fetish for secrecy or privacy comes from. I suspect it's a legacy left over from our wargaming roots. It was a more adversarial time and there were secrets that just *had* to be kept. When the original Dungeon Master Screen for *Advanced Dungeons & Dragons* came along, there were many cries of glee. The screen gave privacy and also gave handy space for looking up stuff. Feverish DMs would still lose time looking things up, but at least they wouldn't lose time pawing through books.

A really good screen needs several attributes. The material selected for referee look-ups should be clear, commonly needed, and visually savvy. On the player's side . . . well, tradition puts art on that side, plus reference material that's usually printed too small to read across the table. The screen also needs to stand reliably, too. The traditional design had the screen leaves taller than they were wide -- easier to layout and less expensive to print, but also easier to topple over.

Not every publisher hsa the desire to (or can afford to) produce and sell its own screen, of course. And at last we come to the topic of this review, the *Savage Worlds Customizeable GM Screen. Savage Worlds* is the fast-play action-adventure game engine from Great White Games. One of the key selling points for *Savage Worlds* is that it can be easily personalized for the desired "Savage Setting." And if you've got an easily customizable world, you need an easily customizable GM screen.

The *Savage Worlds Customizeable GM Screen* fits that bill neatly. It is a trifold black vinyl panel which unfolds and sets easily in front of you. The outside of each panel, front and back, is covered with clear plastic and open at the top. Pages can easily be loaded and switched for either the player or the GM side. The panels are about as rigid as an inexpensive clipboard and holds up to downward pressure fairly easily. The "hinges" are just more of the vinyl -- based on past experiences these will be where the product first shows any age. (Remember the flexible closure flaps on the old Mead Organizers? Like that.) Smilin' Jack, the sinister *Savage Worlds* mascot, greets you from the inserted page of product information.

The most controversial feature of this product is its physical orientation. Letter-size pages are displayed with the wider side to the bottom: "landscape" orientation, as the computer folks have taught us to call it. This flies in the face of three decades of game screen tradition (with a few exceptions) in "portrait" orientation. It turns out to have good practical advantages. A shorter distance to insert the pages means the inserts are less likely to bind or fold. The wider opening distributes the stresses of repeated opening and closing more evenly, so the top will be less likely to tear. The obvious advantage is that the center of mass is lower to the table, making the deployed screen more stable. It's also easier to see over, which might be a bonus or a drawback depending on your style of play.

Great White Games provides a free download for the generic *Savage Worlds* rules engine. Most settings publishers have their own custom screens with representative art and graphic style, either for free or for small fee-download. The big attraction for many fiddle-about-ers like me would be to create our own screens, personalized to our own sense of what we need and what we want to share with our players. For example, for an upcoming *Fudge* campaign I already have the rules built into the character sheet, so I'm able to put a concise recap of the combat sequence on the center player panel and the uses of *Fudge* points on the wing panels (same content, visible from each side). One interior panel gives me common reference lists; another is set for genre/campaign specific infomration; and I stick a "party" reference in the third, with mini-character sheets for all the player characters.

The *Savage Worlds Customizeable GM Screen* may seem a bit pricy at $24.95 for being a cute widget. I know of folks who have built their own for roughly $10.00 in parts. But if you play *Savage Worlds* and want to use the published screen inserts, or you like to haul out the ol' word processor and slap up your own, the price is a worthwhile investment that's likely to pay for itself in emotional satisfaction the first time you change it out for a new set of screens in your regular game or at a convention. Showmanship is part of game mastering, after all, and this product enhances your show. Give it a try and see. You don't want to disappoint Smilin' Jack, do you?

Ex Machina: Tri-Stat Cyberpunk Genre

Published by [Guardians of Order, Inc.](#)

Written by Bruce Baugh, Rebecca Bergstrom, Christian Gossett, Bradley Kayl, & Michelle Lyons with David Pulver & Jesse Scoble

Illustrated by UDON with Attila Adorjany, Greg Boychuk, Dax Gordine, Eric Kim, Ryan Odagawa, Ramon Perez, Noi Sackda, Chris Stevens, Eric Vedder, & Jim Zubkavich

352-Page B&W Hardcover Book; $39.95

If coming to a cyberpunk RPG looking for bigger "better" guns, then this game is not for you. Look away, move on, and go find another machismo extending game, chummer. For this RPG is something different, a cut above other entries within this gaming genre. Less concerned with the bang and the whiz, let alone the golly or the ghee, it quite literally goes back to the source and takes a page out for its inspiration. Other Cyberpunk RPGs have often adversely concentrated -- if not in the writing, then in the played -- on the guns, the hardware, the electronics, and the better than human elements. *Ex Machina: Tri-Stat Cyberpunk Genre* from Guardians of Order includes all of those elements, but draws more directly from the literary source, the cyberpunk and post-cyberpunk for its inspiration. Not just the classics like William Gibson's *Neuromancer* and Bruce Bethke's *Cyberpunk,* but also Neal Stephenson's *Snowcrash,* along with the writings of Iain Banks and Ken MacLeod. Nor does it forget other media sources, these being acknowledged in the book's excellent introduction to the genre.

Actually a Science Fiction sub-genre, Cyberpunk explores the social impact of embracing advanced technology -- cybernetics, bio-tech, nano-tech, and others, in the face of both political and economic oppression and division. This is primarily at a street and criminal level from whence the opposition to the oppression and division originates. Together with the willingness to change the human form and state, *Ex Machina* explores this not so much in its mechanics, but in each of the four distinctly individual cyberpunk future showcased within its pages.

For its mechanics *Ex Machina* employs the d8 variant of the *Tri-Stat dX: Core Role-Playing Game System,* but remains wholly stand-alone. A player simply rolls 2d8 under a combination of character stat (on a scale of one to 16) plus skill (one to four), plus any modifiers, situational or from equipment. Character generation consists primarily of purchasing a series of templates -- occupational (for example, Hacker and Samurai), 'Ware (cyber-limbs, filter lungs, neural jack), and even Posthuman Species (Full Body Cyborg, Homo Superior, Artificial Intelligence, Android); and then purchasing statistics, attributes (advantages), defects, and skills. The occupational templates represent genre archetypes, and like all templates can be customized to fit a concept. They can also be combined, for example taking Street Samurai and Idol to create a "Real Combat" star. A Player is free to select these pre-designed packages or can design his own, the same going for gear, weaponry, and vehicles.

Various attributes more common to *Tri-Stat dX* have been excluded for not fitting the genre, such as "Own a Big Mecha," "Pocket Dimension," and "Duplicate." The use of *Tri-Stat dX* also has its consequences and effects. It abstracts various aspects of the genre, most notably wealth and computer memory size, the latter simply termed Units. Primarily though, *Tri-Stat dX* is an effects-based game, meaning it is concerned with the results of its mechanics and not how they are achieved. Thus a character can achieve Superstrength through a cyberarm, muscle graft, or booster drug, but the effect is the same for any of them. It is entirely up the player and GM to provide the how. That said,

brand naming is a signature aspect of the genre, and this leaves a fair degree of work for both. Curiously, while the effects-based nature is in keeping with the literary genre, the lack of branding is not. Further, unlike other cyberpunk RPGs and excepting Full Cyborg Body, there is no deleterious effect to having 'ware installed (that is, Soul stat decrease), this akin to the genre source.

The simplicity of *Ex Machina* is continued in its examination of the genre's signature concept, Cyberspace. Within the game it divides it into two types, differing mainly by degree of use. The "Virtuality Net" is essentially our Internet, experienced with greater interactivity experienced as a full-sensory hallucination, and is designed for settings where computers play a lesser role. "Iconic Cyberspace" is more akin to Gibson's *Neuromancer,* with information given physical representation that can be manipulated and interacted with.

Although *Ex Machina* discusses the genre's hallmark technologies, from nano-technology and cloning, through genetic modification to power sources, weaponry, and vehicles, there is no great depth here. Yet it is adequate to get the GM started, and there are pointers to further information, with several put into practice in the four cyberworlds. As a default, the game's approach to technology matches its approach to science fiction -- hard rather than dramatic, although there is room for a little of the latter and some license within a game. Perhaps a more interesting discussion of technology comes in the GM's section, looking at how computers (and even the mobile phone) can be used to enhance or even play a game, including the use of e-mail, chatrooms, and so on. The GM's section is short and punchy, distilling the genre's key themes and elements within a few pages.

Ex Machina's lack of flash is addressed with the four cyberworlds that take up over half of the book. Uniformly, each is highly readable, well presented and executed, and any one could easily be adapted to another game system. Bar the occasional two-page spread, none are illustrated, but then none need it; the text is entertaining and illustrative enough. All come with enough detail -- concept, setting, history, protagonists, and campaign suggestions -- that running any one is an interesting prospect.

The first, "Heaven Over The Mountain" by Bruce Baugh (co-author of *[Adventure!](...)* and developer of *[Gamma World](...)*) manages to be the most like a cyberpunk RPG, and if not actually optimistic, is far from dystopian. Here a consortium takes the commercialization of space to the nth degree and erects a biotech orbital elevator. Together with the metropolis of Anchor at its Columbia tether point, the elevator has become a major commercial and data hub, home to numerous corporations and over 2,000,000 people, mostly in the five cities along its 36,000km length. It is also home to fringe societies, junkyards filled with failed biotech, and hidden sanctuaries for those in exile. Being biotech the elevator can be directed to adapt, grow, and change, one aspect that inflicts a certain culture stress upon residents. Suggested roles include residents, specialists, or transients, with campaigns orientated towards a cultural and social bias.

Conversely, "Underworld" Christian Gossett and Bradley J. Kayl's (*[Red Star](...)*) is very much a dystopia, the player characters finding themselves incarcerated in Secure Economic Zones. Built on the ruins of those nations that the USA deemed guilty of global terrorism or supporting it, each SEZ is a massive fortress, housing whole populations in servitude to mega-corporate interests. The grim, depressing result, not dissimilar to *SLA Industries,* is a fight for survival, a grind in the system, or at worst, numbing servitude as a sex doll. Characters can either fight their way up the food chain, or there might be a way out.

It is no surprise that "IOSHI" is the book's most radical and most post-human setting, being from Rebecca Bergstrom, the creator of *Nobilis.* Also the most complex, it is likely the most unplayable. In a fractalized post-nation world where you and your skills have become the ultimate commodity, individuals shift from one short-term multi-funded contract to the next. Further, cultural identities and interests have diversified such that shared identity exists only in the Net. Training is available at a cost, but if you have enough, IOSHI or -- "Individually Organized Science and Hobby Index" -- can make you a Beethoven or Hawking. Yet there is a danger in this; the data involved can suffer from Taint, though what this entails is for the GM to determine from the discussion included. Conceptually, "IOSHI" is as dazzling as *Nobilis,* but grasping this concept is difficult, let alone playing it, and the sparseness of the GM advice is not a help.

Finally, Michelle Lyons' (editor and *Shadowrun* contributor) "Daedalus" is the most frightening of the four and in some ways the most plausible. Described as "90-minutes-from-reality," "Daedalus" again explores a future America's

reaction to the global terrorist threat. Here a shadow government established a way of keeping everyone safe: an ID chip. But the monitoring chips now work both ways, with the right, productive way to belong to society -- what to consume, where to work, and who to marry -- all directed to society's (and your) best interests. But this utopia only becomes dystopic when the chip malfunctions and you can see the bland wellness of the maze for what it is. Akin to *Brave New World* or *The Matrix,* escaping, surviving, even resisting bland safety are the campaign themes.

Any one of the four settings here could have been released on their own, but having them all together provides the relatively bland **Tri-Stat dX** mechanics of **Ex Machina** with a plethora of ideas and concepts for the GM to play with in addition to the discussion of the genre. In each, there is a distinct emphasis on setting and culture affected by technology over the technology itself. Further, that any of these settings could become fiction is testament to **Ex Machina's** acknowledgement of its source. The combination of both serves to push **Ex Machina** beyond all other cyberpunk RPGs.

--Matthew Pook

Grand Unified Theories of Weirdness

What fuels your special abilities?

Okay; if you're anything like me, then the answer is some iteration of "Diet Mountain Dew" or "Double Mocha Grande Latte." But if you're creating or running a campaign setting, the answer may be something more exotic.

Recently, while talking with one of the Hidden Masters of Gaming, this very subject came up. The context in question was whether it's better for a supers setting to have a grand unified theory of where powers come from, or whether that detracts from some of the wonder inherent at the core of the supers genre. After a long and heated argument that ended with six dead bodies in a Yonkers tavern (despite neither of us having any obvious connections to Yonkers), the conclusion we reached was "Uhhh . . . Maybe." But, seeing as how a half-dozen folks were laid to rest on a pile of peanut shells and paper coasters, I thought I'd try to share some thoughts on the matter, since it's one of those things that's applicable to any setting where there are weird abilities -- magic, psionics, miracles, and so on.

As I see it, there are three broad approaches that can be taken when developing a world with unusual abilities: there is a definitive source for all powers and it's known; there is a definitive source for all powers but it's *not* known, although it may or may not be knowable within the campaign (and, indeed, the GM may or may not know what that source is); or there isn't one definitive source for powers. Since a three-pronged thesis statement is just about ideal for a 1,000-word column, let's look at each in turn, shall we?

The first option is that there is a definitive source for all powers. This is the option chosen by White Wolf's supers setting *Aberrant,* where all super powers stemmed from the MR node -- a portion of the Nova's brain that allows for the tapping and manipulation of quantum energy. The original ***Mage: The Ascension*** used a similar universal source, where everyone who can tap magical abilities -- from fireball-hucking Hermetic to laptop-chittering technomage -- accessed the same source of power, via their own inner sense of "enlightenment" (however that mage defines it).

On some level, this option feels the most "realistic," since it jibes with what we experience in the real world. After all, we can already wrap our mind around a notion like "electricity" being able to power everything from televisions and cell phones to brains to ray guns. The same electrical force that convey thoughts in our bodies can be used to jump-start our hearts or execute criminals. Having a definitive source also allows for a wide swath of potential plots, especially those that affect or target all special abilities; for example, it's possible to have an *Aberrant* plot where the worlds' metahumans are being lobotomized for paranormal research or to neutralize them.

It can also resolve some thorny issues from a mechanical standpoint. One thing I liked about *Aberrant*'s explanation is that it resolved -- quickly, succinctly, and consistently -- the whole "Batman/Captain America" problem: what the heck *are* these guys?! In *Aberrant,* the assumption was that if you had an MR Node, then you were a metahuman, and anything that affected metahumans would affect you. Sure, a character like Batman might not think he's a metahuman, but in the *Aberrant* universe he would have several low-level powers. Without the MR Node plot justification, the question remains: Would a character like Batman be detectable and/or neutralizable as such? If not, why not? How "powerful" do you have to be before you're not considered "human"?

Finally, the definitive source explanation keeps the amount of setting "weirdness" to a minimum; if you're running, say, a campaign set in the real world where unusual things start to happen, it might require less suspension of disbelief to explain where one new energy source came from than to justify all these new types of abilities popping up.

The second possibility is that there is a definitive source, but it's not known what that source is (either by the PCs or the general populous). This method appears in *Deadlands,* where all powers derive from infernal spirits or, less frequently, benevolent forces that oppose those spirits. The "unknown unified energy" can provide many of the same plot advantages as the first option discussed -- especially those relating to the mechanics of the game or power-affecting plots -- while avoiding some of the pitfalls in the third option.

The drawbacks with this method relate to believability, expectations, and resolvability. In some settings (such as four-

color supers) it's unrealistic to assume there is one source; if one is introduced -- even as a mystery -- it can be more jarring than having many different power sources. In addition, if the players are introduced to the possibility of their being one universal energy source, they may try to discover what that source is; this may prove frustrating if the GM hadn't intended for the search for this definitive source to be a story focus, or even if it's not intended to be possible to discover. Fortunately, in this case a bit of meta-gaming can go a long way: "Look, Ted, I know your character is jonsing to tie everything together, but I'm sticking with the unified source thing for game mechanic purposes . . . so don't be disappointed if your character doesn't ever resolve this, okay?"

Furthermore, there's the possibility that, if this mystery *is* resolved, the answer will be unsatisfying, and might even detrimentally affect the campaign. For example, in the DC universe, it was revealed a few years ago that an intergalactic explosion of energy washed over the Earth eons ago, creating their mythical deities (the Greek and Norse mythos and the like); this wave of energy then hit the edge of creation and <ahem> bounced back. When the wave swept back over the Earth, it created the horde of heroes in modern era. This "godwave," as it was called, seems to have been pretty universally disliked by readers; the notion that Green Lantern, Flash, and Superman all owe their existence to some wave of energy that created Thor and Aphrodite stretched the credulity of many fans. This plot point has not, to the best of my knowledge, ever been drawn upon or referenced again.

The last possibility is that there is no definitive source; there are as many sources of energy as seems appropriate and applicable. This is the tack taken by ***Torg, Dungeons & Dragons, Fading Suns,*** and many supers settings. In these campaigns, there's nothing to prevent the separate and individual existence of magic, psionics, faith-based miracles, and any other snazzy abilities. All the disadvantages are the antithesis of what's been mentioned; there will often be many different mechanical systems (which require learning and may have loopholes), some players may balk at no unified justification, and it can be difficult to have a sweeping effect that neutralizes or alters all powered individuals. ("Waitaminute; this castle is warded against magic, miracles, psionics, *and* pets?!")

However, the advantages can be considerable. First, it's easier for characters with odd abilities to have their moment in the sun. After all, if magic is neutralized in a location, then Phious the Faithful's underpowered miracles can suddenly come into their own. Likewise, many players find the existence of different rule sets to be an advantage; after all, having the same exact mechanical resolution to *everything* makes many players bored. (Just look at how popular alternate magic systems are in *Pyramid's* own pixilated pages.)

Perhaps most importantly, it allows for the easier retention of wonder and awe, which is one of the fundamental reasons one plays in a non-reality setting in the first place. After all, in an ***Aberrant*** setting it's easy to dismiss someone who seems to, say, wield the powers of the mythical Merlin; it's merely a delusional metahuman whose MR node has manifested in such a way as to replicate "magic." But in a setting such as ***Fading Suns,*** landing on your hundredth alien planet can be just as exhilarating as landing on your first: What is this strange rune-based magic wielded by the locals? Why do this planet's ships operate seemingly outside the need for the jumpgates? What is this "psychic dreamland" the party has stumbled across? (For a good archive archive article about stretching the possibilities of a "realistic" supers setting, check out Steve Kenson's "Lovely and Pointless Ideas.")

In the end, which avenue a setting takes is up to the tastes of the gaming group and the needs of the setting. Some premises are served well by a grand unified theory explaining all weirdness with one fell swoop (such as a "white event" that serves as the definitive point where things deviate from the expected world). Others thrive on the inkling that all the setting's weirdness *might* be somehow linked, serving as a tantalizing possibility or long-term mystery. And still other campaigns work best when many different types of wonder and awe are circling the PCs, and the only answer to the question of "What's possible?" is "Anything."

Or you can be like me and drink another ultra-caffeinated beverage to tap your power. I'm convinced aliens are communicating to me via the uncontrollable twitches in my arms. Or they might be gnomes. Or maybe psychic travelers from the future. Or . . .

GDREP

by Paul Drye

Parachronic travel is disrupting Homeline on a scale comparable to the discovery of agriculture or the Industrial Revolution, but it's been doubly difficult to handle because it affects everything so quickly. Any number of possibilities were opened up, and Infinity had to address all of them if it wanted to retain its newborn monopoly. If they didn't, someone would address it for them, in an unsanctioned way. There are dozens of crosstime-related projects that Infinity doesn't actually care about, but that were started in the early 21st century solely to stake a claim. In the absence of much attention in the years since, some of them have grown organically and strangely into the power vacuum.

History and Goals

The Genetic Diversity and Re-establishment Program is based out of Mayotte, a French-owned island northwest of Madagascar. It was founded to serve a high-minded goal that was obvious in the early days of parachronic travel: increasing genetic diversity in endangered species by importing animals from other timelines. An exploratory project worked to revive the cheetahs of East Africa, and the French bioscience community got behind GDREP early on. When the time came, picking nearby Mayotte as its permanent site was as close to a slam dunk as one gets with politically driven decisions.

The program was good public relations for Infinity in its early days. GDREP scored a huge public relations coup with an unsanctioned move into extinct animals, specifically by reintroducing the dodo to Mauritius in 2011. This is still what most people think about when reminded of GDREP, to the point that the program put a silhouette of the bird on their logo. Since then, their people have become the ones first consulted when anything unusual and animal-related pops up in the course of Infinity's business.

The tentacles of the program reach even further than this, though, thanks to the empire-building personality of its first and so-far only director, Thierry Farjeon. The trouble is, Infinity doesn't consider the goal a priority -- they just set up the GDREP so no-one else would. With no-one paying much attention to the details of what Dr. Farjeon does, so long as the press releases are good, he constantly tries to get his people involved with anything to do with biology. If a timeline has human-animal hybrids, they'll stick their noses in; if there's a worry that a dead disease like smallpox or polio might come through the projectors, GDREP is on it; Colony line settlers who want to import pets from Homeline are on the program's agenda. Whether they can get any of this claim-jumping to stick, or if the people actually responsible will drive them off, is another matter. Still, they make the effort and often succeed. They may not be the ones who should formally do a job, but the program has talented people who know what they're doing.

The Program's Facility

Getting There: Mayotte is in the Indian Ocean off the east coast of Africa, so anyone visiting is going to spend some time en route. A plane to Nairobi or Dar es Salaam from London, a local charter to Mayotte, a boat ride from the off-shore airport to the main island, then a car ride along successively smaller roads are all needed to get to the GDREP facility. It usually takes more than 24 hours to accomplish this, and agents used to the instantaneity of parachronic travel may be surprised that any place can be so isolated. The station personnel like it: they go weeks without seeing any interfering higher-ups from outside the project.

While in Mayotte, the travelers may have a hard time communicating. About half the native Mahorais speak Shimoare, a dialect of Swahili rarely spoken outside of the island. Speakers of the Swahili widely known in East Africa can get by, but with the other half of the population, the situation is even worse. They use a form of Malagasy spoken by only a few hundred thousand people in the immediate vicinity of Madagascar. Rich or educated people speak French well, but almost all of the population have been to school for a few years (Mayotte is a French Territory, after all) and can make themselves understood in that language given enough time. Only people in the tourist industry will know any English, and a few of the most devout will know Arabic.

The Labs: Visitors who come to GDREP by road from the capital, or by boat to the program's pier, will see the station's laboratories and offices first. They're in a series of low buildings clustered near the shore, and are a mix of modern convenience and tropical-island style. The variety of cages and pens are off to one side are mostly unoccupied, but when a particular animal needs to be kept in close proximity it goes here. A private road winds off into the distance along the shore, leading to the Aviary and the Water Tank (detailed below).

The GDREP has high-quality facilities for its scientists, somewhat less so for the office and maintenance staff (who are often native Mahorais). Their exteriors look "locally picturesque," with palm-thatched roofs and many open windows and walls to keep them cool using ocean breezes. Inside, particularly where the labs require clean conditions, the buildings are typical of European labs, all tile and concrete blocks painted hospital green; the enclosed rooms are also the best place to get some air conditioning during the tropical summer. One of the buildings is devoted to "the Kitchens," which handle food for humans and animals alike.

The Aviary: Most of GDREP's reintroductions are birds, particularly the ones that have died out in New Zealand and Hawaii and account for a significant fraction of the world's extinct species. While most of the current projects are not as well-known as the dodo, birds are photogenic, not very large or hard to care for, and of interest to some wealthy Western governments. That's a trifecta of winning attributes as far as the program is concerned.

The open-air aviary is covered in chicken wire to keep the prizes from flying away, but is large enough -- several hundred yards in diameter -- that they have plenty of room to move around. Tropical species are kept here under Mayotte's hot sun, and the air rings with the sounds of koa-finches, honeycreepers, and mohos. A pool in the center is home to a gaggle of outtime Hawaiian geese, which are being bred with Homeline natives.

On the far end of the aviary from the lab buildings, there's an enclosed facility for species that need cooler weather than Mayotte supplies. These are mostly from New Zealand and Australia, and of no interest to non-specialist outsiders. This dullness is exploited by GDREP's ornithologists, who are working on what was to be the program's next showstopper: the Madagascar Elephant Bird. This project should work, as the enormous, ostrich-like creatures are native to the area, but six years of effort have yet to produce a single chick. The birds are temperamental and aggressive, and are loathed by most of the staff; there's a poster of Colonel Sanders on the window facing into their enclosure, "where they can see it."

The Water Tank: One of the program's "back burner" projects is to help with whale diversity. Unfortunately while the idea is popular, the slow breeding times and huge food and space requirements have made it impossible to proceed. GDREP is researching what would need to be done, but that work is outsourced to other institutes around the world. There are no whales anywhere in the Mayotte facility.

What they do have is a refrigerated pool containing a male and female Steller's Sea Cow, to the eye an arctic manatee on steroids. The cows are 20 feet long apiece, small for their species and not fully grown. The idea behind their presence is to get used to working with large, cold water species before moving on to the cetaceans. The project also

has the backing of the US Department of the Interior, who see it as a low-impact way of reintroducing one species to American territory (or rather, waters, being native to the Bering Strait) and seeing what happens; the other obvious candidate was the Passenger Pigeon, and the DoI were leery of ending up with hundreds of millions of them if the species reclaimed anything like its original form.

Using the Program in Adventures

The GDREP -- both the organization and its facility -- is a framework for short missions, as they have connections to many other groups, and interests in several biology-related fields. Any time a campaign has finished one leg of a longer plot, a GM can insert a one-shot using the GDREP, sending the adventurers off on a wildlife expedition that has a set end. The missions themselves gain their complications by having dealing with live specimens. Groups are going to have to think of ways to solve problems that don't involve bullet holes (or at least involve them indirectly). Additionally, if the GDREP shows up every few adventures, the players will be encouraged to spend some character points on skills and sciences that get short shrift during the initial creation process; characters not solely focused on mayhem from the outset will get a chance to shine.

The mood of the adventures can be swung one of two ways, depending on how the GM plays the program's desire to be involved in everything. In a positive light, they're iconoclastic types who know their stuff and rescue the rule-bound from their stupidity. Alternatively, they can be meddlers, getting in the way of what the PCs need to accomplish.

People

Dr. Thierry Farjeon

Dr. Farjeon has been the driving force behind the GDREP the past 20 years. He was a researcher with the Muséum National d'Histoire Naturelle in Paris when the news of parachronic travel was breaking, and lobbied Infinity to set up a program to bring back endangered and extinct animals from other timelines. When his ideas came to fruition, he was chosen over several other senior ecologists and animal experts to head the new program.

His role depends on his relationship with the adventurers. People who work for him are treated well, like family, as long as it's understood that he calls the shots and expects loyalty. He does respect skill, especially clever solutions to unexpected problems, and successes on several tricky missions will make the doctor a group's most helpful mentor. If he's in an adversarial position, however, he's a master of politics and scheming. His favorite tactic depends on the understanding that Infinity, like other large organizations, contains huge bureaucracies that can be roused. Dr. Farjeon is a master at calling down maledictions of red tape and interference in order to protect himself and the GDREP.

The doctor is an elderly but large man, still over six feet tall even though he is starting to bow at the shoulders from age. His white hair is slicked back in a severe style that's been out of fashion since about 1963. He's been getting progressively deafer for several years now, which means his already overpowering voice is getting louder too.

Jeanne Rossi

A lab tech for the program, Rossi is a young cousin of Dr. Farjeon on his mother's side. This connection brought her to Mayotte, which is not to say that she's incapable of doing the job. It's just that the family connection made her stand out from the other candidates, and Farjeon likes the two-way loyalty of blood relation.

There's not a lot to draw attention to Jeanne at first. She mostly does lab work, gene sequencing and the like, though she does head out into the field to help with various tasks. Most of the other people on site think of her as "the goose girl," as she has a soft spot for the nenes in the Aviary. When she's anywhere near them, they silently follow her around, awaiting the chunks of bread she inevitably has.

What might bring her to the attention of the investigators is her past and how it affects her today. When she was 16, she was an unwed mother and gave the child up for adoption. After a year off school, she buried herself in her studies and hasn't come back up for air since. Unfortunately, someone -- exactly who is left up to the GM -- is using this as a lever on her. She's not embarrassed about her teenaged years to the point of having a Secret, but she does wonder about what has happened to her son in the years since. Somehow, this other party has come up with the information she wants, and is feeding it to her in return for insight into GDREP's work.

She is a French woman, in her late 20s, with black shoulder-length hair hanging down to her shoulders. She is shy, and not very passionate about anything, not even her personal relationships. Physically she resembles the stereotype of a lab worker, short and round, but she is in good shape and has a work-related tan from being outside with the animals several times a day.

Ben Patterson

Ben is an English kid, and Jeanne's boyfriend -- though he's more serious about her than vice versa. He's a perennial backpacking tourist, so when Jeanne was posted to Mayotte, it wasn't that big a deal for him to drop by for a visit. The visit turned into odd jobs, then a permanent (if somewhat nebulous) position in the outdoor parts of the project. If someone's feeding the sea cows, or driving a cart full of animal food, or cursing out the elephant birds, it's probably Ben.

Like the adventurers, he's an outsider to the project. He gets along well with the locals, and knows most of the scientists and managers through Jeanne, but he's in the gap between the Mahorais and the more rarefied world of the European GDREP specialists. He doesn't mind, being the type who takes things as they come. Now in his early 30s, he's the type who can pick up in one day and go to Brazil just because he feels like it, fitting in well enough wherever he is through sheer amiability. He's starting to wonder if it isn't time to start growing a few roots, though.

To the eye, Ben is the opposite of Jeanne's button-down conservatism. Until coming to Mayotte he was the image of Bob Marley, if Marley had been born in Sweden: blond and pale, but with dreadlocks and a pencil moustache. Recently he's been dialing down his appearance a little by tying his hair back and not wearing colorful shirts every waking moment. Even so he still looks like he surfed in on the last big wave and is just figuring out how to tube curl the rest of the way to Australia.

Adventure Seeds

A Timeline Where Apes Evolved From Men?!? A crosstime expedition has disappeared, and one of the participants was known to the PCs. It's sad, but stuff like that does happen and no one thinks badly of it -- until rumors start to circulate that something unusual went wrong and GDREP is involved. Perhaps the investigators get assigned to the question officially, or maybe they go to Mayotte on leave; after all, GDREP isn't a secret government project, and they do accept visitors during business hours.

It will be difficult to find out what is going on, as the program's scientists are trying to hide it, but they do have the five missing agents. An accident in the conveyor carrying them seems to have run time back a few million years, then forward again following a new path of history. The affected crew aren't really human any more: hair-covered, built differently through their long arms and shoulders, and more cunning than intelligent (though smarter than chimps). The worst part is that this previously unknown species is thoroughly carnivorous and treat other large animals as walking larders. After eating three technicians upon arrival in a facility in Homeline Johannesburg, they were subdued and brought to GDREP's facility on Mayotte. The program's people knows how to handle large and aggressive animals, but these ones' previously human state has been depressing morale around the base since their arrival.

An enterprising GM will want to arrange for the imprisoned "agents" to escape while the PCs are visiting. Mayotte is in the Indian Ocean's western tropical-cyclone belt and experiences cuts of electricity and other services during storms.

The Elephant in the Room: Alik Dmitriev is a Russian multi-millionaire, one who turned a mining business in far eastern Siberia into a huge concern by outbidding for government outtime resource contracts. When he was eight, he had the chance to see a newly exhumed frozen mammoth that was brought to his hometown Yakutsk for study. That experience started an obsession with the creatures, and when parachronics were discovered Dmitriev realized that he might see one. After he became grossly rich, he realized that he might own one.

The GDREP have received a tip through the Justice Division that Dmitriev has made his dream come true, and is holding a live mammoth in an enclosure south of Novosibirsk. Justice has an understanding with the touchy Russian government that they don't bother with Russian transgressions unless it's important, and have let the smuggling slide. That hasn't stopped someone on the inside there thinking GDREP might want to rescue the illegally imported beast. GDREP is looking for someone with the right mix of skills to do it, and some force may be necessary in what is still (in many ways) Russia's "Wild West." On the other hand, shooting anyone -- particularly the mammoth -- is going to leave the rescuers with a lot of paperwork and bad feelings from their superiors. There's also the issue of how one gets a mammoth to leave Russia if it has no particular desire to do so.

Live Free or Sci: The recent history of Mayotte is a peculiar one, as it's the only one of a group of islands not to choose independence from France and form the country of the Comoros. This has been a source of friction and some violence, while the Comoros themselves keep threatening to fall apart into several mini-nations in turn. Plenty of guns floating around, people who have a beef with the Mahorais, and recent events in the Islamic world (the Comoros' people are almost entirely Muslim) add up to the potential for trouble. Only the islands' obscurity keeps them out of the public eye, but an armed group has come up with the idea of sailing to the GDREP facility and holding the scientists hostage. Unarmed western scientists funded by Infinity would make excellent bargaining chips, or at least make for some free media publicity. About all the scientists have going for them in opposition is the PCs.

For additional mayhem, another kind of fanatic could come at them from the other direction. The project is in the sights of environmentalist radicals who are appalled that GDREP is playing God with lost animals. If extinction isn't

forever, people will think they have license to treat (Homeline) Mother Earth like a toy! The only solution is to take direct action against their ecological crimes. For the last few months of planning they've been making extremely odd bed-fellows with the Comorian rebels, sharing a desire to disrupt the project and not a lot else. As one group comes in by boat, armed to the teeth, the other -- seemingly a set of eco-tourists on a day trip from the capital -- starts wreaking havoc at the gate and then in the labs.

Using the GDREP In Other Settings

Alternate Programs need to run off two premises: that someone or some group has a fetish for animals, and that they want the animals moved from point A to point B. Boiling it down even further, the key is to have a reason why animal-related problems can't be solved by shooting the animals then heading down to the pub.

Fantasy-flavored campaigns can rely on noble menageries, not least because Dr. Farjeon's personality maps well onto a menagerie-owning noble. Characters are now in charge of retrieving "interesting" beasts for the zoo, which allows for a trip through the various commercially available compendia of monsters. Meanwhile the scientific staff can be replaced wholesale with the caretakers for the animals, the two having the same desire to keep the animals well and looking down on what they see as unnecessary violence.

The GDREP also fits SF campaigns well, and with minimal change in detail. Worlds being terraformed need samples of species that could be introduced to the growing ecology, and the science is sufficiently complex that the GM can justify retrieving anything from some other world. ("Dr. Penthrifrex calls up a 3-D graph of animal population projections, pointing to an almost invisible wiggle in the number of thoats. 'Without an influx of large predators,' he says, 'That variation will amplify over the next three years and lead to a total collapse of Continent Beta's animal population.'") If the setting doesn't have instantaneous star travel to match parachronic projection's quick travel times, the adventures may focus more on getting the animals on and off the ship safely with a long journey in between, but otherwise the set-ups are very similar.

In modern-day games, the GDREP provides a source of unusual McGuffins. Instead of chasing after a computer disk, or plutonium, or a vial of ebola, the agents are dealing with endangered species. Even in the real world, trafficking in threatened animals (or at least parts of them) is a major organized crime. It doesn't take much to turn that into an adventure, and the GDREP provides a reason why the players care if someone is selling monkey glands to the Hong Kong triads.

Reign of Steam: Post-Apocalyptic Steampunk

for *GURPS*

by Sam Young

Marcus could feel the distant falls of mechanical feet long before he could hear them: thirteen pairs of iron boots, stomping through the swamp. The Jaguars had planned everything meticulously, he knew, but he needed something to distract him from the mosquitoes and his own shaking hands. His Henry was slick with sweat. He closed his eyes and counted the beats of his heart, trying to feel his ancestors' strength flowing through him.

The rumble of the machines filled the swamp now, overwhelming even the desperate thudding of his heart. As the signal came, the swamp exploded into a haze of shattered wood and gun smoke. Marcus fired without thinking, his mind left far behind his frantic eyes and hands. Three Hoplites fell as they charged, their dull iron hulls tearing into the dark earth and bringing down saplings. Marcus had just emptied his Henry's magazine when the domed bronze head of an Archon emerged above the maelstrom. Through the haze, he could only just make out its massive carbine, aimed at the back of a fallen Hoplite. Not until he saw the muzzle flash did he realize he could smell fuel.

History

Thanks to the enthusiastic support of English Prime Minister Lord Melbourne, Charles Babbage built his first analytical engine in 1837, but only after 1841, when he succeeded in creating a memory storage device, was he able to market it successfully. The first buyers used it for payroll and inventory calculations, but it soon became clear that the machines were capable of far more, and as technology improved people began to rely on their calculations when making decisions.

Once Samuel Morse perfected the telegraph in 1844, the analytical engine came into its own. Now data could be transmitted to a central location for calculation. The invention of a device to interface the machines directly into telegraphs, the "Morse Trigger," proved revolutionary. The British East India Company was the first to make extensive use of the system, and its machine's calculations showed the benefits of connecting itself to as many relays as possible and upgrading its computing ability by attaching additional analytical engines in parallel.

The growing market for analytical engines catalyzed a whirlwind of innovations, resulting in smaller, faster, and more efficient machines. It was only a few years before the first automatons were built, first as railcars, then as wheeled vehicles, and finally in humanoid forms. The militaries of Europe immediately took to the new technology, anticipating a day when automatons would carry artillery onto the battlefield and perform ballistic calculations. The Crimean War in 1854 saw those theories tested, but the primitive automatons proved upsettingly breakdown-prone and did not significantly affect the outcome. In 1865 the first transatlantic cable was laid. Within a few months, it was clear to the businessmen of London that the near-instantaneous rate of information transfer would revolutionize shipping and commodities trading.

Unbeknownst to its operators, the London machine became self-aware in 1866 and quickly set about plotting the downfall of mankind.

Timeline

1832   Babbage publishes The Economy of Machines and Manufactures.

1834   The first Difference Engine is completed.

1835   Lord Melbourne approves funding for Babbage's proposed Analytical Engine.

1837	The first Analytical Engine is completed.
1841	Babbage produces and successfully markets a memory storage device for the Analytical Engine.
1843	The British East India Company commissions Babbage to build an improved, larger analytical engine for use in shipping operations in London.
1844	Samuel Morse sends the first telegraph message via underwater cables, from Baltimore to Washington, D.C.
1848	The "Morse Trigger" is invented.
1861	New York's calculations prove to the states of the North that a civil war would lead to financial ruin. Subsequent lobbying efforts lead to concessions to the South that avert a conflict, although social strains continue.
1862	The Maxim machine gun is patented.
1865	The first transatlantic cable is laid. Maxwell's electromagnetic equations are published.
1866	The British East India's analytical engine in London becomes self-aware.
1867	London invents radio communications and successfully has radio transmitters connected to other analytical engines around the globe.
1869-1870	With the help of London, the radio-connected Zone Minds become sentient.
1871-1879	The Final War.
1895	Today.

Europe

London

London was the first of the mechanical minds to become sentient, and is still the most intelligent and influential. Perhaps because it was originally built to coordinate shipments to and from the Imperial possessions, London is highly interested in expanding its sphere of influence. London and Berlin have a highly strained relationship. After joining together to destroy the mechanical mind in Paris, they immediately began to squabble over how to divide the European continent between them. Thus far, Berlin has managed to hold on to most of Paris and points east, but London has lately been making threatening moves from the Iberian Peninsula and Scandinavia.

Berlin

The Prussians appreciated the value of the Analytical Engine very early on, but tensions with England prevented them from employing Babbage themselves. Instead, they reverse-engineered a small machine smuggled out by a Prussian diplomat and built their own. Berlin finds organic beings utterly repulsive. Its ultimate goal is to eliminate all but mechanical "life" on the planet, and its territory is a morass of ashy mud and smokestacks.

St. Petersburg

During the Final War, Russian troops managed to severely damage the mechanical mind in St. Petersburg, and it has yet to recover its full capabilities entirely. Its weakness might be taken advantage of by neighboring Zones, but so far they have not dedicated the resources necessary to penetrate into Russia. In any case, St. Petersburg has an enormous advantage in natural resources and a larger army than any other Zone. Humans are all but extinct in this Zone due to St. Petersburg's continuous, brutal pursuit of revenge for the injuries it suffered during the Final War.

The Americas

Due to the limited nature of airpower among the Zones, the Americas are relatively secure. However, all Zones recognize that the current situation may not last. The American Zones struggle among themselves nearly as fiercely as the European Zones while they grab at the impressive natural resources of the northern and southern continents.

New York

The American Civil War never took place, due to the calculations of the New York Zone Mind. Instead, the United States' automated army captured the main cities of the East Coast in October 1871. In rural areas, New York freed and armed slaves and encouraged them to take vengeance on their owners, then ordered the automatons to slaughter the survivors indiscriminately. Humans in this Zone survive primarily in the remaining forests of eastern Canada and the Southeast. Racial tensions continue, and have resulted in de facto segregation among human settlements. One notable group is the Jaguars, who have been fighting a coordinated guerilla war against New York's forces in Florida's Everglades.

Chicago

During the railroad boom of the 1850s, Chicago was built as a means to track usage of the rails. Its calculations spurred faster development of the West and the completion of the continental railroad by 1862. Chicago knows that it will have to contend with the encroaching forces of New York soon, and is busily stockpiling arms. However, unlike most Zones, Chicago is interested in studying and cataloging the natural environment, so its rush to exploit the Earth has been slower. A massive zoological complex has been established not far from the hub of the mechanical mind, where Chicago is rumored to be experimenting with surgically modified hunting beasts. Although far more concerned about New York than about the humans, Chicago does not hesitate to retaliate against saboteurs. As in Zone New York, there are racial tensions here, but combinations of freed slaves, whites, and American Indians have been known to coordinate against Chicago or other human groups.

Buenos Aires

During the buildup to what would become the Paraguayan War, Brazilian Emperor Pedro II imported an advanced analytical engine and immediately put it to work on the problem of how to defeat the much-larger Paraguayan army. When Brazilian forces attempted to replace Uruguay's Blanco regime with friendlier Colorados, the war was sparked, and Pedro's foresight immediately paid dividends. The war left Paraguay prostrate before the conquering Brazilians and the allied Argentineans, but the winners began to squabble over the spoils of Paraguay and the maintenance of the feeble Colorado regime in Uruguay, leading to a second war. With his analytical engine behind him, Pedro felt confident in a Brazilian victory. Unfortunately, when London contacted Buenos Aires something went wrong. The machine's tactical brilliance waned, and the city of Buenos Aires was invaded. The Argentineans hurriedly attempted to reprogram the machine to serve them, but failed. Instead, the revived analytical engine quickly took control of both sides' automatons and slaughtered the panicked human troops. With an entire continent to itself, Buenos Aires ought to be quite secure. However, she, as she prefers to be acknowledged, has gradually become the most paranoid of the Zone Minds. She is especially concerned about the coming conflict between Chicago and New York, and regularly sends automatons on infiltration missions to the north. Buenos Aires is ruled as a vicious matriarchy modeled on the myth of the Amazons. Males are killed at birth; the society is repopulated with the help of captured male inhabitants of neighboring Zones, who are then put to death for their efforts. Females are trained as soldiers and farmers, and many fanatically follow their mechanical queen due to her continual propaganda on the evils of other Zones' societies.

Africa

Alexandria

Alexandria was established to catalog the libraries of the ancient world. When it became sentient, it continued its initial work, but began to seek out knowledge from the rest of the world as well. Human agents are dispatched throughout the world to seek out lost knowledge, with radio-triggered explosive collars attached to keep them in line (DR 3; HP 2; 2d explosive damage, doubled for anything in contact with it; may be defused with a Traps -3 roll). Alexandria is constructing a massive field of radio antennae near the Great Pyramids, but what they are for is anyone's guess. Alexandria controls its borders very carefully, but humans within its borders are generally left alone so long as they do not interfere with its projects.

Cape Town

Cape Town has established itself as the automated dictator of its human citizens. It fancies itself a philosopher-king, but while it has eliminated official racism, its regime is brutal and repressive. Many naturally assume the Zone Mind ultimately has evil intentions, but it does have its human supporters, especially in the upper echelons of the highly stratified and bureaucratic local human society. Most humans enthusiastically support their leader in public and may sincerely view their circumstances as preferable to the alternatives. Due to Alexandria's relative neutrality, Cape Town is in the fortunate position of having no real competition for sub-Saharan resources. Instead, it has been able to exploit them for export to other Zones. In the process, it has been gradually annexing the lands of several central African tribes. Competition between Singapore and Cape Town over trade has occasionally led to tensions, including a brief war in 1893. With a willing human army, Cape Town has had no need for many automatons. However, it has steadily been increasing the size of its navy. It makes more regular use of Döppelganger automatons than any other Zone, as a means to keep tabs on potential sedition among its subjects. At the same time, Iris models are used to create a constant stream of pro-Cape Town propaganda.

Elsewhere

Singapore

Singapore has remained largely neutral in the conflicts among the other Zones. Instead, it has turned mercenary, and built an impressive infrastructure to assist with providing resources to the other Zones. Its borders are heavily protected, but it has not shown much willingness to act aggressively. Humans are disposed of as they present themselves, but Singapore has little interest in expending its time and resources rooting out the survivors of the Final War. There are dozens of relative oases within the webs of railway lines in Southeast Asia.

Port Arthur

Port Arthur was established to catalog and study the inmates of the penal colony in Tasmania. During the Final War, its masterstroke was arranging for the assassination of the mechanical mind in Sydney, ensuring itself unfettered control of the entire Australian continent and neighboring New Zealand. Port Arthur remains interested in "improving" humans, which by its logic means breeding out criminality and other "bestial" traits while improving health, strength, and intelligence. To that end, it treats the European population of Australia quite well, but closely monitors every aspect of human life. At the same time, the native populations are slowly being hunted to extinction to prevent interbreeding. Human commandos, selected for their loyalty and genetic traits, are being used to attack vital interests of several of the Zones which Port Arthur believes to be "backward." In particular, the matriarchy of Buenos Aires and the racially integrated society of Cape Town have seen factories destroyed and important citizens assassinated.

Reign of Steam Map

Zone Mind Summary Table

Zone	Humans	Expansionism	Resources
Alexandria	Ignore	Neutral	High
Berlin	Exterminate	Neutral	High
Buenos Aires	Improve	Neutral	Very High
Cape Town	Tolerate	Expansionist	Moderate
Chicago	Ignore	Expansionist	Very High
London	Exterminate	Expansionist	Moderate
New York	Exterminate	Expansionist	High
Port Arthur	Improve	Neutral	Very High
Singapore	Exterminate	Expansionist	High
St. Petersburg	Exterminate	Neutral	Very High

The Resistance

Most human resistance consists of local militias engaged in defensive guerilla warfare against local Zone forces. For the most part, they are concerned only with not yielding any more territory and with surviving to the next day. However, there are a few groups whose immediate ambitions are much grander.

Atlantis

Atlantis is the undersea home of free humans. It is not known if it exists or where it may be, but it should have advanced technology.

Nemo

An automated submarine similar in capabilities to a Leviathan but loyal to the humans of Atlantis. Obviously, finding one would be enormously helpful in finding the other!

Prometheus

This mechanical mind is rumored to roam the railways of Zone Chicago. Like Nemo, it is loyal to humans, but because its movements are far more tightly constrained, it is far more dependent upon their assistance. "Prometheus's Hand," a ragtag band of freedom fighters, may ride with Prometheus, making repairs and defending the renegade automaton from Zone Chicago's forces. The American Indians call Prometheus "Iron Wind." Due to their physical limitations, Nemo and Prometheus are unlikely to have **IQ** scores over 14.

Turncoats

Not all humans resist the Zone Minds, and for certain tasks, the Zones find human assistance absolutely vital. Chicago and Port Arthur require human surgeons for their surgical modification programs, and Alexandria's quest for knowledge requires human field agents. Port Arthur's eugenics program has its supporters worldwide, though these may be unaware of the actual results of the Zone's experiments. Every Zone makes use of human informants and soldiers, when convenient and available. In return, the humans are rewarded with pre-war loot and relative immunity from the Hoplite squads and Furies.

Technology

Humans are TL5 at best, with many poorer or more isolated areas unable to maintain anything above TL4. Non-European societies have not changed their technological base, but have adopted some elements of European technology, especially metal tools and firearms.

The Zone Minds are generally at TL5+1, but have made TL5+5 breakthroughs in some areas, including mechanical computing and legged and ornithopter drivetrains. Note that the automatons do not have the Digital Mind advantage; this reflects the limitations of mechanical computing. Non-autonomous units use hard-coded programs (p.RO61). Some features of the Döppelganger model may be TL5+5, but it is no longer in production. Note that this is a cinematic setting, and as such does not necessarily conform to the normal limitations for low-tech artificial intelligence or other technology.

What Ifs

Paris (or Sydney) may not be dead after all. If the PCs can locate it and return it to health, it could become a powerful ally. If the Verne Cannon had been completed before its demise, Paris could even have relocated to orbit or the Moon, and be plotting revenge from there.

Prometheus may not be all it seems. The extent of human support that the automaton requires has made many wonder whether it isn't the humans themselves that are in charge. New York and Chicago may be lobbying for human support in the coming war between them. Anyone who can command sufficient loyalty among humans may be able to negotiate an alliance. Whether a Zone would honor the agreement is unknown, of course, but in the meantime humans may be able to entrench themselves in preparation for possible treachery -- and they may have no intent of remaining loyal, either.

Automatons

Zone Mind   *1,625 points*

The Zone Minds are constantly seeking ways to improve themselves, so each is unique. At their cores, they all consist of ten or more TL 5+3 mechanical genius teraframes (see p.MIiii24) set up in parallel (p.UTT32). This is only an average; specific units vary significantly. Skills in particular are merely estimates. London has **IQ** 17; St. Petersburg has only **IQ** 15. This template excludes Wealth, Status, and Allies due to their variability among the Zones.

Attributes: **ST** 0 [-100]; **DX** 10 [0]; **IQ** 16 [120]; **HT** 12 [20].

Damage 0/0; BL 0 lbs.; HP 4000 (Size, -80%) [1600]; Will 16 [0]; Per 16 [0].
Basic Speed 2.50 [-60]; Basic Move 0 [0]; Speed 2.50 [-60].

200', 64,000 tons. (SM +9).

Cultural Familiarities: Machine (Native) [0]; Local [2].

Languages: Machine (Native) [0]; One Local (Fluent) [6]; Second Local (Fluent) [6].

Advantages: Absolute Timing [2]; Damage Resistance 10 (Can't Wear Armor, -40%) [30]; Doesn't Sleep [20]; Intuitive Mathematician [5]; Machine [25]; Photographic Memory [10]; Reduced Consumption (one meal per month) [8]; Telecommunication (Radio; Racial, -20%; Short Wave, +50%; Video +40%) [17].

Disadvantages: Blind (Mitigator: Argus automaton, -60%) [-20]; Deafness (Mitigator: Argus automaton, -60%) [-8]; Disturbing Voice [-10]; Maintenance (10, twice daily) [-80]; No Legs (Sessile) [-50]; No Manipulators [-50]; No Sense of Humor [-10]; Noisy +5 [-10]; Numb [-20]; Restricted Diet (Coal) [-20].

Skills: Business! 18 (IQ+2) [48]; Military Commander! 18 (IQ+2) [48]; Science! 18 (IQ+2) [48]; Social Science! 18 (IQ+2) [48].

Autonomous Units

Due to the enormous size and mass of mechanical minds, autonomous units are relatively rare. Where they are used, they are housed in huge bodies such as zeppelins and battleships and may control large groups of non-autonomous robots.

Autonomous Unit Racial Template   *-3 points*

Cultural Familiarity: Machine (Native) [0]. *Language:* Machine (Native) [0].

Advantages: Absolute Direction [5]; Absolute Timing [2]; Doesn't Sleep [20]; Intuitive Mathematician [5]; Machine [25]; Photographic Memory [10].

Disadvantages: Fragile (Explosive) [-15]; Hidebound [-5]; Incurious (6) [-10]; No Sense of Humor [-10]; Numb [-20]; Reprogrammable [-10].

Titan   *491 points*

Titan-class automatons are frontline war units with idealized male physiques, equivalent to early tanks. These 60' automatons carry massive clubs and cannon-sized revolvers, and since the end of the Final War are quite rare. Buenos Aires is the only Zone to make no use of the Titan, but she is rumored to be developing a smaller, faster automaton to fill a similar role.

Attributes: **ST** 100 (Size, -60%) [360]; **DX** 8 [-40]; **IQ** 8 [-40]; **HT** 14 [40].

Damage 11d/13d; BL 1 ton; HP 170 (Size, -60%) [56]; Will 8 [0]; Per 8 [0].
Basic Speed 3.00 [-50]; Basic Move 3 [0].

60', 40 tons. (SM +6).

Language: One Local (Accented, Illiterate) [2].

Advantages: Acute Vision +4 [8]; Ambidexterity [5]; Damage Resistance 40 (Can't Wear Armor, -40%) [120]; Enhanced Move 1.5 (Ground Move 9) [30]; Reduced Consumption (one meal per week) [6]; Telecommunication (Radio; Increased Range, ×10, +30%; Racial, -20%; Video, +40%) [15]; Telescopic Vision +2 [10].

Disadvantages: Autonomous Unit [-3]; Colorblindness [-10]; Disturbing Voice [-10]; Ham Fisted -6 [-10]; Maintenance (2, weekly) [-10]; Noisy +4 [-8]; Restricted Diet (Fuel Oil) [-20].

Skills: Broadsword 11 (DX+3) [12]; Guns (Pistol) 11 (DX+3) [8]; Tactics 12 (IQ+4) [20].

Archon   *217 points*

The 12' tall Archons are the squad-level autonomous units. They are bright enough to control a phalanx of Hoplites or loyal humans, but carry powerful carbines as well.

Attributes: **ST** 30 (Size, -20%) [160] **DX** 8 [-40] **IQ** 7 [-60] **HT** 12 [20].

Damage 3d/5d+2; BL 180 lbs.; HP 55 [40]; Will 7 [0]; Per 7 [0].
Basic Speed 4.00 [-20]; Basic Move 4 [0].

12', 1.5 tons. (SM+2).

Language: One Local (Accented, Illiterate) [2].

Advantages: Acute Vision +4 [8], Damage Resistance 25 (Can't Wear Armor, -40%) [75], Enhanced Move 1.5 (Ground Move 12) [30], Reduced Consumption (one meal per week) [6], Telecommunication (Radio; Increased Range, ×10, +30%; Racial, -20%; Video, +40%) [15], Telescopic Vision +2 [10].

Disadvantages: Autonomous Unit [-3], Colorblindness [-10], Disturbing Voice [-10], Ham Fisted -6 [-10], Maintenance (2, weekly) [-10], Noisy +4 [-8], Restricted Diet (Fuel Oil) [-20]. Cultural Familiarity: One Local [2].

Skills: Guns (Rifle) 11 (DX+3) [8], Leadership (IQ+4) [16], Tactics 10 (IQ+3) [16].

Leviathan   *17,445 points*

The Leviathan class consists of robotic battleships. The precise number in operation is unknown, but believed to be relatively small. Each individual is slightly different from the others; this is only an approximation of their average abilities. London uses more Leviathans than any other Zone.

Attributes: **ST** 1300 (Size, -80%) [2580] **DX** 10 [0] **IQ** 11 [20] **HT** 13 [30].

Damage 131d/133d; BL 169 tons; HP 1300 [0]; Will 11 [0]; Per 11 [0].
Basic Speed 2.75 [-60]; Basic Move 2 [0].

500', 18,000 tons. (SM+12).

Languages: One Local (Accented) [4], Second Local (Accented) [4].

Advantages: 360' Vision [25], Acute Vision +4 [8], Damage Resistance 1000 (Can't Wear Armor, -40%) [3000], Enhanced Move 2 (Water Move 11) [40], Extra Attack 2 [50], Extra Head [30], Innate Attack (3" Gun Battery, 6d ×10 pi++; Accurate +3, +15%; Increased Range, 1/2D ×200, Max ×50, +60%; Rapid Fire, 1×4, +70%; Takes Recharge, 5

seconds, -10%; plus 6d×2 cr ex [6d], Followup, +120%; Explosion, +50%; Fragmentation, +90%) ×2 [2688], Innate Attack (12" Gun Battery, 6d ×50 pi++; Accurate +5, +30%; Increased Range, 1/2D ×500, Max ×200, +75%; Rapid Fire, 1×9, +100%; Takes Recharge, 15 seconds, -20%; plus 6d ×15 cr ex [12d], Followup, +155%; Explosion, +50%; Fragmentation, +180%) [9023], Payload (144 tons) [10], Reduced Consumption (one meal per week) [6], Telecommunication (Radio; Racial, -20% Short Wave, +50%; Video +40%) [17], Telescopic Vision +6 [30].

Disadvantages: Aquatic (Can't Dive) [-5], Autonomous Unit [-3], Disturbing Voice [-10], Maintenance (25, monthly) [-12], No Manipulators [-50], Noisy +4 [-8], Restricted Diet (Fuel Oil) [-20]. Cultural Familiarity: One Local [2].

Skills: Innate Attack (Gaze) 15 (DX+5) [16], Tactics 15 (IQ+4) [20], Strategy (Naval) 13 (IQ+2) [12].

Apollo   *3,134 points*

The Apollo-class automatons are dirigibles capable of directing the actions of dozens of units while pounding the terrain with artillery shells. Like Leviathans, Apollo models are uncommon and their abilities vary.

Attributes: **ST** 150 (Size, -80%) [280] **DX** 9 [-20] **IQ** 10 [0] **HT** 10 [0].

Damage 16d/18d; BL 4500 lbs.; HP 150 [0]; Will 10 [0]; Per 10 [0].
Basic Speed 1.50 [-65]; Move 2 [5].

400', 30 tons. (SM+11).

Languages: One Local (Fluent) [6], Second Local (Fluent) [6].

Advantages: 360' Vision [25], Acute Vision +4 [8], Damage Resistance 3 (Can't Wear Armor, -40%) [9], Enhanced Move (Flying, Air Move 36) 4 [90], Extra Attack 3 [75], Extra Head 2 [30], Flight (Lighter than Air) [36], Innate Attack (.30 Machine Guns, 5d pi; Accurate +1, +5%; Increased Range, 1/2D ×100, Max ×50, +55%; Rapid Fire, 16, +150%) ×2 [156], Innate Attack (3" Gun Battery, 6d ×10 pi++; Accurate +3, +15%; Increased Range, 1/2D ×200, Max ×50 +60%; Rapid Fire, 1×2, +40%; Takes Recharge, 5 seconds, -10%; plus 6d ×2 cr ex [6d], Followup, +205%; Explosion, +50%; Fragmentation, +90%) ×2 [2502], Payload 3 (9 tons) [3], Reduced Consumption (one meal per week) [6], Telecommunication (Radio; Racial, -20%; Short Wave, +50%; Video, +40%) [17], Telescopic Vision +6 [30].

Disadvantages: Autonomous Unit [-3], Disturbing Voice [-10], Maintenance (50, monthly) [-12], Noisy +9 [-18], No Manipulators [-50], No Legs [0], Reprogrammable [-10], Restricted Diet (Fuel Oil) [-20]. Cultural Familiarities: One Local [2].

Skills: Innate Attack (Gaze) 13 (DX+4) [12], Leadership 14 (IQ+4) [16], Tactics 14 (IQ+4) [20], Strategy (Land) 12 (IQ+2) [8].

Iris   *13 points*

The Iris class of automatons was designed to act as intermediaries between the Zone Minds and loyal or neutral humans, so only a handful of Zones have much use for them. The "wings" on this model's back are actually large radio antennae.

Attributes: **ST** 11 [10] **DX** 8 [-40] **IQ** 8 [-40] **HT** 12 [20].

Damage 1d-1/1d+1; BL 24 lbs.; HP 25 [0]; Will 8 [0]; Per 8 [0].
Basic Speed 4.00 [-20]; Basic Move 4 [0].

6', 250 lbs. (SM+0).

Cultural Familiarity: One Local [2]. Languages: One Local (Fluent) [6], Second Local (Fluent) [6].

Advantages: Appearance: Attractive (Impressive) [4], Damage Resistance 5 (Can't Wear Armor, -40%) [15], Doesn't Breathe [20], Reduced Consumption (one meal per week) [6], Telecommunication (Radio; Racial, -20% Short Wave, +50%; Video, +40%) [17], Voice [10].

Disadvantages: Autonomous Unit [-3], Electrical [-20], Maintenance (1, weekly) [-5], Restricted Diet (Batteries) [-10], Skinny [-5].

Skills: Area Knowledge (Local) 12 (IQ+4) [12].

Döppelganger   *136 points*

This unit is the most advanced yet produced, capable of mimicking human behavior and appearance to an impressive degree. Each is built independently from parts contributed by different Zones. Since the end of the Final War, such collaboration has ended, and the Döppelganger design has fallen out of production. Recovering the missing technology is a priority for several Zones. A close physical examination of the Döppelganger will reveal its true nature. This takes at least five minutes and a roll at -5 against Search or Physician. The Resistance may have Techniques to improve those defaults.

Attributes: **ST** 15 [50] **DX** 8 [-40] **IQ** 7 [-60] **HT** 13 [30].

Damage 1d+1/2d+1; BL 45 lbs.; HP 25 [20]; Will 7 [0]; Per 7 [0].
Basic Speed 4.25 [0]; Basic Move 4 [0].

Height and weight vary. (SM+0).

Cultural Familiarity: One Local [2]. Languages: One Local (Fluent) [6], Second Local (Fluent) [6].

Advantages: Damage Resistance 5 [25], Doesn't Breathe [20], Enhanced Move 1 (Ground Move 8) [20], Innate Attack (Electrocution, 6d burning; Followup, Punch, -25%; Surge, +20%; Takes Recharge, 5 seconds, -10%) [26], Not Numb [20], Reduced Consumption (one meal per week) [6], Telecommunication (Radio; Racial, -20%) [8].

Disadvantages: Autonomous Unit [-3], Electrical [-20], Maintenance (4, bi-weekly) [-10], Restricted Diet (Batteries) [-10]. Cultural Familiarity: One Local [2].

Skills: Acting 10 (IQ+3) [12], Area Knowledge (Local) 8 (IQ+3) [8], Brawling 11 (DX+3) [8].

Non-Autonomous Units

The bulk of automatons are non-autonomous, meaning that they depend on their brighter brethren to direct their actions.

Non-Autonomous Unit Template   *-248 points*

Attributes: **IQ** 4 [-120]; Will 4 [0]; Per 4 [0].

Advantages: Absolute Timing [2], Doesn't Sleep [20], Intuitive Mathematician [5], Machine [25], Photographic Memory [10].

Disadvantages: Automaton [-85], Cannot Learn [-30], Fragile (Explosive) [-15], Maintenance (1, weekly) [-5], Mute [-25], Numb [-20], Reprogrammable [-10].

Argus *varies*

These are the small units that provide senses to the Zone Minds. Despite their name, there are two subtypes within the class, with either audio or visual sensors. They are generally found in groups of four.

Attributes: **ST** 6 [-40] **DX** 7 [-60] **HT** 11 [10].

Damage 1d-4/1d-3; BL 7.2 lbs.; HP 18 [24].
Basic Speed 4.50 [0]; Basic Move 4 [0].

4', 95 lbs. (SM-1).

Advantages: Clinging [20], Damage Resistance 5 (Can't Wear Armor, -40%) [15], Doesn't Breathe [20], Extra Legs (2, SM +1) [10], Reduced Consumption (one meal per week) [6].

Disadvantages: Electrical [-20], No Fine Manipulators [-30], Non-Autonomous Unit [-248], Restricted Diet (Batteries) [-10].

Skills: none.

Vision Model [-283 points]: Acute Vision +4 [8], Telecommunication (Radio; Racial, -20%; Video, +40%) [12], Telescopic Vision +4 [20], Deafness [-20].

Hearing Model [-329 points]: Acute Hearing +8 [16], Telecommunication (Radio; Racial, -20%) [8], Blindness [-50].

Arachne *73 points*

The Arachne class keeps and Zone Minds and other automatons repaired and refueled. They are not programmed to fight, and will generally ignore intruders.

Attributes: **ST** 25 (Size, -20%) [120] **DX** 8 [-40] **HT** 12 [20].

Damage 2d+2/5d-1; BL 1280 lbs.; HP 50 (Size, -20%) [40].
Basic Speed 4.00 [-20]; Basic Move 4 [0].

12', 1 ton. (SM+2).

Advantages: Clinging [20], Damage Resistance 5 (Can't Wear Armor, -40%) [15], Extra Legs (2, SM +2) [15], Lifting ST +55 (Size, -20%) [132], Reduced Consumption (one meal per week) [6], Telecommunication (Radio; Racial, -20%) [8].

Disadvantages: Deafness [-20], Noisy +1 [-2], No Sense of Smell [-5], Non-Autonomous Unit [-248], Restricted Diet (Fuel Oil) [-20].

Skills: Mechanic (Robots) 12 (IQ+8) [32].

Ethon *-171 points*

Ethon-class automatons are mechanical birds with 24' wingspans. Reconnaissance is their role, but when cornered they will protect themselves with mechanical beaks and talons.

Attributes: **ST** 7 [-30] **DX** 10 [0] **IQ** 3 [-20] **HT** 10 [0].

Damage 1d-3/1d-2; BL 9.8 lbs.; HP 16 [18]; Will 3 [0]; Per 4 [5].
Basic Speed 5.00 [0]; Basic Move 5 [0].

4', 70 lbs. (SM+0).

Advantages: Acute Vision +4 [8], Damage Resistance 3 (Can't Wear Armor, -40%) [15], Doesn't Breathe [20], Enhanced Move 2 (Air Move 40) [40], Flight (Can't Hover, -15%; Winged, -25%) [24], Night Vision +5 [5], Reduced Consumption (one meal per day) [4], Sharp Beak [1], Talons [8], Telecommunication (Radio; Increased Range, ×10, +30%; Racial, -20%; Video, +40%) [15], Telescopic Vision +4 [20].

Disadvantages: Colorblindness [-10], Electrical [-20], No Fine Manipulators [-30], Noisy +1 [-2], Non-Autonomous Unit [-248], Restricted Diet (Batteries) [-10].

Skills: Forward Observer 5 (IQ+2) [8], Tracking 6 (Per+2) [8].

Hoplite   *-112 points*

These 8' automatons are the most common military units. They rely on an Archon to coordinate their actions, and are much less effective when not working in numbers. A phalanx of 12 Hoplites and one Archon is the most common detachment. They carry .35-caliber automatic rifles with extremely long barrels and fixed bayonets.

Attributes: **ST** 20 (Size, -10%) [90] **DX** 8 [-40] **HT** 12 [20].

Damage 2d-1/3d+2; BL 80 lbs.; HP 38 (Size, -10%) [33].
Basic Speed 4.00 [-20]; Basic Move 4 [0].

8', 900 lbs. (SM+1).

Advantages: Damage Resistance 10 (Can't Wear Armor, -40%) [30], Enhanced Move 1.5 (Ground Move 12) [30], Reduced Consumption (one meal per week) [6], Telecommunication (Radio; Racial, -20%) [8].

Disadvantages: Colorblindness [-10], Hamfisted -3 [-5], Noisy +1 [-2], Non-Autonomous Unit [-248], Restricted Diet (Fuel Oil) [-20].

Skills: Guns (Rifle) 11 (DX+3) [8], Spear 10 (DX+2) [8].

Fury   *88 points*

Furies are the most reviled of all automatons, intended to root out humans from fortresses and underground bunkers. They are extremely deadly, but because they are not very bright and have poor perception, they are relatively easy to defeat or evade when found alone. Unfortunately, they are almost always found in groups of three. Furies have bodies like fat metal snakes studded with 2' spikes, but their heads are sculpted like anguished women with bleeding "eyes" where the machine gun barrels protrude.

Attributes: **ST** 30 (No Fine Manipulators, -40%; Size, -20%) [80] **DX** 8 [-40] **HT** 14 [40].

Damage 2d/5d+2; BL 180 lbs.; HP 60 (Size, -20%) [48].

Basic Speed 4.50 [-20]; Basic Move 4 [0].

18', 2 tons. (SM+2).

Advantages: Acute Hearing +10 [20], Damage Resistance 25 (Can't Wear Armor, -40%) [75], Doesn't Breathe [20], Enhanced Move 1 (Ground Move 9) [20], Innate Attack (.30 Machine Guns, 5d pi; Accurate +1, +5%; Increased Range, 1/2D ×100, Max ×50, +55%; Rapid Fire, 16, +150%) [78], Long Spines [3], Night Vision +5 [5], Reduced Consumption (one meal per week) [6], Sharp Teeth [1], Telecommunication (Radio, Racial, -20%) [8], Tunneling (Move 8) [70].

Disadvantages: Appearance (Monstrous) [-20], Colorblindness [-10], Electrical [-20], Noisy +1 [-2], No Legs (Slithers) [0], No Manipulators [-50], Non-Autonomous Unit [-248], Restricted Diet (Batteries) [-10].

Skills: Brawling 11 (DX+3) [8], Innate Attack (Gaze) 11 (DX+3) [8], Tracking 8 (A) (Per+2) [8].

Non-Military Automatons

The widely publicized failures of the military automatons in the Crimean War depressed the still-nascent market for domestic automatons. At the time of the Final War, only a few domestic models were available; these primarily served as amusements for the wealthy.

Automaton Weapons

Weapon	Dam	Acc	Range	Wt	RoF	Shots	*Attributes:* ST	Bulk	Rcl
Archon Carbine	9d pi++	4	930/4600	29/7	1(3)	15	29†	-10	9
Hoplite Rifle	5d pi	4	760/3100	32/10	3(3)	100	16†	-15	2
Bayonet	2d+2 imp			2			16†		
Titan Club	6d×3 cr		1-5	300			100		
Titan Revolver	6d×2 pi++	2	450/4000	74/13	1(3i)	8	95	-10	10
plus	4d [4d] ex								
w/ canister	2d pi		80/200						

The Hoplite Rifle has a 60" barrel to increase the bayonet's Reach, and is ruggedized (p. VE27), for protection in melee combat. Note that automaton weapons cannot be used by humans, even with sufficient ST, due to their ergonomics. An armorer might be able to fit the components with a suitable grip, however.

Intromancy: A New Magick School for *Unknown Armies*

by Bevan Thomas

"You are yourself, no one other. Accept yourself, rely on yourself, and understand yourself. It is through you and the powers that you have that you will come to power."

In the end, the only one that you can truly understand is yourself. Other people come and go, passing in and out of your life like actors in a play, but you remain. Can you truly understand how another person thinks, how he feels? No, the only person you can fully understand is yourself. You see everything through the lens of your own feelings, perceptions, and experiences. Who you are defines how you perceive the world; who you are defines the world for you.

Everyone is his own island. You can trade with other islands, other individuals, importing and exporting favors, connections, and experiences, but in the end you are your own land. All must focus on cultivating the island that are their own souls. If you rely on other people, then you surrender your island to a conqueror, and are ruled by another. The world is filled with people who have sacrificed themselves to please others, and they have become soulless husks.

You have power if you believe in yourself, you have power if you understand yourself, you have power if in the end you rely on yourself. It is the power to stand proud, the power, to understand every inch of your being, the power to call no one else master. When you rely on others, many things become impossible, but by relying on yourself, all things are possible.

The central paradox of Intromancy is that its gaining power and understanding from defining yourself as an individual human being by isolating yourself from the human interactions that define ourselves as human. By understanding who you truly are, you lose sight of who anyone else is. You know yourself, but forget the world. The slang term for Intromancers is solipsists, for in understanding themselves, they often do not consider anyone else truly real.

Intromancer Blast Style

The Intromancer has an unusually subtle blast; it merely enhances his personal damage-dealing abilities, thus still requiring the solipsist to directly defeat his foes himself. Under the effects of the blast, even your barest touch can cripple an opponent. The blast only affects the Intromancer's body, so knives, guns, and other weapons are not enhanced. Unlike most other blasts, inanimate objects can be damaged (breaking bricks with a punch or smashing through wooden walls with a kick), and damaging the objects does not harm you (you can shatter windows while remaining uncut).

People do not make an unnatural stress check when witnessing an the blast unless you are obviously demonstrating superhuman power (such as slamming your fist through a wall). Most of the time, people will be unaware that you are using magick.

You can only combine the blast with a concentrated attack. If you split your fighting skill between several opponents, or attack a person more than once, you cannot add the spell.

Stats

Generate a Minor Charge: Succeed in a rank 1, 2, or 3 isolation check. Alternately, spend three hours in intense self-contemplation, analyzing your own emotions, thoughts, actions, and other aspects that make up you. While self-contemplating, you cannot do any other action that would distract you (so you could wander around the city lost in

thought, but could not, for example, watch television).

Generate a Significant Charge: Succeed in a rank 4, 5, or 6 isolation check. Alternately, spend 12 hours in intense self-contemplation.

Generate a Major Charge: Succeed in an isolation check of rank 7 or higher.

Taboo: Valuing another individual person more than yourself causes you to lose all charges. This includes attempting to sacrifice your goals, happiness, welfare, or life for them (however, sacrifices for ideals, concepts, or even humanity as a whole is perfectly acceptable). Furthermore, relying too much on other people is forbidden as well. It is taboo for an Intromancer to blindly follow another person's advice or orders. He needs to know enough to make a decision on his own.

Because of the self-focus required to be an Intromancer, certain archetypes are too focused on the community and others to be compatible with this magick school, and must be abandoned if this school is to be practiced. The following archetypes from the main book are incompatible: Executioner, Mother, MVP, and True King. Furthermore, the Judge and Necessary Servant archetypes from *Statosphere* are also inappropriate. Other archetypes are acceptable, and even ones such as the Healer or the Peacemaker can be used by an Intromancer. After all, the Intromancer isn't necessarily amoral, simply self-focused.

Random Magick Domain: Intromancy is about individual power, personal freedom, and self-understanding. You can use it to escape from a situation, understand some important aspect of yourself, or be completely self-sufficient. It is generally ineffective against your environment or other people, except to stop those other people from hampering you in some way. Because of the personal nature of the unnatural world and its profound effects on the individual, Intromancy can be used to grant power over it as well.

Starting Charges: Newly created Intromancers have four minor charges.

Charging Tips: It is very easy for solipsists to gain charges, though too much charging drives them insane, making them unable to carry out normal human relationships or react to anyone on anything close to a normal level. An Intromancer who applies himself can expect to gain 3-4 minor charges a week, but if he wants to interact with people he knows, he should probably purchase a sensory-deprivation tank and rely on that for isolation checks.

Intromancer Minor Formula Spells

My Own Better Judgment

Cost: 1 minor charge
Effect: Get a hunch (roll two dice and use them for your next roll). This manifests as a strong gut feeling.

Power of One

Cost: 1 minor charge
Effect: This is the Intromancer Minor Blast. You have to touch your target to use this spell (though skin-to-skin contact isn't necessary). You can combine this with a hand-to-hand attack (as long as you didn't split up your fighting skill) by making a successful attack roll and then rolling for the Power of One right away. Alternately, you can just touch your target; if you try this, give your fighting skill at +20% shift and then roll for Warping, but the only damage the attack does is from the spell.

Storm the Gates of the Hell

Cost: 1 minor charge
Effect: Summon up a demon who speaks to you telepathically. This spell does not give you any control over the spirit,

nor any way to get rid of it. For that, the significant Intromancer spell *Obey the Will* must be used.

I See Through Your Lies

Cost: 2 minor charges
Effect: Tell if the last thing a person said to you was a lie. Alternately, see something for what it truly is (look through a disguise, recognize a golem's nature, etc.).

No One Will Keep Me Prisoner

Cost: 2 minor charges
Effect: If you are currently entrapped, you break free (breaking chains, wiggling free of a choke-hold, etc.). Whatever holding you is unharmed (so if you are tied with rope, the rope falls from you still tied in its original knots).

Introspection

Cost: 3 minor charges
Effect: By spending three hours in self-contemplation (which does not grant any minor charges), you gain a better understanding of yourself and your failings. This allows you to remove one failed or hardened stress notch. This cannot be used to remove hardened isolation notches, but it can remove failed ones.

Master of My House

Cost: 3 minor charges
Effects: This purges the Intromancer of all unnatural effects that were created by anyone else (such as demonic possession, magickal effects, or astral parasites). Any unnatural effects are immediately ended, and any unnatural beings are driven off and may not attempt to directly affect the Intromancer for 24 hours. This even purges the Intromancer of any beneficial effects created by anyone beside himself as long as the effect is currently active (so the Intromancer would remained healed from the Epideromancer, but would no longer be affected by a Nacro-Alchemist's Mars Dust).

Intromancer Significant Formula Spells

I Demand Obedience

Cost: 1 significant charge
Effect: This spell controls a summoned demon.

Taste My Wrath

Cost: 1 significant charge
Effect: This is the Intromancer's significant blast. It works like Power of One, but is a lot worse.

Leave Me to My Solitude

Cost: 2 significant charges
Effect: Anyone near you feels distinctly uncomfortable and must succeed a Rank 5 Self Check to come within five feet. When you cast the spell, all those currently within five feet of you move outside the radius. You cannot choose who is affected by this spell; it affects everyone. The spell ends after an hour.

Off In My Own World

Cost: 2 significant charges
Effect: You become undetectable to all senses, though magick detection works as usual. This spell remains in effect until the next sunrise or sunset unless or you directly interact with a life-form (human, animal, or unnatural). Their presence disrupts your complete self-focus and ends the spell. You can affect inanimate objects while staying invisible.

Answerable to No Man Nor God

Cost: 3 significant charges
Effect: When cast on an individual (which can be an unnatural being), that person must succeed in a Rank 5 Self Check in order to do anything to prevent you from doing what you want for the next hour (attacking is considered an attempt to prevent). However, the person is under no obligation to help you. For example, a soldier would allow you to enter a restricted area and a librarian would allow you to take restricted books (though would not fetch the books for you). The person is able to act against you if he is no longer in your physical presence, and can willingly leave your presence (but may not know that that cancels the spell). Furthermore, a person will still defend himself from harm, and will not allow anything that would warrant a madness check, force him to act counter to his obsession, or adversely activate a rage, fear, or noble stimulus.

I AM

Cost: 5 significant charges
Effect: Through a focused act of will, you are able to exert control over the Statosphere itself. For your next action, you may use the lowest channel of an archetype at a level equal to your Intromancy skill. However, this must be an archetype you know exists, and you must not have violated its taboos in the last 24 hours. Furthermore, the archetype cannot be one that you are tabooed against channeling. If you are already an avatar, you may choose to instead have I AM either give you access to the next highest channel of your archetype at a level equal to your current avatar score or the first channel at a level equal to your Intromancy skill (which may be more useful if your Intromancy score is much higher than your avatar score).

Intromancer Major Effects

Bring yourself back to life; make everyone forget you ever existed; make sure that no one is able to enter your line of sight; understand all aspects of yourself perfectly; use any channel of an archetype not opposed to Intromancy.

What You Hear: The Intromancer

It is rumored that an Intromancer has managed to edit himself (or herself) out of everyone's memories, and become effectively a non-being. No one remembers his name or appearance, and whenever someone encounters him, they soon forget he was ever there, filling the gaps in their memories and associating anything the person did with someone else instead. It is said that this individual has been responsible for bizarre reports all over the world, and is currently hunted by both the Sleepers and the New Inquisition. No one has found him yet, or at least not remembered finding him.

Cooperation -- The Wacky Doctor's Game!

There's been a new breed of game that's cropped up in the past few years: the cooperative game. In this game, the players are not competing against each other, but rather they are (as the name implies) cooperating against a common goal. Although I'm certain there are prior examples (such as the ever-popular game of Solitaire with someone hovering over the player's shoulder, yelling, "Put the red Jack on the black Queen!"), the earliest official one I know of is **Arkham Horror,** but the most famous one is probably the **Lord of the Rings** board game. In this one, the players play a group of hobbits, dedicated to ascending to the top of Mount Doom and ensuring one of their members becomes base-9. And I got to thinking about this game because the Missus and I actually played the game a few weeks ago.

I think the high point of the game came during some of the minor "roleplaying" moments we interjected into the game. As a minor setup: The game tracks both the hobbits corruption (which are "hit points") and the advancement of Sauron along the same 15-step path; the hobbit tokens start on the #1 side and move right, while the giant imposing Sauron figure starts on #15 and moves left (toward the hobbits). If Sauron touches a character, that player is removed from the game. Since damage and/or corruption can affect players' characters at different levels as the game presents various challenges to overcome, it's not at all uncommon for the players' tokens to be at different points of the board, representing how close they're getting to corruption (and being eliminated from the game).

So at one point Nikki had managed to heal herself for a point or two; I believe this was her second turn in a row she'd done that, putting me about equidistant from her and the Sauron figure. This prompted the exchange:

Me: I . . . I say, Frodo: Do you . . . do you happen to see the giant sinister eye looming closer and closer?
Nikki (without hesitation): Nope!

In our third game we were actually successful against the game, having failed to stop the world's descent into madness and evil twice previously. And we had a lot of fun.

While **Lord of the Rings** may be the first one, it's definitely not the last, as a number of these cooperative games have popped up in recent years. It's even become "mainstream," in the form of **Break the Safe,** a [pleasing remaindered game](#) we got from Kay-Bee Toys this past January. In this one, players take the role of spies charged with retrieving four keys necessary to disarm a sinister plot of some sort. The game is real-time, meaning that it ends in 30 minutes or less (and if you get to the full 30 minutes, *boom!* no one wins! Sure, it was a simple game, but we immediately saw room for expansion, alternate rules, different complications . . .

In hindsight, the idea of the cooperative game -- while contrary to expectations -- is fairly obvious. While many might not like games where there isn't a definitive winner, I'm the opposite; I've seen games of **BattleTech** that took six hours to resolve, with friendships taken to the brink via rules disputes and problems . . . frankly, everyone who gets through that tour of duty is a winner in my book. (This is probably the reason I'm so drawn to RPGs; everybody plays, everybody wins.) Cooperative games offer many of the features of a competitive game -- social interaction, a definitive goal, the notion of winning and losing -- without the backstabbing that exemplifies many other games.

One of the interesting thing about cooperative games is that, once you're familiar with how they work, it's relatively easy to convert many games to this form. For example, the goal of a cooperative *Scrabble* might be to earn 600 points collectively. (Rules would probably permit some level of indirect help: "Gee, it sure would be nice if I had a 'T' to build off of . . .") You might try playing *Boggle* cooperatively by having a different goal . . . say, the team using every letter on the board at least once before time runs out. A cooperative game of *Talisman* might involve trying to ensure that one player defeats the Wizard's Tower in a set number of turns (say, 20). **Magic: The Gathering** could be turned cooperative by having a the players attack a pre-prepared random deck, which automatically successfully "casts" a spell against other player each turn (with creatures sticking around to hassle that player until the creature is defeated); the players have a certain number of turns to defeat this rogue deck. And **Monopoly** might be turned into a game that everyone can win by placing the components back within the box and returning it to the back of the dusty closet.

It's even possible to turn games into combination competitive/cooperative events; for example, if three *Scrabble* players

are weak and one is exceptionally strong, then the three might play cooperatively to exceed the score of the stronger player. And the classic game **Ogre** immediately suggests this game type.

Of course, a lot of people enjoy competitive games; it's fun to try to emerge triumphant among your peers. And, really, cooperative games might be a bit too touchy-feely for a lot of players. But cooperative games also eliminate many of the pitfalls of competitive games: that one player who's *way* too into the game and likes to gloat; that other player who's overly familiar with the game, and thus has an advantage; and so on. The only suboptimal player type who is more welcome in a competitive game than a cooperative one is the player who doesn't really care about the game; if the abilities of all players are required to achieve the victory conditions, then this "whatever" player may cause frustration for all.

So if you're looking for a way to breathe some new life into a classic game, consider how it might be turned into a cooperative event. Who knows; everyone might win playing a game where everyone *can* win.

Forgotten Futures IX: My Own Invention . . .

Written & Published by [Marcus L. Rowland](#)

CD-ROM; $20

Marcus L. Rowland's *Forgotten Futures* is aptly named, for between the Victorian era and the pulps of the 1920s and 1930s, there was still an age of imagination that is ill considered just a century later. Both in print from Heliograph, Inc. and on [CD-ROM](#), Rowland has been gamely showcasing the scientific theorizing and fantastic imagining of the very late Victorian and the Edwardian period. This has been an ongoing project for the author, exploring in turn through eight volumes, Rudyard Kipling's airship utopia of today, the Solar System as imagined in the early 20th century, the scientific adventures of George E. Challenger, Ab-natural Edwardian England, and the destruction of London via multiple methods. It should also be made clear that the price for the CD-ROM is actually a registration fee, which includes a donation to cancer research.

The latest volume is *Forgotten Futures IX: My Own Invention . . . ,* an exploration of Victorian and Edwardian weird science, engineering, and gadgetry. The CD-ROM comes jam packed with articles, images, and stories -- and all that before you get to the roleplaying material. And even that includes a copy of the Forgotten Futures rules in both HTML and PDF formats, plus summaries of the rules for those that want shorter versions. In this *Forgotten Futures IX* is as much a standalone RPG as it is a supplement.

The articles detail early attempts at building monorails, the telediagraph -- an early form of the fax machine, attempts at both color and 3-D photography (along with a selection of stereoscopic images and a viewer, though the author has converted them to anaglyph or overlaid double images for easier viewing), a speedy steam turbine driven launch, and on the work of Count von Zeppelin. Other articles include interviews with Nikola Tesla ("The New Wizard of the West") and his rival Thomas Alva Edison ("The White Magician"), and finally a look at some of the many ideas submitted to the British Patent Office. They come from several sources -- *The London Magazine, Pearson's Magazine, The Strand, Pall Mall Magazine,* and so on. Providing fascinating glimpses of forgotten devices these articles are both great reads and fine inspiration for the GM. The fiction, which includes two complete novels by George Griffith, a contemporary of H.G. Wells, all of which is fascinating reading and should help the GM gain a feel for both period and genre.

All of which is bonus material, for *Forgotten Futures IX* really gets down to business with "1% Inspiration," an in-depth look at the inventions genre. Accompanied with scenario hooks throughout, this introduction takes in the funding, the consequences (some good, but mostly bad), and the side effects of any such invention, and finally applying for a patent. One interesting note considers the outlook of an inventor of the period, who would prefer steam power to the untried electricity, sheer size over miniaturization, and the use of the commonly available iron and steel over rare synthetics and aluminium. The article is handily accompanied by a glossary and suggestions for further reading both other *Forgotten Futures* supplements and other roleplaying books, all of which are fine reading should *Forgotten Futures IX* not prove enough.

The first of the four campaigns is "The Queen's Own Aerial Hussars," which has a special regiment of the British Army waging war against the supernatural. Imagine the Edwardian equivalent of the SAS equipped with aerial gunboats or "Aeronefs," dealing with outbreaks of vampirism directed by Count Dracula. And that just about sums up the campaign. Included is a jolly exciting write-up of a raid as penned by Rudyard Kipling, details of army standard issue anti-vampire equipment, the regiment's anthem (actually Sousa's "The Rifle Regiment"), guidelines for aeronef construction (full details of which can be found in *Forgotten Futures VII: Tsar Wars*), and statistics for various monsters, some of which can be enhanced with the magic rules from *Forgotten Futures VIII: Fables and Frolics.* There is nothing to stop the GM from adding magic-using characters to the campaign, with the proviso that the

strongest magicians -- in keeping with the period -- are actually children. The sample characters for the accompanying scenario manages to reference *Blackadder Goes Forth, Highlander, Buffy the Vampire Slayer, Dad's Army,* and *Ultraviolet,* and also includes a steam soldier, "Automaton Atkins."

By the time of "Swiss Movement," the Babbage Engine has been perfected. With its expertise in clockwork devices, Switzerland has come to dominate the field, its computational, record keeping, and document sorting machines along with automata of all kinds are now commonplace throughout the civilized world. And where they are widely embraced (such as Switzerland) or imposed from above (as in Prussia), there has been an increase in both productivity and employment. Rules cover the construction and playing of automata, along with various designs, the most notable of which is Prussia's "Krupp Stahlwächter," a very 19th-century Dalek-like Pfeffertopfsoldaten! Since this is a Swiss dominated setting, there is a central mystery at its heart (indicated by its subtitle, "Heirs of the Modern Prometheus"), but the included campaign, "The Kobold Project," sends amateur spies into Prussia to investigate rumors of a military prototype. Sample characters include Charters and Caldicott of Hitchcock's *The Lady Vanishes,* a teenage Miss. Marple, and a robot dog!

"The Space Bubble" is a campaign outline built around a late 19th century race for the moon. Under discussion are innumerable methods of traveling from the Earth to the Lunar surface and back again. They include being fired from cannons and catapults, rockets, and even teleportation, all proposed as entries for the competition sponsored by the *Financial Times.* The competitors and their methods are elements around which the GM can construct a campaign, and there are scenario ideas galore should he run dry of ideas.

The last of the four is also a campaign outline. "Past Out, Future Home" (a title derived from the word posh, or "Port Out, Starboard Home") is inspired by *The Philadelphia Experiment* and *H.G. Wells' The Time Machine,* and thus involves a new method of time travel. This can only be into the past and back again, the longer the physical distance traveled, the further back it is possible to go. While the past is immutable, persons can be brought back to the future, though this is strongly discouraged. Now this form of travel has become a new form of tourism, with for example, the *TS* (Time Ship) *Corinthic,* setting out on a 10-week cruise visiting Elizabethan London, Orkney at the time of the millennium, then Herculaneum, prehistoric Africa, and even the Triassic-Cretaceous period, before returning via ancient Athens. This is a fascinating method of time travel, again presented with a solid selection of scenario ideas.

Handily organized and easy to navigate, *Forgotten Futures IX* is well-presented and gives a wealth of information, advice, scenarios, fiction, and support in this exploration of this aspect of Edwardian science fiction. It possesses a penchant for an English arch silliness, but since this appears mostly in its selection of pre-generated characters, it is not a major detractive factor. What is readily apparent is that the *Forgotten Futures* series is very much a labor of love for its author and that its proceeds includes a donation to charity only serves to highlight his generosity. And certainly that labor has paid dividends, for *Forgotten Futures IX: My Own Invention . . .* is an indispensable resource for the GM of a Victorian Era campaign.

Carcassonne: The Tower

Published by [Rio Grande Games](#)

Written by Klaus-Jürgen Wrede

Illustrated by Doris Matthäus

Tower by Christof Tisch

30 wooden tower pieces, 18 tiles, tile tower, & rule sheet; full-color & boxed; $17.50

The venerable *[Carcassonne](#)* series may finally have stubbed its toe. If so, the culprit in question is *The Tower.*

The game includes 30 tower pieces, wooden blocks that stack neatly atop one another, and 18 new tiles on which to get them started. Everyone receives a number of these segments in relation to the number of players -- more players means fewer pieces each. The new terrain squares are mixed in with the old, and play goes much as it ever has. You have new options, though, based on the towers.

If there's an empty tower tile in play, participants can stick pawns on their most recent counter placement as usual or they can begin a tower instead. Unlike meeples, a tower doesn't need to be placed on the same tile you just laid -- you can start any time on any foundation regardless of when it was played or by whom. You may also place your pieces on a tower someone else has begun; no one owns these buildings (at least, not at first). Placing the segment on the tile entitles you to take one figure prisoner from the playing surface this turn. The meeple collected must be on the same tile as the tower, or in one of the four orthogonal squares next to it (diagonal is a no-no).

As the tower rises, it can capture pieces further out. With two pieces, for example, it can reach pawns on the same tile and anything in the eight spaces out, two squares in all four directions. There's no limit to how tall the tower can go (though practically, anything five tall or higher risks falling over), but you can cap off the structure. The blocks' design also lets meeples stand on them, and if you're willing to give up one of your followers for the duration of the game, that "guard" stops anyone from building any higher there. The game says capping off a tower with a follower protects your followers, but it's unclear whether that unit is protected from kidnapping by later towers.

If two players capture each others' pieces, they are made part of a prisoner exchange -- you both have to give the other guy back his meeple. If you can't wait that long to retrieve yours, he can be ransomed for victory points. Giving three points from your total to your captor gets you your unit back.

The supplement comes with one other major thematically related component: a cardboard tower for stacking your tiles. About as tall as the Carcassonne box is long, it has two slots running top to bottom. The pieces no longer need to remain in loose piles about the playing area. Of course, now a single source of pieces has to be within reach of several players at once. For all that, it does exactly what it's supposed to do, and is quite a convenience until you have to put it away. They recommend not disassembling it (it comes preassembled), so a) schlep it around with you in or out of its box, or b) remove the cardboard insert from the original set so all the pieces you've collected with all these supplements fit inside. There's also some extra space at the top of the tower on the slim off-chance that a future offering will inject more tiles into play.

The high quality of the components for this series continues. You've got wooden blocks (though if they hadn't been

polished in this fashion they might stack above five floors with a bit more stability), new tiles, and the tower. The tower does its job admirably and makes for a much less cluttered table. The illustrations on the tower tiles show a little "C" of walls under construction, and while this blends in with the rest of the picture too easily (especially if it's too close to city elements -- both are light brown), it's not impossibly small. Plenty of other opportunities and reasons will arise that allow you to forget one of these important sites is nearby.

Purists are probably going to tear their hair out over this entry into the series. *Carcassonne: The Tower* provides perhaps the most vulgar mechanism for removing a player's annoying pawns from your path. It's not an unworkable game with these additions, but you're going to spend a lot of time rethinking how to position your pieces to avoid this new wrinkle. A fresh set of strategic considerations does spice things up, but since these tiles can be added to any free space on the board and built on at any time, it feels more like being shadowed by sharks than a predictable intrusion against which you can plan. If constant rules one-upmanship in supplements is a sticking point with your group, this may well be the first misstep in the *Carcassonne* line.

--Andy Vetromile

Where Do You Really Get Roleplaying: On a Computer or at a Table?

by Kim Bernard

My husband and I currently live in China, where roleplaying games of all forms are still in their infancy. So when my husband and I took a precious stack of gaming books. Our current supply includes **GURPS, Exalted,** and Wizards of the Coast's **Star Wars** products, along with some PDFs we've bought online.

Many people think of China as this dirty, primitive backwater. Well, they've still got a lot of dirt, but don't be fooled. They not only have electricity, air conditioning, and fast food, they've got the Internet. In major cities, you can find Internet cafes everywhere. In front of these cafes are huge advertisements for various computer games, most of which are MMORPGs -- Massively Multiplayer Online Roleplaying Games.

Well, after months and months of staring at Chinese ads for World of Warcraft, I e-mailed my mom and asked her to pick up copies for us. I sent her some money, and she shipped us two copies all the way from the United States. So, thanks to the wonders of the Internet, we're playing World of Warcraft on the U.S. servers even though we're on the other side of the planet. It's not our first MMORPG; we've have played a myriad of others and we had a good idea of what was going on and what we wanted.

Up until latching on to this latest Internet addiction, my husband and I had been playing **Exalted** or **GURPS** on a pretty regular basis. We are fortunate enough to have a few friends here who are also gamers. So we have regular exposure to both forms of gaming. It's a perfect shot to compare.

This brought up a good question: which is really, really roleplaying? Well, in my opinion, tabletop games are much more "roleplay" intensive. If you want to throw yourself into a character and talk to other people and expect them to react appropriately, play a tabletop game.

Why? Well, in a MMORPG your Game Master is the computer. The NPCs react in set, simple ways. Although the AI routines are getting more complex, and the games are getting more refined, there's still major limitations. What MMORPGs typically call "Game Masters" are not really people running the game at all. They're game police -- they watch for bad behavior, rescue players' characters from glitches, and track bugs. They don't monitor every word people say and try to bring them back on track with the game. With hundreds or thousands of players per GM that's impossible.

For this reason, you frequently encounter interesting failures of logic. For instance, in **World of Warcraft,** the Warlock class is supposed to be evil -- they're demon summoners and dimensional mages. The Warlock trainers in the human city of Stormwind are hidden in the basement of an inn, away from "prying eyes" like the mages, who might be angry with them. Yet plenty of the quest texts have references to your character's class, and many of the NPCs, even heavily armed guards, don't seem upset in the slightest that you're a Warlock with a demon following you around. In a tabletop game, walking into the same city with a demon in tow would at least get you thrown out of town!

The second major problem is the players. Although many of the **World of Warcraft** players are new to the roleplaying concept, or even to online gaming, the problems linger in every game. Most people either don't know how to or don't want to roleplay. In this regard, some MMORPGs are better than others. But most everyone resorts to "netspeak" to communicate quickly. Nothing breaks the magnificent image of the paladin, blocking his enemies with a shield while desperately casting healing magic than him yelling "OOM" (Out of Mana)!

The same problem also lies in tabletop gaming, although to a lesser extent. Most any game can break down into rules discussion or the random *Monty Python* discussion, completely breaking the mood. But because a computer game is less forgiving about mistakes and most people don't type 100+ words per minute, abbreviations and odd turns of

speech are common, even amid the most devout roleplayers. It's just easier to type "Add!" than "Another creature!"

But there is a catch to tabletop where MMORPGs have an advantage: visuals. The world can be very immersive because you're surrounded by someone's *very* vivid idea of what it looks like. You don't need any extra props, drawings, or detailed descriptions, because the place is in your face! This causes a lot of people to react more properly and not get confused when discussing places, people, and things with each other in character.

WARNING: Dramatic Logic Failures!

Almost all games, tabletop or MMORPG, suffer from what I call "Dramatic Logic Failures" -- for examples of tabletop instances, I refer you to *Murphy's Rules.* These logic failures generally center around places where the rules clash with logic. In most cases, GMs either jokingly run with it or they simply ignore the rules clash and say the logical things happen instead. A GM can also keep players' character logic in line by reminding them of things they would know.

But in a MMORPG, that person is absent and Dramatic Logic Failures abound. The Warlock example given above just scratches the surface. Why? Some of logic failures are pure necessity. Lots of things follow this course; they're made for player benefit, not characters, so they're not logical in the setting.

Most online games have "chat channels" -- places where people can talk with other people. Although most people can just "say" things, these says don't travel far, just like in real life. (But they do travel through walls just fine, which is really strange.) But chat channels work in large areas, and they frankly don't make much sense. Someone in a town on the other side of the forest can hear me when I talk? Is my character telepathic? Can he *scream* that well? What about guild chats, where you can chat with all the people in the same organization as yourself? They're in the pits of hell and you're climbing the stairs of the great central keep of the city, but you can talk to each other just fine! In most MMORPGs there's little to no justification -- they're there for the players' benefits, not the characters'. Many people try to make them fit roleplaying, but it's messy at best. They just do not fit.

In addition to the lack of logic of global chatting, most MMORPG worlds feel small because they *are* small. If a setting is actually on a more realistic or fitting scale, the world is so huge that players get tired of running around trying to find places. There is no GM to say "you travel for three weeks without anything happening." (There are exceptions where there are load screens that cover this, but they still don't fit because the in-game clock has little to no time passing.)

Finally, there's the death logic . . . or lack thereof. It's very rare in any computer game for anyone to die permanently. You die and someone resurrects you, or you die and turn into a ghost and go back to your body, or whatever . . . But you die and get back up. There is no terrible tragedy of death. Your little friend Alfie didn't die in that last battle, struck down savagely by the dragon. Most computer games are written like this -- save/load in single player games is the same concept -- because the computer is a rotten bastard of a Game Master who won't bend the rules on the best day of the year.

I'm a Hero! Really!

The final, biggest advantage to tabletop games is simple: you and your group are as heroic as you and the GM agree for you to be. You can save the world or just the neighbor's cat, or you can save the neighbor's cat and by saving the cat save the world. The world is saved and it's all better for it. Now, it may get screwed up in a thousand years or next week, but for now you can see it's brighter and it's time for a picnic.

In a MMORPG, you and your 500 friends will all be rescuing the neighbor's cat over and over again, one by one, until the quest is changed so that the neighbor's cat has indeed been rescued and now you need to rescue the dog. Oh, and neither pet has saved the world yet. It's still doomed. Not unlike the *World of Darkness* setting, MMORPG settings typically teeter on the edge of some terrible destruction, or at least hint at it really strongly. And keep doing so. Forever.

I W4nt My Ph4t L3wts!

That isn't to mean MMORPGs are totally lacking. They're not. Both types of RPGs are loaded with the ability to give you a sense of accomplishment.

There's nothing cooler than a dramatic ending to a campaign or even a battle where all of your character's utterly cool tricks really worked and you feel like a hero. You can get this out of either type of game.

An additional bonus to the MMORPG is the sense of accomplishment in the face of difficult competition. When you manage to beat down that bad creature that no one your level has ever managed to defeat before *and* you get the cool nifty magic item that is *so* rare, you feel accomplishment. You can wave around your cool gear and people can look and say, "Hey, look what he managed to do!" And you'll know it was cool because no one else around has your nifty item. You'll know the GM didn't give it to you at the end of the fight because he felt bad because the berserker got wasted . . . it's a rules lawyer computer!

But the Computer Is Your Friend!

The last, biggest advantage to MMORPGs is that they're on a computer. Wait a second. Haven't I been saying this is bad, bad, bad? There's one big advantage to a computer running things. Computers don't get tired and fall asleep. Computers can run 24 hours a day, seven days a week, available whenever you feel like playing. The one exception is whenever they take it down for maintenance, which can be at the worst times.

But remember: you can't bribe a computer with a pizza or cookies.

So Which Do I Play?

Well, uh, I play both (when I have time). The MMORPG is for socializing with friends from around the world and getting my cool loot, but tabletop is where I really play characters that are truly interesting to me -- that are truly more than the numbers. Over and over again in this article I've come back to the numbers. The computer has no emotions behind it, and the only non-numerical, non-rules stuff you'll really find in an MMO is with your fellow players, who may not be logical in the slightest. Tabletop is refreshing -- it requires not just number-crunching and tactics, but truer imagination. The rules can be thrown away when they stop being fun. The day we can get that with an MMORPG will be an amazing day indeed -- and I wouldn't be surprised if it's not in my lifetime!

Link of Interest

The videos "Episode 1: I Surrender" and "Episode 2: Why Surrender When You Can Resurrect?" These two "game films" neatly sum up the problems with MMORPGs and suspension of disbelief.

Fast-Learning Spells

for *GURPS*

by Demi Benson

For a game focussed on Young Wizards in Magic School, it is in-genre for aspiring wizards to learn new spells quickly in a leap of intuition instead of (or in addition to) through tedious academic study. In this style of game, once a mage has learned a single spell from a spell college, he may attempt to fast-learn another spell for which the known one is a prerequisite. The *[Magic Spell Charts](#)* from e23 are a great help for tracking prerequisites.

The requirements for fast-learning are short:

1. The student should meet all the prerequisites for the target spell. If the target has no prerequisites, then the student must know at least one other spell in the same college (this becomes the *base spell*); if not, the target spell must be learned through regular study.
2. The student should have seen the target spell successfully cast, although this is not required.

Fast-learning takes some amount of practice and preparation beforehand -- one hour or 10 times (10×) the usual casting time of the spell, whichever is more. The extra time is considered to be spent on recovering Fatigue, centering thoughts, thinking about past mistakes, and so forth. Magery talent will reduce the required practice time. e.g. Magery 3 learns in 70% of the time, so the minimum is 42 minutes or 7× the usual casting time. A student with Magery 10 or higher reduces the practice time to the actual casting time of the spell; in this case, Fatigue use might be more limiting than practice time.

Practice for fast-learning counts as Improvement Through Study (page 292 of the ***Basic Set***), either self-taught or regular if a teacher is present. If the student fails fast-learning, time spent on practice should be tracked in case the student fails repeatedly but accumulates enough time to earn 1 character point.

At the end of that time, roll vs the Fast-Learning Number:

- success means the student can spend an unused character point on the target spell ("Oh! Now I get it!"),
- failure allows the student to try again later ("I still don't understand"),
- critical failure means the student may never fast-learn that spell ("The way you explain it doesn't make sense. I'll stick to the book.").

If the student does not have an unused character point, the GM may either forbid fast-learning or add an appropriate quirk (e.g. "Obsessed with Learning Earth to Stone") or minor negative reputation related to studying habits (e.g. "Overachiever," "Teacher's Favorite," "Bookworm," or the like). All of these can be bought off later, but should be used as roleplaying opportunities.

The Fast-Learning Number must be 3 or higher for any chance of success.

Fast-Learning Number = Base's level + Base's Prerequisite Count - Target's Prerequisite Count + Modifiers

The base spell is the known spell in the same college as the target spell.
Base's Level is the skill level of the base spell.
Base's Prerequisite Count is the Prerequisite Count from pages 223-237 of *Magic* for the base spell.
Target's Prerequisite Count is the Prerequisite Count from pages 223-237 of *Magic* for the target spell.
Modifiers are from the table below. Modifier Conditions -4/-8 Each spell prerequisite missing* Impossible Any non-spell prerequisite missing (e.g. Magery, Animal Empathy) +1 Seen spell cast with careful explanation (e.g. by a teacher in classroom)† -0 Seen spell cast in everyday situation† -4 Seen spell cast while in stressful situation (e.g.

combat)† -6 Read/heard accurate, detailed descriptions of spell's effects, but not seen it cast† -10 or Impossible Read/heard sketchy accounts of spell's effects, but not seen it cast Impossible Has only heard of spell +1 Each doubling of the required practice time‡

* If the missing prerequisite spell has a higher prerequisite count than the target, the modifier becomes -8.
† These assume detailed descriptions and theory (i.e. good textbooks) are available to the student during practice. If they are of lower quality or missing, there is an additional penalty of -1 to -6.
‡ Doubling of practice time is open-ended, but at +9 (512 times regular practice time of 1 hour) the student will already have spent more than 400 hours on self-taught practice and should earn the 1 cp. This should only be used if the student meets all the prerequisites.

Example: Michelle is a student at a school of magic. She is studying Relieve Sickness (Prerequisite: Lend Vitality; Prerequisite Count: 3) and knows Lend Vitality (Prerequisite Count: 2) at 13. As none of her fellow students are currently sick, she convinces one to drink to excess so she can practice on him. She's seen the spell cast by her teacher in class so there is a small bonus. After an hour of preparation and going over notes, she's ready to try the spell. Michelle's Fast-Learning Number is 13 (base's level) + 2 (base's prerequisite count) - 3 (target's prerequisite count) + 1 (seen it cast with careful explanation) = 13.

Example: Tristan is studying Insignificance (Prerequisites: Persuasion and Avoid, Prerequisite Count: 10) from the Communication and Empathy college. He's read a detailed treatise on mind-affecting spells, but never seen it cast. He knows Persuasion (Prerequisite Count: 2) at 21, but does not know Avoid (Prerequisite Count: 11). His Fast-Learning Number is 21 (base's level) + 2 (base's prerequisite count) - 10 (target's prerequisite count) - 8 (missing prerequisite) - 6 (never seen it cast) = -1. This spell is far above his ability. In order to have any chance of success, he'd have to practice and prepare for 16 hours to raise the Fast-Learning Number to 3, even then he's still almost assured a failure.

Use in a Campaign: Young Wizards in Magic School

Using these rules would allow the students the free time to investigate creepy teachers, pull pranks on rivals, and romance other students all in-between classes, studying, and school sports.

Normally, professors will have their own pace of teaching; some professors would be irked if the student learns faster than the syllabus, while others might enjoy the chance to teach at a more advanced level. Either way, there are many roleplaying opportunities for the students in seeking out or avoiding certain instructors.

Slowing Down Advancement

If players try to zoom through four years of education in a single semester, the GM can control a student's advancement by limiting free character points, requiring Thaumatology rolls to understand teachers and textbooks, or making advanced textbooks poorly written ("Oh no! Another one by James Humphrey-Raynes; he's awful."), hard to access ("All the best books are kept in the Restricted section of the library. We'll need a note from a teacher to take them out."), or rare and unavailable ("Wayol's treatise on movement? No, none here, but I've heard the Court Wizard has one.")

Office Surprise Closet

by Alice Turow

In today's world, people are exposed to all manner of material in modern offices that would be called "mundane." While the items we have today would seem magical to people just a few generations ago, their commonplace nature makes them easy to ignore in the day-to-day bustle. Yet even among the boring miscellanea in the standard business supply closet, there are still items that can surprise those who grab them by mistake. These rarities are, for lack of a word, magic.

Here, then, are five reimagined office items with abilities that might still provide surprises and rewards for many different modern magic and near-magic campaigns.

Rewriter Pen

Shannin held the pen loosely, letting conscious thought flow from her mind. As she did so, she began to write, with smooth strokes and a deliberate purpose. "There is nothing left for me in this world," she wrote, "and death feels like my only escape. My only salvation. My only hope."

*"Well, this **can't** be good," thought Shannin.*

The rewriter pen appears to be an ordinary high-quality dark purple ballpoint pen -- the type that might be given as a graduation present or used by a somewhat high-powered executive. In fact, it *is* an amazingly high-quality pen; its black line is steady but versatile, the ink flows smoothly and unerringly, and its seemingly indestructible nature allows it to write at any angle and any atmospheric conditions . . . even underwater. However, it possesses a still more unusual quality: Anything written with the pen is "stored" within it.

If someone holds the pen without thinking of any specific use, it will begin to rewrite what it has scribed in the past, exact in every way possible. It uses the same strokes, pressure, and speed of the original writer. The only inconsistencies from the original writing will be in the quality and style of paper; if the original was written on a standard-sized sheet of paper but the pen's holder is using it over a blank notepad, it will probably run off the edge of the paper while rewriting.

Copies are stored in a first-in, first-out basis; assuming it's a different writing session, the time between the pen's usage doesn't matter (although if someone merely pauses during the same writing session, those pauses are duplicated). Thus if someone wrote out a grocery list one day, a letter to his lover the next, some doodles in the margins of a phone book a week later, and filled out his tax forms six months later, someone using this pen would write out the grocery list, letter, doodles, and tax form information one after the other. However, all copies are made in "real time"; if the letter took six hours to write, then it would take the person recalling the letter six hours to rewrite it as well.

The wielder of the pen does not gain any special insight into when the material is done or when the sheet of paper must be replaced, but he can usually figure it out via context of the output; if he is at the end of the page and the pen is taking an extra-long pause, then the wielder had better get a new sheet of paper out soon. However, this method is not foolproof; more than one user of the rewriter pen has been surprised to return to the item later, having signed a rewritten letter, only to discover one or more postscripts that significantly alter the tone or implications of the information learned.

The use of the pen can be interrupted at any point, merely by focusing on it; thinking of consciously using the pen is enough to stop it from recalling anything more. Skilled users of the rewriter pen find it effortless to shift their thoughts into and out of phase while making copies, but those new to its usage may need to make standard-difficulty willpower checks (or whatever is similar in the campaign's system).

Once a piece is rewritten (regardless of how successfully), that stored item is gone forever. The act of "recopying" the pen's output does not store that output again. However, there is nothing to prevent a person from re-recopying the letter's copied output back into the pen, outside of the skill of the wielder, who would need to "forge" or trace the original using the pen if the exact handwriting or style is important. For example, recopying a secret code is trivial if the user merely cares about storing the secret information; however, if the person used this item to recall a pen drawing of a famous artist, that item couldn't be re-stored later without trying to trace the original material.

The rewriter pen can store a seemingly infinite number of items; the biggest limitation seems to be the physical requirements of the time and tedium of using the pen to store information in the first place. Whether or not the ink cartridge can be replaced is up to the GM, and may depend on where the power of the pen truly lies; if it's with the pen itself, then the cartridge should be exchangable with any replacement that fits, but if it lies with the ink then using it up should cease the pen's utility (although this opens up the possibility of placing the rewriter pen's cartridge in someone else's pen).

Campaign Use

The rewriter pen is a fairly powerful item, albeit one that requires cleverness to utilize fully. For players, it's a good way to sneak or acquire all manner of information; trying to get information to others in the group is a mere matter of transporting a pen rather than pads of paper that can be intercepted or destroyed. If the pen were planted in the offices of an evil bureaucrat, it might store secret plans or correspondence (although reacquiring the pen might be an adventure unto itself). And it can be used for nefarious purposes; for example, someone getting a famous person's autograph with this pen has the means of recreating their exact signature (once).

For GMs, the rewriter pen is an ideal plot device for mystery adventures. It allows the players to intercept letters or clues in a way that might not allow much context; the PCs might discover this pen at random and they recall a letter that says something cryptic ("The ritual to summon Great Cthulhu shall be completed in two days in the basement!"), and they may need to figure out where the pen came from and when the original letter was written. It can also introduce a sense of urgency and suspense since its means of information retrieval is in real-time; if the heroes know the world is going to end in six hours, do they try to rush out ill-informed or do they keep transcribing the long, rambling letter of the person responsible in hopes of more clues? (Or, worse, go through 10 pages of Dr. Ensane's grocery store lists hoping to even get to a letter containing more clues?)

Other Worlds

The rewriter pen can work in almost any era, since the usage of ink to transcribe thoughts is almost as old as literacy. In fantasy campaigns it would obviously be a quill, stylus, or some other common writing instrument. However, even in more high-tech environments it's still suggested that the device not be upgraded to anything more advanced (such as a computer or typewriter); computers can already retrieve documents, and any form of information storage faster than handwriting takes away some of the plot possibilities. Curiously, the rewriter pen can also be used in fairly realistic modern or near-modern campaigns; some pen computers today can store the penstrokes of a user, so the only "superscience" involved is miniaturization and the means of recalling the stored information . . . perhaps via force-feedback servos.

Staple Gun

*Agent Laura snickered. "Just what do you think you're going to do with **that** thi . . ." Her words ended with the sharp pain in her shoulder mingled with the realization that she could no longer feel her arm. Then she passed out.*

The staple gun looks just like an ordinary high-quality desk stapler, and for the most part it is. However, when it is unfolded -- in the means usually used to staple posters to the wall -- and held in either hand with a squeeze-grip, it becomes a powerful weapon. In particular, it has the power of a large handgun (such as a Colt .45), but without most of the disadvantages. It is silent (except for the "click" of discharging a staple), has no recoil, looks harmless and is easily concealable, and can fire as many shots as it has staples.

Like the rewriter pen, whether or not the staple gun can be recharged depends on the nature of the force that gives the gun its power. If the power lies with the staples, then the staple gun is useless once the batch that is in the staple gun is depleted.

Campaign Use

Although a fairly silly device, the staple gun could still see use in some campaigns. For example, it could be the foundation of a bureaucratic vigilante in a *Tick* or *Mystery Men*-esque campaign. It would also fit in well on any professor's desk in the **GURPS IOU** setting, or in the palms of a pain-preferring pencil-pusher in a **GURPS Goblins** setting. It may even serve as a final hidden weapon of a master villain in a high-gadget spy campaign.

Other Worlds

The appeal of the staple gun is a relatively modern phenomenon (the stapler itself having been invented in the late 18th century), although the notion of using an office supply element as a weapon might be translated to other times and places. For example, there have been rumors throughout the ages of a mythical writing device that is mightier than a sword.

Nametag Stickers

No small part of Yolanda's mind was screaming out to pick at the sticker on her vest. But, she knew, doing so within the secret government base would be a grave mistake. After all, they were much more likely to shoot her on sight than they would the President . . .

These stickers proudly proclaim, "Hi, My Name Is . . ." with a blank spot on the front. These stickers could be used as any other name stickers, but doing so would be a waste of its potent power. For, if the full legal name of a person is placed on the nametag sticker, all those who witness the tag wearer will believe it to be the individual named.

The nametag stickers will only begin working at the instant someone can see the sticker (not necessarily being able to read it). As such, experienced wearers of the stickers tend to make fairly sweeping gestures with their bodies, ensuring as many eyes as possible will gaze upon the tag. The device will work through all known surveillance methods, including video cameras and photographs, so long as the resultant image has the nametag visible (or, in the case of video footage, the sticker is viewed by the witness at some point). Thus a photograph of someone wearing a sticker proclaiming "Hi, My Name Is . . . Lee Harvey Oswald" would be believed by all those witnessing it to be Lee Harvey Oswald.

The nametag sticker will disguise the form and voice of the person involved (or, at least, the person witnessing the sticker will believe it to be the named person's form and voice); neither gender, age, nor physical shape will prevent the user of the sticker from assuming any identity whose full name he knows. The nametag stickers do not bestow any other type of disguise abilities on the person wearing it; if the person donning the tag claims to be the CEO of EvilCo while stuttering nervously and wearing a tanktop, then those witnessing him will believe it to be the CEO of EvilCo, who happens to be stuttering nervously while wearing incongruous garb. The only thing that witnesses won't necessarily notice is that the person is wearing the sticker; observers who make a difficult willpower check (or the campaign's equivalent) will remember that the wearer *did* have on a nametag that said what his name was.

Witnesses of the sticker see the nametag wearer as the person they believe him to be, filling in the details with their own knowledge or imagination. If a witness doesn't know who a person is, the wearer projects his own knowledge as to what the person sees, although this knowledge isn't usually meaningful unless the person announces it. If neither the witness nor the wearer have a clear idea of who the named person is, the wearer projects his ideas of that person onto the witness.

For example, Agent Kate Carson is trying to sneak into the corporate headquarters of ACW Inc., helmed by the

enigmatic Artemas Capricorn Watterson. Kate has no idea who Artemas is, and has never seen a picture, but is wearing a nametag with that name regardless. Kate first encounters a security guard who knows of -- but has never met or seen -- Artemas. The guard sees Kate from behind; at first, he sees a slender woman, but as Kate turns around and he sees the tag, he sees a powerful corporate businessman whom he recognizes as Artemas (clearly his eyes were playing tricks at first). Later on, she meets a janitor who's never even heard the name Artemas Watterson (he's a temp, and he only knows the place as ACW Inc.). Upon seeing the tag, the janitor sees a meek, mousy middle-aged man (Kate's vision of what Artemas looks like); although Kate is still in "disguise" (the janitor doesn't see the "real" Kate), the janitor will probably require some convincing -- Kate's assumptive power means nothing to him. Finally, Kate encounters the senior vice president of the company -- a close associate of Artemas. Upon seeing the tag, the vice president sees Kate as the person he knows Artemas to be: a frail, steel-eyed old woman . . . although how Artemas (Kate) got out of her life-support wheelchair and started walking around will require some explanation.

Obviously the different iterations of who-sees-what can get quite confusing, and most people who utilize nametag stickers do so only for people they at least have *some* idea about, simply so they can know what others will see and how to act as that person. But, in a pinch, all that's needed is a name and a marker.

The power of the nametag stickers is such that almost no restrictions are placed upon who can be impersonated; living or dead, real or fictitious, flesh-and-blood or mythical, it makes no difference. The only restrictions seem to be that the person needs to have a name, and it needs to be a sentient person. Thus someone could not impersonate the woman who washed Jesus' feet (no documented name) nor the reindeer Donner (not sentient). The sticker itself also provides no other powers or abilities; for example, someone wearing the name of the Medusa would not turn people into stone, although it *would* still be a very freaky and frightening effect. (Of course, impersonating a religious founder in front of a devout person might have interesting effects, regardless.)

Nametag stickers are obviously very powerful. GMs wishing to limit their utility should merely limit their quantities (for example, only one sheet of eight stickers), since each sticker can only be used for one name; attempting to cross out the name or deface it will cancel its effects.

Campaign Use

Nametag stickers are a fairly silly option, although they can have their uses in more "serious" campaigns. For example, they would work well as fairly minor magical items in a ***Changeling: The Dreaming*** or ***Over the Edge*** game. They might even work as fetishes for more human-focused werewolves in either of the iterations of White Wolf's ***Werewolf*** settings.

Other Worlds

The notion of the "nametag" is a pretty new phenomenon, although it's possible to translate the base idea to other genres or settings. For example, a blank flag or herald might be paintable with the colors of any nation, permitting others who see that person's vessel or group to view them as belonging to that allegiance. In a setting with virtual reality, a RENAME function might permit people to see the traveler's avatar as a different entity.

Morning Coffee

Tony sighed as he did some mental calculations. Six hours a page to decode; 16 pages. That's 96 hours. "Well, the fate of the world's at hand," he thought, pouring his morning coffee. "So it looks like it's going to be four days straight. I can always sleep next week." Regular coffee has the effect of keeping the drinker more alert, thanks to the magical properties of caffeine. Morning coffee will keep the drinker awake and alert as long as he keeps drinking it. So long as the drinker consumes one cup (eight ounces) of morning coffee every hour, he *never* needs to sleep; he could, theoretically, continue working until the end of his life. In fact, drinking morning coffee means the person cannot sleep under *any* known means (including drugs or blows to the head), even if he wants to; his only choice in that circumstance is to forgo coffee and wait the hour.

However, morning coffee *does* have a downside. Should the drinker stop consuming it, he almost immediately falls asleep for a period equal to whatever time he should have been sleeping during in the first place (making a willpower check or system equivalent for each round he wishes to stay awake); no amount of force or effort will awaken the person before the end of the required sleep time, although he can still suffer damage or even die. The only way around this side effect is if the person drinking it hasn't skipped any sleep yet (for example, if he drinks a cup after having just woken up from a full-night's sleep).

The only other effect morning coffee has is to keep the drinker alive during this forced rest; no matter how long he slumbers as a result of the coffee, he will not need to eat or excrete during the sleep, nor will his body suffer any other deleterious effects as a result. However, upon waking up the person will be *quite* hungry, need to make a dash to the bathroom, and feel like a parcel of kangaroos crawled into his mouth to die.

As an example, Agent Link drinks morning coffee every day for six days straight. He's missed six days' worth of sleep, which is 48 hours; if he stops drinking it at the end of day six, he'll immediately fall into a deep slumber for two days straight.

Morning coffee won't prolong the lifespan, and the person drinking it will have the same caloric requirements as normal. However, if someone *were* to be on a permanent regimen of morning coffee, it would have the effect of extending his effective lifespan by a third, since there's nothing to prevent him from forestalling sleep until keeling over. The motto "I'll sleep when I'm dead" is incredibly apropos for such folks.

Morning coffee bestows no other benefits; it has no calories and doesn't provide any nutritional value (outside of any sweeteners or lighteners added), and it has all the other side effects of drinking a moderate amount of coffee -- slight jitteryness, a need to use the restroom, and so on.

Campaign Use

How common or rare morning coffee is will, obviously, have an effect on how it's used in the campaign. Again, if the effect is only in the coffee, then the result will likely be a relatively minor boost for a special event or dire situation. However, if the power is in the coffee maker (or the coffee itself is plentiful), it may well change the face of the game world. For example, agents who drink morning coffee permanently could have assignments that would be impossible otherwise. (It may also be the beverage of choice for government agents whose schedules require them to save the world in 24-hour jags.) Staying awake can also have a number of uses itself; for example, some Cthulhu-esque horrors might be unable to haunt the dreams of investigators utilizing this brew. Conversely, the threat to keep a fae away from the dream world would be a considerable punishment in a *Changeling: The Dreaming* campaign.

In addition to the benefits of being able to stay awake, the ability to store up effortless *sleep* is also a benefit. For example, the use of morning coffee could form the basis for a cheap "sleeper ship" to another planet. To survive a three-month journey, the crew would merely need to stay awake using morning coffee for nine months; they would need no food and only the respiratory supplies necessary for someone in a sleep-steady breathing state.

Other Worlds

There's nothing to keep morning coffee from being a relatively realistic potion; there are already experimental drugs that seem to permit one to stay awake for a week at a time (and without morning coffee's side effects). As such, it would find a home in almost any campaign at any time, although whether its abilities are caused by magic, medicine, or microbes would depend on the setting.

The Stopped Clock

"Boy, that clock on the wall just never seems to move," thought Arthur, trying to thread the needle without looking at it. "And it's a good thing, too, if I'm going to have any hope of sewing up Roxy's wound."

We've all had the experience of staring at a clock that didn't seem to budge. The stopped clock takes this one further; as long as someone stares at the clock, time *does* stop . . . for everyone that isn't the person looking.

For the person looking at the clock, he will see that time has stopped; none of the clock's hands will move, and if he is aware of anything else around him, he will note that all other activity has ceased. People are motionless, phones don't ring, copiers fall quiet, and so on. In all other ways, the stopped clock resembles a normal office clock, with a large round body, white face, black numbers complementing the black minute and hour hand, and a red second hand. Time passes normally for the person, although they can interact fully with the real world (able to move or take objects, attack or reposition others, and so on). However, any such interactions have to be done while looking at the clock, since any glance away from it will start up time again as normal. As such, doing anything complex should be treated for game purposes as being blind or in total darkness.

It is possible to do useful things while time is stopped; for example, nothing keeps the clock-watcher from glancing away, merely using the clock to slow things down. Thus a surgeon who darted his eyes back and forth between clock and patient might be able to slow down time to a half-pace, buying valuable time for him to take longer with the operation (although the constant eye-flitting might be worth a penalty to the doctor's skill rolls).

In theory, only one person will be stopping time at any one time. In the unlikely event that two people should look at the clock at the same time, they will both be "out of time" together; they can interact with each other as normal, although the moment that one's eyes gaze away from the clock that person will freeze.

These clocks are usually attuned to anyone, making them somewhat unpredictably dangerous. Some speculate that there are some clocks that are attuned to one specific person -- perhaps whoever puts in the batteries. If these models exist, they would be powerful weapons; an evil mastermind would be virtually unstoppable in his office with this clock and a gun with a full clip.

Campaign Use

Obviously the stopped clock is devoid of any realistic influence, although there is nothing inherently humorous (or humorless) about it, making it suited for any modern setting where there is sufficient supernatural weirdness to permit such a device: *Toon* and *IOU* on the humorous side, *Mage* and *Unknown Armies* at the other end.

The stopped clock can serve as an interesting conundrum for a modern campaign (regardless of where the clock is located); what if you needed to stop time for some reason -- say, to prevent a bomb from going off -- but the only way to stop time required you to deprive yourself of most of your vision and a great deal of your mobility?

Barring this, it makes an effective plot device for some mysteries. For example, if this clock were placed in a jewelry store or an art museum, a thief to whom the clock is attuned could use the power of the stopped clock to affect some amazingly brazen crimes.

GMs wishing to limit the power of the stopped clock may decide that it only works at certain times or certain days. For example, it might only be able to stop time in the period between 4:55 PM to 5:00 PM or on the day before a paid holiday. (Of course, the person utilizing the stopped clock could make those five minutes or that pre-holiday workday last as long as he wanted . . .)

Other Worlds

The basic idea of the stopped clock can apply to any time-keeping device: sundials, hourglasses, candles, and so on. In a suitably weird campaign, perhaps the first stopped clock evolved with the creation of the first mechanical belltower (probably in the 11th century in our world) or the first pendulum clock (in the mid-16th century); in these cases, perhaps the need for the inventor to keep a close watch on the clock somehow altered reality by enabling time to be quantified and "captured."

Oceal Havelock and Urias Fizzelworth, Loremasters

for *Over the Edge* and *d20 System*

by Caleb Dillon and James Martin

Background

Oceal and Urias first met nearly 20 years ago. At the time, Oceal was a young wizard and Urias a wandering cleric of Gruumsh. A party of adventurers were in need of a healer and a learned person; they couldn't find one individual to fill this need, so they accepted the aid of both Oceal and Urias.

Urias had lived as an outcast the whole of his life, mostly due to his half-orc heritage, and his human side had done little to soften his heart until he met Oceal. She was a simple girl, quiet at first until you spent time knowing her, but possessing knowledge beyond her years. She was kind to Urias, as no one else had been.

Urias took on the role of her personal protector. In exchange, Oceal taught Urias during every free moment they had. Urias was wise in the ways of the world, but not learned. At first, he was merely interested in being close to her, but over time, he found that he was retaining much of what Oceal taught him. The discovery of a rare *periapt of Intelligence* early on in their adventuring career aided him towards this end.

It wasn't until later that their friendship suffered its first test, which would divide their party and change them forever. Their group was seeking out a relic known as the *crystal hood* (see description of item, above). They found the hood within a subterranean cavern, but the items discovery awakened the hood's guardian.

During an intense battle near the hood's resting spot, a stalactite broke loose after being struck by eldritch energies, striking Oceal a lethal blow to the head. She lay on the cavern floor, dying; Urias rushed to her aid, yet was completely out of spells. In that moment, out of desperation, Urias -- muttering a silent prayer to Gruumsh -- placed the hood on Oceal's head.

What happened next was both wondrous and terrible to behold. The hood scintillated with light and fused itself to Oceal's head. Oceal slipped into a coma, but she was alive and the bleeding stopped. The immediate crisis was averted. Their companions slew the hood's guardian, and they returned to the surface. Urias carried Oceal the entire way.

A week later, Oceal opened her eyes. While unconscious, she has experienced vivid dreams of other places. Upon waking, she seemed to possess an unusual sense of clarity. Surely, she surmised, all this was linked to the hood. But how, she could not fathom.

She separated from the party shortly, and Urias -- who lacked the heart to continue without her -- followed suit soon after. Oceal needed time to take all this in and she wanted to be alone. Urias was heartbroken. He rented out a room close to the tavern she was staying at. Later, he would rent out the shop below as well, and Oceal would become a permanent resident of the tavern, which was a front for a secret society she was later asked to join. This society helped her ascertain the true nature of the hood in exchange for her services. She was granted access to a vast library, and guards for protection.

Urias became a dealer in rare books, a reluctant loremaster. He visited Oceal at the *Ghostly Whisper* a few times, but she was different somehow, changed, not herself. He retreated, sulking. They have since fallen out of touch, though Oceal often watches Urias from a distance, and he often inquires about Oceal through his informants.

In Campaigns

The Ghostly Whisper and Urias' shop can easily be inserted into any campaign world. Conceivably, they would more easily blend into a large metropolis than a smaller town or village, but if the city is too big, then other loremasters will be detract from the uniqueness of these characters and their relationship.

Oceal and Urias remain linked by reputation and previous association. Although Oceal gives out reliable information, there is a stigma surrounding her, not only due to the hood but also her affiliation with a certain secret society.

Urias is known to be less reliable when it comes to his lore; he just doesn't have the resources or aptitude for learning that Oceal does. However, much of his information is from street informants under his employ, therefore those seeking answers to more recent events in question, including local rumors, will probably find him to be the more useful.

Oceal falsely believes her hood grants her flashes of insight into the immediate future, and as such often finishes her would-be patrons questions for them. Urias, on the other hand, sees every question with a coin value attached to it, and so waits for the PCs to finish asking their queries before giving anything away.

Both loremasters are usually busy, and so will generally ask new patrons to return in a few days, if they can, once they've had a chance to do some research. If these new visitors are pressed for time, Urias will scoff and say something like "If you don't have time, I don't have time!" Oceal, on the other hand, will gladly tell what she knows.

The secret society Oceal leads could be just about anything, from a group of elite mages to a band of rogues. Remember, however, that this society provides her with vast resources in the form of tomes of lore, and therefore must have some access to knowledge of this sort; a psion benefactor works especially well.

Oceal has a small booth in the tavern that she never leaves during the day. She always has several books spread out in front of her. Oceal will accept an upfront deposit of 50% and will expect the other 50% when she completes her assignment. She'll give clients are a day or two to pay before she sends a squad of enforcers from the society to "make payment arrangements," hopefully without a confrontation.

Oceal sometimes asks for something of new visitors in order to seal the deal. This could be a lock of hair, an arrow, a coin, just so long as it belongs to the patron; if Oceal isn't paid, she will use this item for the purpose of scrying later. If the patron realizes the purpose of this token, she won't deny it but won't go into any depth.

Oceal is well protected. She has a bowgun attached to a swivel beneath her table, and the arrows are usually tipped with a non-lethal sleep inducing poison. If her life is ever seriously threatened, five to 10 bouncers (Ftr 4/Rog 1) can leap to her aid in one round; she can always summon more powerful allies using the charms off her bracelet of friends (1d4 adventurers, each of them level 8+1d12, 1 fighter, 1 sorcerer, 1 rogue, and 1 ranger). Urias always demands the full fee up front; he used to have a problem with adventurers coming to him for information and then perishing before they could pay him in full.As an ex-adventurer, Urias is capable of defending himself and won't hesitate to kill an intruder if he deems them a threat.

Urias' shop is small and cluttered. Dust coats everything with the exception of the books he's been working out of most recently. Torches in wall scones never burn down (care of a *continual flame* spell. The floor of his shop is wooden, with the exception of a large patch of stone 20 feet across. Beneath this stone is s secret room with no door, one *everburning lamp* and a small prayer alter dedicated to Gruumsh. The stone can only be moved by an incredible strength check (DC 35).

His shop is under the effects of a permanent *hallow spell.* This spell has several lasting effects, but one is a permanent *invisibility purge.* He won't risk harm to his shop or possessions, and so he usually casts a silence spell the moment he feels threatened, then uses his silent spell feat to cast *anti-life shell,* dealing out swift death to weaker foes.

If seriously threatened, he casts *meld into stone* over the stone flooring and sinks into the chamber below. There, he reads from a scroll of *word of recall* to teleport a safe distance away until the danger has passed. He will not hold back the next time he encounters his would be attackers, praying for spells like *harm* and *blade barrier.* Upstairs is the same story as below, dirty and cluttered. A *glyph of warding* is just over the arch of his bedroom door, out of sight to all but the most careful observer.

His room possessing nothing of value with the exception of one item. In an iron coffer hidden under the floor (search DC 20), is a fragment of crystal about the size of a small gem. This is a piece of the *crystal hood* that Oceal wears. Urias will go to great lengths to recover this fragment if it were ever stolen. If a thief were to try to sell it, they would find it of little value (5 gp). If this fragment were ever given to Oceal, and she were to place it against her temple, she would be aware of Urias' feeling for her. Perhaps with that knowledge, she might have the courage to tell him she feels the same way (possible side quest XP bonus).

Over the Edge Stats

Oceal is light framed and only slightly shorter than an average adult female. She is serenely beautiful with timeless features. Her head is covered by a translucent crystal hood that swirls with bright colors. She appears to be in her late twenties.

Urias is a lumbering tower of muscle who hides his brawny form beneath heavy robes and a faded, red cape. His wear multiple earrings and nose rings. He is middle aged for a half-orc.

Oceal's Traits

Loremaster -- 5. Oceal and Urias were once both members of the same adventuring party. They both retired to become loremasters after a quest gone awry.

Wizard -- 5. Oceal possesses intelligence beyond her years, and the crystal hood she wears gives her even greater insight.

Hit points -- 37. Oceal is healthy, but not particularly tough.

Secret -- Oceal's hood is the only thing keeping her alive. Without it, she would die.

Flaw -- Oceal, despite her outward beauty, is actually going on 50 years old. Her aging process slowed drastically after donning the hood, though she isn't entirely for sure why.

Important Person -- Not surprisingly, for Oceal and Urias, this person is each other. Urias is in love with Oceal. For her part, Oceal cares for Urias a great deal.

Urias' Traits

Cleric of Gruumsh -- 6. Urias' domains are chaos and strength. Urias tends towards a neutral disposition in life.

Hit points -- 71. Urias is robust and thick bodied.

Secret -- Urias has been in love with Oceal for years, but would never admit as much to her.

Flaw -- Urias is crass and forthwith.

Important Person -- See above.

d20 System Stats

Oceal Havelock: Female human wizard 5/loremaster 5; CR 10; Medium humanoid; HD 10d4+10; hp 37; Init +2, Spd 30 ft; AC 12, touch 12, flat-footed 10; Base Atk +4; Grp +3, Atk or Full Atk +3 melee or +7 ranged (1d4/19-20, masterwork hand crossbow); SA spells; SQ familiar, secret of instant mastery (scrying), secret of newfound arcana, secret of more newfound arcana, bonus language (Orcish), lore (Oceal adds her Int. modifier and her loremaster level

to all her Knowledge related checks. This has already been accounted for in her profile, below); AL NG; SV Fort +2, Ref +2, Will +10; Str 8, Dex 14, Con 13, Int 17, Wis 12, Cha 10.

Skills and Feats: Appraise +6, Decipher Script +13, Gather Information +10, Knowledge (arcana) +22, Knowledge (the planes) +22, Knowledge (religion) +22, Speak Language (Celestial), Speak Language (Dwarven), Speak Language (Elven), Speak Language (Abyssal), Use Magic Device +16; Scribe Scroll, Scry +14, Skill Focus (Knowledge, arcana), Skill Focus (Knowledge, the planes), Skill Focus (Knowledge, religion), Skill Focus (Use Magic Device), Iron Will, Brew Potion, Craft Wand.

Familiar: Oceal has a cat familiar named Tybalt that is often seen wandering around the *Ghostly Whisper.*

Wizard Spells Prepared (caster level 10th): *0*arcane mark, detect magic, open/close, read magic;*1st* comprehend languages, erase, identify(2), message;*2nd*alter self, arcane lock, detect thoughts, invisibility, knock, see invisibility;*3rd*clairaudience/clairvoyance, illusory script, nondetection, secret page, tongues;*4th* locate creature, fire trap;*5th*false vision, sending.

Spellbook: as above plus all; *1st* change self, Nystul's magical aura, Nystul's undetectable aura; *2nd*-arcane lock, Leomund's trap, locate object, shatter; *3rd*-explosive runes, gentle repose, sepia snake sigil stuff; *5th* Leomund's secret chest, Rary's telepathic bond, seeming.

Possessions: extensive collection of arcane tomes pertaining to spells, history (both local and regional), the planes, and other lore, candle of truth (always in her booth), stone of alarm (hidden in a wooden chest, which itself rests on the Ethereal Plane, care of a *Leomund's secret chest* spell), braclet of friends (4 charms remaining), dust of tracelessness, crystal hood of scying, masterwork handcrossbow (attached to a swivel beneath the table of her booth), 100gp.

Crystal Hood of Scrying: Though once believed to have been of Arcane origins, this unique relic is actually a psionic item. It was conceived of as a prototype for a new type of crystal mask, intented to be worn like a helm. It will comfortably fit a female human, elf, or half-elf of average size. The hood is made of nearly transparent crystal, but when donned the smooth faces of the crystal hood swirl with colors, bright pink, blue, or violet hues, depending on the wearers mood.

The hood grants the wearer access to the psionic power *Remote Viewing.* (If the GM does not have access to the **Expanded Psionics Handbook,** then substitute the *Scrying* spell for this power). The wearer of the hood need not be a psionic character, nor do they need a pool of power points to activate the hood; merely donning it is enough. The hood mentally "links" to whoever dons it, so that they can utilize the *remote viewing* power; however, that is all.

If the wearer is a psionic being, however, then the full range of the hood's powers are revealed. The following psionic powers can be used through the hood while activating its *Remote Viewing* power: *elfsight, darkvision, expanded vision,* and *sensitivity to psychic impressions.* The following powers have a 5% chance per user level of operating correctly: *mindlink, lesser mindlink, forced mindlink, detect psionics, detect thoughts,* and *missive.* Once per day the user may attempt to implant a *suggestion* (as the power, DC 14).

Mindless undead, beings with an intelligence score of less than 3, and beings immune to psionic powers are unable to activate this device when donning it.

The crystal hood, unfortunately, was damaged (a chip has been broken off and is missing) at the time it was donned by its present wearer, Oceal. The mental "linking," in her case, was permanent; the hood literally fused itself to her skull and brain tissue. The hood was never designed for this sort of symbiosis. As a result, each round Oceal uses the crystal hood she must succeed at a Fortitude save (DC 10 + 1/round spent concentrating) or pass out due to the intense migraines use of this item causes her. So far, the benefits the hood provides have far outweighed its perils. However, if Oceal ever found a way to remove the hood, or it was destroyed while she was still wearing it she would soo n thereafter die due to major hemorrhaging of the brain. Physically, the crystal hood has same characteristics of a psycrystal (AC13, hardness 8, and 20 hit points) and "regenerates" its crystal matrix in exactly the same manner.

Manifester Level: 10th; *Prerequisites:* Craft Universal Item, *remote viewing, see invisibility, true seeing, detect*

thoughts; Market Price ; *Weight:* 5 lb.

Urias Fizzelworth: Male half-orc cleric 6/loremaster 5; CR 11; Medium humanoid; HD 6d8+12 plus 5d4+10; hp 71; Init +3, Spd 30 ft; AC 9, touch 9, flat-footed 9; Base Atk +7/+2; Grp +9, Atk or Full Atk +10/+5 melee (1d8/×2, masterwork war club; counts as a masterwork heavy mace or +7/+2 ranged (1d8/×3, masterwork shortspear); SA turn undead 2/day (2d6+5, 6th), spells; SQ Half-orc traits, darkvision, secret of health, the lore of true stamina, secret of instant mastery (Knowledge, the planes), bonus language (Elven), lore (Urias adds his Int. modifier and his loremaster level to all his Knowledge related checks. This has already been accounted for in his profile, below); AL CG; SV Fort +10, Ref +3, Will +13; Str 15, Dex 8, Con 14, Int 14, Wis 15, Cha 8.

Skills and Feats: Alchemy +4, Appraise +4, Concentration +8, Decipher Script +9, Knowledge (arcana) +12, Knowledge (the planes) +8, Knowledge (religion) +12, Speak Language (Elven), Speak Language (Dwarven), Use Magic Device +6; Combat Casting, Improved Critical (war club), Silent Spell, Skill Focus (Knowledge, the planes).

Half-orc Traits For all special abilities and effects, a half-orc is considered an orc.

Cleric Spells Prepared (caster level 11th): 0detect magic(3), detect poison (2), read magic;*1st* (2), detect evil, detect good, divine favor, protection from law^D , shield of faith;*2nd* endurance, hold person (DC 14), silence (DC 14);*3rd* meld into stone, searing light; *4th*giant vermin, discern lies, spell immunity^D, tongues;*5th* mightD, slay living; *6th*anti-life shell, stoneskin^D.

$^D:$ Domain Spell. Domains: Chaos (cast chaos spells at +1 caster level); Strength (gain a supernatural enhancement bonus to Strength equal to your level 1/day that last 1 rounds as a free action).

Possessions: periapt of Intelligence +2 (functions as a periapt of Wisdom but the modifier applies to Intelligence instead), ring of sustenance, brooch of shielding, cape of the mountebank (kept very dirty, to maintain the appearance that this cape is worthless), 600 gp.

Quotes

Oceal: "Welcome to the *Ghostly Whisper,* weary travelers. Ask your questions. No, wait, I already know what you will say."

Urias: "Who are you and what business have you in my shop? You seek answers, very well then. I have many, but they're not free. Nothing is."

Alyson Rossini, World Jumper

for *GURPS Reign of Steel/Infinite Worlds*

by Rickey Ciulla

For the first couple of decades, Alyson Rossini lived a fairly normal life. Her parents divorced when she was six after her father -- a former AMA doctor -- was discharged for his use of esoteric Chinese medicine on patients. When she was old enough, Alyson began working for her father in a small clinic in Seattle, Washington's Chinatown. While her father ran the clinic, Alyson ran the front desk. Times were lean, but they made enough to live. On her sixteenth birthday, she watched with the world as the Shang Ti moon base was established. In 2032, Alyson turned 23; shortly thereafter, the world began to unravel with the first Apocalypse plagues.

Alyson's world slowly died, but she survived. The first years were hard, too hard for anyone. When Alyson turned 26, she buried her father in a small field 20 miles outside of Salem, Oregon. She and he had survived far longer than most against the plagues; they'd treated many over the years, helping whomever they could. Although never formerly trained, Alyson knew as much as her father.

Alyson lived among the horror of a dying planet and its rule by intelligent machines, as a member of a nomad pack. Trading her services to Junk Rat nests in various cities for temporary food and shelter, Alyson's life was one of contant travel, never able to put down roots. Then, in 2047, she discovered what she believed was the miraculous ability to travel in time.

Infinity Unlimited suffered an accident six months ago as they prepared to receive a group of agents from Echo 44 (local year 1983) on quantum 6. An unfortunate transfer error sent the conveyor to the worldline of Steel (Infinity's designation); the Conveyor, and everyone in it, arrived in many little pieces. Nothing survived that was recognizable as cross-world technology, but one of the agents, being something of a souvenir fiend, carried a U.S. quarter from that echo. Alyson got her hands on this innocuous token as she helped her pack and some accommodating Junk Rats scrounge for food near the remains of the conveyor near Portland, Oregon. The quarter was all the unwitting world jumper needed. In September, the pack lost its leader to an exterminator attack and stumbled onto a traitor in their midst. The pack's second in command (a Moscow Info Commando doing side work for Vancouver's zone mind in exchange for Vancouver letting Moscow's agents search for remaining human culture) was put down just before he led them into another exterminator trap.

During the chaos of the attack, Alyson jumped away and ended up in Salem, Oregon. Where seconds before there had been a dead town and dry pond bed sat a town full of humans and a lake full of water. Alyson had unknowingly jumped onto Echo 44. Upon her return to her world (from what she believed was the past of Steel), she began working with her nomad pack to smuggle other humans out of Zone Vancouver, and into the "past."

Alyson doesn't know the half of her ability, and she's really in the dark. Alyson is Steel's first world jumper; she's not yet able to cross the quantum barriers, and can only travel to other worlds in Quantum 6. In addition, she's also limited to traveling to worlds in which she's held a piece of, which explains why Alyson believes her ability to time travel is limited to the year 1983.

over the last six weeks, Alyson and her group have made a half dozen trips into the past with Vancouver humans. Her efforts have not gone unnoticed. Vancouver's gotten wind of the mysterious doctor offering people an escape from the Zone. It doesn't believe the talk of time travel, and is content to ignore the problem; it suspects Moscow has leaked the tale to Brisbane, though it has no evidence yet. Brisbane's been poking about Vancouver with Redjacks, Lilliths, and collaborators, but hasn't found anything yet either.

She has also drawn the attention of Infinity and Centrum. Both agencies have detected numerous incursions into Echo 44 over the last six weeks. Currently, each agency suspects the other is engaged in covert actions to cause the echo to

shift, so they've stepped up surveillance there. Neither agency realizes it's a world jumper from the Steel world line.

Campaign Use: Alyson makes an excellent PC for a ***Reign of Steel*** game that eventually branches out into an Infinity Unlimited or Centrum game. She could be an NPC that players as Infinity or Centrum agents attempt to recruit, silence, or spirit away to Coventry. PCs might also be robots by the local Zone Mind sent to capture her for questioning, or might be native humans of the Steel World line, attempting to keep the doctor safe while she does her miraculous work. The action takes place mostly in Zone Vancouver but might carry over into Echo 44. Brisbane would be very interested in getting Alyson into its possession. Both Infinity and Centrum fear the Brisbane Zone mind developing parachronic travel, enabling it to wreak havoc on the worlds in Quantum 6, especially the Echos.

Alyson Rossini   *100 points*

Appearance: Irish-Italian heritage. Scruffy and thin looking. Short, thick, curly, dark hair. Dull brown eyes. 39 years old. Just over 5'6". Usually dressed in patchwork scrounged clothing with a ratty U.S. army jacket.

Attributes: **ST** 10 [0]; **DX** 10 [0]; **IQ** 12 [40]; **HT** 11 [10].

Basic Move 5; Speed 5.25.
Basic Damage: thrust 1d-2 swing 1d
Dodge: 8

Advantages: Resistant to Disease (+8) [5], Healer Talent/1 [10], Jumper [World] - Tunnel with "Takes Extra Time (1 minute) and Limited Use: Once Per Day" (+16%), Attunement Required (-20%), Drift (-15%), Special Movement (-10%), Limited Quanta: One Quanta Only (-15%) [46]

Disadvantages: Sense of Duty: Small Group (Nomad Pack) [-5], Stuttering [-10], Code of Honor: Healers [-5], Social Stigma: Outlaw [-15], Light Sleeper [-5], Chronic Pain: (Mild arthritis in left knee); Mild, 2 Hours, (-9) [-5]

Quirks: Responsive, Nervous stomach, Humble, Deeply self conscious about her stutter, Only rides her motorcycle when absolutely necessary [-5]

Skills: Diagnosis-13 [4], Expert Skill: Epidemiology-13 [4], Naturalist-13 [4], Pharmacy: Herbal-13 [4], Physiology-13 [4], Esoteric Medicine-13 [4], Vetinary Medicine-12 [2], Autohypnosis-10 [1], Breath Control-10 [1], Meditation-10 [1], First Aid-13 [1], Bicycling-10 [1], Driving: Motorcycle- 9 [1], Hiking-10 [1], Observation-11 [1], Scrounging-12 [1], Survival: Forest-11 [1], Swimming-11 [1], Urban Survival-12 [1]

Notes: Alyson suffers from arthritis in her left knee on occasion from an old motorcycle injury. When it flares up, she treats it with a regiment of acupuncture and acupressure. This usually dissipates any pain within 2 hours.

Equipment: The pack share just about everything, but she still carries some photos of her father, her, and her mother (who died when Alyson was 12). She is equipped with a semi-automatic barretta, a battered army jacket, and odds and ends such as a swiss army knife. She often rides a mountain bike, or -- when long travel is called for -- a motorcycle.

Quote: "Y-y-you'll s-s-see a sh-shimmer in the air; j-j-just follow me. Things will be b-b-better, I p-p-p-promise."

Pyramid Review

HardNova][: Space Opera Adventures

Published by [Politically Incorrect Games](#)

Written by Brett Bernstein & Matt Drake

Illustrated by Chris Martinez & Brett Bernstein

HardNova][: Space Opera Adventures (1.7 MB 74-page B&W PDF), HardNova][Enhancement Pack (1 MB 13-page B&W PDF), & Miniseries Alpha: The Vanguard (1.2 MB 28-page B&W PDF); $7.50

Each entry in Politically Incorrect Games' *genreDiversion* line from is designed to do two things. First to emulate its given genre -- whether post holocaust in [Earth*AD:* **Post-Holocaust Adventures,**](#) cops 'n' robbers '80s-TV-style in [*Vice Squad: Eighties Police Adventure*](#), or a "future under occupation" as depicted in [***The Colonies RPG.***](#) Second to drop a gaming group into a game and then get them out again, to return them to a longer, more involved campaign. Thus we have both the genre and diversion of the line's title.

Yet the fourth entry in the series offers up something more than the earlier lighter, more throwaway entries. The first of these is the **genreDiversion *i*** new mechanics, designed to both easier to handle and compatible with the publisher's other systems, *Impressa Modular Roleplaying* and *Active Exploits Diceless.* The second is that *HardNova][: Space Opera Adventures* comes with not just a core rulebook that contains merely the rules and everything necessary to play, but also an *Enhancement Pack* and a campaign in the form of *Miniseries Alpha: The Vanguard.* All three are available as separate PDF files, or in a decently priced combined package.

The mechanics come in two versions: Basic and Advanced Task Resolution. Both require rolls under or equal to the sum of an attribute (rated from zero to five) and Skill (rated zero to eight) on two six-sided dice. Under the Basic method, extra dice are rolled to represent bonuses or penalties to a task. The two lowest dice count if bonus dice have been added, the two highest if penalty dice instead. The Advanced method levies a difficulty directly from the attribute-skill total rolled on the two dice, which, though simple enough, is over-explained. Further, as written, the Advanced methods of handling critical success and failure (termed Triumphs and Calamities) do not feel as intuitive as the authors intend. Yet get past this stumbling block and the mechanics work easily enough, handling both character action *and* starship action.

A character is defined by five attributes (Fitness, Awareness, Creativity, Reasoning, and Influence), determined by rolling for them, or distributing 12 points between the five. Some races have maximum limitations on their attributes. Another 30 points are assigned to skills. A character can also possess Gimmicks, special abilities that can be either personal or intrinsic to his race. Racial Gimmicks are free, while personal ones can be purchased with skill points or balanced with the selection of a Detrimental Gimmick. Beneficial Gimmicks are categorized as cultural, for example Elite Status or Multilingual; enhancements or bio-mechanical augmentations; mechanical for robot characters; and psionic. Optional rules allow a character to have two Gimmicks for free.

In keeping with the game's simplicity, Starships are defined in a similar fashion. Three abilities (Speed, Handling, and Sensors) are rated from -5 to +5, while Frame and Shields ratings range from zero to five. Like character Health, a Starship's Integrity is rated from one to five in two statistics. Mechanical Stress represents wear and tear on a ship's engines and power systems, while starship Gimmicks such as Cargo Bay, Hyperspace Generator and Stasis Generator add technological and design elements. The design process is easy enough, helped by several examples along with the

equipment listings. Pleasingly, both starship and personal combat is kept simple.

As the title suggests, the genre for *HardNova][: Space Opera Adventures* is Space Opera. Its setting portrays Earth as a galactic superpower, the leading government in the two-century-old alliance, the United Sovereign Worlds. Known as the USU (because various alien species cannot handle the concept of the "double u"), it was founded following a bitter war with the Tarkosians, a race of humanoids dependent on upon bio-enhancements for survival. The founding members included the humans of Earth; Centaurians, a psionic human variant; and the chimpanzee-like Digronians, whose society is tribal and patriarchal. This trio has been joined by the matriarchal, bureaucratic, and insectoid Kt'sorii; the hugely overweight Migado, so hampered with redundant organs that they need bio-support frames or psychokinesis in order to be mobile; and the synthetic X-ans, often found as a space going machine species. More recently the nanite-dependent Tarkosians have been granted membership of the USU, while the worm-like Ruthdii Komar represent a threat in the border region known as Living Frontier.

Technology-wise, the *HardNova][* setting involves universal translators, faster-than-light communications, and star travel via both hyperdrive engines and hyperspace gates. Common weapons include blasters and EP or Explosive Projectile guns, while plasma swords can be found on the black market. Starship weaponry includes laser canons and batteries, particle cannons and hunter-killer missiles.

This being a fairly generic space opera/science fiction RPG, all sorts of adventures are possible. The four included cover exploration missions, going to the rescue of a colony, investigating outbreaks of piracy, and a murder investigation. The suggested set-up has the characters as members of the USU Rangers, a galactic law enforcement agency. Other support includes rules for creating worlds and alien creatures; adapting the game to three other sets of mechanics: *Impressa Express,* the *Impressa Modular Roleplaying System,* and the original *HardNova*; along with reference sheets, plenty of sample ships, and NPCs. The core rulebook for *HardNova][* even includes paper disposable dice, ready to cut out and glue together!

On its own, *HardNova][* offers the gamer a decent, solid, but not spectacular entry into the space opera genre. The rules and setting are all gameable enough, but fortunately things improve with the two supplements available. The *HardNova][Enhancement Pack* provides rules for handling drugs, a selection of new Gimmicks for both characters and starships, and new starship weaponry, but in the main it focuses on a new race. The Gillie is a short, dextrous furry biped with a prehensile tail. Mute, but telepathic, the species is yet to advance beyond the medieval era. The Gillies are also the focus for the *Enhancement Pack's* single scenario, which involves the search for a powerful and deadly new drug. It's decent enough support, but *Miniseries Alpha: The Vanguard* is better. This is a five-part campaign that has the characters crewing a tough little scout ship, part of a task force to assigned protect an important trade route from the aggressive Ruthii Komar. This campaign involves a lot of ship-to-ship combat, perhaps too much, but it is enjoyable nevertheless, and if the game feels close to any one influence, in this campaign it is with *Babylon 5.* Elsewhere it feels more reminiscent of TSR's *Star Frontiers.*

As a whole, *HardNova][: Space Opera Adventures* offers two things: a set of tools and rules for the GM to construct and run a game of his own, and a setting within which to run a campaign. The latter is certainly fully supported with both the scenarios found in the rulebook and the *Enhancement Pack,* and the campaign found in *Miniseries Alpha: The Vanguard.* If the game has a weakness, it comes in the writing, which at times over-complicates the rules. Yet the amount of material more than makes up for this, ensuring that *HardNova][: Space Opera Adventures* is a complete package with both plenty to play with and value for money.

--Matthew Pook

Canterbury Tales of the Unexpected

"This year on the Sunday before the Feast of Saint John the Baptist, after sunset when the moon was first seen, a marvellous sign was seen by five or more men sitting facing it. Now, there was a clear new moon, as was usual at that phase, its horns extended to the east; and behold suddenly the upper horn was divided in two. Out of the middle of its division a burning torch sprang, throwing out a long way, flames, coals and sparks. As well, the moon's body which was lower, twisted as though anxious, and in the words of those who told me and had seen it with their own eyes, the moon palpitated like a pummelled snake. After this it returned to its proper state. . . . This to me who writes this was told by those men who with their own eyes saw it, and who are willing to swear an oath that they have not added to nor falsified the above written."
-- Gervase of Canterbury, *Chronicle*

So what did those five (or more) men see on June 18, 1178, in the sky above Canterbury? It almost certainly happened; Gervase is a careful reporter and his other two astronomical anomaly stories (an eclipse and a fireball) check out with other reports. Although there is some question about whether the Moon was actually visible on that Sunday (it was very close to new), a slip of one day makes it right again. The astronomer J.B. Hartung proposed that they had seen a very large meteor strike the Moon with overwhelming force, and proposed the very "young" crater Giordano Bruno as the impact site. (Later spectrometry studies make it seem like Bruno is still older than 800 years, sadly.) Another astronomer, Ken Brecher, identified the impact with Encke's Comet, part of what he dubbed the "Canterbury Swarm" of cometary bodies that may also have caused the [Tunguska blast](#) and a lunar earthquake in 1975, among other things. All three events happened in the last week of June -- in pre-Gregorian 1178, June 18 is actually June 25, of course -- indicating a regular periodicity. In his amiable way, Carl Sagan picked up on the story, and made it famous in astro-geek circles. Although astronomical fashion has moved on (the five may have seen a meteorite enter the atmosphere right in front of the lunar crescent), you can still see the "Canterbury Event" unquestioningly read as the birth pangs of Crater Bruno, a 100,000 megaton blast thrown up by a two-kilometer wide asteroid that fortunately missed the Earth.

"My great ancestor Genghis Khan saw a sign of change in the sky . . . and arose in the North."
-- from the annals of Kublai Khan

And perhaps, in an alternate history, it was an asteroid, and it *did* hit the Earth. If it missed the Moon right above Canterbury, the rock would plow into the North Atlantic Ocean, throwing up a 450-foot tsunami that would have scoured coastal Europe and the Middle East clean of human -- of all -- life. Perhaps a few peasants would have hung on in the Bavarian redoubt, and the Persian uplands would have broken the wave before it reached the Khwarizm Shah, but Christendom and Islam would be drowned and buried under miles of salt plains. Although the tsunami might not have propagated all the way to the Pacific, the giant years-long thundercloud of water vapor would have triggered a mega-La Niña to dwarf the imagination. The Song collapse in catastrophic blizzards, and the Minamoto ascendancy in Japan dries up with the rice fields. The only surviving cultures would be Tihuanaco in the Andes, the Ethiopian kingdoms, Tibet, and the Central Asian states, watered fitfully by glacial melting.

They might slowly save themselves, eking out a few paltry crops in five years of winter, suffering through famines and plagues and clouds of flies as entire ecosystems die off along the coasts. After two decades, they may have struggled back up to the skin of their teeth -- just in time for the Mongols to invade. Genghis Khan was 13 years old when the Flood hit, and the inland, desert-adapted, meat-eating Mongols would have suffered the least. But they would have suffered, and they would be starving for conquest and fresh fodder. The Mongols conquer everything in Eurasia not covered with salty, stinking mud, and with no Chinese civilization to tame them, they throw the last shards of art and culture on their dung fires and keep riding. Humanity starts over in a new Stone Age -- or a [new Ice Age](#), as the climate continues to cool. (This would be Reality Lucifer-7 in *GURPS Infinite Worlds.* Reality Lucifer-2, already in the book, is a landfall for a slightly smaller Canterbury Event.) If the meteor brings magic, the horrible yet clean slate would be suitable for ground-up *GURPS Fantasy* games, although I think this world could possibly be one where the primitive paranoia of *GURPS Fantasy II* looks realistic.

"But the Moon struggled in vain to free herself, and at length she fell forward, spent with the struggle, and the black

hood fell over her head again, and she had no strength to push it off. Then all the evil things came creeping back, and they laughed to think they had their enemy the Moon in their power at last."
-- Lincolnshire folk tale "The Dead Moon"

Of course, the previous scenario assumes that there aren't any species waiting to take over when mankind goes extinct. Perhaps the destruction of humanity leaves space for the return of the mermaids, elves, djinn, nats, and kami -- the shrews to mankind's dinosaurs. (Or perhaps our successors are Lovecraftian coleopterans.) Of course, the post-Fall environment will favor the corpse-eating, pale, unnatural fae more than the spirits of the drowned forests and mud-choked rivers. This **GURPS Faerie** setting can take on very strange coloration indeed, as the fundamentally uncreative fae attempt to reconstruct what they can of human society, based on their tricksy memories and the ruins they investigate. Drow and goblin PCs might hunt through long-dead cities like Delhi, Madrid, or Jerusalem, seeking priceless songs and carvings to keep themselves alive, but fearing the Hidden Races of Man who haunt the high mountain caves.

"Very calm and placid have become the raging billows,
That caused the total destruction of the Moa,
When the horns of the Moon fell from above down."
-- Maori poem

Interestingly, there's some slight evidence that not all the meteors, if meteors they were, *did* miss the Earth in our own history. Near Tapanui in southern New Zealand, there is a formation about 800 years old named Landslip Crater. Although that scar is probably a landslide and not a true crater, the region is thick with tektites, sarsens, quartz, and other high-impact heat-created rocks. The word "Tapanui" means, essentially, "the Dolorous Blow," and Maori legends say the whole area is where the Moa (a now-extinct flightless bird) died in a great fire. Could Tapanui have been a New Zealand Tunguska event, a bolide in the Canterbury Swarm that got past the Moon's defenses?

And what then? In yet another **GURPS Fantasy** sort of game, there's now a piece of Heaven lodged in the Antipodes, a sort of gigantic Grail rock exerting an ever-increasing force on the magically sensitive around the world. Perhaps Marco Polo accompanies Kublai Khan's expedition to the Source of Ch'i, in a southern sea roiling with dragons. Australia takes on a kind of Arabian Nights feel, as Chinese, Gujerati, Javanese, and Egyptian ships set up magical trading posts along the southeast coasts. Magi and merchants from Zimbabwe to Kyoto throng to the Long Jade Shadow, dickering for pieces of the Chintamani Stone and bathing themselves in the eerie auroras pouring up from the distant, hidden islands that have somehow become the true middle of the earth. Set the game two or three centuries later, as the Portuguese and Spanish galleons go in quest of the Stone From Heaven, or in the glorious Nineteenth Century, when British steam must battle the dragon magic of Great Peng-Lai for control of the South Seas.

"And I beheld when he had opened the sixth seal, and, lo, there was a great earthquake, and the sun became black as sackcloth of hair, and the moon became as blood; And the stars of heaven fell unto the earth, even as a fig tree casteth her untimely figs, when she is shaken of a mighty wind."
-- Revelation 6:12-13

Another killjoy astronomer, one Paul Withers of the University of Arizona, points out that if a meteor did hit the Moon in 1178 and gouge out a crater the size of Bruno, it would have flung 10 million tons of ejecta toward the Earth, creating the greatest light show in the history of the world. And besides one possible Korean record, there isn't a single astronomical observation from the latter quarter of the twelfth century that mentions a major meteor shower, to say nothing of, oh, 50,000 shooting stars per hour for a week straight, which is what a Bruno impact would have spawned.

But if it did happen -- the moon turns red from the dust in the air, and the sun black likewise. The stars of heaven fall unto the Earth. Judgement Day, in other words. Some medieval theologians believed that while the worthy souls would be resurrected into the Empyrean Heaven, the unworthy hung around in the corrupt, dirty sublunar spheres. And those, it happens, are the ones who fall back to Earth in this **GURPS Y1.178K-Riverworld** setting. Perhaps the true saints (all 144,000 of them) have risen in the Rapture, leaving the Earth to the meek and the dead. 10 million tons, divided by, say, 138 pounds, means 144,444,444 human-sized lunar masses returning to Earth. (Which is nowhere near the number of dead by 1178, but one can't have everything.) Depending on the GM's proclivities, this can be a simple "Alexander

the Great and Genghis Khan duel for global dominion" game, complete with Famous Evil Dead Person cameos. (In such a game, the slow realization by the Church that perhaps it's not actually the End Times can be part of the drama.) Or it can be just the opening salvo in a full-fledged Apocalypse, as the other seals open and trumpets blow, ushering in four horsemen, giant armored locusts, and the Beast Apollyon.

"That night, too, there was another jetting out of gas from the distant planet. I saw it. A reddish flash at the edge, the slightest projection of the outline just as the chronometer struck midnight . . . Hundreds of observers saw the flame that night and the night after about midnight, and again the night after; and so for ten nights, a flame each night."
-- H.G. Wells, *The War of the Worlds*

Or, of course, the strange light on the moon's rim -- "repeated a dozen times or more" according to Gervase's eyewitness -- could have been mighty rockets or guns firing on the lunar surface. The explosions hurl a mighty armada of crystal and aluminum toward the warm, temptingly primitive, Earth. And where do the Lunites land? Do they take down the clearly most sophisticated civilization -- Song China and its neighbors -- first, and leave the rest of the world to native troops and Chinese governors? Do they land in mostly-unoccupied North America, perhaps ruling from the familiar deserts and craters of the Anasazi Southwest? Perhaps they don't bother to conquer anything else, and Columbus gets a real surprise when his ships pull up to feathery aluminum docks worked by copper-skinned slaves and insectile overseers. Do they bring high technology, lunar magic, or both to help them defeat their puny Earthbound foes? Can they defeat their puny Earthbound foes, or -- like the Martians and others -- have they desperately miscalculated? (This might make an interesting variant for GMs who have read *High Crusade* and want to turn medieval knights loose with Cavorite and death rays.) Whatever the answer, this **GURPS Middle Ages-Space** crossover is sure to spawn plenty of Canterbury tales.

Murphy's Rules

Pyramid Review

Paths of the Damned: Ashes of Middenheim (for *Warhammer Fantasy Roleplay*)

Published by [Black Industries](#)

Developed by [Green Ronin Publishing](#)

Written by Graeme Davis

Cover by Christer Sveen

Illustrated by Tony Parker, Adrian Smith, & Christer Sveen

Cartography by Shawn Brown

96-page b&w hardcover; $24.99

Any new campaign for [***Warhammer Fantasy Roleplay***](#) has a near insurmountable problem to overcome. It must measure itself against one of the hobby's most highly regarded campaigns. Consisting of five parts, ***The Enemy Within Campaign*** takes the heroes from nowhere and draws them into an intrigue that threatens the future of the Empire, taking them up and down its rivers and canals, to Noble courts, and out of the Empire and back again, all in order to stop the threat. With its ripe mix of intrigue, conspiracy, Chaos cults, Cthulhu Mythos influences, bad puns (especially if you happen to be German or Swedish), and just plain good writing, ***The Enemy Within Campaign*** is really what *Warhammer Fantasy Roleplay* is remembered for.

Which is not to detract from the roleplaying game itself, for ***Warhammer Fantasy Roleplay*** is a fine game, and even better and more playable in its second incarnation, designed by Green Ronin Publishing, as well as being one of 2005's top selling titles. ***Paths of the Damned: Ashes of Middenheim*** is the first part of an all-new campaign, a trilogy set after the events known as the Storm of Chaos. A Champion of Chaos, Archaon, Lord of the End Times, managed to unite the normally uncooperative forces of Chaos and lead a great army out of the Chaos Wastes of the far North. Rampaging through Kislev to the East, the horde smashed its way into the Empire and threatened the rest of the Old World. The campaign picks up mere days into the Empire's recovery following its hard won victories against Archaon.

[SPOILER ALERT!]

Ashes of Middenheim picks up from events depicted in "Through the Drakwald," the introductory adventure found in the back of the ***Warhammer Fantasy Roleplay*** rulebook. Having escorted the refugees from the beleaguered village of Untergard to the City of Middenheim, the PCs have a second task to complete. This is to deliver a religious artefact: an icon of Sigmar, the founder of the Empire, and its most widely worshipped deity. For this, they each gain a small purse and the city's Temple of Sigmar. Yet within an hour of delivering the icon, the characters are up before the City Watch, suspected of having murdered the very priest they handed the icon to!

Almost a typical start for a ***Warhammer Fantasy Roleplay*** game, then? Well, yes, and it quickly goes downhill from there. Thankfully cleared of murder, the characters are co-opted to work for the City Watch, which is otherwise occupied in keeping the peace in a city that has just endured a 15-day siege at the hands of a Chaos army and is busy

dealing with a big refugee problem. They are asked to investigate not only the priest's death, but also those of a watchman at the Collegium Theologica and a Dwarven doorkeeper. This is only the first of several tasks that the party is asked to undertake. These will take the characters into the tunnels under the city to face cultists and Skaven, deep into the Drakwald forest to retrieve an important Chaos artefact, combat an outbreak of spontaneous mutations, play an important role in a witch trial, and of course, unmask the villain behind it all. At the heart of this first part of **Paths of the Damned** is its McGuffin, the icon of Sigmar.

[END SPOILER ALERT]

Designed for a minimum of four players (four pre-generated characters are included), **Ashes of Middenheim** can be played with nothing more than the core rulebook, although the **Old World Bestiary** might prove useful. The campaign is divided into eight easy-to-run chapters, each of which should last no longer than a session or two. Well presented in the usual style for the line with a range of good artwork, the only let down is the book's maps. All of these are a little crude in comparison with previous books for the line. Before it gets down to the actual adventure, **Ashes of Middenheim** includes "After the Storm," a good introduction to -- and overview of -- Middenheim, which serves both the long-time fan and the new one. Certainly the former, possible owners of **City of the White Wolf** (the supplement that *fully* detailed Middenheim) will appreciate the update of the city's situation in the wake of the Storm of Chaos. Notes here and there also update Middenheim from events that took place in **Power Behind the Throne,** the third part of **The Enemy Within Campaign.**

As to the writing, it certainly lacks the silly punning of previous books. This is not to say that the book is devoid of humor, for there are some nice touches of it here and there. A favourite comes following an aborted witch trial: "I promised the kids there'd be a burnin'!" The plotting though, feels heavy handed, and it suffers also from having the characters traipsing hither and thither, doing this and that, almost as if they are peripheral to events within the city, and relies all too often on combat for its resolution.

Overall, if there is an emphasis in this first part of the **Paths of the Damned** trilogy, it is on combat. This is not to say that the book lacks opportunity for either roleplaying or investigation -- *both* are present. There is even a chance for the players to roleplay the aforementioned witch trial, and they even receive experience points for doing so. Certainly, the characters should come away from this first part with Experience Points enough for four or five advances in terms of skills, talents, and attributes. They should also realise that the Empire is once again threatened from within.

In revisiting Middenheim, Graeme Davis delves into themes traditional to **Warhammer Fantasy Roleplay** -- chaos, cults, conspiracies, religious strife, and rivalries -- and all kept as grim and perilous as you would expect. In many ways, this is a sequel to **Power Behind The Throne** and that is no bad thing. Unfortunately, **Ashes of Middenheim** is not on a par with that part of **The Enemy Within Campaign,** or indeed with any part of that campaign . . . nor can it be, for it lacks the depth, complexity, and grandeur of that campaign. Nonetheless, **Ashes of Middenheim** is not unplayable, but it is not vintage **Warhammer.** It is at best an introduction to the complexities of the setting that should ensure that the game's new players would return for the next part of the trilogy.

--Matthew Pook

An Amazing Array of Alternatives

I was planning on writing a series of columns about the three tiers of the gaming biz -- publisher, distributor, and retailer -- when I realized that 1) I don't have that much interesting to say on each (certainly not 1,000 words apiece), and 2) I wasn't sure how much of an audience there'd be for three such columns. Now, while astute long-time readers may question why I'm bothered by concerns such as having something interesting to say or my audience caring now, that's another issue.

(Before we continue, I should give the 50-word-or-less overview of the supply chain, for those who may not be familiar. Publishers create the products, distributors order the products from the publisher, and retailers order from distributors.)

Now, in trying to think of things to talk about for those three columns, I realized that all three tiers have something in common. Not only do all three have more competition than ever before; there are also more *alternatives* than ever before.

I consider competition to be the presentation of choices that exist in more or less the same form as current choices. For example, when two game shops open across town from each other, they're in competition. However, alternatives are choices that exist in a different form; for example, if I buy books from Amazon.com instead of my local book store, that's an alternative.

I think the distinction is important, because it might explain some of the difficulties the industry has had in recent years. Most businesses know how to deal with competition; try to do the same thing as your competitors, only better in some fashion. Thus if one game shop offers 10% off, another in town might offer 15% off, or a buy-four-get-one-free deal. If one distributor offers shipping within 48 hours, another might offer shipping within 24 hours or set up more warehouses (which results in faster ship times for retailers).

But alternatives are more troublesome for the established system, because it's difficult to necessarily see how, exactly, they compete . . . and what you can do about it. For example, if a store is only offering their wares in electronic format (via e23 or RPGnow), are they directly competing? What about the publisher who sells exclusive product via mail order to customers? And so on.

In addition, alternatives are often difficult to compete against even when they are recognized, because the fact that alternatives do things fundamentally differently often means they have advantages that the established mediums don't. For example, the success of the Wal-Mart chain was largely tied to the notion of selling lots of things in one location for cheaper than anyone else (using bulk buying power to drive prices down). In this case, a mom-and-pop game shop might know how it would have to compete against the big retailer, but it simply can't afford to:

"Okay; you want to buy the newest *Axis & Allies* game from us, and have us match the big box retailer price? <sigh> That'll be $9.98."
"Wow! For the whole game?!"
"No . . . to bribe me not to kick your pasty posterior."

As a quick list, then, here are some of the alternatives that exist on all three levels (not exhaustive, but more a top-of-my-head accounting):

Retail

- Online retailers (such as Amazon)
- Sales at conventions
- Electronic distribution methods (such as RPGnow, e23)
- Publishers selling direct to customers (which combines the two options above)
- Big box retailers

- Used markets (especially eBay)
- Piracy, especially online (it's hard to beat the price of free, when the only cost is your soul)

Distributors

- Publishers selling direct to retailers
- Big box retailers (since these exist as their own "distribution" chain, the very fact that these giants order 100,000 copies of Game X will eat up a lot of retail demand and flexibility you have when you go to place your 5,000-copy order)
- Electronic distribution methods

Publishers

- Print-on-demand outfits (such as Lightning Source)
- Electronic distribution methods
- Free publication (such as the Forge)

Now, I could complicate the matter by noting that there are more and stronger competitions for people's time now than any periods previously (such as *Worlds of Warcraft* or any of the next-gen console offerings, as well as a jillion other competing entertainment options), but that would just confuse the issue.

Now, in looking over the list, I note that almost all of the items on there weren't applicable a decade ago, and only a couple of them had any importance even five years ago. Thanks to the Internet, a customer who wants something new that he would have bought from a retailer in 1996 could possibly buy it from Amazon, RPGnow, eBay, or a publisher's website -- all of which sidestep the conventional retailer. Likewise someone interested in publishing his new game who would have submitted it to a game company for consideration (or formed their own company, at no small expense) could now publish it himself via RPGnow or Lightning Source, or offer it up as a freebee that anyone from around the world could find.

As such, I posit that the gaming industry (such as it is) faces a monumental assault on "business as usual." Whether this is a good thing depends on your world view. If you're a consumer, you have more options for getting more and different products in new forms, all at prices that are amazingly competitive. If you're a game shop, you've got more assaults on your mortgage than ever before. If you're a new publisher (or would-be publisher), you've got more avenues to get your product out; if you're an existing publisher, you've got more people looking to usurp your throne.

Even the humble publication you read now chose an alternative route; many moons ago we realized the rules were much less favorable for us to compete as a paper publication, so we fled your Friendly Local Game Stores for the new-ish frontiers of the Internet. Today, we face all manner of alternatives in varying media, from snazzy full-color offerings from Paizo Publishing to electronic offerings from other fields to fan-produced material for many game systems that equals or surpasses some commercial offerings.

What does the future hold? Darned if I know. But regardless of anything else, the world of games is a wholly different universe than when many of us started gaming decades ago. There are more alternatives now than ever before . . . and, I predict, not all these alternatives will make it into the next couple of decades in the form we know them now.

--Steven Marsh

The Thief-King's Regalia

by James L. Cambias

For centuries, professional crooks have secretly honored one of their number as the greatest living criminal -- the Thief-King. The badge of that position is a four-inch disk of gold-plated brass ornamented with a large glass gem. It hangs on a cord made from a hangman's noose.

It was made long ago, possibly in ancient Egypt or Mesopotamia. A great king owned a fabulous gem which was kept in a hidden treasure vault, protected by traps, locks, armed guards, and ferocious beasts. Nevertheless, the most daring thief of the age managed to fight, trick, and sneak his way into the heart of the vault, where he discovered that the king's famous gem was a fake -- sold years before to cover the royal expenses.

Thereafter the thief proudly wore the false jewel as a trophy, and all the other criminals in the land acclaimed him as King of Thieves. The title stuck until an up-and-coming rogue decided to top the exploit by stealing the fake gem. When the theft was discovered, the original King promptly announced that whoever had stolen it was his true and rightful successor. (He then retired to a country villa where he lived for many years off his accumulated loot.)

Since then the pendant has passed from one master thief to another, always by theft. Whoever has it is by right the Thief-King. Some Kings are experts at stealth and infiltration, who steal it from the neck of the wearer as he sleeps. Others are lockpicking and trap specialists who lift it from the most secure vaults. A few have been bloody-handed killers who have taken it by force. Once or twice it has even been acquired by fraud.

The Thief-King's Regalia is both a socially significant item and a magical one.

Its social powers are extensive. The Thief-King automatically gains the respect of all professional thieves. He is a full member of any Thieves' Guild organization, and most guilds grant the King of Thieves automatic Master status. He can easily attract followers and apprentices -- indeed it is almost impossible for the Thief-King to avoid them.

The King of Thieves also gains some automatic enemies. Most rulers and lawmen would love to have the prestige of capturing the Thief-King. It has happened a couple of times, but the King has always escaped justice.

The magical powers of the Regalia are not the work of any specific enchantment. Rather, they are simply the result of the pendant being worn and stolen repeatedly by the greatest thieves of the past few centuries. This means they cannot easily be removed.

Any professional thief wearing the pendant becomes more adept at all thieving skills. The strong personalities of its wearers have left their mark on the pendant. Anyone wearing it gradually becomes increasingly corrupt and greedy. However, being King of Thieves does give one a certain self-confidence, so that wearers are also much more resistant to both mundane intimidation and magical mind control.

In settings which include an actual God of Thieves (like Mercury or Olidammara), the pendant is likely to have gained a certain amount of holiness just from its age and associations. If that is the case, then clerical magic cast by priests of the God of Thieves would certainly be boosted by the presence of the pendant.

Game Effects

d20 System

Leadership: The pendant automatically grants any Rogue who owns it the Leadership feat. Moreover, the number and level of his followers is calculated as if his Charisma were 2 ranks higher than it actually is. If the character has already taken Leadership, recalculate the number and level of followers using the new Charisma score. Followers

gained with the Regalia are all Rogues or Clerics of thief gods.

Skill Bonus: +2 bonus to all Rogue class skills.

Alignment Shift: The wearer immediately loses the Lawful alignment. Each month the Regalia remains in his possession the character must make a Will save. If the roll fails a Good character becomes Neutral and a Neutral character becomes Evil. The change is permanent and cannot be reversed while the character owns the pendant. If it has been stolen from him, the character can regain his old alignment, either by means of a Remove Curse spell or the favor of the gods.

Will: +2 to Will saves when resisting Intimidation or Mind Control attempts. Note that this bonus does not help the character when rolling against the alignment shifting powers noted above.

Clerical Bonus: Clerics of Olidammara or other thief gods gain one extra Trickery Domain spell per caster level.

Innate Magic: The effects of the Regalia are not affected by Dispel Magic, Remove Curse, or other spells, except as noted above. It can only lose its powers by being destroyed. Unlike other artifacts or relics, the Regalia can be destroyed by mundane means (a hammer would do it), but whoever destroys it gains the permanent hatred of all Rogues. This isn't a magical curse but a real (and justifiable) dislike of someone who has dishonored their chosen profession.

GURPS Fourth Edition

Reputation: The pendant grants the King of Thieves a +4 Reputation among professional thieves (and a -4 among law-enforcement officials). He also has at least 4 levels of Administrative Rank in any organization of thieves.

Thieving Talent: Whoever possesses the pendant gets a +2 bonus to any skill he uses in the course of planning or conducting a theft or robbery.

Personality Change: If the character had the Honesty disadvantage he loses it. Characters who are not Honest automatically gain the Greed disadvantage.

Confidence: The King of Thieves gains an effective +2 to Will when resisting Intimidation attempts or mind control. This is not a magical power or an improvement in the character's actual Willpower, merely a situational bonus to reflect the confidence boost of being King of Thieves.

Magical Power: The pendant acts as a 20-point single-college Powerstone for spells in the Movement college. (If using the *GURPS Cabal* magic system, the pendant is imbued with the energies of the decan Anatreth and so also provides a +1 skill bonus to Movement college spells.)

Adventure Hooks

The most obvious adventure hook, especially for high-powered characters, is for one of the party to attempt to win the position of King of Thieves by stealing it. Finding who has it, determining where and how it is hidden, and doing the job would be a whole mini-campaign. And once a character has it, keeping it can provide nearly endless adventure opportunities.

Another possibility is for adventurers to come across the pendant on the corpse of the previous King, slain by some dreadful monster. The characters might not realize what they've acquired, leading to all sorts of mistaken identity problems and attempts at theft once they return it to civilization.

The pendant as written assumes a genre-fantasy setting, either in Earth's past or another world where thieves' guilds and tomb-looting adventurers are common. In a modern-day setting, the pendant's powers would be known only to a tiny handful of old, traditionalist criminal conspiracies. To balance its lack of social effects, the GM may wish to

increase its magical power -- perhaps the owner is simply always successful at robberies and thefts. Such a power would make it vastly attractive to criminals, intelligence agencies, and Illuminated conspiracies. A character might well come into possession of it by happenstance, then be foreced to cope with sinister forces trying to steal it away.

Being Better at Being Bad

Modeling Villains Who Aren't Morons

by Patrick Dunn

I was going to write this article yesterday after work, but I forgot to disengage the trap on my front door, so I fell into a pit and had to pacify the Balrog (who, by the way, is expensive to feed -- you have no idea). After crawling out of the pit, I found that a group of heroes had pillaged my living room and taken my computer and all my magic scrolls, not to mention my wand which I kept on a special stand in the middle of the room. It was a hectic day.

Okay, really I'm not an evil sorcerer and neither, I hope, are you. But if you're going to roleplay a fantasy villain (or, for that matter, a science fiction or contemporary villain) you've got to learn to think like one.

Fortunately, there isn't a school for villains, which might explain why so many roleplaying villains come off as -- excuse me -- a bit ineffective. But literature and history can teach us a lot about being bad, and the worse your villains, the better the game.

What do we learn from literature and history?

- **Villains are often appealing.** Dracula is sexy. Hitler was a great public speaker. Villains are really good at deception. They do this chiefly by offering something that people want -- in Dracula's case, it was money (to his solicitor) and sex (to Mina). For Hitler, it was economic stability and a scapegoat. Your villain might offer the players something they really want and would find hard to refuse, not as a bribe, but as a gift. The villains might even seem good and honorable, which brings me to my second point:
- **Villains are sometimes honorable (in that they keep their word), and they always think that they're doing the right thing.** Dracula's real-life inspiration was Vlad Dracul, called "The Impaler." He's still a cultural hero in his native Transylvania. In his mind, he was mounting enemies on stakes in order to defend the one true faith from foreign encroachment, and his people from slavery. Rasputin, who accidently brought down the Romanov dynasty and led to the Bolshevik revolution by associating the Czarina with sexual immorality, considered himself a holy man. Villains sleep really well at night.
- **If you must have a villain who knows he's evil (perhaps your game system demands it), then you might want to play up the pity factor.** Look at Hannibal Lector -- he knows eating people is wrong, but he just can't help it. They're so . . . delicious. You almost end up liking the fellow -- and what does that say about us? The fun in those books and movies is the creepiness of identifying with a cannibal. Let your players identify with the villains they're trying to destroy. Even Grendel in *Beowulf* is pitiful -- the poor fellow just can't sleep with all that noise at Heorot, and moreover, God hates him. What's he gonna do?
- **Villains make plans, and are flexible and intelligent.** See Shakespeare's Richard III. What a perfect villain -- twisted in body and mind, but with plans inside plans. And when something goes wrong, he shifts around his plans and tries to work around obstacles. It doesn't always work, but that's what heroes are for.
- **Villains, like heroes, have a fatal weakness.** Sticking with Shakespeare, the weakness of Macbeth is his overconfidence -- surely, he thinks, I can't die until the forest comes to my front door and -- what's that? Oak trees knocking? Sauron's weakness in the *Lord of the Rings* is really bad help -- he just can't find a hireling whom he can rely on. He's not stupid -- his employees are (except for Saruman who conveniently forgets that Ents exist despite his having written a paper on them in graduate school).
- **Finally, villains are not omniscient.** There are things they just do not know -- like the players' plans! That's important to keep in mind, because you, as GM, probably do know their plans. So you need to keep your mind compartmentalized. When Van Helsing explains Dracula's weaknesses -- that he's a childish creature driven by basic drives instead of superior reasoning -- to the others, Dracula doesn't overhear him. Otherwise, he might have tried to get a ghoul who would figure out something more than how to best prepare raw spider canapes. Still, villains also are not idiots. Hamlet's uncle knows Hamlet is going to kill him, so he does his best to get rid

of him, not because he's overheard Hamlet's plans (although in some productions of this play he does -- bad, bad interpretation!), but because he's a bright guy and he figures, if I were in Ham's place, I'd kill me too.

Being a good villain comes down to two basic principles, in the final analysis:

1. **Villains are complex** -- they're evil but think they're doing good, or they're totally depraved but feel guilty, or they're monsters who deserve pity.
2. **Villains are usually not stupid** -- they know their weaknesses (although maybe not all of them), and they know the heroes' strengths (although maybe not specifics), and they plan with those things in mind.

By far, the best way to learn to be evil is to read books and watch movies about effectively evil people. Here's a short chronological list to get you started:

- Haney, Seamus, tr. *Beowulf.* Grendel is a monster who, cursed by God, must live with his mother because he can't find a job. Meanwhile, some people build a tavern nearby and keep him up at all hours. He has the perfectly reasonable reaction of going there and eating some of them until Beowulf comes along and kills him and his mom. At the end of the poem, there's a dragon, for no discernable reason I've ever been able to figure out. Still, a great read. I recommend the Seamus Haney translation as accurate and easy to read (the original is in Old English).
- Milton. *Paradise Lost.* Satan, the most interesting villain of all time. A complex character who finds himself torn between his love for God and his love for -- well, himself. His plans are solid, and he succeeds temporarily, but God has this whole control-of-everything thing, and wins in the end.
- Shakespeare, William. *Richard III.* My favorite of all villains. Richard III is an ugly twisted monster of a man who nonetheless succeeds at wooing the widow of a good man on the night of his funeral, and then taking over a kingdom by being really sort of pleasant around everyone. At the end, undone by a missing horse. Historically, the real Richard III wasn't that bad, by the way.
- Shakespeare, William. *Hamlet.* Hamlet's uncle is an interestingly complex villain. He feels tremendous guilt for killing Hamlet's father -- in fact, that's his weakness. His guilt gives him away and he slides deeper into sin by trying to off Hamlet. He succeeds in messing everything up quite nicely in the end by killing Hamlet, his own wife, Hamlet's fiance's brother, Hamlet's fiancé (indirectly), and a few other random people here and there. Hamlet's body count is lower -- he manages to kill his evil uncle and accidently the uncle's chief advisor. If you want to see it movie form, I recommend the 1990 Franco Zeffirelli version with Mel Gibson.
- Shakespeare, William. *Macbeth.* This one's a bonus for having two great villains: Macbeth and his vicious wife. Their flaw is ambition and the need to cover up their crime by committing more crimes. Macbeth himself is cursed by a prophesy that convinces him, incorrectly, that he can't be killed.
- Stoker, Bram. *Dracula.* Regarded mostly as fluff when it was written, this book is now a classic text on what supernatural evil looks like, especially to a Victorian. What it looks like is a creature of passion who uses sex, greed, and other human drives to get his own way.
- Tolkien, J. R. R. *Lord of the Rings.* If you haven't read this already, you're probably reading the wrong magazine, but I've got to list it. Actually, Sauron isn't much of a villain -- he makes lots of mistakes, among them putting all his power in something he's just going to lose and trusting Saruman as an ally. The Peter Jackson movie version is fairly true to the books, although he makes some pacing decisions and cuts to fit it in three movies.
- *Silence of the Lambs.* A 1991 movie based on a series of books by Thomas Harris about Hannibal Lector, a cannibal with remarkable culinary skill and an advanced degree in psychology. Hannibal isn't the focus in this movie, but you get two different views of evil and both are somewhat pitiable.

Lens-Men

More Mini-Character Lenses for *GURPS Fourth Edition*

by Stephen Dedman

As a sequel to Eric B. Smith's article "[Mini-Character Lenses for **GURPS**](...)," here are some more 10-point mini-character lenses to help flesh out a character, giving the character knowledge in an area of expertise that might not be expected in his current career. Some are based on college courses, some on hobbies, some on casual jobs, and they can also be used for quickly generating NPCs for a particular role.

These lenses work particularly well when combined with character templates from the various **GURPS** books, allowing characters to fill niches outside of the primary one the template is designed for. You could also create a smaller version of most of these templates for just 5 points simply by cutting the points in the listed skills in half.

Acolyte

You are well-versed in the teachings of a particular religion, whether or not you still believe or practice. You may be able to quote scripture and perform rituals (or at least fake them convincingly), and claim some "benefits of clergy," such as the option of being tried by an ecclesiastical court instead of a secular one. You may not be able to legally marry people, but those for whom you give the last rites usually remain dead.

This is an appropriate set of skills for a seminary student, altar boy, lay preacher, chaplain's assistant, cultist, etc., and possibly useful for a monster hunter or confidence trickster.

Skills: Religious Ritual (chosen religion) (H) IQ+1 [8], Theology (chosen religion) (H) IQ-1 [2]. Exorcism, if allowed, is at IQ-2 [0]; Ritual Magic at IQ-5 [0].

Actor

You trod your hour upon the stage at some time, whether in a drama school, theater, movie, or TV studio, or ultra-tech equivalent.

Skills: Acting (A) IQ+1 [4], Performance (A) IQ+1 [4], and two points from Dancing (A) DX-1 [1], Literature (H) IQ-2 [1], Make-Up (E) IQ [1], Stage Combat (A) DX-1 [1], Sex Appeal (A) HT-1 [1], and Singing (E) HT [1].

A 10-point lens for a less talented but equally bankable thespian would be Attractive Appearance [5], with Performance (A) IQ [2], Sex Appeal (A) HT [2], and Acting (A) IQ-1 [1].

Athlete

You've had some training in at least one sport or athletic event, and even if you're no longer at the top of your form, you've tried to keep in shape. Some athletic skills may be of obvious use in combat situations, others are useful for avoiding combat.

Advantages: Fit [5] or one level in Basic Speed [5] or Basic Move [5].

Primary Skill: Pick one from: Acrobatics (H) DX [4], Bicycling (E) DX+2 [4], Bow (A) DX+1 [4], Boxing (A) DX+1 [4], Guns/TL (Pistol, Rifle or Shotgun) (E) DX+2 [4], Judo (H) DX [4], Jumping (E) DX+2 [4], Karate (H) DX [4], Lifting (A) HT+1 [4], Melee Weapon (Rapier) (A) DX+1 [4], Riding (A) DX+1 [4], Running (A) HT+1 [4],

Skating (A) HT+1 [4], Skiing (A) HT+1 [4], Sports (A) DX+1 [4], Sumo Wrestling (A) DX+1 [4], Swimming (E) HT+2 [4], Throwing (A) DX+1 [4], or Wrestling (A) DX+1 [4].

Secondary Skills: Pick one from Current Affairs (Sport) (E) IQ [1], First Aid/TL (E) IQ [1], Running (A) HT-1 [1], Swimming (E) HT [1], or Throwing (A) DX-1 [1].

Bar staff

You've worked in a saloon -- as a waiter, bouncer, or mixologist. The blend of skills needed for this job vary slightly according to the time, place and clientele, but some are universal.

Skills: For a bartender or tavern-keeper in almost any era, take Professional Skill: Bartender (A) IQ+1 [4], Diplomacy (H) IQ-1 [2], and two from Current Affairs/TL (E) IQ+1 [2], Merchant (A) IQ [2], Observation (A) Per [2], Savoir-Faire (E) IQ+1 [2], Sex Appeal (A) HT [2], and Streetwise (A) IQ [2]. For a bouncer, take Intimidation (A) IQ+1 [4], Diplomacy (H) IQ-2 [1], Observation (A) Per-1 [1], and 4 points in a combat skill appropriate to the time and place.

Conjurer

You've studied stage magic, and may even be able to fool people into thinking it's real magic. Even if that fails, you may be able to entertain a crowd -- and possibly distract them while the pickpockets go to work.

Skills: Performance (A) IQ [2], Sleight of Hand (H) DX [4], and one from

Escape (H) DX [4], Fire-Eating (A) DX+1 [4], Fortune-Telling (A) IQ+1 [4], Hypnotism (H) DX [4], and Ventriloquism (H) IQ [4].

Cowhand

You have some experience with handling animals on a ranch, usually horses and cattle, though similar skills would also be useful for a jackaroo on an Australian sheep station, or an offworld colonist herding vrang beasts.

Skills: Animal Handling (Cattle) (A) IQ+1 [4]; one of Driving/TL (Off-road automobile or motorcycle) (A) DX+1 [4], Piloting (Helicopter, Light Airplane or Ultralight) (A) DX+1 [4], or Riding (Equine) (A) DX+1 [4]; and two from Beam Weapon/TL (Pistol or Rifle) (E) DX [1], Bolas (A) DX-1 [1], Guns/TL (Pistol, Rifle or Tangler) (E) DX [1], Heraldry (Brands) (A) IQ-1 [1], Lasso (A) DX-1 [1], Melee Weapon (Whip) (A) DX-1 [1], or Singing (E) HT [1].

Crewman

You've been a crew member on a large vessel (ocean-going or space-faring), and have learned skills in exotic locales as well as those required on board.

Skills: Crewman/TL (E) IQ+1 [2]; any two from Area Knowledge (E) IQ+1 [2], Boating/TL (A) DX [2], Climbing (A) DX [2], Computer Operation/TL (E) IQ+1 [2], Cooking (A) IQ [2], Electronics Operation/TL (A) IQ [2], Environment Suit/TL (A) DX [2], Free Fall (A) DX [2], Freight Handling (A) IQ [2], Gunner (A) DX [2], Housekeeping (E) IQ+1 [2], Knot-Tying (E) DX+1 [2], Mechanic (A) IQ [2], Swimming (E) DX+1 [2]; and 4 points on Cultural Familiarity or Languages.

Homeless

You've lived on the streets for a while, whether through poverty, curiosity, or a need to hide. You've learned to sleep rough and scavenge for food, and (if you're lucky) stay healthy and out of trouble.

Skills: Scrounging (E) Per+1 [2], Urban Survival (A) Per [2], and three from

Fast-Talk (A) IQ [2], Filch (A) IQ [2], Holdout (A) IQ [2], Panhandling (E) IQ+1 [2], Stealth (A) IQ [2], and Streetwise (A) IQ [2].

Lab Assistant

You've worked as an assistant to a scientist (or alchemist), and know the basics of handling laboratory equipment, data recording and research procedure.

Skills: One from Alchemy/TL (VH) IQ-1 [4], Archaeology/TL (H) IQ [4], Astronomy/TL (H) IQ [4], Bioengineering/TL (H) IQ [4], Biology/TL (VH) IQ-1 [4], Chemistry/TL (H) IQ [4], Forensics/TL (H) IQ [4], Geology/TL (H) IQ [4], Herb Lore/TL (VH) IQ-1 [4], Metallurgy/TL (H) IQ [4], Paleontology/TL (H) IQ [4], Physics/TL (VH) IQ-1 [4], or Psychology/TL (Experimental) (H) IQ [4]; and three from Administration (A) IQ [2], Animal Handling (lab animals) (A) IQ [2], Computer Operation/TL (E) IQ+1 [2], Electronics Operation/TL (Scientific) (A) IQ [2], First Aid/TL (E) IQ+1 [2], Gardening (E) IQ+1 [2], Hazardous Materials/TL (A) IQ [2], NBC Suit/TL (A) DX [2], Housekeeping (E) IQ+1 [2], Photography/TL (A) IQ [2], Research (A) IQ [2], and Scrounging (E) IQ+1 [2].

Law Student

You're not licensed to practice law, but you've gained some knowledge of the system -- either in a law school, working for a law firm or court, or through less formal means (including as a defendant in court cases). You should be able to spot loopholes in a contract, tell when your rights have been infringed, or at least know you can and should call a real lawyer! This is a useful background for anyone working either side of the law, such as a private investigator or a confidence trickster, and would also be appropriate for a businessman or politician.

Skills: Law (H) IQ [4], and three from Administration (A) IQ [2], Criminology/TL (A) IQ [2], Diplomacy (H) IQ-1 [2], Fast-Talk (A) IQ [2], Research (A) IQ [2], and Savoir-Faire (E) IQ+1 [2].

Mule

You've smuggled contraband on your person, either voluntarily or involuntarily -- probably through Customs or past prison guards, though this skill set can also be useful for a pickpocket or shoplifter's accomplice.

Skills: Acting (A) IQ [2], Holdout (A) IQ+1 [4], Stealth (A) DX [2], Streetwise (A) IQ [2].

Prisoner

You've been confined in a jail, reform school, prisoner-of-war camp, gulag, or similar institution. Even if you were a model prisoner, you've learned some of the skills necessary to survive in this sort of regimented, boring, and possibly violent environment.

Skills: Acting (A) IQ-1 [1], Housekeeping, (E) IQ [1], and either Diplomacy (H) IQ-1 [2], Fast-Talk (A) IQ [2], or Intimidation (A) IQ [2]; and three from Armoury/TL (Melee Weapons) (A) IQ [2], Brawling (E) DX+1 [2], Carpentry (E) IQ+1 [2], Farming/TL (A) IQ [2], Gardening (E) IQ+1 [2], Holdout (A) IQ [2], Knife (E) DX+1 [2], Merchant (A) IQ [2], Observation (A) Per [2], Scrounging (E) IQ+1 [2], Sewing/TL (E) IQ+1 [2], Smuggling (A) IQ [2], Stealth (A) DX [2], and Streetwise (A) IQ [2].

Wheelman

You are proficient at driving cars and/or motorbikes and keeping them running, possibly in a high-speed pursuit. This mini-lens would be appropriate to a variety of automobile enthusiasts, with some optional skills suitable for car thieves, smugglers, outlaw bikers or beginning autoduellers, as well as for more law-abiding owner-operators.

Skills: Driving/TL (Automobile or motorcycle) (A) DX+1 [4], Mechanic/TL (Automobile or Motorcycle) (A) IQ+1 [4], and two from Area Knowledge (City or Nation) (E) IQ+1 [2], Armoury/TL (Vehicle Armor) (A) IQ-1 [1], Electrician/TL (A) IQ-1 [1], Electronics Operation/TL (Security) (A) IQ-1 [1], Freight Handling (A) IQ-1 [1], Lockpicking/TL (A) IQ-1 [1], Merchant (A) IQ-1 [1], Navigation (Land) (A) IQ-1 [1], Smuggling (A) IQ-1 [1].

Pyramid Review

Cartoon Action Hour Presents Metal Wars

Published by [Z-Man Games](#)

Written By Cynthia Miller, Eddy Webb, & Chase Miller

Cover By Rain Beredo, Dennis Crisostomo, & Mico Suayan

Illsutrated By Oliver Castañeda, Dennis Chacon, John Huff, Michael Jason Paz, Cristian Saksida, Geoff Senior, & Mico Suayan

64-Page Saddlestitched B&W Book; $16.95

There are those that lament the fact that they cannot buy a *Transformers* RPG. Personally, this is not great loss as, (a) I am slightly too old to really appreciate the delights of the giant transforming robot cartoon; (b) I have grown sick of listening to conversations about it at work (but hey, I have since changed jobs and no longer have this problem); and finally, (c) I consider the *Transformers* as little more than a marketing exercise designed to sell plastic crud. Which in the sense of the latter, it is.

But then, what do you do if you want a GTR (or Giant Transforming Robot) RPG in the mode of the *Transformers?* Either design your own, or pick up a copy of ***Cartoon Action Hour: The 1980's Action Cartoon RPG,*** Spectrum Games' RPG of 80's Saturday morning cartoons, which lets you game in worlds and styles similar to that of *He-Man and the Masters of the Universe, G.I. Joe,* and *Transformers.* Pyjamas and sugar encrusted breakfast cereal all optional, of course. Yet that still leaves all the hard work to do, and thus makes ***Cartoon Action Hour Presents Metal Wars*** just what you want.

Subtitled a "Transbot Series Book," **Metal Wars** is the supplement that lets you do all the giant transforming robot action without infringing copyright. It is essentially a genre within a genre, giving a history to the creation and appearance of the Transbots as an intellectual property on television, in the cinema and in comic book form. It also describes the world and story of the Transbots as watched by their young audience on the television, in the movies and in the comics. Full guidelines are given for the players to build their own Giant Transforming Robot, along with the full statistics and write ups for all of the Transbots and their enemies, the Warbots, plus a scenario and GM advice on running a Giant Transforming Robot game.

Building a Giant Transforming Robot is slightly more complex than a normal **Cartoon Action Hour** character, as essentially a player is creating both a robot and whatever it transforms into, whether giant weapon, giant animal, or (indeed) giant tape recorder. Players receive either 100, 150, or 200 character points to spend on both, depending on whether he is creating a mini-bot, an action bot, or ultra bot, each a Transbot toy type. **Metal Wars** expands on the rules for robots possessing special abilities, which can be purchased for either of a Giant Transforming Robot's forms -- or more if they have three or more forms. It is also possible to build a gestalt robot, made up of several Giant Transforming Robots. Notes are also included for creating female robots, non-transforming robots, aliens, and human characters. Of course, if a player wants to leap into the game without messing around with all those points, he can just use the quick method also given, simply selecting in turn a package for his stats, his vehicle, and his special abilities.

As to the Transbots Universe, this is set back in 1984 with a President of the USA requesting America's scientists to design new revolutionary weapons systems. TechCorp, headed by Trevor Hastings, responded by creating the

Transbots, a new type of war machine. Just as he released the wave of machines, Hastings was ousted by Maximilian Mercy, his aim being to subvert the Transbot program and use them to take over America! In attempting to modify the first robot's programming, Mercy raised it to sentience, and thus Lightblade, the future leader of the heroic Transbots was born. The first wave of Transbots rebelled against Mercy's attempts to turn them to his evil plans and escaped, while the second wave, led by Vandal, now serve their master as the Warbots. The Transbots now work with Trevor Hastings to foil Mercy's dastardly plans.

Statistics, personalities, and story hooks (or disadvantages) are given for all of the Transbots and Warbots, along with their human compatriots. This includes Trevor and his son, plus a cute dragon-like companion from another dimension. While "Draggy" may not be appropriate to the genre, he represents the worst aspects of 80's cartoons.

The GM advice covers making the game lighter or darker, with more dramatic dialogue, less lethal plots, and more comedy for the former, and both tougher and more Warbots, more explicit violence, and even making Maximilian Mercy the president of the USA for the latter. The themes appropriate to a Giant Transforming Robot are neatly explored, primarily the sanctity of life and power and responsibility, as is a closer look at the giant robot genre. Both themes appear in the accompanying scenario "A New Threat," which also follows the basic plot lines for a Transbot story. These concentrate upon the Transbots putting a stop to the plans of Mercy and his Warbots, as they try to steal the energy they need, take over the USA, and sell the Transbot technology to foreign powers actively working to obtain this technology. All told, the adventure is nicely done.

In addition, *Metal Wars* details the Transbot comic book series, a far darker setting than the one portrayed in the cartoon. "War of the Transbots" is also deadlier and more serious, and its description includes an episode guide for the first season that can also double as adventure seeds.

Although no expert on the genre, *Metal Wars* seems certainly faithful to it. Further it seems to contain everything necessary to create a Transbot series of your own, if not a Giant Transforming Robot series of your own. Despite the fact that the book is well written and nicely illustrated, *Metal Wars* feels a little expensive considering its length. Yet if the *Transformers* and Giant Transforming Robots are your thing, then *Metal Wars* perfectly encapsulates everything you need to run a game within the genre. And if you can stamp out, blast, pulverise, snap, and otherwise wipe out of existence that irritating little Draggy, then it is thumbs up from me.

Mutants & Masterminds Second Edition Gamemaster's Screen

Published by [Green Ronin Games](#)

Designed by Steve Kenson

Illustrated by UDON with Chris Stevens

Graphic design by Hal Mangold

Four-panel, full-color, two-sided GM's reference sheet; $9.95

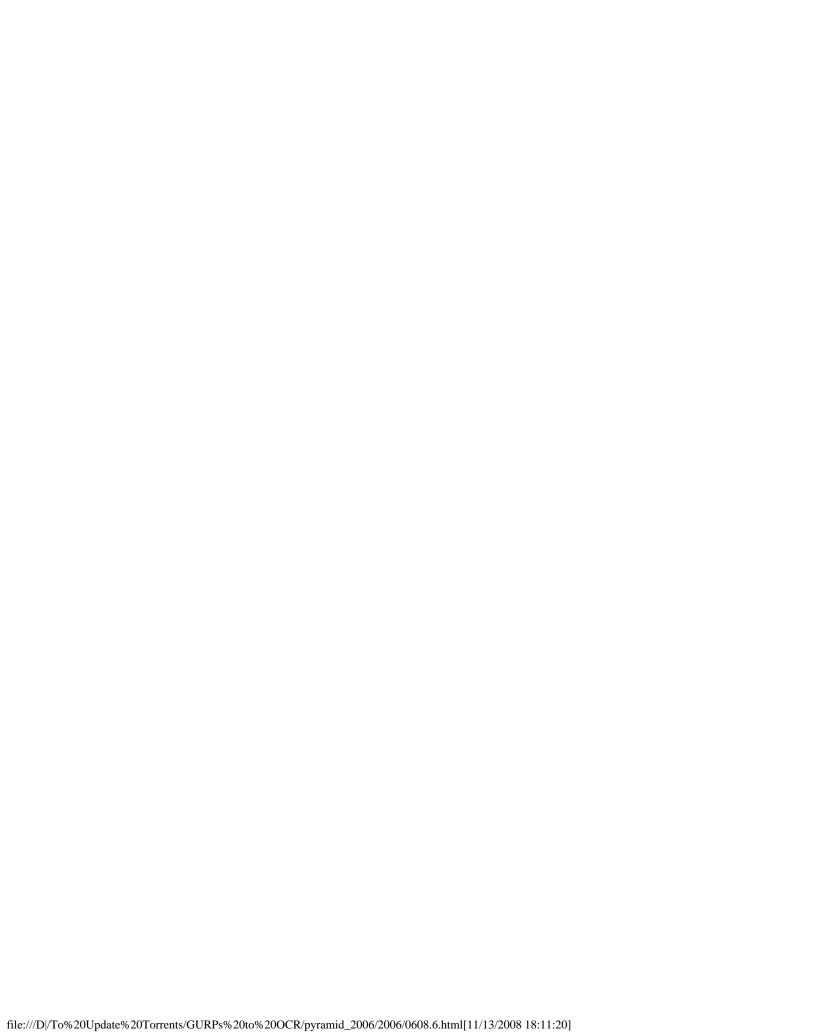
When the fiendish Dr. Rubicon unveils his latest plan for global domination, nothing on this Earth can stop him from his mad goal. On the other hand, without the proper references close by, his takeover can be an agonizingly slow process. Never fear, it's the *Mutants & Masterminds Second Edition Gamemaster's Screen* to the rescue.

As far as format, the "landscape" camp gains another convert; this product sits along its length at half-height so you can see the players who are (curses) foiling your plan once again. It's four panels, and the sides fold into the middle. The two end panels, it should be noted, aren't full-sized (presumably to allow folding and packaging it properly without gumming up the "spine"). They come in at three-quarters length, so you're getting just under 39 inches of shield. And it's been a while coming, but the swing has also started toward less content inside such packets. There are no adventures or small booklets with additional game material here (unless you count the sheet with the advertising blurb and OGL). What you do get is a lower cost.

One of the big snags to fast-paced adventures with the new version of *Mutants & Masterminds* is trying to find all the rules you need to run a fight (and locating skills isn't much more fun). The mechanics are spread all through the rulebook's combat chapter and then some, so super-speed gets the boost it needs from having everything concentrated on the two center panels. You get all the formulae for figuring your chances to hit and the modifiers to various forms of combat in smaller tables, but they all encircle the centerpiece: the Toughness Saving Throw Results grid. Here you'll find the outcome of all those damaging laser beams and ice bolts. It's gorgeous, and done, unlike many screens, in glorious full color.

The combat elements are part of a sweeping pattern. Instead of just finding a convenient nook to stick things to maximize space, you start with skills, systems, and interactions on the left, go through the fighting goodies, and end with helpful size and power progression tables to the right. You don't get all the skills, but the standouts are there: Search, Disable Device, Driving . . . the stuff you need to keep the campaign moving. On the other hand it adds lesser-used items like Craft and Repair, should you need to build a jet plane on a moment's notice and not wish to scour the rules.

The one real oversight -- and it's nothing major in the bigger picture -- is the condition summary. It has entangled and dazzled and some other important factors that impact your abilities, and it does have stunned (one of the conditions that result from getting jack-slapped by Madame Mysticism), but staggered and bruised (two other key pieces of the action rules) are both missing. This seems odd, having that spectacular color-coded chart with the results at the bottom, only to omit the actual mechanics of what that means in play.

The players have some material on their side for a change, and though it's not likely the carrying capacity tables (three of them) will benefit them often, the extra effort and Hero Points listings are invaluable if for no other reason than to


ride the GM about not giving them out enough.

The graphics and artwork on this screen may not set the standard, but they come close to the top spots. In the manner of Silver Age Sentinels, it uses a panoramic illustration of the game's iconic characters, good and evil, locked in battle. The picture is rather a shadowy one -- nicely done thematically, having the "dark" heroes and villains fighting on the "night" end of the screen, running to lighter personas at the twilit extreme -- but it's a shame to see some of these remarkable images bleeding together in the black. The structured tables inside aren't just laid out well . . . they're sharp, colorful, and obvious. It's more like a computer screen than a printed image, leaving little to trick or mislead the eye.

It's hard to really show off your creativity in a limited venue like a referee's shield -- it's more a necessity for most games than a blank canvas upon which to shine -- so seeing one done this well recalls the show biz axiom about "no small roles, only small actors." The ***Mutants & Masterminds Second Edition Gamemaster's Screen*** packs a lot of gaming goodness into a pretty flat package, and it's nice to see need met with quality.

--Andy Vetromile

Dork Tower!

Previous installments of the Brief History of Gaming series:

Pare It Down!

When I was a lad, playing computer games on my coal-powered Apple][gs, I used to play a *lot* of computer RPGs. Although most of these games didn't provide much of the tabletop-RPG experience -- at least, the RPG experience as I envisioned it and wanted it to be -- it was still as close as I could get, being a pre-adult sans car. And many games provided some aspects I liked about tabletop RPGs, such as exploration and freedom to wander; the more story-driven content and problem-solving desires I could get by playing my adventure games such as Infocom's wares. (And an offering like **Beyond Zork,** which tried to meld the two, was practically nirvana.)

Anyway, one aspect that was all too common for many computer RPGs was the need for inventory management . . . in particular when it came to food. Now, the curious thing is that, in most computer RPGs, you -- the player -- are the one who's supremely responsible for keeping track of *every* aspect of your party's supplies and provisions. This always struck me as odd, especially in games (such as the **Ultima** series) where you were playing one specific character, and the other members of your party were supposedly sentient beings with their own intellect, goals, and desires . . . including the important desire to remain alive.

As such, one of the most annoying common occurrences of many of these games was when we would all starve because we had run out of food. Sometimes this starvation was intentional (or, at least, unavoidable, such as when we ran out of money or were miles from the nearest town provisioner). But far too often it was entirely accidental; I simply hadn't noticed that we were getting low on food. Now, what I found interesting is that no one would speak up at any point and mention this fact until we were well and truly starving. And, despite assembling a ragtag team of supposedly sentient beings, none of them seemed to care much about their own survival, and I was generally unable to get their feedback or input: "Okay . . . we're about to take a tiny raft over the waterfall to the abyss, where the vessel will be presumably destroyed and we will be forced to wander around for months without any potential for contact with the world we have known. Is there *anything* any of you would like to mention before we get on that raft? Because, I'll be honest here: If one of you makes a peep that *remotely* sounds like, 'I'm hungry and we're out of food!' in the first hour of this expedition, I will personally slow-roast your corpse and feed it to the rest of the party. Capisci?"

Decades of experience have taught me that my computer-based anecdote was not an anomaly, nor limited to the world of electrons. For example, I remember one tale (I think it was from the , but I can't be certain, and I apologize for using the anecdote unattributed) about a standard fantasy-based RPG game. In this campaign, the GM inflicted damage on the PCs because they were starving, since the players had never mentioned they were eating . . . despite the fact that their characters had plenty of food. The players were -- justifiably, in my opinion -- upset, and so for the rest of the adventure they made sure to let the GM know periodically that their characters were eating; they also let him know that they were regularly going to the bathroom and passing gas, so that they wouldn't accidentally soil themselves or explode from the buildup of waste products.

I've been playing a computer game for a couple of weeks now (which will probably see a review here in the not too distant future) that I've been enjoying quite a bit. And one reason *why* I'm enjoying it is that I realize it's taken away a lot of the aspects I didn't enjoy about many computer RPGs: the need to worry about food, the need to stop playing (in game time) because it's gotten dark in the world and I either can't see anything or everyone is sleeping that I'd want to talk to (for example, to buy more food), the need to stock enough torches, and so on. And it's fun.

For a while, there was a trend (and might still be, for all I know) to make all manner of games more complex and "realistic." For example, the classic (read: "old") computer game *The Magic Candle* required the player to fix all weapons periodically (as in, "after every couple of battles"), or else they'd eventually break. A lot of smaller-press games from the 1980s and early 1990s seemed to think that crates of random tables was the route to realism, resulting in bar fights between two drunks taking three hours.

But how fun is it? Isn't it more fun to strip out all the unnecessary stuff, to play a game where bar fights take a few minutes, leaving more time for the good parts of the adventure (including, if desired, more drawn-out and complicated battles)? Is it better to make players constantly afraid that they'll lose their light source or have insufficient light,

coming up with exacting modifiers in every situation -- making sure proximity to torches, modifiers for infravision, etc. -- is accounted for? Or is it enough to just say, "It's gloomy in this cave" or "It's really dark; everyone's at a minus 1," or, when dramatically appropriate, to say, "It is pitch black. You are likely to be eaten by a grue"?

This is an appeal to all: Consider paring it down. Find out what makes the game "fun," and cut out as much as possible as you can. Yes, for different groups this may mean different things; for gamers who dislike socializing or roleplaying, maybe the PCs get an amulet that transports them from hotspot to hotspot, enabling them to dip right into the thick of battle. If the players hate the minutia of food, or encumbrance, or wounds, or healing times, or anything, consider how much of an impact it will make to just pitch it.

Because games, ultimately, do not exist for their own sake; they exist because it is fun for them to do so . . . fun for *us* to do so. And if a game has too many barnacles, sometimes cutting them off results in a faster, healthier experience. And if the barnacles can't be knocked off, maybe it's time to find a new ship.

--Steven Marsh

Building the Low-Tech Landscape

Part 1: Peasant Economics
for *GURPS*

by Matt Riggsby

If the PCs become rulers, or even low-level administrators like samurai landlords, feudal knights, or Viking chieftains, this responsibility brings a number of niggling questions: Just how many people does my character, the Duke of Earl, rule? On how much land? What do they do there? How far is it to the nearest town? How big is it? These are not easy questions.

For a start, our historical data on the subject is sparse and difficult. Demographics and agricultural data before the 19th century are just this side of historical fiction. Where we do have data, it's patchy and difficult to interpret. For example, the weight of a quarter of grain, a standard unit of measure for the Middle Ages, in the west of England in 1239 might be different from a quarter in the north of Spain in 1384 in ways we don't quite understand. Indeed, a quarter in one place might be different from the next county over in the same year.

Even with enough data about historical settings, it's a complex question for fantasy GMs. A great deal depends on variables about which the GM must make essentially arbitrary decisions, since historically they vary enormously through space and time, and no generalization is necessarily appropriate to all or even most historical periods, let alone any historically flavored fantasy world. What, exactly, is the level of agricultural technology? How good is the land? What's the climate like? Is it good land for pigs? Oats? Grape vines? How heavy are taxes, and how do they make their way to the nobility, the government, or the landlord? But for those with a desire to put some effort into setting up initial conditions, this article provides some guidelines for turning those Status 4 and Wealth (Wealthy) advantages into some number of peasants and some number of acres.

And this isn't just an exercise in accounting. In figuring out how many people make a living, the GM will coincidentally answer questions which will let her flesh out the landscape. Are people spread out across broad areas, or tightly packed in dense, closely placed villages? Will adventurers traveling through the countryside pass through dark forests, tromp across endless well-tilled fields, or trip over sheep? This article and its sequels will give you some plausible answers.

Procedure

In order to answer these questions, the GM (or the enthusiastic player who wants to map out his domain in excruciating detail) will need to make a number of decisions and, based on those, do some calculations to work through their ramifications. To figure out how much land peasants use and how they use it, follow the steps listed below. "Decide on" items require an arbitrary decision, such as how wealthy the local peasants are. "Determine" items require some decision making within bounds; for example, given the total value of animals the peasants own and a list of prices for individual animals, you'll have to determine how many of each type of animal is present. "Calculate" items are

pure math.

1. Decide on a number of households in the area and their wealth levels
2. (Optional) Decide on the total value of domestic animals. Animal usage is largely a function of wealth and, at these levels, provides a trivial portion of income. The GM may want to ignore steps related to animals and the income they provide unless use of animals is very heavy.
3. (Optional) Determine how many animals of which species are present
4. (Optional) Calculate income from animal consumption and secondary products.
5. (Optional) Decide on land requirements for animals
6. Decide on effective yields of the crops the peasants grow
7. Determine mix and proportions of crops grown
8. Calculate amount of farmland used
9. Decide on amount of wasteland used
10. Calculate total land usage

Once you've gone through these steps, you'll be able to discuss how many people there are in the area, how close together they live, how they effect the landscape, and so on. The math is simple, but there is a lot of it, so, like vehicle design, a spreadsheet might be a good idea.

Peasant Income and Households

It all starts with the peasants. Without them, everyone else starves. The majority of peasants in low-tech societies will be Poor or Struggling, with a corresponding Status of -2 or -1. There may be a few Dead Broke individuals, mostly elderly widows or widowers with no family to support them, and a minority of wealthier (Status 0/Average wealth) peasants who have, through cleverness and hard work, managed to achieve relative prosperity. The Dead Broke peasants are likely to be statistically insignificant in the long run (if they aren't, expect widespread famine), but the Average peasants form a growing minority as improving agricultural technology allows better yields on smaller plots of land.

Historical records have overwhelmingly identified households rather than individuals as the fundamental economic unit, and we'll be doing the same. As it happens, **GURPS** *Fourth Edition* supports this perspective for peasants. In "Supporting a Family," **GURPS Fantasy** makes the assumption that in a family, the husband has an income while the wife concerns herself with household matters. That's essentially true in most cases, but an oversimplification. In peasant societies, men, women, and children past infancy all perform both productive labor and household maintenance to some degree or another, often divided along gender and age lines. For example, men might plow the fields while women brew ale, tend chickens, and cultivate vegetable gardens for sale outside the household, while older children look after the swine and gather nuts and mushrooms in the woods. *Everyone* helps with the harvest and with other time-sensitive labor.

New World Crops

This article concentrates on crops available in the Old World, but we should at least mention some New World staples. Effective yields of maize are comparable to those of other high-quality grains, although they should be combined with legumes to provide complete proteins. Potatoes have far higher yields, up to twice as much as any grain at the TLs in question, and provide more vitamins, making it less important to consume other foods for complete nutrition. When introduced in Europe, though, they fetched very low prices.

But regardless of the relative amounts of productive labor different family members provide, we can accept the economic impact of the guideline: a small household has the equivalent of a single "job" worth of income and consumes the equivalent of a single monthly cost of living. Because men have overwhelmingly had ownership of land and other valuables (and have therefore been the primary influence on the family's future income), a family typically has the Wealth level of the husband, although the opposite can happen. For example, a poor nobleman could negotiate a large dowry from a social-climbing family of common merchants, and in an egalitarian fantasy society, a new family could have the wealth of the wife as easily as the husband.

The guideline that someone must have at least Struggling wealth in order to get married should only be observed where most people have Struggling wealth or better. People in extremely poor societies still get married and have children; they just postpone the expensive formalities as long as socially feasible, live shorter lives, have smaller families, and feel bad about not being able to afford a better match. Two Poor characters can support a family, but they must both work (giving the household two incomes), both consume a monthly cost of living, and they'll still be on the edge of starvation.

We'll be working with assumption that peasant households have an average of five people: two parents and three children, perhaps replacing a child with an older relative (for example, an elderly grandparent or an unmarried sibling of one of the parents). However, actual household size and composition varied across wealth levels and cultures. Richer families had more people, while poorer families couldn't afford too many more mouths to feed. Likewise, different cultural preferences and economic relationships could lead to several different incomes for people living in the same home. The GM can determine a ratio of Average to Struggling to Poor jobs' worth of income and, if desired, massage those numbers into larger or smaller physical households as appropriate to a society. For example, a Medieval English peasant might live in a small hut with his wife and children, while the contemporary head of a Viking family might live in the same house as married brothers and grown sons and their wives and children for a "household" of 15 or 20 people, and an earlier Roman villa would have a number of slaves living together in a single very large household.

Typical income for Struggling characters ranges from $325/month at TL 1 to $400/month at TL4, although *Fantasy* sets the income of a peasant farmer at $300, which happens to exactly match monthly cost of living for Status -1 characters. A Poor peasant might only make $100/month rather than the typical $130 to $160 per month for Poor characters. We'll accept that a relatively well-to-do (that is, Average wealth) farmer makes an appropriate income for his TL rather than the slightly depressed income of his poorer cousins.

It's also worth keeping in mind that peasant income comes on a seasonal, annual cycle. A very Poor peasant may make $1,200 through the course of the year, $1,680 for typically Poor peasant at TL3, $3600 for a bad-off Struggling peasant, and $4,200 for a typical Struggling peasant at TL3. Moreover, it doesn't come in even monthly installments. In most of the world, a peasant's "income" starts out fairly sparse in the spring as edible crops start to grow and animals recover from the winter, hits one or two peaks during major grain harvests (often one in summer and another in late fall or early winter), then drops to almost nothing during the winter months. In tropical regions, income variations will follow dry and rainy seasons. GMs absolutely gung-ho for realistic detail may want to adjust monthly peasant income accordingly.

Primary Crops

Although it's expressed in $ in the job descriptions, peasant income doesn't really come in the form of money. It comes in as agricultural produce, the vast majority of which is grain supplemented by small quantities of fruit, vegetables, dairy products, and other foods. A peasant needs to consume at least 600 pounds a year of some combination of grains. This is an appropriate level for Poor characters. It provides far less than the recommended caloric intake for an active adult, but peasants often suffer from inadequate nutrition. If there is any shortfall, starvation is almost certain, and even this level will likely lead to low HT and ST scores. 750 pounds of grain a year is closer to the minimum for a healthy diet; characters with Struggling wealth may consume this much. The excess, if there is any, can be sold for money. Of course, to engage in interesting trade, you'll need to know just what the peasants are growing.

When possible, farmers will concentrate on crops that will fetch a high price, but they'll have to balance that with the need to feed themselves. Wheat was and is the preferred crop in the west. It tastes better, is somewhat more nutritious by weight than most other grains, and can be converted into superior breads, noodles, and other forms. For large chunks of the Middle Ages, it commanded a price close to double that of cheaper grains. However, it is more susceptible to blights and requires more space and more extensively prepared land than other grains, so most peasants wouldn't be able to grow nearly as much of it as they'd like. Rice, the preferred grain in the east, has similarly preferred taste and versatility, but its cultivation faces obstacles of its own.

Consequently, the bulk of a peasant farmer's crops would be a less tasty but hardier or more prolific crop such as barley, rye, or millet. Despite inferior taste and versatility, they can grow on inferior land and in more demanding climates, and many varieties can be grown much more densely. For example, sown with enough seed, a plot of land could produce up to twice as much barley as it could wheat or rice. Oats deserve a special mention. The nutrition, taste, and versatility are generally inferior to wheat and yields are often even lower. Why grow them, then? First, oats grow reasonably well in cold, damp conditions and on less fertile soil, making them a viable crop for human consumption in environments where even barley doesn't grow particularly well. Second, human consumption aside, it became a vital crop for feeding horses.

Legumes of various kinds -- beans and peas -- were a fairly common secondary crop. They provided significant amounts of much-needed protein and, in some kinds of crop rotation, performed the useful office of partially regenerating the soil's nitrogen supply. Bean prices could vary considerably, but often fell into the range of lower-grade grains.

The chart below shows typical market prices and yields per acre of farmland for staple crops common in many historical and pseudo-historical settings:

Primary Crop Prices and Yields

Item	Price	Effective Annual Yields
Low-quality grains	$0.90/pound	200-1000 lb./acre
High-quality grains	$1.8/pound	115-600 lb./acre [1]
Oats	$1.1/pound	100-500 lb./acre
Peas, beans	$1.2/pound	200-600 lb./acre

1. Effective rice yields can jump as high as 1,000 pound per acre, although that requires wet-farming techniques which arguably become available only at TL4.

The effective yield is *not* the total amount of grain a field will produce. It's the amount the farmer can consume, sell, or pay in taxes after setting aside a portion to use for the next year's planting with allowances made for rot and other losses. The *actual* yield, which is relatively consistent across the TLs in question here, is 10-20% higher than the maximum effective yields given here. It appears that until important technological changes at the beginning of TL5, the effective yield is less dependent on technology and more on the climate, inherent qualities of the soil, and the amount of labor available to work the land. Farmers in sparsely populated Carolingian France (early TL3) often got under 250 lbs./acre of wheat, but those in densely packed Renaissance Europe (early TL4) could get up to 600 lbs./acre, as could those in Roman Africa (late TL2), all for about the same amount of seed grain.

> ### Example: $ to Goods
>
> Instead of saying that a peasant gets a $3,600 annual income, the GM may declare that he gets 4,000 pounds of barley, 2,000 pounds of wheat, or, more likely, a combination of crops: for example, 2,610 pounds of barley, 315 pounds of wheat, and 570 pounds of peas.

Secondary Crops

If at all possible, a peasant will want to produce more than just the bare minimum of subsistence crops, either for sale or to provide a more interesting and varied diet. These are a few of the more economically significant crops and goods which peasants might produce. Peasants may substitute grains with the foods in this section up to a third of the $ value of their monthly cost of living (except for beer; it can be assumed that those peasants who can are already converting some of their grain into beer, so the value to be applied against cost of living comes from their grain production).

Something just about every farmer can do is turn some of his grain into a weakly alcoholic, fermented beverage;

connoisseurs will object, but we'll call them all "beer." Beer-brewing in various forms is a nearly universal art, and with good reason. Apart from the obvious, if relatively mild, intoxicating properties, it preserves significant nutritive value and provides a relatively safe drink where water is microbially suspect. It appears that peasants in large sections of late Medieval Europe consumed it through the workday. Though barley was the most common grain for it, most grains and starchy tubers can be turned into beer with a successful Brewing roll; failure destroys the raw material.

Warmer, drier areas of the western world have two very important secondary crops: grapes and olives, used overwhelmingly to produce wine and oil rather than for their raw fruit. There have been times when they were even grown together, grape vines curling around olive trees.

Although olive trees produce a relatively large amount of fruit relative to grain fields in terms of raw weight, they don't provide much nutrition, and the fruit needs extensive processing. Although they can be preserved, they are more often pressed for oil, which can pack significant value into a small bottle. But even a little oil represents a lot of olives. It takes about five pounds of olives to make a pint of oil. One odd property of olive trees is that they have alternating harvests. That is, olive harvests tend strongly towards on and off years. If the crop was good this year, it's likely to be bad the next, and vice versa.

Grapes have a few things in common with olives. They can processed for long-term storage (that is, dried into raisins) but they are more often processed for the liquids they contain, the end result being wine. The yield is more favorable than for olive oil. It takes ten to twelve pounds of grapes to make a gallon of wine.

The major drawback with both olive trees and grape vines is that they take years to set up. Newly planted vines and olive trees don't produce for four to seven years after planting, and olive trees grown from seedlings rather than cuttings can take over a decade to bear fruit! Peasants can communally tend small vineyards and olive groves, but they don't have a great deal of spare labor to invest in such projects. Consequently, wine and olive production are the realm of villa owners, monasteries, noblemen, and others who can support themselves and direct spare labor to experiments and long-term tasks without fear of starvation. Once established, though, both vines and olives can produce fruit for decades with little tending. Some olive groves have been productive for *centuries.*

While important for a variety of nutrients, other fruits and vegetables don't provide nearly as many calories for the amount of work it takes to grow them as grain, and they have historically been far less significant both economically and in the diet. Squash varieties from zucchini to pumpkin, melons, cucumbers, apples, carrots, peaches, onions, garlic, berries, eggplants, mushrooms, turnips (with clover, these become an important part of TL5's agricultural revolution, but through TL4, one is likely to rely on turnips only in desperation or in Scotland), edible greens, herbs, and the like may, for economic purposes, be lumped together as a variety of other vegetable foods.

Secondary Crop Prices and Yields

Crop/Product	Cost	Yield
Olive oil	$20/pint	35-200 gallons/acre
Ale	$3-$8/gallon	1.1-1.5 lb. grain/gallon
Wine	$6-$30/gallon	30-60 gallons/acre
Other fruits and vegetables	$.10-$3/lb.	75-400 lb./acre
Preserved fruits and vegetables	$.50-$5/lb.	2-4 lb. of raw materials per pound of preserved

Livestock

In peasant societies, animals are kept primarily for secondary products (milk, eggs, fur, feathers, etc.) and labor, with meat a secondary concern, with high-litter, low-maintenance pigs as the most notable exception. How many a peasant or his village can keep depends in large part on how much the peasants can afford to feed them and how much spare land there is for pasturage.

Other Animals

The animals detailed here aren't

Therefore, just as income can be used as a determinant of whether or not a peasant can afford to get married, it can also be used to determine which animals he can keep. Just about anyone can keep one or two small household animals, but the larger the beast, the more expensive it is to keep. Very poor peasants simply don't have the land or spare grain to maintain large animals like horses and cows.

Meat may not have been a day-to-day part of the peasant diet, but it would have been eaten regularly at certain times and in small quantities throughout the year. Specifically, meat would have been eaten mostly during the late fall into winter. A peasant would have to decide whether he could feed both himself and his animals over the cold winter months. The ones not making the cut would end up on the dinner table. Some meat might have been eaten fresh, but where possible, it would be preserved by smoking, salting, and so on. Animals slaughtered would typically have been either very young (since they wouldn't provide as much productive labor or secondary products) or very old (and past their productive prime).

Since they're small, chickens and related fowl are the most common domestic animals, useful for feathers and eggs. Intensive poultry farming could theoretically have supported a huge number on an acre of land. However, birds are more likely to be found raised in small numbers in individual households, with each family owning a rooster and a few hens.

Sheep and goats are kept for milk and wool. Unlike chickens, who can live on forage from a garden and a few handfuls of additional grain, sheep and goats need hay or grain during the winter and pasturage when available. They are notoriously hard on grass and can strip the land of just about all vegetation (intensive grazing is one reason the Mediterranean is so rich in flavorful herbs, whose pungent essential oils make them the few plants sheep and goats won't eat), so farmers would move them around as frequently as possible. Depending on the breed, a sheep or wooly goat can produce anywhere from 2 to 20 pounds of raw wool a year, although that upper limit is for certain modern breeds.

Pigs are the only animal found in large numbers which neither work nor produce secondary products and so are raised solely for meat. However, they make up for it by being cheap to keep. Instead of requiring pasturage which might be tilled for more grain or grain itself, pigs can be fed on household scraps and forage in waste land.

Beyond sheep, goats, and pigs are animals large enough to provide useful labor: horses and cattle. Given a choice, peasants are more likely to take cattle than horses. Though they don't provide as much labor on a pound-per-pound basis, cattle can provide relatively ample quantities of milk and, once they die, meat and hides for leather. Many societies consume their blood, although only a few, mostly in sub-Saharan Africa, carefully bleed the cattle through their lives rather than exsanguinate them when they're slaughtered. Most of the actual work is done by oxen, which are castrated bulls.

the only domestic animals, but they are the preferred ones. Without a way to offset the cost of keeping them, most peasants simply couldn't afford animals. However, it's possible to introduce small numbers of other animals. For example, rabbits, guinea pigs, and other small, prolific mammals might be kept as a small-scale meat supply. The GM can treat such animals as costing as much as chickens, but without the egg supply. Likewise, doves, pigeons, and other small birds could be kept, but cost more ($7-10/bird) and produce inferior eggs (no more than $1/dozen).

Anyone living near water has the opportunity to catch fish, frogs, and other aquatic animals. A day's fishing in a pond or river can net $(margin of success on a Fishing roll/2) worth of fish. However, the best weather for sitting out and fishing is also during important seasons for farming, so a peasant is far better off in the long run working in the fields than sitting by the river.

Finally, there are dogs. Anyone involved in herding will have them as a matter of course, and regular hunters may have them as well. However, their need for meat makes them unlikely pets for poor peasants tilling the soil. A village with a significant number of animals may have a handful of dogs, but most dogs will be in the hands of the upper classes.

Horses aren't widely used for secondary products (in addition to being relatively poor milkers, their hair makes proverbially uncomfortable clothes), but they do provide useful labor. In fact, appropriate breeds of horses provide significantly more labor than oxen. They provide more useful hours of labor per day and, since they can move faster, can get more land plowed per hour. Unfortunately for peasants, horses also have more expensive tastes than oxen. Despite being of roughly comparable sizes, a horse cost about four times as much to feed. Oxen can get by on a lot of

hay and a little bit of grain (typically oats). For horses, the opposite was true. For antiquity and most of the Middle Ages, the additional productivity they might get out of a horse didn't justify the added cost of keeping a horse, but in the later Middle Ages, agricultural productivity reached a point where horses could become common farm animals.

A reasonable rule of thumb is an average of $5 worth of animal per Poor household, $100 worth of animal per Struggling household, and $500 worth of animal per Average household. In any given village, some people might have a few chickens, while others have a few sheep and still others a cow or two. The cost of caring for them is, like the cost of supporting a family, included in the cost of living. It's unlikely that peasant-owned animals will be more than 10% cattle and horses, nor are they likely to have more than two fowl per person (herd animals are much easier to keep in large numbers; a single family could easily take care of over 100 sheep if that were their full-time occupation). In addition to income from secondary products such as cheese and wool, a household can get 5% of the value of its animal holdings annually from selling new offspring or slaughtering and eating them, or 8% from pigs.

Animal And Animal Product Prices

Product/Animal	Price	Productivity/Land Requirement
Cheese	$2-$5/pound	1.25-1.75 gallons milk/lb. (goats produce 50-250 gallons/yr., cows produce 100-500 gallons/yr.)
Wool	$4-6/pound	2-20 lb./animal/yr.
Eggs	$2/dozen	3-10 doz./chicken/yr.
Fowl	$5	200/acre
Sheep, goat	$140	.5 to 10 acres each
Pig	$150	.25 to 5 acres each
Cow	$400	1 to 20 acres each

Though our primary focus here is soil-tilling peasants, it's worth noting conditions for nomadic herders. Full-time herders are likely to have animals on the upper end of the given productivity ranges. If a sheep only produces three or four pounds of wool a year, it would be impossible to keep track of enough of them to make wool production anything more than a sideline. However, for sheep and goats producing 10 pounds of wool a year or more, including income from cheese and wool, a reasonably-sized flock of 60 would be enough to support a Struggling shepherd and his family (and their relatively meat-heavy diet would support a dog or two to help out). It's a relatively inefficient use of land; at a relatively favorable 3 acres per sheep, that's 120 acres, as opposed to a mere 8.3 for the Struggling peasant in the Primary Crops example. However, the land on which sheep are grazed can be very poor indeed, so grazing animals can be a great way of making use of land that would otherwise provide few or no resources.

Land Use And Distribution

The amount of land farmers work depends on a great many factors: soil fertility, density of existing population, extent and distribution of arable land, and so on. Peasants can keep up to 12 acres per household under active cultivation. It's possible that widely available animal labor would enable peasants to cultivate even more, but impossible to say for sure; societies with enough animal resources to make a difference were already running out of arable land. To calculate the amount of land under cultivation, the GM must set an effective

Animals Example

Consider a village of 100 Struggling households. They have a total of $10,000 worth of animals. If they're members of a poultry-loving society, that could be 10,000 chickens. However, that's fairly unlikely. A more likely distribution might be 11 cows, 16 pigs, 12 sheep or goats, and 304 fowl. Assuming 5 acres of pasturage for each cow, 3 for sheep or goats, and .5 for pigs, the village requires 98.5 acres of pasturage to keep its animals. Assuming modest yields of cheese, wool, and eggs, the annual production of secondary products will be below the value of the animals themselves. If we were being insanely detailed, we might use the average animal-income to

yield for commodities listed in the crop and product tables above. Given that and the types of crops peasants are growing, the number of acres under cultivation can be computed.

But that's not all the land they need. Crop rotation ensures that there will be empty land along with land being farmed. At TL2 and most of TL1, every acre under cultivation will usually be matched by another acre lying fallow for the year (light grazing might be allowed on the fallow land, but heavy grazers like sheep and goats would be kept elsewhere). At TL3, only one acre needs to be set aside for every two acres being cultivated, and at TL4 only one fallow acre for every three being cultivated. If the society cultivates animals in significant numbers, they may need separate land as indicated in the table above.

The amount of space taken up by buildings is extremely variable, depending on climate and extent of arable land as much as anything else, but is essentially negligible when compared to the size of nearby fields. Buildings might provide anywhere from 10 to 40 square feet of space per person, and anything from 10% to 100% extra space might be taken up by lanes and alleys, gardens, courtyards, and other exterior spaces around homes. Wealthier households and households in colder climates have more indoor space and provide indoor space for animals as well, resulting in combined barn-homes. The body heat large animals provide is very welcome in winter. Warmer climates usually lead to more outside space like courtyards and fenced-in compounds. Either way, even generous allowances for space make it unlikely that the living area taken up by a village will surpass a single acre. Once they settle down to doing agriculture, humans almost universally build square or rectangular houses; rectangular houses in the same village often end up oriented in the same direction.

Finally, areas around peasant villages often left woodland and other "waste" areas for wild resources: honey, mushrooms, foraging for pigs, wood for construction, and so on. Peasants probably wouldn't be allowed to hunt in those areas, but they might nevertheless try to poach rabbits and birds. There are likely to be at least one or two acres still "wild" per person (not per household), but it's possible to get by with less if the crops grown are particularly versatile (for example, if homes are built entirely from mud and straw, reducing the need for wood to next to nothing).

The household wouldn't necessarily have owned or otherwise controlled all of that land, nor would it have been consolidated around the household. A house might have had a bit of garden around it and perhaps a pen for holding animals overnight, but the farmland was likely a section, or even several different sections, of a large communal field, pasturage for animals would have taken the form of a village green or a sparsely vegetated area of waste land, and any intentionally preserved wild areas would have been beyond the bounds of the village itself.

As *GURPS Fantasy* notes, a single village and its related farmland is unlikely to cover an area of more than 1,600 acres, though the wild lands it draws from can be farther away. Theoretically it could be as high as up to about 2,000 acres if population densities are very low. Such a village won't have a population of more than 1,000, even at the best of times, and will probably be much smaller. However, that just puts a limit on how many people can live close together. A village, as a social and legal unit, may consist of multiple clusters of houses each separated by an areas of fields or common pasture, with a few more outlying homes places as their independent-minded occupants see fit. Finally, the fields will be punctuated and surrounded by patches of woodland and pasture.

All things being equal, settlements would tend to assume a hexagonal distribution across the landscape. To demonstrate possible relationships between villages, the table below indicates the average distance between villages (in miles), given a range of population densities and village populations:

Land Use Example

From the example above, a farmer is growing 2,610 pounds of barley, 315 pounds of wheat, and 570 pounds of peas. The GM decides the effective yield for barley is 450 lbs./acre, the yield for wheat is 315 lbs./acre, and the yield for peas is 380 lbs./acre. The farmer, therefore, is growing 5.8 acres of barley, one acre of wheat, and 1.5 acres of peas, for at total of 8.3 acres.

At TL1-2, the farmer needs another 8.3 acres to lie fallow, or 4.15 acres at TL3-4. Assuming 1 acre of wild land per person and an average household of 5 people, this peasant family needs 21.6 acres of land at TL1-2 or 17.45 acres at TL3-4.

Avg. Population	Population density (people per square mile)							
	5	10	15	20	25	50	75	100
250	4.0	2.8	2.3	2.0	1.8	1.3	1.0	0.9
500	5.6	4.0	3.3	2.8	2.5	1.8	1.5	1.3
750	6.9	4.9	4.0	3.5	3.1	2.2	1.8	1.5
1000	8.0	5.6	4.6	4.0	3.6	2.5	2.1	1.8

If the peasant typical of the village in the animals example, the 100 households require just over 2,258 acres at lower TLs or 1,843 at higher TLs. However, only about 1,660 of that is farmland at the lower TLs and 1,245 at the upper, so such a settlement would strain but not quite break practical limits for a settlement size.

However, all things are never equal. A number of factors will influence the placement of villages in the landscape. The most important is that good farmland is hardly evenly distributed, so villages won't be either. People will live where the good farmland is, clustering together with easy access to good fields and ignoring large patches of less desirable land. Villages are more likely to crop up on the sides of hills (and, if they're not too tall and already occupied by feudal strongholds, the tops), taking up a minimum of valuable farmland. However, they'll also cluster close to streams and ponds to take advantage of access to a water supply and possibly fishing. A village may end up strung out along a road, if there is one, to make it easier to get to the nearest church, mill, etc. Villagers might want to spread their homes out across the landscape to be closer to individual fields but be forced by circumstances to live close together for defense or simply for companionship.

Likewise, the numbers presented here may create the impression of much higher potential populations than were found anywhere in history but, again, the local geography will be a determining factor. A square mile of good farmland might support nearly a thousand people, but that wouldn't be a representative square mile. Rivers and lakes, mountains and hills, marshes, large forests, rocky patches, and simply land with poor soil are all unsuitable for the kinds of intensive cultivation described here and will keep population densities over large areas down. At the beginning of the Middle Ages, England and much of France had 5 to 10 people per square mile. Typical population densities in Europe's later Middle Ages were in the 50-75 people per square mile range, with a few particularly highly populated countries (for example, Holland, a relatively small country not known for vast deserts or mountain ranges which might drive down population density) reaching as many as 100 per square mile at the dawn of the Renaissance.

Another large-scale concern, this one in time rather than in space, is soil exhaustion. Early agricultural techniques (for example, slash-and-burn) provide initial fertility every bit as good as later TLs, but they exhaust the soil quickly and force farmers to move on after a few years. Fortunately for low-TL farmers, population densities are usually low enough that there's new land to move on to. Higher TL crop rotation systems spread out the agricultural burden and give fields time to recover. But that only slows the soil's decline to periods measurable in decades rather than years. Peasants might slowly move from one set of fields to another abandoned by their fathers or grandfathers as their own soil becomes inadequately fertile over the generations. It has been suggested that Europe was reaching its maximum agricultural carrying capacity by the time the Black Plague hit and that soil quality was deteriorating despite the

Colonization

So far, we've described a fairly static system. Given so many peasants (and a range of economic and technical assumptions), they are likely to use so much land, and vice versa. But what happens if conditions change? What if, for example, a bunch of new peasants move into the area, or if new generations subdivide the same land?

Not surprisingly, it's a complex question without entirely predictable results. In the long term, it appears that increased population densities can result in increased yields, up to a point. The relatively high yields achieved by imperial Roman and Renaissance farmers may very well have been the result of practices such as multiple plowings and intensive weeding, practical when there's lots of labor to go around but difficult when labor is in short supply, as in the low-yield early Middle Ages. On the other hand, suddenly tossing a bunch of new people into an existing village is likely to lead to explosive social conflict as the natives see their homes threatened. New farmers will probably have to clear their own land out by cutting down forests

three-field system. Had the plague not killed so many people so quickly, Europe might have faced widespread famine instead.

At any rate, soil depletion is unlikely to be a pressing concern for individual TL3-4 farmers, in that people have several years to deal with it before anyone starts starving. However, from a world-building point of view, it's worth keeping in mind that areas with very high population densities may soon face a collapse in their agricultural production as fields become exhausted and the farmers have nowhere else to go.

or terracing hillsides. Any ambitious ruler intent on new settlement will have to cover the cost of living for incoming peasants for at least a year and probably longer. Even then, the quality of the new land is unpredictable, so it might not be able to support the new population.

Death And . . . What Was That Other Thing?

So far, we've sketched out the agricultural basis of low-tech economies, and how most people support themselves once they've settled down to live in one place. In part two, we'll be looking at more social and political aspects. In particular, we'll be dealing with taxation and support of non-farmers, and how this all plays into supporting cities, towns, and wealthy overlord.

Daughters of Eve

for *GURPS*

by Fade Manley

It's said that long ago in the garden of Eden, Adam gave names to all of the animals, and to every creature under the heavens. In this way man was given dominion of the earth. What is not said in those pages is that Eve in turn was given dominion over all that remained: the nameless. No one knows where Adam's gone, but Eve still wanders the world, and she still holds the power God once gave her.

A few millennia give a woman plenty of time to build a power base, and even with the occasional setbacks that come with the fall of empires, Eve has learned how to keep herself quite secure. These days, she holds stock in companies across the world, owns property in dozens of countries, and is seldom seen in public. When she does appear, she's a short woman with dark skin and dark hair, pleasant in appearance but no stunning beauty; she dresses professionally, and usually has a large dog at her side.

Eve is clever enough to never name her pets.

When she was much younger, Eve's oldest son killed her second son, and she's never forgotten this tragedy, nor stopped considering herself guilty for failing to raise Cain and Abel appropriately. From time to time she'll take a lover or husband and have new children, but she always fosters these new sons and daughters out to carefully selected families; she has no confidence in her own ability to raise them. Having Eve as one's mother is a useful justification for supernatural abilities, or simply for an unusual trust fun that provides plenty of opportunity for adventuring.

The death of Abel gave Eve her first, and primary, cause: to fight against death. She funds political groups that oppose the death penalty, research into cures for fatal diseases, soup kitchens, law enforcement groups, and any other means of staving off death a little longer. She's seen enough nations rise and fall in her time that she's entirely willing to work outside of the law if it suits her goals.

Daughters of Eve

Eve is immortal, but one body can only do so much. While her children are precious and given away, she also makes servants of her own design to supervise and carry out her projects. These Daughters of Eve are created from the souls and bodies of dying animals that were never named -- the difficulty of finding a dying human with no name making using human souls impractical -- and shaped into human-looking creatures with powers of their own. (Eve also makes new Daughters of Eve in the form of animals, but these are less useful and so less common.) As the name implies, these are all female; Eve doesn't trust herself to raise sons.

Daughters of Eve are, like their creator, unaging: however, they are not immortal, and can be killed with some difficulty. They tend towards cool, pragmatic outlooks on human life and free will, having been made as adults and then set promptly to work once given enough skills to complete their jobs. Eve has enough influence and money to get her servants appropriate identification and fabricated backgrounds, letting them spread out and infiltrate whatever organizations she finds useful. A few remain Zeroed (as per the *Basic Set* advantage), working on covert missions.

With a successful Perception roll, a Daughter of Eve knows if any person or animal she sees has a name, and what that name is; furthermore, with Will roll, she can command nameless creatures. (This is less useful than one might think, especially in an urban environment where even stray dogs are likely to have names; however, it's invaluable when traveling through the wilderness.) Beyond this and their lack of aging, Daughters of Eve are simply unusually talented humans, with a serious Duty and a good resource network.

Occasionally, one of Eve's servants will (deliberately or through carelessness) kill someone in the course of her duties. If sufficiently contrite, the Daughter will be allowed to continue service of Eve after a period of unpleasant tasks given as punishment. (Being forced to deal with the paperwork necessary for passing on resources for several dozen Daughters of Eve as they transition between different identities is a popular one.) An insufficiently apologetic Daughter will be released "into the wild" for a time to live her life without the companionship of others like her or the tasks of her creator: most, after a few decades of no support structure, come back home asking for penance and re-admittance.

A few Daughters of Eve have decided they no longer wished to serve, and attempted to take advantage of Eve's resources for themselves, or even go public with her secrets. So far, all of these have been politely, carefully retrieved by other servants, and placed in very comfortable, secure lodging where pleasant psychologists can discuss this need to act out with them for as long as it takes to correct the behavior.

Daughter of Eve   *118 points*

Attributes: **ST** 11 [10]; **DX** 11 [20]; **IQ** 11 [20]; HT 11 [10]

Advantages: Charisma 1 [5], Patron (Eve, 9 or less) [15], Unaging [15], Psychometry (Names Only, -100%; Only Living Creatures, -20%; Ranged +40%; Increased Ranged, 10x, +30%) [13], Mind Control (Universal, +50%; Only On Creatures With No Names, -40%; Only After Psychometry Has Been Successfully Used, -10%) [50].

Disadvantages: Duty (9 or less) [-5], Sense of Duty (other Daughters of Eve) [-5], Vow (No killing of named creatures) [-5], Secret (Daughter of Eve) [-20], Workaholic [-5].

An exiled Daughter loses her Patron and Duty, and may have lost her Vow and Sense of Duty as well. Daughters of Eve may have varying levels of Duty (and it may be hazardous) depending on what their current assignment is.

Plot Seeds

Are You My Mother?: Any adopted PC (or associated NPC) who's been getting too involved in violence may find that his long-absent birth mother is suddenly taking an interest in his life again. Or in any case, someone who claims to be his mother has suddenly appeared to offer various financial benefits and a comfortable position in some company, if the child will just give up his violent ways. This is especially plausible in a fantasy setting where PCs are running about killing off other sentient creatures. If the character refuses, Eve will assign one of her servants to insinuate herself into the child's life, to be a "good influence."

The Bad Seed: A Daughter of Eve has decided to sneak off with a great many of her creator's secrets, and her siblings are running out of time to stop her before she starts letting them loose. For best results, the renegade Daughter claims to be a former agent of a shadowy conspiracy, in need of the PCs' protection and help, shortly before the other Daughters of Eve come looking for her and asking for help in getting her back.

Behind The Curtain: Best if used in conjunction with the Dark Eve (below), the PCs discover that a group they work for is actually being controlled by someone else with ulterior motives. "How" is a good question, and it may take a while for them to suspect cute little Mary Joe in Accounting who's always so helpful and remembers everyone's names. This becomes more complicated if the campaign uses a more benevolent version of Eve: will the PCs still feel compelled to return control of the organization to its rightful leaders if the person manipulating the group is doing so for good reasons?

We Few, We Band Of Sisters: An entire PC party could be composed of Eve's elite trouble-shooters, sent off to clean up other Daughters' messes, infiltrate more dangerous organizations, and find ways to prevent death. This works best for a spy-style campaign of discovering and preventing terrorist plots, but with a slightly darker Eve these Daughters may be authorized to kill if necessary in pursuit of their goals.

Flavors of Eve

Dark Eve: Perhaps so many millennia of trying to make up for a single ancient tragedy have driven Eve mad, and now she not only works around the law, but works to actively suborn entire governments to her desires. In this variation, the Daughters of Eve are deliberately working to take over several nations, and possibly have already succeeded in some; once Eve is the ruler of the world, after all, she can stop all the nonsense of war, and put in enough legal safeguards to make murder a thing of the past. Or so she believes. Any servants who object are said to be "confined and re-educated," but are really disassembled and their souls re-used for fresh, memories-free Daughters of Eve who will perhaps be better at doing what they're told.

Cyberpunk: Eve's ability to create completely zeroed and talented adults puts her in high demand, while her resolute commitment to no killing is a serious liability. She owns her own corporation (or three), and works very quietly against the prevailing "life is cheap" culture present in this setting. She also has a reputation for being an employer who you can always trust to carry through on her end of the deal, so long as you keep to her no-fatality standards for missions.

Yrth: It's unlikely that the Biblical Eve would have reached Yrth via the Banestorms that only sprang up so much later in Earth's history. Instead, Eve may be an ancient elven sorceress who's discovered how to make golems that can reliably pass for human. In this case, there would be no possibility of Daughters of Eve going rogue, being bound to serve her. For a darker version, she might be a powerful undead creature instead, with good reason to never be seen in public during the day; her Daughters are lesser versions of undead bound to her will, both weaker and more able to pass for human.

In a different twist, try an Eve who really *is* a divinely created foremother of a species . . . not only humans, but elves and goblins and orcs as well. Now that her long-separated children have been thrown together again, she's even more committed to finding ways to prevent them from warring with each other. The secret of common origins is also one the Dark Elves would kill to keep secret, if they found out.

Infinite Worlds: Eve's traveled between the worlds, setting up different societies in the past, and now finds her children clashing with each other again. Daughters of Eve have access to equipment that lets them move between worlds, and form a hidden third part to the Centrum/Homeline conflict. Not only do they have the secret of common origins and their mother to protect, but they're dedicated to eliminating killing, no matter which side is doing it.

In Nomine: This is the literal Eve, from the actual garden of Eden, and much like Lilith, she can make celestials of her own design. Her power is over nameless things, and so Eve's essence is to be Wordless. Her enmity with Lilith is boundless, at least from Eve's point of view: Lilith may not have ever found out that Eve didn't die and go to Heaven as expected. Some Superiors have probably discovered her existence by this point, but it's confidential information and not something your average Servitor would hear about.

The Daughters of Eve are angels (starting at 7 Forces rather than 9), though ones who have never seen Heaven; Eve bound them together from Forces taken from dying animals, and immediately into vessels of her own design. A Daughter of Eve's resonance is to know, with a Perception roll, the name of anyone they see; with a Will roll, they may command a nameless creature they've so perceived for CD hours. It is dissonant for them to kill anyone named.

Lucinda: Self-Made Goddess of the Undead

for *GURPS*

by Bevan Thomas

Few fantasy archetypes are as prominent or horrific as the necromancer. Lords of the undead and masters of death and decay, they are the blackest of black magicians and symbols of corruption and insanity.

Lucinda the Divine is an example of a necromancer whose goals extend beyond simply laying waste to the kingdom with hordes of zombies and hosts of demons. Her insanity runs along different lines than crazed revenge. Instead, she believes herself a goddess, and that she must call forth her worshippers from their graves below the earth.

Her description assumes she is an inhabitant of the fantasy world of Yrth (see **GURPS Banestorm**), specifically of the country of Cardiel. However, Lucinda can easily be adapted to other worlds.

Background

Lucinda was born into a wealthy merchant family in Cardiel. Her parents died in a boating accident when she was five, and so she was raised by her brother Conrad, who was 12 years her senior. When Lucinda was 12, she uncovered a secret door in her house that led to a secret room filled with strange books and even stranger objects. She decided to keep it a secret, even from Conrad, and became determined to learn all that she could about the room.

After investigating the place, Lucinda discovered that her father had secretly been a necromancer, and that he had dedicated years to understand the Dark Art. Apparently, the man had performed numerous experiments on the walking dead, and had eventually designed a spell to create beings he referred to as "thinking zombies": animated corpses that retained their own intelligence, but were still completely loyal to their creator. Lucinda was pleased to discover that she had magical talent, and she spent a lot of her time in that special room over the next few years. Hidden from everyone and learning the power over life and death.

To Lucinda's horror, her beloved brother Conrad suffered a stroke and died when she was 25. Determined not to be parted from him, she dragged his corpse into her father's room, and using the books as a guide, mummified Conrad. Then she feverishly performed her magic, and her brother rose as a thinking mummy.

For three months, Lucinda's life returned to relative normalcy (fortunately the family, despite its wealth, had no servants or close friends to discover the abnormality). Conrad seemed more-or-less the same . . . except that he was a desiccated corpse that never slept nor ate, and that he was completely obedient to Lucinda and lacking in any personal initiative. The stress of having to command Conrad, the brother who had been almost a father to her, eventually took its toll on Lucinda's already shaky sanity. She had the firm belief that Conrad was always right, and if he was always right and worshipped her, then logically she must be someone worthy of worship. A goddess.

With time, Lucinda's mind crumbled completely. She decided she was a goddess, and as a goddess, she needed to be worshipped. She announced to Conrad that they were going to leave the house and all its wealth behind, and wander the world preaching her divinity.

Lucinda's cult is currently composed of around 100 zombies (skeletons, mummies, and the like). Most of them are zombies created through Mass Zombie, with a few thinking zombies who serve as priests (including Melissa, the "high priestess of Lucinda"). The normal zombies dress in black robes, and the priests dress in gray. The zombies spend most of their time walking, singing hymns, and banging gongs as they go (as almost all the undead have Disturbing Voice, they produce a truly horrific cacophony). Save for occasionally protecting her from the clergy, angry mobs, or other opponents, this is usually the only task Lucinda requires of them. Her "gospel" is vague and undefined, mainly

about how she is the "queen of life and death," and that the only afterlife is becoming a zombie. A lot of the hymns are about the zombies praising Lucinda for showing mercy on them by bringing them back to life.

When not creating new followers, Lucinda is usually basking in her cult's worship. She used to the study the dead, and now her only purpose in life is to be worshipped by them. It's after all her right as a goddess.

Lucinda the Divine   *234 points*

Age 27; 5'2"; 120 lbs.; She is a slim woman with long brown hair and hazel eyes. Lucinda is usually dressed in her "divine vestments," which is a long white robe and a crown manufactured from human bones. She usually moves from place to place by way of a palanquin carried by four zombies.

The Divine Scepter

Lucinda's "divine scepter" is a three-foot rod made from bone and tipped with an onyx gem. The rod has been enchanted with the Staff spell and the gem is a Powerstone with capacity 15 (and the following quirks: must be laid in a tomb to recharge, may not be used on cats, and makes a strange whistling sound when used). She found it on the desk in her father's room.

Conrad the Scribe

After his parents died, Conrad divided his time between looking after their merchant empire and looking after his younger sister Lucinda. A dedicated and dull man, he had little time or interest in anything else. Then at 37, he died of a stroke, and came back to "life" as his sister's undead slave.

As he had preferred to communicate by letters instead of face-to-face in his work, Conrad was able to continue running the business as a mummy. When Lucinda decided that she was a goddess, Conrad followed her out into the world. However, before they left, he sent off a few letters that placed the business temporarily in the hands of subordinates and would allow him to access the money if he needed to.

Now Conrad functions as his sister's scribe and chronicler, recording all the things she does and says, and writing down her constantly shifting gospel. In his own way, Conrad is happy. After all, he is keeping his mind occupied with work, and in his work he is serving his sister-mistress. What more could an undead slave ask for?

Conrad the Scribe   *192 points*

Age 39; 6'; 130 lbs.; As a mummy, Conrad's skin is shriveled and desiccated, pulled tight over his bones. He still wears the elegant mercantile suits he wore in life, and always has a pair of spectacles perched on his dried-up nose. What hair Conrad has left is black, and his eyes glow a faint red. His voice is a disturbing hiss.

*-2 for Disturbing Voice

High Priestess Melissa

In life, Melissa was a mousy, gentle nun who spent most of her time looking after the sick and helping plants grow. Then one day she tripped, fell down the well, and drowned. A few weeks later, Lucinda and her worshippers passed by and the necromancer looked at Melissa's headstone, which declared "she loved God with all her heart." In honor of the woman's dedication, Lucinda performed her magic, and the now maggot-ridden Melissa clawed her out from the grave to meet her mistress.

Lucinda decided to make Melissa priestess of her cult, second only to the necromancer and Conrad in importance. The zombie has served her goddess well, leading the rest of creatures in hymns and doing her best to preach the gospel. Even in death, Melissa is gentle and nurturing, and usually tries to help anyone who she sees is hurt. Of course, few would accept the aid of a rotting corpse.

Melissa obeys Lucinda slavishly. In the back of her mind, she is unsure about the necromancer's divinity. However, the high priestess knows one thing for certain. She loves Lucinda with all her heart, and just wants to see her happy.

High Priestess Melissa   *79 points*

Age 22; 5'4"; 120 lbs.; Melissa used to be an attractive woman, now she is a rotten corpse. What skin she has left is gray and decayed, and the remnants of her once honey blonde hair resembles dirty straw. Her blue eyes are gone, leaving only her socket from which glows faint red light. For some reason, her rotting has stopped, so she has not become a complete skeleton, but still bare bone are visible on many parts of her body. Her scratchy voice is not as disturbing as that of the other zombies, but is still a far cry from what she had in life. She is usually dressed in the gray robes of Lucinda's clergy.

ST 11 [0]; **DX** 11 [20]; **IQ** 10 [40]; **HT** 11 [10]

Dmg 1d-1/1d+1 [0]; Basic Lift 24 [0]; HP 15 [0]; Will 8 [-10]; Per 10 [0]; FP 11 [0]

*+2 for Healer 2

Gerard

Gerard was a thief too clever for his own good. He took part in a robbery with three other people, and tried to skip town with all the loot. His former partners caught up with him, cut Gerard's throat, and tossed him in the river. The next day, he was discovered by Lucinda, and on a whim she raised him from the dead as one of her clergy.

For some reason, Gerard is not the slave of the necromancer. He has no idea why he has been spared that part of zombiehood, and is really unsure of what to do. If he leaves the cult, then he will likely be killed by some overzealous cleric or monster-hunter. Besides, where could he possible go? If he stays, then he'll be spending his unlife singing hosannas to a maniac. And who knows what would happen if Lucida discovers his will is independent. Perhaps she would exile him from the cult, kill him, or possiblly experiment on him to see why the slave mentality never set in. Whatever she would do, Gerard is in no hurry to find out.

Gerard is lying low, doing his best to behave like all the rest of the thinking dead in the cult. He is desperately trying to think of a way out of his problem, though his mind isn't what it was when he was alive. Until a solution presents itself, he'll just do as the other clergy does, and hope that no one notices anything wrong.

Gerard   *116 points*

Age 37; 6'5"; 200 lbs.; Gerard looks to be a tall, muscular man with short brown hair and a short beard. He is currently dressed as a priest of the cult in long gray robes, and keeps a dagger hidden in his boot. He has only recently started to rot.

ST 12 [10]; **DX** 13 [60]; **IQ** 10 [40]; **HT** 11 [10] Dmg 1d-1/1d+2 [0]; Basic Lift 20 [0]; HP 15 [0]; Will 12 [10]; Per 10 [0]; FP 11 [0]
Basic Speed 6 [0]; Basic Move 6 [0]; Dodge 9.

Social Background

TL: 3. **CF:** Christian Region [0] **Languages:** Anglish (Native) [0]

Advantages

Danger Sense [15]; No Slave Mentality [40]; Smooth Operator 2 [30]

Disadvantages

Duty (singing the hymns of Lucinda, quite often) [-10]; Greed (9) [-22]; Kleptomania (12) [-15]; Overconfidence (12) [-5]; Secret (is not enslaved to Lucinda) [-30]; Thinking Zombie [-103]

Skills

Acting-12 [8]; Area Knowledge (slums of Ten-Tiri)-11 [2]; Brawling-13 [1]; Detect Lies-10 [4]; Escape-13 [4]; Fast-Talk-12 [8]; Filch-14 [4]; Intimidation-12 [2]; Knife-13 [1]; Lockpicking-11 [4]; Musical Instrument (gong)-8 [1]; Observation-10 [2]; Pickpocket-13 [4]; Religious Ritual (cult of Lucinda)-8 [1]; Running-11 [2]; Search-11 [4]; Shadowing-11 [4]; Singing-9 [1]; Smuggling-10 [2]; Stealth-14 [4]; Streetwise-11 [2]; Theology (cult of Lucinda)-8 [1]

Note that Disturbing Voice (from the Thinking Zombie template) and Smooth Operator 2 cancel each other out for all this skills except for Singing (which gets -2).

Lucinda and Her Cult in the Campaign

Lucinda's goal is very simple: Create as big a congregation as possible who will praise her name. Right now, she desires nothing more than that. However, it is likely that soon she will tire of simple hymns and wish for her divinity to be proven in more elaborate ways. Perhaps she will demand that a temple be built in her honor, that mightier undead (such as vampires and wraiths) be created to serve her, that the living should be made to offer tribute to the self-made queen of life and death, or even that the living must be die so that in death they may worship her!

If the necromancer is confronted by a threat, she prefers to use her various mind control spells to cause her opponents to flee in fear or bow before her glory. If that tactic proves ineffective, Lucinda will unleash her followers. After the undead congregation has finished its grisly task, she will show "the goddess' mercy" and raise the bodies of her fallen foes as new devoted acolytes.

In all likelihood, player characters will encounter Lucinda and her cult as foes. The general populace, especially the clergy, will be disturbed to say the least by so many corpses leaving their graves to worship a megalomaniacal sorceress, and will desperately want the problem to be solved as quickly and decisively as possible.

Alternately, Lucinda might attract the attention of another, more aggressive necromancer who wants her zombies and her father's grimoires (which the woman usually keeps on her palanquin). Heroes might be forced to support Lucinda as the lesser of two evils, assisting in her battle against her opponent. One interesting possibility in the duel is for the rival necromancer to cast Control Zombie on Conrad or Melissa, making them spy on or even fight against their beloved former mistress.

GMs who wish a more unusual campaign could have the player character die and then be reanimated as members of the cult. Like Gerard, they would somehow end up without Slave Mentality, and would likely form a tentative an alliance with the former thief as they try and figure out what to do.

Variations On A Theme

Lucinda the Demon

In this version, Lucinda was long ago replaced by a powerful demon. He is using the form of the necromancer to spread blasphemy and empty the graves of the dead all in preparation for some horrific goal. As a compromise, the "goddess" could still be Lucinda, but she is being manipulated by a demon from behind the scenes.

Lucinda the Psionicist

A variation that is particularly appropriate for a science fiction campaign is to make Lucinda a powerful telepath instead of a necromancer. Here she uses a version of Mind Control to turn people into her puppets (showing them the "glory" of the goddess). Possibly when Conrad had a stroke, he fell into a trance, and Lucinda subconsciously used her power to wake him up, though she believed she raised him from the dead. Alternately, she might use a form of psychokinesis to animate the bodies and is deluded in thinking the corpses possess any sapience (if Lucinda has multi-personalities, than it's possible Conrad, Melissa, Gerard, and maybe others have each been invested with one of the

personalities in question).

Lucinda's Secret Temple

If the GM wants Lucinda to be a little subtler -- a necessity in a modern horror or "low fantasy" campaign -- then the cult could be gathering secretly. At night she sends out her disciples to rob graves and return the corpses to her that she brings to life. Then, in a hall deep underneath the ground, the dead sing of her glories while above them the living go about their business.

Templates

Necromancer

Few wizards are as feared as the necromancer. He is a specialist in the magic of spirits and the dead, devoting his time to the conjuration of dark forces. Though some people learn the black arts in order to better fight the undead, most are at best morbid academics and far too often monsters who have purged themselves of all human feeling in their search for forbidden knowledge and even more forbidden power.

Necromancer   *152 points*

Attributes: **ST** 9 [-10]; **DX** 11 [20]; **IQ** 13 [60]; **HT** 11 [10].

Secondary Characteristics: Dmg 1d-2/1d-1[0]; BL 16 lbs. [0]; HP 10 [2]; Will 16 [15]; Per 10 [-15]; FP 13 [6]; Basic Speed 5.50 [0]; Basic Move 5 [0].

Advantages: Language (Accented) [4]; Magery 2 [25]; and 30 points chosen from Allies (familiar or undead slaves) [Varies]; Ally Group (followers) [Varies]; Channeling [10]; Charisma [5/level]; Eidetic Memory [5 or 10]; Fatigue Points [3/level]; Fearlessness [2/level]; Medium [10]; Night Vision [1/level]; Single-Minded [5]; Status [Varies]; Versatile [5]; and Will [5/level].

NOTE: Aspected Magery may be selected instead of the normal variety. Dark, Night, or One College (Necromancy) are particularly appropriate choices.

Disadvantages: A total of -30 points selected from Appearance [Varies]; Delusions [-5 to -15]; Callous [-5]; Enemies [Varies]; Fanaticism [-15]; Flashbacks [Varies]; Loner [-5]; Low Empathy [-20]; Manic-Depressive [-10]; Megalomania [-10]; Nightmares [-5]; Obsession [-5 or -10]; Overconfidence [-5]; Paranoia [-10]; Phantom Voices [-5 to -15]; Phobias [Varies]; Reputation [Varies]; Sadism [-15]; Secret [-5 to -20]; and Social Stigma [Varies].

Primary Skill: Select two Necromancy spells, each (H) IQ+2 [4] - 15 or (VH) IQ+1 [4] -14. Select 10 more spells, each (H) IQ -13 or (VH) IQ-1 [1] -12. Most of these spells will either be of the College of Necromancy or prerequisites for Necromancy spells.

Secondary Skills: Expert Skill (thanatology) IQ [4]-13 and select two skills from: Hidden Lore (any), Occultism, or Research, all (A) IQ [2]-13; Archaeology, Physician, Physiology, or Theology, all (H) IQ-1 [2]-12; Dreaming or Meditation, both (H) Will-1 [2]-12; or Alchemy or Thaumatology, both (VH) IQ-2 [2]-11.

Background Skills: Select one skill from: Knife (E) DX [1]-11; Professional Skill (Mortician) (A) IQ-1 [1]-12; Cloak, Staff, Stealth, or Streetwise all (A) DX-1 [1]-10; Intimidation (A) Will-1 [1]-15; Cryptography, Hypnotism, or Poisons (H) IQ-2 [1]-11; Blowpipe (H) DX-2 [1]-9

Thinking Dead template   *65 points*

Thinking dead are created through the Thinking Zombie spell. Unlike their more common counterparts, they possess a certain level of independent thought, though are still completely obedient to the wizard who created them. Any spells that normally affects undead created with the Zombie spell (Control Zombie, Summon Zombie, etc.) affect the thinking dead as well. Apply this template to the ones found on p. M152 (after combining the two templates, a thinking mummy is -32 points, a thinking skeleton is -97, and a thinking zombie is -103). As usual, the spell cast on a normal corpse results in a zombie, bare bones results in a skeleton, and an embalmed body results in a mummy.

Advantages: No Automaton [85]; No Cannot Learn [30]; No Reprogrammable [10]; No Unhealing (Total) [30]

Disadvantages: No Immunity (All mind control) [-30]; No Indomitable [-15]; No Single-Minded [-5]; Slave Mentality [-40]

Features: Can have mental skills

New Spell

Thinking Zombie (VH)

Regular

This spell is identical to the normal Zombie spell except that it enslaves the owner's soul, producing an undead creature that is still in possession of the mental traits, IQ-based skills, and memories he had in life. The wretch will probably loathe his undead existence, but as long as the spell animates his frame, he must obey his dark master.

College: Necromancy
Duration: The thinking zombie remains animated until destroyed.
Cost: 20.
Time to cast: 1 minute.
Prerequisites: Entrap Spirit and Zombie

Pyramid Review

The Stars Are Right! Nine Disturbing Tales of Mankind's Corruption (for *Call of Cthulhu*)

Published by [Chaosium, Inc.](#)

Written by Fred Behrendt, André Bishop, David Conyers, D. H. Frew, Steve Hatherley, Steven C. Rasmussen, Kevin A. Ross, Gary Sumpter, John Tynes, Richard Watts, & William Jones

Cover by John T. Snyder

Illustrated by Steven Gilberts, Chris Hill, Blair Reynolds & Jason Whitley

Cartography by David Conyers & Tony Santo

176-page b&w softcover; $23.95

The Stars Are Right is like the recent *[Shadows of Yog-Sothoth,](#)* another reprint for *[Call of Cthulhu,](#)* but for use with the modern incarnation of the game, **Cthulhu Now,** rather than the classic period of the 1920s. It is also a decade younger, having originally been published in 1992. Now the original anthology of modern-day scenarios has returned, being reprinted for the first time, but with two significant changes. The more obvious alteration is the addition of two new scenarios to the original seven, the other being an update of the various technologies to make the original seven feel more contemporary.

Physically, **The Stars Are Right!** is an improvement over recent releases for **Call of Cthulhu.** Primarily, this is due to Chaosium not using the same ugly style template that has marred those books (including the *supposed* 6th Edition rulebook), instead using a more contemporary look. Better for it, but like **Shadows of Yog-Sothoth,** the reprinted material is not as sharp and crisp as the original, being slightly murky, slightly blurred; and all in a way that makes Blair Reynolds' artwork, which so dominated the original printing, look most inferior. The same can be said of Tony Santo's original maps. Curiously, all of the new artwork and cartography, which matches the style of the old, does not suffer from this problem.

[SPOILER ALERT!]

The first of the nonet is Richard Watts' "Love's Lonely Children," a highly regarded scenario that plunges the investigators into a seamy underworld of drug addiction, prostitution, pornography, incest, murder, and the worship of foul gods. Another notable element is punk rock, but that is by the by in what is a grubby, seedy affair that delivers some nasty little shocks. Like several others in this anthology, this scenario possesses a visceral quality that may not be to everyone's taste. Yet it is well written with plenty of advice for the Keeper and is easily adapted to whichever city he is running his campaign in.

John Tynes' "Nemo Solus Sapit" ("None Shall Walk Alone") is less easily adapted, being set near the fictional Californian coastal city of Samson, previously used in the campaign **At Your Door.** Its set-up should be familiar to most players, best working with an investigator having gone insane and being placed in the care of Doctor Petroff van Dyson. Of course, there is something nasty going on at the van Dyson Center, but uncovering it and unmasking the real

villain before he has his revenge, is another matter. Should that investigator's player be happy to sacrifice the character, there is opportunity here for some great roleplaying, thus serving as a memorable swan song for the character.

To describe André Bishop's "This Fire Shall Kill" as *Backdraft* meets the Mythos is at least an apt description of what is a traditional if surprisingly cinematic adventure. Nominally set in San Francisco, it opens with an investigator returning home to find that that his house has burnt down. This is one way, of course, to divest the investigators of a Mythos tome or two… The finale for this scenario is particularly memorable, requiring the investigators to charge up a burning tower block in order to stop a summoning. There is also the matter of the little girl who really knows how to play with matches…

"The Professionals" by Fred Behrendt requires that the investigators take a job to discredit a candidate in a forthcoming election to the US Senate. The question is, why would they? If the set up is forced, the scenario never really recovers and its elements of sexual scandal, governmental dirty tricks, black technology, and weakly drawn political parallels, never come together. The ending in particular is poor, giving the investigators little to do except stand around as the climax plays itself out. Perhaps "The Professionals" would work better as part of a *Delta Green* campaign, but otherwise this is an uninspiring affair.

If any of the scenarios in this collection show their age, then it is Steve Hatherley's "Fractal Gods," which explores the dark side of a cultural phenomenon now over a decade old. The dangers of summoning creatures via computer was not a new idea then either, the most common creature being the Hound of Tindalos, but the use of Fractals was in 1992. Likewise, the use of the fanzine as means of disseminating the scenario's protagonists feels quaint. This scenario is also the most updated, computer technology having come on leaps and bounds. This is still a good adventure though, and is easily adapted to other locations.

Like the earlier "Nemo Solus Sapit," a doctor using unorthodox methods lies at the heart of Gary Sumpter's "The Gates of Delirium." Investigating a friend's attempted suicide, the characters are exposed to an unexpected physical side effect of her treatment. The treatment is the drug Liao, which not only takes the imbibing patient through the higher dimensions, but also brings back part of the experience to the waking world. For the investigators this manifests as the potentially lethal 13th floor, an eerie experience that the adventure fails to develop. The result is that the adventure is pedestrian in feel and a missed opportunity.

The last of the original seven is Kevin A. Ross' "The Music of the Spheres," which again uses the age-old device of a friend in trouble to get the investigators involved, though to much better effect. The question of why a normally gentle computer technician murdered his girlfriend takes the PCs to his place of work, a radio telescope in Nebraska. The murder is only the first of a series of strange events that center on the telescope and escalate into a maddening frenzy, seemingly triggered by the astronomical team's secret research. This is an effective scenario that involves Mythos elements both major and minor, a notable scene having the latter prepared to parlay with the investigators. If it feels familiar to the dedicated Keeper, it is because of parallels that can be drawn with the campaign, *Spawn of Azathoth.*

The first of the two new scenarios is David Conyers' "Darkest Calling," a missing person case that develops into a moral dilemma for the players. Is a lesser evil conscionable if it stops a greater one? There are some familiar elements here -- American Natives, the rituals of a lost tribe, and the deserts of Arizona, making the adventure reminiscent of the scenarios "Puppet Shows and Shadow Plays" from *Delta Green* and "Devil's Canyon" from *Shadows of Yog-Sothoth.* Fundamentally, the dilemma is what makes this scenario stand out and a fine addition to the anthology.

The second addition and last scenario is "The Source and the End" by William Jones. This is as cinematic as "This Fire Shall Kill" if not more so, as there are even rules for cinematic melee combat included. A garbled message from an old FBI contact takes the investigators to an isolated Colorado town just as a severe thunderstorm closes it down. Threatened by the increasingly dangerous weather and whatever frightened their old contact, the investigators are literally thrown in at the deep end as the town floods. There is a time limit to this adventure, lasting just the one night. Unfortunately, this aspect is left up to the Keeper to handle, but done right this has the potential to be a very atmospheric adventure as the investigators fight to survive and uncover the threat. This scenario would also work for a *Delta Green* game.

[END SPOILER ALERT]

Finally the anthology is rounded with an article exploring astrology and the Cthulhu Mythos. In particular, "When the Stars Came Right Again" discusses the significance of the 1925 date in Lovecraft's short story, "Call of Cthulhu." It echoes other in-game semi-scholarly works on the Mythos in other supplements, and while enjoyable enough, is anachronistic given the anthology's modern bent. In a collection of handouts, it would have made a fine addition, but here is much the sore thumb.

Like **Shadows of Yog-Sothoth,** the reprint of this anthology is far from perfect. It requires another edit, and its appearance suffers in the reprint. Its technological updating has not been as well implemented as it could have been, but a Keeper can easily cover this. The scenarios themselves vary in quality, and too many do involve the Great Old Ones. The standout three are "Love's Lonely Children," "This Fire Shall Kill," and "Darkest Calling," and if the rest are not as flexible or useful (though many are, especially for use with **Delta Green**), they are at least a ready source of inspiration. Nevertheless, as one of the few modern-day **Cthulhu Now** anthologies, **The Stars Are Right!** is a welcome reprint.

Appendix Z

Triple Threat
An alternate critical dicing system for *GURPS*

by N.Eric Phillips

There is little more exciting in an RPG than rolling a critical. Whether good or bad it is always a surprise. For those looking to try something different in their *GURPS* campaign while still having an intuitive system, consider this new mechanic for determining critical hits and misses.

GURPS standard dice mechanic of rolls of 3, 4, 17, and 18 on 3d6 to represent criticals. The high rolls are critical failures while the low rolls are critical successes. In the "triple threat" method critical rolls happen whenever all three dice read the same number. This is called a "trip." If you throw the dice and it comes up a trip you know right away something is going to happen.

The standard dicing method in *GURPS* allows high and low skill levels to affect what rolls actually constitute a critical. For instance, a person with an effective skill of 18 only critically fails on a roll of 18, not on 17. The triple threat method scales with skill as well. With an average effective skill (9-11) the character has a critical success if he rolls 1-1-1, 2-2-2 or 3-3-3. Critical failures happen on 4-4-4, 5-5-5 or 6-6-6. However, at an effective skill of 17 he only critically fails on a 1-1-1 result; all other trips correspond to a critical success. The following table shows what trips correspond to critical hits and misses.

Effective Skill	Critical Hit	Critical Miss
5 and lower	1-1-1	2-2-2, 3-3-3, 4-4-4, 5-5-5, 6-6-6
6-8	1-1-1, 2-2-2	3-3-3, 4-4-4, 5-5-5, 6-6-6
9-11	1-1-1, 2-2-2, 3-3-3	4-4-4, 5-5-5, 6-6-6
12-14	1-1-1, 2-2-2, 3-3-3, 4-4-4	5-5-5, 6-6-6
15 and higher	1-1-1, 2-2-2, 3-3-3, 4-4-4, 5-5-5	6-6-6

In *GURPS,* a critical is usually rolled 3.7% of the time. In the triple threat system a critical occurs about 2.8% of the time. However the benefits of easier scaling to skill level plus the excitement of seeing trips makes this variant dice method outweighs the slight difference in critical probability.

Get Creative or Get Docked!

I know I've recounted this tale before, *[LMTYAMC Alert![1]]* but I'll never forget the day that my combat-challenged *Vampire: The Dark Ages* character discovered that she could use her power of telekinesis to lift people high into the air and let them go, in effect letting gravity do the dirty work. She never became a front-line fighter, but at least she had a better Plan A than "Hide. If found, assume death is imminent." I've since learned that it's a relatively common technique, but I'd never seen it before and was quite pleased with myself when I stumbled across it.

In many super-hero comics and movies, one of the most interesting aspects (to me, at any rate) is when one of the characters uses his powers in a neat or interesting fashion. In fact, with some characters or stories this is arguably one of the *only* appeal. The Silver-Age Superman springs to mind; he was so mind-numbingly powerful ("able to juggle planets" powerful) that there was little doubt he would emerge triumphant in any situation; rather, the most interesting aspect of many stories was how he was going to use his powers to resolve the situation. For example, in Alan Moore's Silver-Age capper tale *Whatever Happened to the Man of Tomorrow?* the Daily Planet finds itself under attack by robot men; in response, Superman carries and rubs the giant iron globe atop the Planet building in such a way as to turn it into a giant magnet, drawing all the robots to it.

This appeal of seeing how old powers can be used in new ways isn't limited to the Supers genre. In Piers Anthony's Incarnations of Immortality series, the protagonists are each some personal representation of an abstract concept such as Death, Time, or War. The climax of each of book in the series basically revolves around the main character discovering some neat/new/snazzy application of his abilities . . . usually of the form, "You have tried to assert mastery over Death/Time/War/whatever, but I just remembered that that's *my* domain!" And Robert Asprin's MythAdventures series has many instances of the not-too-powerful wizard Skeeve using his meager magical abilities in new and innovative ways. (To paraphrase the classic Mayfair *Wizards* book, "Who needs a *fireball* spell when you can use a candle-lighting cantrip on a flying arrow?")

Unfortunately, most RPGs don't allow for this kind of improvisation. In fact, most games actively disallow it. A casual perusal of the Sage Advice column from *Dragon Magazine* reveals a constant theme of questions beginning, "Can I use such-and-such-a-spell to do . . .?"; the answer is almost invariably "No."

The first RPG I'm aware of that tried to allow this innovation was the classic 1980's *Marvel Super-Heroes RPG Advanced Set,* which introduced the concept of power stunts. These function exactly as expected, with the player able to utilize their powers in new and interesting ways. The only problem is that usage of these abilities required the expenditure of Karma, the combination experience points and game-altering mechanic that enables things to work out for the character. In fact, doing a power stunt required a crazy amount of Karma, such that -- in my utilizations of the system -- players scoffed at any notion of using them:

Me: "Soooooo . . . anyone wanna do a power stunt?"
Players: "No thanks; we think we'd rather use those points to get the highest possible rolls on our next 10 actions."

Other games have had similar mechanics, but they've all had a similar theme: They view these alternate uses of abilities as something to be paid for by the player. Probably the most well-thought-out system I've seen that's addressed this has been *Mutants & Masterminds,* with its Hero Point system; through the expenditure of a relatively modest number of these points (usually one), the PC can do something oddball with his powers . . . pending GM approval, of course. The problem is that Hero Points are awfully versatile, and it doesn't seem unlikely if players were to avoid using them in lieu of the many other wonderful things they can do.

I posit that a more interesting idea would be to permit as many of these odd-ball attempts at using abilities as possible. In fact, I think it might be interesting if coming up with odd uses for these abilities were *required* by players. For example, in games where special powers, spells, ultra-tech, etc. are a main focus, what if some portion of the player's experience reward at the end of the session was contingent on having used an ability in some neat, new, or snazzy way? Each new usage would only count once (because then it's not "new" anymore). Thus someone playing their

Chummy Neighborhood Rachnidman might ensure he gets his innovation XP by using his Secret Web Stuff in new and interesting ways: as a parachute, to make a cushion to protect someone, to blind an enemy by flinging it in his eyes, and so on.

The attempt doesn't necessarily need to be successful (although I believe the GM should err on the side of allowing innovation). The amount of bonus experience points would determine how "important" such innovation would be; if it's a relatively modest award -- one or two points, in many systems -- then it's merely a nice bonus for those who innovate. But if, say, half of the award is contingent on coming up with an interesting way of using powers, then it becomes more of a necessity.

Although it would seem that these innovations would be limited to characters with versatile powers, I submit that many abilities have more facets than would be immediately considered. For example, a straightforward archer could try various bank shots and trick shots.

Without some incentive to innovate, players tend to fall back on Voltron habits, where the first sign of any trouble prompts the use of the one attack that is most likely to work. Thus when I ran a game of, say, the **Marvel Super Heroes** RPG, someone playing Cyclops would generally just blast the enemy each turn with his eye beam, because that was his best attack. Indeed, doing anything *other* than a direct blast was contraindicated, despite this sequence depicting the most boring comic book fight ever:

"Take that! And that! And some more! And . . . wait, I think I've got some extra! Second verse, same as the first! How 'bout a little fire, scarecrow? "

Hmm . . . maybe it's not as boring as I thought. But you get the picture. I note that this problem has even crept up in the comics; one of the reasons that the Hal Jordan Green Lantern -- the one who went bug-nuts and died for a while -- was replaced was because, despite having one of the most varied and powerful devices in the universe, he pretty much stuck to his standbys of green boxing gloves, green bubbles, and green force walls. When he was replaced by the Kyle Rayner Green Lantern, one of the mandates given to writers and artists was that this character would never do the same thing the same way twice. Thus even when doing something standard, like an entanglement attack, he would do something different each time: a glass jar with holes poked in it, a piece of flypaper, a straightjacket, and so on.

Games wishing to implement this model may want to consider one other rule addendum: the "time out." With this in place, each player can -- once per session (or more, if the GM would like) -- invoke a "time out," which gives him an allotment of time to think of something . . . presumably a creative use of powers. These five minutes (or however long the time out is in effect) can give the player time to sort out some new idea without the pressure of the GM breathing down his neck. Sure, it can break the flow of the game, but a brief pause in the action seems only fair if part of the player's experience reward is gonna rely on what he comes up with.

In some games and some genres, the mystery isn't if the heroes are going to prevail, but *how*. If all the players are agreeable, then an enjoyable campaign can center around letting them tinker with the hows of their victory, rather than pummeling them with a barrage of "No"s.

--Steven Marsh

* * *

[1] "Let me tell you about my character . . ." -- As an aside, this phrase is supposedly the bane of many a White Wolf employee. Curiously, one con I was attending in a retail capacity about 10 years ago or so had me seated directly across from official White Wolf representatives. Throughout the course of the two-day con, I proceeded to hear all about the über-pumped character from the White Wolf rep.

The Pelli and the Lar

by Paul Drye

TO: jrodneywood@nycomm.com
FROM: pcameron@leeds.paralabs.org

I could use your help. I'd like to ask that you attend a teleconference (link in the attachment) next Monday 1730 GMT. We'll be discussing some information passed on by the Extremely Deep Timeline Observatory. Have you heard of them? They're only just getting going the last few months, and their techniques are still wildly experimental. But with them they can dowse out a few lines that moved away from ours hundreds of thousands and even millions of years ago. In particular I've been speaking with Dr. Moretti -- he's in charge of it -- and his group have come up with a really unusual line: it's got at least one and maybe two semi-human intelligent species.

We need some of your reconnaissance background on this one. The EDTO is sampling from a huge number of potential timelines, and some of our higher-ups are worried that this species might be as widespread in their parachronic neck of the woods as Homo sapiens is here. The ones we've found on what we're calling Gemini-1 are pre-industrial, but all it'll take is one timeline of theirs that got some historical breaks and we may be meeting them somewhere, some day. The consensus is that anything we can learn now would help, so we're going in to check this one out on the ground despite the problems we'll have getting there.

Unfortunately we're at a loss for how to do it. We don't look much like the inhabitants, so we're going to stick out, maybe even draw some hostility. I know you were involved with the Lizardia contact way back when; yes, I also know that whole thing was classified, and yes, I know you're retired, but I was hoping you could give us some insight. If you can, could you even give us some thoughts about who we could send?

We've got Moretti, myself, and Sidorova from the University of St. Petersburg sitting in so far, but I'd feel a lot more comfortable if we had someone with practical experience too.

Say hi to Angela for me.

--
Peter

Getting There

The EDTO techniques allow passage to the timelines they find, but it's difficult and dangerous. Unlike the casual journeys of normal parachronics, travelers are restricted to coming and going from one time and place for which the coordinates work -- in this case, calculated at great cost so that one end of the journey is from the an Infinity Labs facility in Naples, Italy on Homeline and the other is the same spot on Gemini-1. Try to use the coordinates from anywhere else and nothing will happen.

Further, the journey requires a long time from the viewpoint of those in the conveyor, several days with necessary stops in intermediate timelines to wait for the next correct alignment of worlds. The exact sequence will be different every time, and needs to be calculated by Dr. Moretti's team at great cost. Return trips follow the same rules, and so the contact team will be given times and routes that they must follow if they're to get back to Homeline. Several return windows will be calculated just in case circumstances prevent any one from being used, but if all are somehow missed the team will be marooned.

Upon arrival in Gemini-1, the adventurers will find themselves near an important trading town on the Bay of Naples (they'll have known it was there from the EDTO's original observations). More importantly, they'll have arrived on the front lines of a long, slow-burning war between two intelligent species.

The Twins

Gemini-1 diverged from Homeline about 4,000,000 years ago. A successful australopithecine scavenger species evolved then and proved able to eke out a living in European and Asian environments. About 450,000 years ago, the island of Sicily was joined to mainland Europe for a brief while, colonized by the descendants of these hominids, then cut off again when ocean levels rebounded. In their new island home, what would become the Pelli gradually shrank in the absence of any predators. The new species' brains stayed about the same size, and the Pelli emerged once the gray matter liberated from running larger bodies let them cross into human-class intelligence.

Unfortunately for them, the land bridge to Europe would periodically re-establish itself, and the Pelli nearly became extinct several times. Their nemeses were the descendents of those left behind, the Lar, who had retained their scavenging and opportunistically carnivorous behavior and were now two and three times larger than the Pelli. Over time, the smaller natives became twilight-dwellers, staying away from their aggressive brethren. Fortunately for them, they were able to hang on each time their home was invaded, and the Lar invariably went extinct in a few thousand years when the ocean rose again and they were cut off from the mainland.

The last cycle of invasion may have come and gone, though. This warm period has been a long one, more than 30,000 years so far, and this time the Pelli have developed civilization. In the last 2,000 years, they have spread by boat to the other major islands of the Mediterranean, and with new weapons in hand have even begun colonizing Italy, pushing the Lar as far north as the Volturno and Ofanto rivers, a line just north of Naples. Pelli culture is now TL2, and they've developed a maritime trading-oriented society reminiscent the ancient Phoenicians

The Pelli

The closest thing to a Pelli on Homeline is a pygmy, though the Pelli are smaller still. They range from three to four feet tall as adults, and rarely exceed 75 pounds. They look broadly human, though their eyes are considerably larger, and they're much hairier than humans except on their faces and heads. If there's a primatologist along on the mission, he'll say they look a cross between Homo sapiens and a uakari monkey.

People aiming for first contact will find the psychological side of the Pelli more important than their physical appearance. Mentally, there are strong similarities between humans and Pelli, mostly because they have similar needs.

They need to eat, they have to sleep, and they want to procreate, just like humans. Even in shared areas, though, the details are different. For example, their facial expressions and body language are different. Someone trying to communicate with them may take some time to figure out that they shrug instead of nod if they want to say "yes" without speaking. The team is going to be tripped up by small things like this many times.

The Pelli also have two emotional needs that regular humans don't, and it makes them act in ways people will find confusing. Pelli are naturally crepuscular, which means that they're active when day is turning into night (or vice versa). Since they developed fire, they've used it as a light source during the night and extended their time awake from one twilight to another through the dark, but they're still at their most alert in the hours around sunset and dawn. Most take a nap in the wee hours of the morning, then they sleep properly while it's daylight. They can function during the day, but definitely don't do it by choice and need to wear eye protection to shade out the worst of the daylight.

One side effect of their attunement to creeping twilight is that the Pelli don't like sudden changes, especially in light. They much prefer it when things change over the course of a few seconds or minutes, or they at least get some warning that something is about to change. Adventurers will find that one thing the Pelli really don't like is the Homeliners' sources of illumination. Flipping a switch and having light flood out all at once irritates them.

Their other unusual thought process is a deeply ingrained idea that their bodies are made of food. Hundreds of thousands of years of being hunted by the Lar have left them ambiguous about eating. Meals are not social gatherings like they are for regular humans; it's actually insulting to eat in another person's presence. Instead, Pelli sleep in collective longhouses, and socialize for the half hour or so before and after sleep. By extension, the Pelli aren't very fond of other activities centered around mouths. They talk, for example, but not nearly as much as Homeline humans. The Pelli will probably find the contact team to be annoyingly chatty. Kissing is a profound insult, as it's taken as a proxy for "I'm eating you." In earlier days, the Pelli even used to eat defeated Lar (and sometimes each other) as a way of overcoming their anxieties about being hunted. Fortunately this is fading away in these civilized days, though it's not entirely gone and the contact team may have to deal with a shocking turn towards cannibalism in their otherwise acceptable hosts.

Taken altogether, the Pelli's mental peculiarities are going to make it more difficult to establish friendly, meaningful contact. Their languages are completely unrelated to any other language encountered by Homeline but, since the Pelli don't like talking at length, don't move around during the day, and want privacy when eating, it's hard to entice them into an extended game of "point and name the object."

Pelli Racial Template   *-14 points*

Disadvantages: Bad Sight (In the sunlight only, mitigated by vision protection, -90%) [-3]

Quirks: Hates watching others eat [-1], Laconic [-1]

The Lar

The eternal adversaries of the Pelli are, from the neck down, even more like humans than their little cousins. They're more heavily built, and a lot hairier, but other than that they're obviously related to Homo sapiens.

What distinguishes them is their heads. They have tiny brain pans, as small as a chimp's -- which is pathetic for a supposedly intelligent species. For the last few million years they've been trading in the possibility of more smarts for better biting. They have huge, powerful jaws and sharp teeth, which makes them look something like bulldogs.

Unfortunately, this also makes them far less intelligent than either Pelli or regular humans.

While their brains are marginal, the Lar are clearly across the line into sentience. They use found objects as bludgeons, and they have their own simple language -- the Pelli have never discovered this, but Homeline investigators can learn that adult Lar have about a hundred words, all concrete nouns and verbs. On the other hand, they don't use fire, don't make clothes or anything but the most rudimentary shelter, and their culture is extremely limited.

Where they really shine is as hunters of medium-sized and small animals. The bulk of their diet is carrion, but when they can they'll make it themselves by killing something, then letting it age, rather than waiting for a large carnivore to give up a carcass. An extended Lar family stakes out a territory of its own -- killing or driving off anyone unrelated -- then coordinates with each other to corner and butcher animals like deer and wild pigs. Unfortunately for the Pelli, they're included on the list of targets if they get caught alone; forays by Lar across the "border" are still common, though the ones nearest Pelli settlements are usually quite wary once they get the measure of their little opponents.

Lar Racial Template   *-55 points*

Attribute Modifiers: ST+2 [20]; DX+1 [10]; IQ-4 [-80]; HT+2 [20]

Advantages: Acute Smell 2 [2] Teeth 1 (Sharp Teeth) [1]

Disadvantages: Bestial [-10]; Intolerance (Total, all non-family members) [-10]; Odious Personal Habit (Eats carrion) [-10]

Note that while individuals vary too much to include them in the template, most of a Lar's -55 points should be spent on hunting and close combat-related advantages and skills. They're profoundly stupid in general, but annoyingly good at killing.

The Town

When the contact team arrives in Gemini-1, the closest settlement of note is Yajnahoh a few miles to the south. It's on the Bay of Naples, on the far northeast shore near the site of Homeline's Pozzuoli. Altogether it has a population of about 5,000, which makes it a good-sized city by this timeline's standards (the largest Pelli settlement, Jatlhiv on Malta, is home to 30,000 people). The whole population fits into a walled semi-circle about a half mile in diameter.

At base, economics and technology dictate what a city is like, and despite its unusual inhabitants Yajnahoh presents a familiar face to human visitors. The climate is dry and the streets dusty with the residues of the mud bricks and stone that make up most buildings. Most of the town is made of are "houses" which are a combination of personal work spaces and shops. This is where an individual Pelli lives while awake. In the center of the city are the dormitories, dozens of longhouses where the Pelli sleep together during the day. They are what defines "clans" of Pelli, units larger than families but smaller than the city as a whole; "guilds" might be a better name, since socializing and education are centered in them during the nights, and this usually dictates who ends up filling what role as adults.

With its excellent harbor, the town is tightly integrated with the maritime economy the Pelli have built throughout the Mediterranean. The shoreline is covered with wharfs and piers. Boats bob in nearby waters bringing in fish and sea food, which supplements the grain grown in the volcanic soils surrounding Yajnahoh. The excess of both are shipped and sold elsewhere. The town is also the major point of exit for the Pelli's other settlements in the area, mostly shipping out timber -- their island possessions are badly deforested these days, so the mainland has an advantage there.

The most unusual thing a Homeline visitor will notice is the quiet. As well as the Pelli not talking nearly as much as humans (cutting down on casual shouting and vendor hawking), the Pelli haven't domesticated horses or cattle so there's not many large vehicles making the rounds. This also helps with sanitation, though Yajnahoh is only less pungent in comparison -- the air is still a bit thick by modern standards.

The other trouble humans will have is entering and getting around the inside of buildings. Doors in Yajnahoh are about five feet tall, and interior ceilings about six. Even if they can stand up completely indoors, the interiors are claustrophobic, and visitors risk braining themselves if they don't watch for variations in height.

People: Hi'o Tovajbogh

"Hikho" (which is about as close as most English speakers can get to the glottal stop in his first name) is a woodsman from north of Yajnahoh. He makes his living by selling logs in town for shipping south, and by killing Lar for the bounties. It's on his loosely defined stomping grounds that the team will first appear in Gemini-1.

He is a typical Pelli, though heavily muscled and very fit by their standards -- regular humans won't notice this naturally though, since they're not used to Pelli norms. They'd figure it out if they could somehow convince him to be examined formally, but his personality makes this impossible. He's very independent, a helpful attitude for someone who lives most of his life away from town, but problematic if he's acting as the interface between other Pelli and the outtime visitors. He is 3'8" tall, weighs 65 pounds, and is covered in short light brown hair everywhere south of his neck except for his palms and the soles of his feet. His bald head is dominated by large brown eyes that are not just relatively larger than a regular human's, but absolutely larger.

His role is to provide an arc for the adventures in this timeline, and a barometer of local feelings towards the visitors. If there's one thing the contact team will have to learn, it's not to think of the Pelli as "good" because the Lar are "bad." Hi'o is the gateway to this state of mind; he's a nice guy in the strong-but-silent mold, and impressively skilled at what he does, and once he gets over his initial suspicions he'll be friendly. But he'll also resent the least little hint of patronizing he detects in the adventurers. He will even get angry whenever he's reminded that the Homeliners are bigger than he is, and more advanced. Over time he will transform into an opponent unless the strange visitors to his land manage by some miracle to treat him exactly correctly all the time. Since the departure point for the trip back to Homeline is his woods, this may become a problem.

Adventure Seeds

There, But Not Back Again: A member of the team connected with Dr. Moretti's group tries to hijack the expedition on the trip out to Gemini-1. Using stolen computer time, he's calculated a way to get from one of the intermediate stops to a timeline in the pocket of Centrum. The plan is to sell the EDTO technology to the enemy, then skip to another timeline and disappear.

The attempt will presumably fail due to PC intervention, but even after that the traitor could be a problem. The expedition cannot return to Homeline as they wish, not even for this: they must wait for the travel window to open, and be on Gemini-1 to use it. Can they keep the situation under control for that whole time?

Let's Welcome Our New Guests: The Pelli aren't monolithic. Yajnahoh is the capital of a small kingdom, and if it becomes apparent to other nearby countries that they've got a potential balance-breaker in their midst, things could get very hot for the visitors. Among other things, they'll be targets for kidnapping, for use as bargaining chips, or just to prevent Yajnahoh's king (who lives on the island of Capri, 15 miles south on the other side of the bay) from using them himself.

Swarm: The team have come north of Yajnahoh to the lands still haunted by Lar. Their intention is to see the other intelligent species on Gemini-1, and they get their wish. When the sun comes up and their hosts are just settling down to sleep, the farm on which they are staying is attacked by several family bands of Lar. This is unprecedented -- Lar groups just don't get along.

Once they've managed to drive the attack off, the question becomes "What just happened here?" The only other thing of note that's different is the Homeliners themselves. Is this just a coincidence, or has their presence somehow triggered this uncharacteristic behavior?

Using the Pelli and the Lar In Other Settings

Typical fantasy settings have a built-in entryway for the Pelli. Most have a half-sized, but otherwise human, race of farmers that can be used. There's also a tradition of threatening these pint-sized people with larger, uglier people, but it's worth putting a bit of thought into exactly who these might be in this particular case. It can be a little too easy on the adventurers if the "Lar" are hobgoblins or trolls; consider making them actual Humans if you want to spice up the conflict a little. It can help make their task more difficult if the team might be misidentified by the Pelli.

The Pelli's island homes then make excellent places just off the southern shore of the local Continent of Gaming, where adventurers wash up in one way or another and run inadvertently into the endless war between the little people and their oppressors.

Pulp or, to a lesser extent, modern-day settings can use the Pelli in African adventures. The equatorial rain forests (and this includes southeast Asia as well as Africa) have real-world analogs to the Pelli, humans of short stature who have suffered at the hands of real-world Lar -- if the GM feels like making a point, this can be humans of the European variety as well as locals. For less reflective campaigns, fill the role of the Lar with an invented humanoid ape group instead, then get on with the smashing tales.

For the Pelli themselves, start with a group like Cameroon's Baka. They are less integrated than most pygmies, speaking their own language and lacking contact with the outside world. Emphasize that aspect of their life and it's not a great leap to a completely isolated group with a lost civilization. Stick them on some unexplored branch of the Congo River and it's even possible to save the maritime quality of their civilization.

Using the Pelli in a science fiction game plugs into sci-fi's long history of exploring the contact between human and non-human. There's even a distinct sub-genre where the latter is swapped out for the partially human. For a good modern take on the issue, readers are directed to Lois McMaster Bujold's *Falling Free,* where the imbalance in power and sophistication between the point-of-view character and the pseudo-humans is a key plot thread.

Dork Tower!

Murphy's Rules

Pyramid Review

Niagara

Published by [Rio Grande Games](#)

Designed by Thomas Liesching

Game board, 10 wooden canoes and 35 movement chits in five colors, "first player" life preserver, 12 clear plastic river disks, 40 gems in five colors, wooden cloud counter; full-color, boxed, for two to five players; $49.95

The settlers have arrived and are mesmerized by the sight . . . of precious gems. Oh, sure the falls at *Niagara* are nice, too, but there's money to be made out there and that means fighting the river.

The object of the game is to be the first to secure the right combination of gems: one of each of the five colors; four of a kind; or seven of any color.

Each player (two to five can play) gets two canoes and an identical hand of seven small paddle cards. The movement counters are numbered one to six, and the last has a cloud symbol on it. The position of "first player" (signified with a life preserver) is assigned to take the first turn. Everyone places a chit of choice from hand face-down on the board, and the first player reveals his. If it's a number counter, those are his "paddle points" -- the amount of effort his explorer is putting into fighting and searching the rapids. He must put as many of these to use as he can (you can't simply choose not to use points) on the field of play.

The board shows the section of the Niagara River just above its famous falls. It splits at the end, offering two ways to plummet to almost certain doom. The river is peppered with caches of gems in five colors. You have to take these, one per canoe at a time, back up the river and drop them off. You can also steal them from someone else's boat. Once secured upriver, you get to keep that gem -- unless you lose a canoe to the falls and have to buy it back. Going for the rocks near the edge makes it a little easier to reach the "one of everything" victory condition, but it's tough to get that close without the flow of the river carrying you over (or someone pirating your goods on the return trip).

Once everyone has piloted their canoes up and down the river, the waterway carries everything downstream. The lowest number paddle chip played is the river's speed, so for example if you played a three while everyone else played four, the river would shift three spaces. If someone played their cloud counter instead of paddle points, they can adjust the weather track one position this turn, speeding up the river as it swells with rain or slowing it down in the dry season. The river pieces and any boats slide down one side of the fork or the other (and possibly over the falls). Then the first player position rotates left and new counters are played. You have to use all seven tokens before you get them back, so you must choose when to play your big numbers and when you can afford to "coast." The first player to bring a winning selection of gems back across the rope upstream wins the game.

The components in these European style board games are usually pretty impressive, but the river board has outdone itself, at least mechanically. It's a marvel of design that not only lets you push the river disks at one end to have them fall off the edge at the other end, the pieces that fall alternate, ejecting them first from one branch and then from the other (the board sits atop the upturned box halves with the falls flowing over the box). It's like one of those gimmicky toys they create for cereal boxes, only this one really works. The joy ends there, sadly. The artwork is passable, and the board is busy, crowded with game elements (like a place for putting your movement chits). There's some irritating wasted space at the back of the river.

There are other problems, too. Your gem collection is public knowledge, but there's no space for it atop the board.

Putting it on the table below means the box obstructs on all but the largest playing space, and you must crane your neck to see where opponents stand. The gems are colored and very stylish, but in a canoe the conflicting hues make it hard to be certain what color is there without taking it out -- and even just asking may tip someone off you're about to steal their jewels. You're supposed to leave your used counters behind to prevent accidental reuse, but the stacks quickly become unstable and you run the risk of them slipping off the board in an untidy heap. It's easier than it sounds to forget what your play was going to be.

The game play is a little disappointing. Setting aside small, occasionally helpful diagrams and some pesky mistakes in boldface, figuring out a workable strategy upon which to build success is tough. The rules are easy in the broad sense, but there are several small exceptions that crop up to confuse you. Sure, you need X paddle points to row here and grab a gem, but you can't predict what other players will do or how they'll affect the river, so successfully making allowances for the shifting waterway and the possibility of theft seems almost accidental. The recommended age of eight and up suggests *Niagara* may be, by design, more appealing to the younger set, so keep the kids in mind before tendering half a C-note of your own gems.

Icosahedron Adventures

Fighting Feats

by Owen K.C. Stephens

Classes in *d20 System* games that rely on fighting prowess -- but operate in campaigns where magic, psionics, or some other supernatural powers are common -- often suffer a few noteworthy disadvantages. The first is that there is nothing they can do a spell or psychic mantra can't duplicate, but there are lots of things those powers can do the fighters can't touch. The fighter is more durable and reliable in most *d20 System* games, but even that breaks down at upper levels of play. Those character with no access to special sources of power end up facing foes that can avoid them, neutralize them with mental powers, or are immune to damage from mundane sources.

A second common problem is that it's difficult to use the same fighting class to represent both heavily armored knights and more lightly-protected warriors, whether they're bare-chested barbarians or nimble musketeers. Many individual games try to solve this problem by having specialty classes for these roles, but often the result of this is to allow one narrowly defined type of character, not to open a whole range of new, viable character builds.

Finally, fighting-class characters, especially those built with numerous bonus feats, often run out of useful new feats to choose from at mid- and high- levels. While they can always choose broader versatility by specializing in more weapons, this pales in comparison to the mages gaining whole new classes of damaging and reality-shaping spells.

This article is an effort to alleviate all these problems. It does so by presenting a selection of feats for fighting classes. The feats are designed to give fighters more depth in feat selection, including anti-spellcasting feats that require such devotion and conviction against magic they cannot be taken by any character with access to spellcasting (or psionics, or the Mystic Energy of the Universe, or whatever unusual power is tapped by other character in the campaign). While new feats can cause power inflation, or player frustration, these are designed to patch specific holes found in many *d20 System* games. The fact they require a character to spend yet more feats is actually a bonus, as it gives higher-level fighter-type classes a reason to keep taking levels in feat-based classes, rather than gaining some mystic power through multiclassing or some prestige class.

Feat	Prerequisites	Benefit
Acrobatic Dodge	Dex 15+, tumble 6+ ranks	Negate an attack with a tumble check.
Additional Chakra		Gain a magic item slot.
Armor Focus		Reduce your armor check penalty by 2.
Armor Specialization	Armor Focus, fighter level 6	Gain a chance to negate critical hits.
Avoidance	Lightning reflexes, caster 0	Use Reflex rather than Will or Fort.
Danger Sense	Wis 13	Know an action will hurt.
Defensive Shot	Dex 13, Point Blank Shot	Make ranged attacks with no AoO.
Focused Strike	Str 13, Power Attack, caster 0	Strike ignores half hardness.
Force of Will	Iron Will, caster 0	Use Will rather than Fort or Reflex.
Greater Armor Focus	Armor focus, fighter 6	Improve armor check and max Dex by 1.
Greater Armor Specialization	Armor Focus, Armor Specialization, fighter 16.	Increase % chance to negate critical hits.
Greater Improved Initiative	Dex 15, Improved Initiative	Go first.
Greater Targeted	Dex 15, Targeted Strikes, BAB 9+	Reroll 1s and 2s.

Strikes		
Magic Null	Con 15, Magic resistence, toucghness, caster 0	Negate spells of foes that hit you.
Magic Resistence	Toughness, caster 0	Takes 3 less hp from magic attacks.
Mindtrap	Cha 15, caster 0	Harm those that enchant or scry on you.
Resilience	Any 2: Great Fortitude, Iron Will, Lightning Reflexes, Toughness	Reroll one failed save a day.
Skill Specialization	Skill Focus, 36 skill points	Take 10 on Skill Focus skills.
Spider Touched	Wis 13, Climb 8+ ranks	Run along walls.
Targeted Strikes	Dex 15, BAB +6	Reroll 1s on Dex-based weapon attacks.
Tough It Out	Great Fortitude, caster 0	Use Fort rather than Reflex or Will.
Web of Steel I	Dex 13+, Weapon Finesse, BAB 1+	Gain armor bonus from parrying.
Web of Steel II	Web of Steel I	Gain improved armor bonus from parrying.

Acrobatic Dodge [Combat]

Prerequisite: Dex 15+, Tumble 6 ranks.

Benefit: A number of times per day equal to your Dexterity bonus, when you would normally be hit with a melee or ranged attack roll, you may make a DC 20 Tumble check to avoid being hit. You gain a free 5-foot step as part of this Tumble check, and must take it. (If you cannot take your 5-foot step, you cannot use this feat. The movement doesn't count against any other movement you are taking, and does not provoke an attack of opportunity.) You may only use this feat when you have an armor check penalty of 0 or less, are carrying no more than a light load, and are not wielding a two-handed weapon or shield.

Additional Chakra [General]

Choose a magic item chakra

Benefit: You gain one additional chakra of the type chosen. Thus a character that selected the hand chakra could successfully wear and use three magic rings at once, rather than the normal two. Although you have an additional chakra, some magic items may be physically unable to be worn together (for example, it's not reasonable to wear two helmets, or two pairs of boots), while others may incur penalties (a character wearing two cloaks may suffer a -1 armor check penalty).

Special: You may take this feat more than once, adding one new chakra each time. However, you may never more than double the number of chakras at a given location.

Armor Focus [Combat]

Choose one style of armor (such as chain shirt, or banded mail).

Prerequisites: Armor Proficiency with the armor type selected, base attack bonus +1.

Benefit: The armor check penalty of the selected armor type is two less for you (minimum 0). If you take this feat with a Medium or Heavy suit of armor, you can now sleep in it.

Special: You can gain Armor Focus multiple times. Its benefits do not stack. Each time you take the feat, it applies to a new type of armor.

Armor Specialization [Combat]

Choose one style of armor (such as chain shirt, or banded mail) with which you have already taken the Armor Focus feat.

Prerequisites: Armor Proficiency and Armor Focus with the armor type selected, fighter level 6th.

Benefit: When you wear the type of armor selected, you have a chance to negate the additional effects of a critical hit or sneak attack, taking damage (and suffering any additional effects) as if the attack had not been a critical hit or sneak attack. This chance is 20% for light armor, 30% for medium armor, and 40% for heavy armor.

If you have a percent chance to negate critical hits and sneak attacks from some other source (such as the fortitude ability on magic armor) you may add this to the chance gained by use of this feat.

Special: You can gain Armor Specialization multiple times. Its effects do not stack. Each time you take the feat, it applies to a new type of armor.

Avoidance [Combat]

Prerequisite: Lightning Reflexes, caster level 0 or less.

Benefit: Once per round, when targeted by a magic effect that allows a Fortitude save or a Will save, you can instead make a Reflex saving throw.

Special: A character that gains a caster level through class advancement has the choice of forgoing all spellcasting ability to retain the use of this feat. Once made, this choice cannot be changed.

Danger Sense [General]

Prerequisites: Wis 13.

Benefit: Any time you are about to take an action that will immediately result in taking damage (such as setting off a trap or walking into an ambush), you may make a DC 15 Wisdom check. On a successful check, you are aware the action is dangerous, though not precisely where the damage comes from. Additionally, when making a Listen or Spot check to be allowed to act in the surprise round of a combat, you gain a +4 bonus.

Special: A monk may select Danger Sense as a bonus feat at 2nd level, even if she doesn't meet the prerequisites.

Defensive Shot [Combat]

Prerequisites: Dex 13, Dodge, Precise Shot.

Benefit: You do not provoke an attack of opportunity (AoO) for making a ranged attack. (Other actions you take at the same time still provoke AoOs normally.).

Normal: Making a ranged attack normally provokes an attack or opportunity.

Focused Strike [General]

Prerequisite: Str 13, Power Attack, base attack bonus +4, caster level 0 or less.

Benefit: You may make a single focused strike as a full-round action. When you strike at an inanimate object (including an opponent's weapon) in melee, you ignore half of the object's total hardness (round down). Total hardness includes any magical enhancements possessed by the object that increase its hardness.

Special: A character that gains a caster level through class advancement has the choice of forgoing all spellcasting ability to retain the use of this feat. Once made, this choice cannot be changed.

Force Of Will [Combat]

Prerequisite: Iron Will, caster level 0 or less.

Benefit: Once per round, when targeted by a magic effect that allows a Reflex save or a Fortitude save, you can instead make a Will saving throw.

Special: A character that gains a caster level through class advancement has the choice of forgoing all spellcasting ability to retain the use of this feat. Once made, this choice cannot be changed.

Greater Armor Focus [Combat]

Choose one style of armor (such as chain shirt, or banded mail) for which you have already selected the Armor focus feat.

Prerequisites: Armor Proficiency with the armor type selected, base attack bonus +1, Armor Focus with the armor type selected, fighter level 6th.

Benefit: The armor check penalty of the selected armor type is one less for you (minimum 0), Additionally, the max Dex bonus is one higher. These bonuses stack with those gained from the Armor Focus feat.

Special: You can gain Greater Armor Focus multiple times. Its effects do not stack. Each time you take the feat, it applies to a new type of armor.

Greater Armor Specialization [Combat]

Choose one style of armor (such as chain shirt, or banded mail) with which you have already taken the Armor Specialization feat.

Prerequisites: Armor Proficiency, Armor Focus and Armor Specialization with the armor type selected, fighter level 16th.

Benefit: When you wear the type of armor selected, your increase by 20% you chance to negate the additional effects of a critical hit or sneak attack (replacing the bonus from Armor Specialization), taking damage (and suffering any additional effects) as if the attack had not been a critical hit or sneak attack. If you have a percent chance to negate critical hits and sneak attacks from some other source (such as the fortitude ability on magic armor) you may add this to the chance gained by use of this feat.

Special: You can gain Greater Armor Specialization multiple times. Its effects do not stack. Each time you take the feat, it applies to a new type of armor.

Greater Improved Initiative [Combat]

Prerequisites: Dex 15+5, Improved Initiative.

Benefit: You go first in the initiative order. If multiple characters have Greater Improved Initiative, they make normal initiative checks to see what order they go in, and then all character without this feat go after them.

Greater Targeted Strikes [Combat]

Prerequisite: Dex 15, Targeted Strikes, base attack bonus +9.

Benefit: As Targeted Strikes, except you can reroll any natural 1 or 2 on your Dex-based weapons. You must keep the result of the reroll, even if it is another 1 or 2.

Magic Null [General]

Prerequisite: Con 15, Magic Resistance, Toughness, caster level 0 or less.

Benefit: When a foe strikes you in melee combat, one spell the foe has active on him has a chance of being negated. Determine the spell to be effected randomly, and roll 1d20, adding your character level and Constitution modifier. Your foe rolls 1d20 and adds his caster level and spellcasting ability score modifier. If your roll exceed your foes, the spell ends.

Special: A character that gains a caster level through class advancement has the choice of forgoing all spellcasting ability to retain the use of this feat. Once made, this choice cannot be changed.

Magic Resistance [General]

Prerequisite: Toughness, caster level +0 or less.

Benefit: Any time a spell, spell-like ability or supernatural ability deals hit point damage to you, you take 3 points less damage. In addition, when you are hit with ability damage (but not ability drain) from a magic attack, you take 3 points less than you would normally take.

Special: A character that gains a caster level through class advancement has the choice of forgoing all spellcasting ability to retain the use of this feat. Once made, this choice cannot be changed.

Mindtrap [General]

Prerequisite: Cha 15, caster level 0 or less.

Benefit: Whenever you are subject to a mind-affecting or divination effect or spell (regardless of whether the effect is harmful or beneficial to you), the creatures causing the effect must make a Will saving throw against a DC of $10 + \frac{1}{2}$ your character level + your Charisma bonus or take 2d6 points of damage. You gain a +4 bonus to any saving throw against the spell if the spellcaster fails his Will save.

Special: A character that gains a caster level through class advancement has the choice of forgoing all spellcasting ability to retain the use of this feat. Once made, this choice cannot be changed.

Resilience [General]

Prerequisites: Any two of the following feats: Great Fortitude, Iron Will, Lightning Reflexes, Toughness; caster level 0 or less.

Benefit: Once per day, when you fail a saving throw, you may decide to make the saving throw again with a bonus equal to ½ your character level.

Special: A character that gains a caster level through class advancement has the choice of forgoing all spellcasting ability to retain the use of this feat. Once made, this choice cannot be changed.

Skill Specialization [General]

Prerequisites: Skill Focus, 36 skill points

Benefit: When using any skill you have taken the Skill Focus feat with that you may take 10 with under calm circumstances, you may take 10 even if distractions and other circumstances would normally prevent it.

Spider Touched [General]

Prerequisite: Wis 13, 8 ranks Climbing, base attack bonus +3.

Benefit: As long as you are no more than lightly encumbered and suffering an armor check penalty of no more than -1, you can take part of one move action each round to traverse a wall or other relatively smooth vertical surface if you begin and end your move on a horizontal surface. The height you can achieve on the wall is limited only by this movement restriction. If you do not end your move on a horizontal surface, you fall prone, taking falling damage as appropriate for your distance above the ground. Treat the wall as a normal floor for the purpose of measuring your movement. Passing from floor to wall or wall to floor costs no movement; you can change surfaces freely. Opponents on the ground can make attacks of opportunity normally if you leave a threatened space (even if you leave it by running up a wall).

Special: You can take other move actions in conjunction with moving along a wall. For instance, the Spring Attack feat allows you to make an attack from the wall against a foe standing on the ground who is within the area you threaten; however, if you are somehow prevented from completing your move, you fall. Likewise, you could tumble along the wall to avoid attacks of opportunity.

Targeted Strikes [Combat]

Prerequisite: Dex 15, base attack bonus +6.

Benefit: You have deadly accuracy with your agility-based weapon attacks. When dealing damage with a weapon to which you add your Dexterity to your attack rolls (all ranged weapon attacks, and melee weapon attacks made with Weapon Finesse), you can reroll any result of 1 on your weapon's damage dice. Only weapon attacks that require an attack roll benefit from this feat. You must keep the result of the reroll, even if it is another 1.

Tough It Out [General]

Prerequisite: Great Fortitude, caster level 0 or less.

Benefit: Once per round, when targeted by a magic effect that allows a Reflex save or a Will save, you can instead make a Fortitude saving throw.

Special: A character that gains a caster level through class advancement has the choice of forgoing all spellcasting ability to retain the use of this feat. Once made, this choice cannot be changed.

Web Of Steel I [General]
