The Omniscient Eye

Is It Kryptonite, or Just a Rock Painted Green?

In *X-Files* and similar stories we are frequently treated to "metal that does not exist on earth" and the like. How would that be found out? Say that my party found a mysterious piece of metal or other substance. What test could/would be carried out on it, either by the party themselves (assuming a reasonable laboratory) or the entire scientific community, and what might the results look like?

"Extraordinary claims demand extraordinary proof."
--Carl Sagan

Any time we find a meteorite it is something that "does not exist on earth," or at least didn't originate here. We'll touch on that, but most of this article will focus on the more mysterious aspect of the question: if you find Substance X (a piece of metal, a puddle of goo, a glowing crystal), how can you show that it's *alien?* How do you demonstrate that it is evidence of alien life, perhaps secreted by the equivalent of an alien slug, maybe even manufactured by intelligent creatures who crossed the stars to reach Earth? Any claim of extraterrestrial manufacture would require some of the most rigorous materials analysis ever carried out in order to satisfy the scientific community and eventually the public that it is real.

We'll start with the assumption that characters have some reason to think Substance X is alien; you don't analyze every piece of metal you find just for the fun of it. We'll also assume that this Substance has some kind of properties which distinguish it from Earthly objects, and you just have to figure out what those properties are. In addition to discussing how and where one could get this analysis done, we'll also touch on the difficulty of making fakes, since in any good game, movie or novel it's always an uphill battle getting "the authorities" to believe you.

What Are "Off-World Properties"?

If you were at a Top Government Research Lab in 1980 and an excited field scientist came running in with a chunk of ceramic, dunked it in liquid nitrogen, and floated it over a magnet, you might have been able to convince some reputable scientists that it was from off-world.

It would be a superconductor, a material with zero electrical resistance, and which repels magnetic fields. Nobody then had heard of a ceramic superconductor, or anything that superconducted at liquid nitrogen temperatures, and if you had talked to reputable scientists you could have made some good money by betting against either. Alien tech? No, anyone with fairly simple gear could have made this stuff back in 1920. It is actually easier than some low temperature superconductors that had been known for three quarters of a century. So mysterious properties previously unknown to science are no guarantee that something has been made by superior beings.

To look at this systematically, let's start by distinguishing between "elements," which are the familiar atoms from our periodic table, and everything else. The term "unknown elements" is bandied about much too often in science fiction. We know all the stable elements as well as the unstable ones which will survive long enough for analysis (but see below for a theoretical exception). No others can exist without changes in the physical laws of our universe. There are, however, many larger assemblies which can be made from these elements which will have properties we don't know yet. One type of assembly is the molecule, which can range in complexity from the familiar water to DNA, which defines our genetic code and required a Human Genome Project to unravel. Another is the crystal, an orderly assembly of atoms in a lattice. Yet another category is composites, which use combinations of materials, sometimes with specific sizes or geometries, to achieve unusual properties. Natural examples include things like spider webs and opals. Most of the really interesting, novel materials that are being made today rely on microcomposite structures. The tiny

size of the components cause changes in physical, electronic, and optical behavior that add up to big changes in properties we see in the "real world."

In the category of unknown elements the only real possibility lies in a theoretical "isotopic island of stability." It is well known that as atomic nuclei get larger and larger past iron, they get less stable. Nothing heavier than Bismuth has any stable isotopes, though Uranium and Thorium are quite long lived. Ultraheavy "new elements" are made in particle accelerators by colliding lighter atoms together and identified by deducing what was there from the fragments after it falls apart microseconds later. Some theories indicate that there is an as-yet-unaccessed area of heavier atoms with atomic weights around 300 which might be more stable, possibly lasting for minutes or longer.[1] If an ingot of such a substance were found, it would certainly fall in the category of possibly alien. Because of the enormous resources needed to even experiment with such things, it would verge on impossible to fake with current day technology.

Examining the atoms in Substance X can be one of the main indicators that something may be from off planet. An element is defined by the number of protons in the nucleus, which distinguishes (for example) oxygen from nitrogen. There can be more possibilities for the number of neutrons in the atom, however, each of which is an *isotope.* Ratios of these isotopes depend on where the matter came from, and can be characteristic of different planets. Those are how the Martian meteorites like the famous ALH 84001 were identified. The gases trapped in pockets in those meteorites happened to have similar chemical and isotopic makeup to the very-well-studied atmosphere of Mars, showing that they were blasted loose millions of years ago and later rained down here on earth (if Mars had hideous diseases destined to wipe out humanity, they'd already be here by now, but that's another issue). The years of debates on whether the residues in this meteorite are evidence of extraterrestrial life are instructive when one asks how easy or hard it might be to "prove" something is alien. Note, however, that everyone agrees this meteorite is from Mars; that was easy to figure out. We know a lot about isotopic mixes on our planet, and can even in some cases figure out where people grew up by strontium isotope ratios in their teeth.[2]

So, then, if the iron in Substance X has an isotopic mix of about 92% Fe56 and 6% Fe54, it might well be from Earth, because that's a typical isotopic ratio from here. If it's 85% Fe56 and 2% Fe54, either it is from an alien planet (possibly even solar system, depending on how far off it is) or it has been deliberately synthesized in a laboratory.[3]

When it comes to composite materials, there are many examples of things humans have already developed which have strange properties. Getting light emission from silicon was believed impossible because of certain fundamental electrical properties, but in the last decade ways were found to do it via nanoengineering. Meta-materials (engineered composites that have a specific lattice-like arrangement of components) with negative indexes of refraction were first modeled, then built, despite predictions of some theorists that they were impossible.[4] An ordinary rectangular slab of such a material can focus light like a lens, and moreover, could achieve a holy grail of lens making by getting optical resolution better than the diffraction limit. Impact Armor, a flexible material that stiffens on impact and described by Larry Niven in several science fiction stories, has been developed and built into sports equipment.[5] Materials with negative Poisson's ratios (they get thicker when stretched instead of becoming thinner like taffy) have been demonstrated[6] and could potentially be incorporated into things such as rock climbing equipment and specialized machine parts. An example of a composite which would probably be of alien origin is a large (several hundred kg) piece of lead/aluminum alloy. These can only be alloyed in zero gee, and so far nobody has launched the equipment needed to make such a big piece. Since launches are closely monitored, it would be good evidence for something alien. Similarly, a diamond several cubic feet in size, or another type of hard-to-produce crystal like insulating indium antimonide could be things that humans can't currently make by any known technology.

The trick with analyzing the properties of these types of unknown materials is to perform the right test. Some properties are much easier to test for; Cavorite (from the HG Wells story "The First Men in the Moon") blocked gravity, which is hard to miss. If you had given a chunk of superconducting ceramic to a general analysis lab pre-1986 and said "Hey, is there anything interesting about this?," it's very unlikely they'd stumble on the fact that it is superconducting. Most analytical tools aren't designed to work at low enough temperatures to see superconducting properties, and prior to that time superconductivity was a very specialized field of study. Analytical techniques, time, and tools can vary a lot in this category, depending on how obscure the effect is you are trying to test. Diamond has some obvious properties (very hard, high index of refraction, which makes it sparkly) but some less obvious ones. It is

actually one of the best heat conductors known, better than copper, and is very chemically inert. When diamond-coated frying pans come out, they will knock Teflon pans right out of the market. Lots of expertise, knowledge of the state of the art in the field of Substance X, and time are needed to decide if it has truly unique properties we could not duplicate on Earth.

Biological substances are harder to prove alien. In addition to laboratory synthesis, there are millions of organic chemicals in terrestrial life which could be unknown but not alien. There are a couple of things which can indicate Substance X is from off planet, at least if it is something organic and complex like a cup of alien blood. Many complex organic chemicals have two different forms which have identical chemical composition but which are mirror images, called enantiomers. A laboratory synthesis of these chemicals generally produces an equal ("racemic") mix of "left-handed" and "right-handed" forms, but in Earth's biology one form often dominates over another -- for instance, most sugars found in nature are "right-handed" (D-) while most amino acids are "left-handed" (L-). Unrelated life forms -- for instance, aliens -- would be just as likely to go the other way; if you *did* find organic samples dominated by L-sugars or D-amino acids, they are either from an alien planet, deliberately purified that way in a laboratory, or from one of the few exceptions with an earthly origin.

Once the basic compound has been identified, the easiest way to tell whether a sample of a known chemical is D- or L- is to shine a beam of polarized light through the sample and measure the rotation of the beam's polarization; for instance, D-glyceraldehyde will rotate the beam clockwise (as will L-fructose) and L-glyceraldehyde will rotate it anticlockwise (as will D-fructose). An equal mix of both enantiomers will not rotate the beam at all. Confusingly, substances that rotate light clockwise are also identified with a lower-case d, and those that rotate it anticlockwise with a lower-case l -- thus, while "D-glyceraldehyde" is the same thing as "d-glyceraldehyde," "D-fructose" is actually the *opposite* of "d-fructose"!

Even for as narrow a subject as microscopic life on Mars, though, it's hard to establish a good, unambiguous biological marker.[7] This type of expertise is different enough from that needed to analyze an alien microchip or metal sample, for example, that in real life there may be no one who could do both; more than one member of the Omniscient Eye was needed just to write this column! It is rare, in fact, to find a laboratory equipped to do both. In a game, of course, cinematic science skills may be enough to allow analysis of anything you find.

There are certain special cases of things that may be identifiable as "off-planet" because of specific properties. An example of this is the Widmanstatten pattern of lines which can be seen in many iron meteorites upon cutting and etching; their presence seems to be characteristic of their formation in deep space. Some of the other materials which are found in meteorites aren't seen in anything on Earth, because they require zero gravity to form or because they are completely unoxidized. There are actually companies which will analyze rocks which you think might be meteorites if you promise to give them some to sell. Dan Brown's novel *Deception Point* is good background for how a fake meteorite might be produced, studied, and uncovered.

There are also, of course, more speculative materials. Mathematics shows that a material with negative mass could potentially exist.[8] If so, it would allow for perpetual motion machines and warp drives. We have no idea how it could be made today, its properties would be very easy to test for, and alien origin might be as good an explanation of where it is from as anything else. Properties of negative matter would include being repelled when you put an opposite charge on it, in the process pulling you with it with no net energy input, and annihilating normal matter with no energy release. Ultrasmall black holes (asteroidal mass) which are small enough that they should have evaporated since the big bang are another possibility for something that would probably require Extremely Advanced Tech to build. An object fabricated from antimatter would likely be of alien origin, since we've barely made a few anti-hydrogen atoms so far, though hopefully this is not something that would be found on Earth unless it is in a darned good containment system.

How Do We Know Aliens Made It?

Even if you show your Substance X has mysterious properties, it may be hard to prove it couldn't be made today by humans in a lab you don't happen to know about. If you were to drop a one-mile-long coil of 100 Gigapascal tensile

strength carbon nanotube rope on someone's desk, it would be easy to test, but hard to say if it is of alien origin. Nobody has reported being able to make anything that long or strong yet, but much shorter (like a few microns to a few mm length) pieces have been made, so it is not out of the question that someone has made that breakthrough. You could "throw off" many of the natural isotopic ratios discussed earlier by purifying and mixing things in the lab. Different isotopes of common elements can be purchased for scientific experiments, so it would be possible to mix up an alloy that had the appropriate composition for a material from Mars, for example. Conversely, aliens could take care to build their ship out of the exact mixtures of isotopes found on Earth, so that if a piece were sampled it would not give them away. Specifics on this depend a lot on the particular object of interest, and might involve bringing in some specialized teams to argue with each other. For a claim of microscopic alien life from comets based on red rain in India and some refutations, see the footnotes([9]).

How Do We Do The Analysis?

It is, of course, easiest to analyze a smallish lump or vial of something which you can put into various instruments. Identifying a complex organic compound and looking for appropriate dextrorotary or levorotary polarization is fairly straightforward, but then trying to tell what it does ("Oh look, this goo would give the alien Tremendous Strength!") is much, much harder. Drug companies spend years and tens of millions of dollars trying to figure out if particular molecules do anything in a human, and humans are very well studied. The Human Genome project shows the scale which could potentially be needed for a really complex molecule (DNA), and we still don't know what most of the genes do. Isotopic analysis, which might at least tell you that Substance X is not something natural from Earth, is available from some commercial services. They focus on elements like nitrogen and carbon, for things like carbon-14 dating of archaeological samples[10], but you could find a wider variety of expertise among academics with some hunting.

When it comes to solid materials like spaceship hulls or dilithium crystals, we are on firmer ground, as it were. There are literally dozens of analytical techniques to tell you everything from crystal structure to elemental analysis to molecular bonding. Inorganic materials are simpler than organic, so it is likely that with the right techniques you can learn quite a bit about your substance. "Simple" is a relative term, of course, and the instrumentation is generally bulky, expensive, and delicate.

For example, one common technique for analyzing the elements in a solid is Energy Dispersive Spectroscopy (EDS). This is carried out by generating a high energy probe "particle," either electrons in an electron microscope or x-ray photons. The probe particle slams into an atom, knocking an electron or two out of its shell, depending on how energetic the probe is. An electron in a more distant shell drops down to the vacant level, and sheds its energy in the process by emitting an x-ray of a particular wavelength unique to that orbital pair and thus to that element. You detect that emitted x-ray, measure the exact energy, and can tell what element is in your target. This requires only that Substance X has atoms, and that they obey the physical laws of our universe. This doesn't tell you how the atoms are bonded together to make molecules or composites, which can affect its properties tremendously, but at least you know something. In order to learn all about a mystery solid, you want to apply many different techniques like this.

Where Do We Do Analysis?

One way to get access to a good lab is to spend three or four million dollars and buy all this equipment yourself, as well as hiring half a dozen people to run it and interpret data. This won't cover every possible organic and inorganic instrument; it's a basic assortment. That also won't be state-of-the-art for all the items; multiply by 5 if you want that. Divide by 2 if you are willing to take used last generation equipment, which is plentiful. Expect to spend at least six months getting all the equipment in and set up in a specialized building with supplies of compressed air (filtered and dried), ventilation, cooling water, nitrogen, and enough electricity to run several houses. Expertise in materials analysis is important; the more exotic the technique and material the more you need to go beyond prepackaged analytical software and basic lab technicians to figure out what you have, and if your material isn't exotic you're going to have a tough time proving it is alien.

To return to the Energy Dispersive Spectroscopy (EDS) example above, the unit costs from $50,000 to $70,000. A used one isn't generally worth it, since a new one is so cheap. It is about $40 \times 40 \times 80$ cm in size, and requires several liters of liquid nitrogen to cool the detector every few days, unless you spend another $30,000 for a closed cycle refrigerator. The research lab this member of the Omniscient Eye works at goes through about 10,000 liters of liquid nitrogen per week for various things, so this last requirement is not as exotic as it might sound. Note that this is just a detector; in order to get data it needs to be attached to a Scanning Electron Microscope (SEM) which holds the sample, creates a high vacuum, and generates the electron beam that does the probing and forms an image. The microscope can be bought for $50,000-$80,000 used, with another $80,000 or so to get it set up; yes, it can easily cost more to get some used equipment going properly than to buy it new. A new SEM can cost anywhere from $100,000 for a small, simple model to several million for an automated one which might be found in a semiconductor manufacturing plant, but which is overkill for analyzing an alien material.

Getting a technician to run this microscope means a $30-50,000 annual salary, depending on location and skill. If you are lucky, you may be able to find someone who can run several different analytical tools. This is not for someone who can tell you that Substance X is alien; it is for someone who can tell you it contains iron, aluminum, and silicon and take a microscopic photograph of it. Repairing these analytical tools is a different skill, of course; just as a typical truck driver doesn't know how to rebuild his transmission, he would hire a mechanic. A service contract for a SEM/EDS combination like this might cost $50-100,000 per year, depending again on reliability and skill. There are more service people in southern California than in North Dakota.

If you don't want to get involved in this, another option is to spend a few thousand dollars and send Substance X out to a company like Evans Analytical Group[11], which has all the equipment and people who can interpret the data. They can even make recommendations on what techniques will work the best for different types of samples. That does not mean they are going to report back that your Substance is alien. They are just going to tell you what it is made of, so you have to have some idea what to ask for. In any case, if you don't have a dedicated scientist and a pretty impressive laboratory, this could work well, at least for a first pass to see if you have something really unusual. Then you could hunt down academics or government lab scientists who have an entire research group built around a specific analysis tool that would be more ideal for what you want to know. There are, for example, scientists who have spent their career analyzing moon rocks, or studying isotopic ratios in Jupiter's atmosphere. Getting the specialized expertise to declare something alien would mean working with a professor or government lab scientist, in which case an offer of sharing publication rights would probably be enough providing you had something interesting and you seemed credible.

But suppose it is something you have to analyze in situ, like the impenetrable spaceship hull in the classic movie *The Day The Earth Stood Still*, and you can't ship pieces of it to labs. People who build satellites and mobile labs like the recent Spirit and Endeavor Mars rovers are used to this, and there is a surprising amount you can learn without being able to touch your sample. The rovers carry a variant of the EDS mentioned above, called an Alpha Particle X-Ray Spectrometer (APXS). It has the advantage that the "probe" particles, alpha particles, are generated from a radioactive source, so you don't need the big power supply you do in a normal EDS system. This is good because the whole shebang -- rover, motors, antenna that talks to Earth, and analytical instruments -- runs on a power supply not much bigger than the one in your PC. The down side is slower data collection. As another example, the Lunar Prospector satellite mapped water (actually hydrogen) distribution all over the moon from orbit with an Epithermal Neutron Spectrometer which used the signal generated by normal space radiation hitting the moon.

But My GM Says Sensors Won't Work on it!

What if your Substance X has some kind of "force field" that "blocks sensors"? You can still see it, right? That's all you need to find out quite a bit about it.[12] Part of what makes gold, for example, look gold-colored is that it absorbs parts of the optical spectrum that platinum and silver don't. More subtle variations of that technique can reveal quite a bit about elements and even compounds or molecules present in your mystery target. Fluorescence is light emitted by particular compounds or molecules due to light shining on it, and can be used to identify many minerals visually. More full spectrum light probing and analysis will measure a wider variety of molecular bonds, and is used, for example, to see trace blood at crime scenes by applying chemicals which form fluorescent complexes only with hemoglobin. With

the right equipment hemoglobin could be detected directly by looking at absorbance or emission of light with wavelengths specific to its molecular bonds. Only full electromagnetic spectrum invisibility plus shielding from radiation and force fields to prevent you from observing or contacting Substance X can completely thwart the Materials Scientist, in which case you aren't likely to find your sample in the first place.

Talking A Good Game

If you want some jargon to throw into a knotty analysis problem in game, this article should make a decent starting point. Taking a Fourier Transform of a spectrum (performing a mathematical transformation that enhances certain aspects of the data) is often a good choice, as is improving Signal-to-Noise ratio. A good way to confuse the unwary is to refer to Auger Electron Analysis, pronounced "OJ," which shows the elements present in a material but is more surface sensitive than the EDS mentioned previously. Other fun techniques include Rutherford Backscattering Spectroscopy (RBS), which requires a small particle accelerator and learns about elements in a sample; Nuclear Magnetic Resonance (NMR), which requires extremely strong magnets and learns about organic molecules in a liquid; and Laser Induced Fluorescence, a popular forensic technique which looks for particular molecular bonds like those left from bloodstains.

In general, the closer you are allowed to get to something, and the wider variety of probe beams you can hit it with, the more you can learn about it. "Passive" detectors, which rely on merely observing something without actively bombarding it with a probe beam will learn less, but are less intrusive. Virtually all measurements used in or generated by a lab will be in metric units: grams, milliliters, degrees Celsius, and such. There are some exceptions and oddities, for example in the U.S. pressurized gases will be in psi (pounds per square inch), but a high-vacuum system will measure in Torr, an "almost metric" unit; and in Europe and Japan the Pascal, a true metric SI unit, is sometimes used.

Conclusion

In real life, contrary to the impression the *CSI* TV show gives, analysis takes time. Ten different analyses are done, one of them points to something interesting, you hunt down a lab or expert who knows more about that field, they take their customized instrument and work for a week, and on the 37th spectra, someone looking at it gets an idea of what it means. It is unlikely that you will do just the right experiment to discover the Mysterious Property on the first try, though in a game or story, of course, protagonists get lucky all the time.

To get back to the Carl Sagan quote, to convince people you have something alien you would want to bring in the Best Experts In The Field. The effort of proof is low for something really spectacular, like some of the types of exotic matter discussed earlier. For something that's not obvious, though, this kind of science is so specialized that, much like with the Martian meteor analysis, various people would contribute analysis with their particular instruments and expertise, trusting each other for data they didn't personally generate based on the reputation the other scientists have for good work. The more people who analyze it by different means and are convinced, the higher the likelihood that even people who didn't analyze it will be convinced. That's how the ALH 84001 Mars meteorite analysis has gone, and it is probably the best example we have to date of something that's "on the borderline" for whether its extraordinary claim is true or not. So feel free to have skeptics with honest doubts about any alien artifacts, as well as the obligatory Men in Black out to quash anything that might be Mysterious. Characters are more likely to be limited by time, expertise, and knowledge of "Earth normal" than by modern analytical tools. So don't be afraid to make an analysis plot hook focus on the players, rather than the technology. Ultimately the ongoing story of the game is what the players will show up for, unless you have the extraordinary good fortune to be gaming with Materials Scientists, in which case, have fun!

Icosahedron Adventures

Fun Fighters

by Owen K.C. Stephens

In most *d20 System* fantasy games, classes that gain spellcasting abilities (or similar Special FX powers) are automatically customizable. Two sorcerers can be radically different purely by selecting different spells. Fighting classes, unfortunately, lack that same versatility. While some differentiation can be gained through feat and weapon selection, this is secondary to the core of those classes -- a style of fighting. For some reason, the tradition in *d20 System* fantasy games is to develop a new character class for each basic combat style, making it very difficult to use these classes for a new fighter idea.

There's no reason why this needs to be the case. By adding class features as talents -- which may be selected from a long list -- rather than set abilities gained at set levels, it is possible to make extremely versatile fighting classes that highlight the ease of a class/level based game system, rather than enforcing unneeded restrictions. Coupled with the common belief that the fighter class is underpowered in a typical fantasy game, the opportunity arises to build a flexible, easy, versatile set of fighting character classes that can be used to replace a broad range of existing core classes.

Below are presented two classes, the Champion and the Combatant, which are designed to replace all core fighting classes for any fantasy *d20 System* campaign. A character can multiclass between the two classes if needed to get a particular mix of combat abilities and special powers. If some new ability needs to be added for a given campaign it can be turned into one or more talents, following the examples given below.

Champion

Champions are warriors dedicated to a higher ideal, who believe that their martial prowess is best used to further the goals of their liege, deity, philosophy, homeland, or all of the above. Not all Champions are Good, not all are Lawful, and not all depend purely on skill at arms.

The Champion replaces the blackguard, paladin, and ranger classes. When building a Champion you must okay your concept with the GM, and all talent choices you make should support that concept.

Hit Points: 1d8 + Constitution modifier/level, maximum hit points gained as 1st level character.

Skill Points: 20 + ×4 Int modifier at 1st level, 4 + Int modifier per level after that. A character starting as a combatant at 1st level gains the benefit of more skill points to cover background training, but when advancing as a combatant most of your time is spent learning fighting techniques rather than other skills.

Proficiencies: All martial and simple weapons, light armor, all shields (except tower shields).

Avenger Talent Tree

Champions have many functions, but among the most important is striking down the enemies of their lords and masters. Avenger talents are geared toward helping the Champion bring punishment, and nothing else. The list of avenger talents is as follows:

Aura of Menace (Su). (Fear, mind-affecting.) Once per encounter as a swift action, you may shout a threatening challenge to all foes in a radius 5-feet per Champion level. Creatures with an Intelligence of 5 or more that have HD or CR of your character level or less must make a Will save (DC 10 + 1/2 Champion level + Charisma modifier) or be shaken for a number of rounds equal to your Champion level.

Prerequisites: Must not be Lawful Good.

Challenge (Ex). Once per encounter, as a swift action, you may call out a foe to face you in combat. The foe must have an Intelligence of 5 or more HD or CR within at least 2 or your character level, but need not understand your language. You gain a bonus to all attack and damage rolls and opposed checks made against your called-out enemy, as well as to saving throws made against effects he creates. This bonus is equal to +1 for every five full Champion levels you have (minimum +1).

This talent may be selected multiple times, with each additional selection increasing the number of times per encounter you can use it by 1.

Prerequisite: Lawful alignment.

Chastise Heathens (Su). As a standard action you can unleash a wave of negative energy that damages all living creatures with an Intelligence of 5 or more that do not worship your god. The wave deals 1d6 points of damage per 2 Champion levels, with a Will save (DC 10 + 1/2 your Champion level + your Charisma modifier) resulting in half damage. Incorporeal creatures take this damage normally. You may do this once per day per three full Champion levels (minimum 1/day).

This talent may be selected multiple times, with each additional selection increasing the number of times per encounter you can use it by 1 per 3 full Champion levels (minimum +1/day).

Prerequisite: Must not be Good.

Chastise Undead (Su). As a standard action you can unleash a wave of positive energy that damages all undead within 30 feet of you. The wave deals 1d6 points of damage per 2 Champion levels. Incorporeal undead take this damage

normally. You may do this once per day per three full Champion levels (minimum 1/day).

This talent may be selected multiple times, with each additional selection increasing the number of times per encounter you can use it by 1 per 3 full Champion levels (minimum +1/day).

Prerequisite: Must not be Evil.

Favored Enemy (Ex). You gain a favored enemy as a ranger, chosen from the ranger list. This talent may be taken more than once. Each time it is taken, the bonuses for any one previous favored enemy increases.

Ranged Skirmisher (Ex). When wearing light or nor armor, you may act as though you had the Rapid Shot and Manyshot feats.

Smite Evil (Ex). Once per encounter as a free action, you may add additional damage to an attack against an Evil-aligned foe. You deal an additional 1d10 points of damage for every four full Champion levels you possess (minimum +1d10). You may declare a smite after you hit your target, but if your target is not of Evil alignment the ability is used and wasted.

This talent may be selected multiple times, but not more than once every four full levels, with each additional selection increasing the number of times per encounter you can use it by 1.

Prerequisite: Good alignment

Smite Good (Ex). Once per encounter as a free action, you may add additional damage to an attack against a Good-aligned foe. You deal an additional 1d10 points of damage for every four full Champion levels you possess (minimum +1d10). You may declare a smite after you hit your target, but if your target is not of Good alignment the ability is used and wasted.

This talent may be selected multiple times, but not more than once every four full levels, with each additional selection increasing the number of times per encounter you can use it by 1.

Prerequisite: Evil alignment

Strike True (Ex). Any weapon you use bypasses DR as if it were of your alignment and either cold iron or silver (selected when you take this talent). This is in addition to a y properties the weapon actually has.

Prerequisite: Any smite talent from this talent tree.

Sneak Attack (Ex). You gain a 1d6 sneak attack. This talent may be selected more than once, but not more than once every five Champion levels. It's sneak attack dice stack with dice from any other source.

Prerequisite: Evil alignment (you don't have to be Evil to use sneak attack, but only Evil Champions earn it).

Two-Weapon Skirmisher (Ex). When wearing light or nor armor, you may act as though you had the Two-Weapon Fighting and Improved Two Weapon Fighting feats.

Boon Talent Tree

Many Champions receive special abilities from their dedication, allowing them to resist or ignore various special attacks and conditions. No Champion may have more than three talents from the Boon list. The list of boon talents is as follows:

Aura of Alertness (Ex). You are attuned to balance in all things, making you immune to all magical sleep, and need not engage in mundane sleep. As long as you are conscious, your allies within 10 feet gain a +4 bonus to saves against fear and despair effects.

Prerequisite: Must not be Good or Evil.

Aura of Courage (Ex). You are immune to all fear and despair effects and penalties. As long as you are conscious, your allies within 10 feet gain a +4 bonus to saves against fear and despair effects.

Prerequisite: Must be Lawful Good.

Aura of Freedom (Ex). You are immune to all paralysis, hold, and entangle effects (but not grapples) and effects that reduce your move rate. As long as you are conscious, your allies within 10 feet gain a +4 bonus to saves against such effects.

Prerequisite: Must not be Lawful.

Divine Grace (Ex). You gain a bonus to all saving throws equal to your Charisma bonus, to a maximum of half your Champion level.

Prerequisite: Must not be of Evil alignment, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Divine Health (Su). You are immune to all mundane and magical diseases, including lycanthropy and mummy rot.

Prerequisite: Must not be of Evil alignment, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Evasion (Ex). When in light or no armor, you have the evasion ability.

Prerequisites: 9th level Champion, not of Lawful alignment.

Loyalty (Ex). Once per encounter you may shake off the effects of any mind-affecting spell or ability. This requires a full-round action, which you may take even if the mind-affecting ability would normally prevent it.

Prerequisites: Must not be Chaotic or Evil.

Profane Grace (Su). If you fail a saving throw against an effect, you can delay the consequences of that failure as a free action. As a full round action you may transfer the consequence to a willing, fully informed intelligent creature by touch. You may only delay the consequence of one failed save at a time, if you fail a second without transferring the first you must either accept the consequences of the current failed save, or of the one you are delaying (to then delay the new consequence).

Prerequisite: Must not be of Good alignment, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Profane Health (Su). You are immune to all mundane and magical poisons.

Prerequisite: Must not be of Good alignment, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Dark Empathy (Su). No creature of the vermin type is ever less friendly than Indifferent to you unless it is under magic influence, or you attack it. Even then, it takes a -4 to all attacks made against you.

Prerequisite: Must not be Good, must have some Neutral alignment component.

Wild Empathy (Su). No creature of the animal type is ever less friendly than Indifferent to you unless it is under magic influence, or you attack it. Even then, it takes a -4 to all attacks made against you.

Prerequisite: Must not be Evil, must have some Neutral alignment component.

Defender Talent Tree

Many Champions must stand up for those who cannot defend themselves. These paragons of their beliefs work to protect the weaker members of their orders.

Detect Evil (Su). As a standard action you may cast *detect evil*, as the spell, at will.

Prerequisite: No other detect talent from this tree.

Detect Good (Su). As a standard action you may cast *detect good*, as the spell, at will.

Prerequisite: No other detect talent from this tree.

Detect Magic (Su). As a standard action you may cast *detect magic*, as the spell, at will.

Prerequisite: No other detect talent from this tree.

End Affliction (Su). Once per week you may cast one of the following as a standard action: *neutralize poison, remove blindness/deafness, remove curse, remove disease,* or *restoration*. This talent may be selected multiple times, with each additional selection increasing the number of times per week you can use it by 1.

Prerequisite: Must not be Evil, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Lay On Hands (Su). As the paladin ability.

Prerequisite: Must not be of Evil alignment, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Shield Brother (Ex). You may grant any defense you gain from a shield you carry to one ally in an adjacent space, without losing the defense yourself.

Prerequisite: Must be Lawful.

Steadfast (Su). As long as you are between a foe and allies or innocents, you cannot be knocked down or forced back while you are conscious.

Prerequisite: Must not be Evil.

Spell Talent Tree

Some Champions draw upon arcane or divine power to augment their powers and grant them more power to serve their cause.

Canon. You can cast 1st and 2nd level paladin spells as a paladin of your Champion level.

Prerequisite: Must not be of Evil alignment, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Paladin. You can cast 3rd and 4th level paladin spells as a paladin of your Champion level.

Prerequisite: Canon talent. Must be Lawful Good, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Treefriend. You can cast 1st and 2nd level ranger spells as a ranger of your Champion level.

Ranger. You can cast 3rd and 4th level ranger spells as a ranger of your Champion level.

Prerequisite: Treefriend talent. Must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Vile. You can cast 1st and 2nd level blackguard spells using the paladin spell chart for a paladin of your Champion level.

Prerequisite: Must not be good.

Blackguard. You can cast 3rd and 4th level blackguard spells using the paladin spell chart for a paladin of your Champion level.

Prerequisite: Vile talent. Must be Chaotic Evil, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Herald. You can cast 1st and 2nd level bard spells using the paladin spell chart for a paladin of your Champion level (including ASF in medium or heavy armor).

Prerequisite: Must be Lawful.

Harbinger. You can cast 3rd and 4th level bard spells using the paladin spell chart for a paladin of your Champion level (including ASF in medium or heavy armor).

Prerequisite: Herald talent, must be Lawful.

Hexen. You can cast 1st and 2nd level assassin spells using the paladin spell chart for a paladin of your Champion level (including ASF in medium or heavy armor).

Prerequisite: Must not be Good.

Wyrd. You can cast 3rd and 4th level assassin spells using the paladin spell chart for a paladin of your Champion level (including ASF in medium or heavy armor).

Prerequisite: Hexen talent. Must not be Good.

Spellmaster. You determine how many spells you gain from any Champion talent as if you were four levels higher. This has no impact on your caster level, just spell access.

This talent may be taken a second time by a Champion of 10th level or higher.

Prerequisite: Any two spell talent tree talents.

Ally Talent Tree

Many Champions are granted allies, often steeds, to aid them in their constant struggle for their cause.

Angelic Steed (Su). You can summon a special mount as a paladin of your Champion level.

Prerequisite: Must be Good, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Animal Companion (Ex). You gain an animal companion as a druid of half your Champion level. This may be used to gain an unusual mount.

Improved Ally (Ex). One ally you gain through a talent from this talent tree gains one of the following templates: celestial, fiendish, draconic. Once the template is chosen, it cannot be changed.

Prerequisite: Must be Good (celestial), Evil (fiendish), or neither (draconic).

Infernal Cohort (Su). You can summon an Evil outsider. This acts like a paladin's special mount, except the creature summoned is as powerful as it would be if you had selected it as a cohort with the Leadership feat.

Prerequisite: Must be Evil, and must follow a divinely inspired code of conduct. Any violation of that code ends this ability for 24 hours.

Bonus Feat: At 4th, 12th and 20th level a Champion gains a bonus feat. This feat must relate to your duties as a Champion in some way (as adjudicated by the GM).

Combatant

Combatants are the most common of all adventuring classes. They are specialists in dealing damage and in combat, and surviving the efforts of others to deal damage to them. Many Combatants are heavily prejudiced toward big weapons and heavy armor, but this attitude is less prevalent in some countries than others. Many lands have traditions of dancing warriors, gentleman duelists, and even stealthy commandos.

This Combatant class is designed to replace the barbarian and fighter classes. A non-spellcasting woodsman can also be built with this class, though to recreate a classic ranger you must also take levels of Champion.

Hit Points: 1d10 + Constitution modifier/level, maximum hit points gained as 1st level character.

Skill Points: 16 + ×4 Int modifier at 1st level, 3 + Int modifier per level after that. A character starting as a Combatant at 1st level gains the benefit of more skill points to cover background training, but when advancing as a Combatant most of your time is spent learning fighting techniques rather than other skills.

Proficiencies: All martial and simple weapons, light armor, all shields (except tower shields).

Table 2: The Combatant Class

Level	Base Attack Bonus	Fort. Save	Ref. Save	Will Save	Special

Archer Talent Tree

While most Combatants focus on melee combat, some turn to ranged weapons to allow them to fight from afar.

Careful Shot (Ex). As a full-round action, the Combatant may line up a careful shot by targeting a single character, creature or object (including chariots and other vessels) that he can see. The following round, the Combatant gains a +4 competence bonus to his first ranged attack against that target. Subsequent attacks in the round do not gain this bonus to the attack.

Prerequisite: Point Blank Shot feat.

Deadeye (Ex). As a full-round action, the Combatant may line up a more damaging shot by targeting a single character, creature or object (including vehicles and other vessels) that he can see. The following round, the Combatant gains a +4 competence bonus to his first damage roll on a ranged attack against that target. Subsequent attacks in the round do not gain this bonus to the damage.

Prerequisites: Precise Shot feat, Careful Shot

Dire Accuracy (Ex). When dealing damage with a ranged attack, you reroll any die that results in a "1." You take the result of the second die rolls.

Prerequisite: Far Shot and Precise Shot feats.

Greater Dire Accuracy (Ex). When dealing damage with a ranged attack, you reroll any die that results in a "1" or "2." You take the result of the second die rolls.

Prerequisite: Far Shot and Precise Shot feats, Deadly Accuracy talent, BAB +6.

Defensive Shot (Ex). You do not provoke an attack of opportunity when making a ranged attack.

Prerequisite: Any other talent from the archer talent tree.

Penetrating Shot (Ex). As a full-round action you may make a single ranged attack at a target in point-blank range, dealing an additional 1d8 points of damage.

Prerequisites: Far Shot, Point Blank Shot and Precise Shot feats, +9 BAB.

Barbarian Talent Tree

The fighting styles many tribes in the frozen north and sad-filled east emphasize focusing on a single target and pounding it until it stops moving. While these attack styles developed among uncivilized cultures they have spread to other lands as well, though employing them always involves obvious, massive effort and normally a lot of yelling.

If you have three or more Barbarian talents, you cannot have more than two Fighting Style talents.

Cunning Attack: The Combatant gains a +4 competence enhancement bonus to damage against flat-footed opponents.

Frenzy: Once a day, the Combatant may fly into a frenzy. He gains a +2 bonus to weapon attack and damage rolls and a +2 AC bonus. This frenzy lasts a number of round equal to 3 + his Constitution modifier. At the end of the rage, he is fatigued for ten minutes. While in a frenzy, the Combatant may not perform any task that requires patience or a

delicate touch.

This talent may be bought more than once, with each additional time adding one to the number of times per day the Combatant may frenzy and the number of rounds each frenzy lasts.

Improved Frenzy: The Combatant no longer takes a level of fatigue after his frenzy.

Prerequisites: Rage and any other brute talent.

Mighty Blow (Ex). You gain a +4 bonus to any attack roll made to confirm a critical threat.

Prerequisite: BAB +6

Momentum: Some Combatants can throw the full weight of their bodies behind an attack, dealing extra damage. Whenever a Combatant with this talent makes a melee attack when charging, he gains a bonus of 1d8 extra damage. Thus, a human Combatant with a 14 Strength and a short sword would normally do 1d6+2 points of damage on a melee attack, but when charging he would deal 1d6+2+1d8 points of damage instead.

Punishing Blow: Once per day the Combatant may focus all his effort on a single attack, which gains a +4 morale bonus to hit and deals an additional 1d8 points of damage for every four full class levels of the Combatant (minimum +1d8).

This talent may be taken more than once. Each additional time adds one to the number of times per day it can be used.

Prerequisite: Any other two Barbarian talents.

Uncanny Dodge (Ex). You have uncanny dodge.

Prerequisite: Any other Combatant talent

Improved Uncanny Dodge (Ex). You have improved uncanny dodge.

Prerequisite: Any other Combatant talent, uncanny dodge talent.

Commander Talent Tree

Many Combatants train to improve not only their own skill at battle, but how to make the best use of warriors around them, or reduce the effectiveness of enemy Combatants.

Command Aura. You may add a competence bonus to allies in range of you that can see and hear you. This bonus is equal to your Charisma bonus. The range is a radius from you equal to 5 feet per Combatant class level. You must decide what this aura applies to at the beginning of each round, and it is a swift action to change it, establish an aura, or lower an aura. You may add the command aura to the following things: Attack rolls to confirm critical hits; attack rolls made as attacks of opportunity; AC against attacks of opportunity; damage rolls made as part of a charge; saving throws vs mind affecting spells and abilities; rolls made to oppose being bull rushed, disarmed or grappled; Concentration checks; and Spot checks.

Prerequisite: Any other Combatant talent.

Dual Aura. You may have a second command aura in effect.

Prerequisites: Cha 15, any other Combatant talent, command aura talent.

Plan (Ex). Prior to a dramatic situation, either combat- or skill-related, the Combatant can develop a plan of action to handle the situation. Using this talent requires preparation; a Combatant can't use this talent when surprised or

otherwise unprepared for a particular situation.

The Combatant makes an Intelligence check. The result of the check provides the Combatant and allies with a bonus to attack rolls and Str-, Dex- and Con-based skill checks. A Combatant can't take 10 or 20 when making this check.

Check Result	Bonus
9 or lower	+0 (check failed)
10-14	+1
15-24	+2
25 or higher	+3

The bonus only lasts for the first 3 rounds of the encounter. After that time, reduce the bonus by 1 point (to a minimum of +0) for every additional round the situation continues, as the vagaries of circumstance begin to unravel even the best-laid plans.

Tactics. Whenever a Combatant is about to launch an attack against an opponent (or group of opponents), the Combatant may spend one minute planning the attack with his allies. If he does so, when combat begins he and all his allies within 60 feet suffer no penalty for being flanked, and when flanking a foe gain a total of a +4 bonus to hit. The Combatant must be able to see his opponents, his opponents must not be aware of his presence (or of his allies), and he must be able to communicate with all allies gaining the benefit of this talent (though he may use hand signals or communicators to do so).

Trick. The Combatant has the ability to temporarily confuse a target through the use of ploy and deception. The target must have an Intelligence score of 3 or higher to be susceptible to a trick, must be within 30 feet of the hero, and must be able to hear and understand the hero.

To play a trick on a target, the Combatant must use a full-round action and make an Intelligence check (DC 15), adding his or her class level as a bonus. If the Intelligence check fails, the target thinks quickly and ignores the trick.

If the Int check succeeds, the target resists the trick by making a Reflex saving throw (DC 10 + fighter's class level + fighter's Int bonus). If the saving throw fails, the target is stunned for one round. A trick can only be played on a particular target once per encounter. After the first trick in an encounter, whether the attempt succeeds or not, that target becomes wary and immune to such ploys.

Extreme Effort Talent Tree

A Combatant can push him or herself to make an extreme effort.

Extreme Effort. The effort must relate either to a Strength check or a Strength-based skill check. The effort requires a full-round action and provides a +1d8 bonus on the check.

Improved Extreme Effort. The effort requires a full-round action and provides a +1d8 bonus that stacks with the bonus provided by extreme effort (+2d8 total).

Prerequisite: Extreme effort.

Tough It Out (Ex). Once per day, the Combatant can gain a second wind as a swift action. When the hero does this, he recovers a number of hit points equal to his Constitution score plus his Combatant class level. This talent does not heal the hero's hit points beyond the character's full normal total.

Fighting Style Talent Tree

As the art of combat has advanced, it has been studied, codified, altered and improved. Several different fighting styles have developed, taught by army soldiers, master knights and fencing masters. Many of these styles offer trade-offs,

improving a Combatant in one circumstance but limiting him in other ways.

If you have three or more Fighting Style talents, you may not have more than two Barbarian talents.

Armor Use. You are proficient in medium and heavy armors, and tower shields.

Armor Master. You gain a +1 dodge bonus to AC in light armor, +2 in Medium armor, and +3 in heavy armor.

Prerequisites: Armor use talent and any other Combatant talent.

Canny Fighting. When wearing light armor or no armor, you may add your Wisdom bonus to your Armor Class, to a maximum of your Combatant class level. If you lose your Dex bonus to AC, you also lose your Wisdom bonus.

Prerequisites: Any other Combatant talent.

Duelist. You may increase you AC by up to +3 against one foe as a free action at the beginning of your turn. You reduce your AC against any other foe by twice that number. These changes last until your next round.

Prerequisite: Dodge feat.

Exotic Weapon Master. The Combatant is considered proficient in all exotic weapons.

Prerequisites: Exotic Weapon Proficiency feat, any other Combatant talent.

Flashing Blades. When wearing light armor or no armor and holding a melee weapon you are proficient with, you gain an armor bonus to AC. This bonus is equal to 4 + your base Will save from the Combatant class. This does not stack with other armor bonuses, but does stack with shield bonuses or an enhancement bonus from armor you are wearing (a 5th level Combatant with +3 leather armor, flashing blades and a sword in hand has +8 to AC, 5 from flashing blades, 3 from the leather's enhancement bonus).

Item Style. Choose one item that can be held in one hand. You may use this item as a light weapon. It deals 1d6 points of damage, threatens on a 20 and has a ×2 critical multiple. Common choices for this talent are cloaks, daggers, bear mugs, and iron fans.

Improved Item Style. Chose one item you have item style talent with. You may either increase its base threat range by one or its critical hit multiplier by one. When you have one of these items in hand, you gain a +1 shield bonus to AC.

Prerequisite: Item style with item selected.

Parry (Ex). Once per round when the Combatant would normally be hit with a melee attack, he may force the attacker to re-roll his attack. The first attack roll is only used if the second attack roll is also a hit. If the first attack roll is not a critical hit the attack is not critical, even if the second attack roll falls within the weapon's threat range.

The Combatant must be aware of the attack and not flat-footed. Unusually massive melee weapons, such as a Huge tree used as a club, can't be deflected. This talent may be used twice per encounter.

Prerequisites: Combat Expertise feat, any other Combatant talent.

Weapon Master. Choose a specific weapon. When fighting with that weapon, you deal an additional 1d8 points of damage.

Prerequisite: Weapon Focus and Weapon Specialization feats for chosen weapon.

Rugged Talent Tree

Many Combatants are simply tougher than other people, able to soak up damage that would crush lesser creatures. The rugged talent list is as follows:

Acid Resistance. The Combatant ignores an amount of acid damage equal to 2 + his Constitution modifier. This talent may be taken up to twice, doubling the resistance granted.

Cold Resistance. The Combatant ignores an amount of cold damage equal to 2 + his Constitution modifier. This talent may be taken up to twice, doubling the resistance granted.

Damage Reduction 1/-- . The Combatant ignores 1 point of bludgeoning, piercing or slashing damage. This stacks with any other DR the Combatant has.

Damage Reduction 2/-- . The Combatant ignores 2 points of bludgeoning, piercing or slashing damage. This replaces the DR 1/- talent, but stacks with any other DR the Combatant has.

Prerequisites: Damage Reduction 1/-- talent.

Damage Reduction 3/-- . The Combatant ignores 3 points of bludgeoning, piercing or slashing damage. This replaces the DR 2/- talent, but stacks with any other DR the Combatant has.

Prerequisites: Damage Reduction 1/-- and damage reduction 2/-- talents.

Electricity Resistance. The Combatant ignores an amount of electricity damage equal to 2 + his Constitution modifier. This talent may be taken up to twice, doubling the resistance granted.

Fire Resistance. The Combatant ignores an amount of fire damage equal to 2 + his Constitution modifier. This talent may be taken up to twice, doubling the resistance granted.

Magic Resistance. Any time the Combatant takes damage from a magic source he does not have resistance against, he reduces the damage he takes by 5.

Prerequisites: Any two other resistances from the Rugged talent tree.

Robust. The Combatant becomes especially robust, gaining a number of hit points equal to his class level as soon as he selects this talent. Thereafter, the hero gains +1 hit point with each class level he gains.

Thunder Resistance. The Combatant ignores an amount of sonic damage equal to 2 + his Constitution modifier. This talent may be taken up to twice, doubling the resistance granted.

Bonus Feat: Combatants gain bonus feats from the fighter bonus feat list.

Too often gamers find themselves without a group of friends to play with, and while they may have the possibility of a computer game open to them, a first-person shooter or strategy resource management game doesn't always have the same appeal. On the other hand, if the computer game actually is a favored board game, you're in like Flynn. ***Ticket to Ride*** is available as a CD-ROM from Days of Wonder.

Like the [physical version,](#) the game asks participants (or in this case, the participant) to play card sets and secure the lines running from one city to the next. Finish with more points than the pixilated competition and you win. But now it's all automated. No more fiddling with tiny train car miniatures or even tinier train cards. No one forgets to move their scoring marker around the circumference of the board . . . and no one has to find a table on which to put said board, either.

The display is dominated by the map view showing the cities and lines you must claim. Above that are your opponents (you can select from one to four rivals) and a quick summary of what they have: their remaining train cars, how many cards they hold, their current score (sans whatever tickets they may have completed), and so on. Along the left side are the draw piles showing what's available from different decks, and the bottom belongs to you -- the same information as your opponents but with more detail.

Your computer screen is now the gateway to all the railroad gaming you could want to do, and when you see how much there is to do you're going to want to do a lot. Rather than stick it to their customers and make them pay for the basic game and then some add-ons for all the sequels (or worse, make each iteration in the line a separate, standalone purchase), you get both the original *Ticket to Ride* and its European-mapped sequel. Then they throw in an all-new map of Switzerland.

Now how much would you pay? Don't answer yet, because if you try to go on-line (more in a moment) with your new toy, you find there's an update waiting at the website. In most cases this would mean a patch released by the company to fix countless problems, but here it means they're offering the *[1910](#)* supplement and all three of its rule variations. The cost to you? Nothing.

So what do you do if you get tired of playing three maps six ways? Well, since the game only allows single play at home -- sadly it doesn't even offer a "hot-seat" option (with friends on one machine taking turns at the keyboard), let alone LAN play -- you'll find joining other people at the site a good way to fill empty VR seats. If your buddy can't come across town to play, meet Pierre and Chan, your new best global friends, with a chat option and other goodies that make it a true on-line experience. (You can even play all AIs when you're on-line. Why? Who knows . . . it's your game, and you can't fault the company's thoroughness.) Purchasing the computer disc gives you a year's subscription to the service.

There are a few irritating features. Usually it's pretty easy to tell the difference between a line of empty spaces ready for your train car placement and a line of your opponent's cars occupying a road, but occasionally the colors get a little tricky and throw you. Claiming a line requires you to click the appropriate cards in your play area and drag them to the segment you want, and sometimes the selecting or "centering" operations demand too much precision. A little practice eliminates this for the most part, so again, not too galling. The new rules on linking to neighboring countries take some getting used to -- you're essentially connecting to a rail ending in nothing -- and sometimes the text on the maps is too small or stylized to make out easily. Thus, the inclusion of a zoom button that gives the far-sighted a better look at the details.

The game is as colorful as the real thing, and it plays well. The AIs are just tough enough that, even after you've got the game down, they still pose a challenge. You won't be able to walk over the system without putting thought into every game. Each color is represented by a separate character (if you've ever seen the box top, the people thereon are your icons), and while they just play the game (they don't talk or taunt or animate crazily) each has a personality that emerges over time. Herr Doktor, for example, usually ends the game with a big score from playing a lot of trains on high-value lines, but he can't complete a ticket to save his electronic life.

It takes a while to get tired of the sounds and animations, and most can be toggled on and off. The music is cute, if repetitive, and the cut-scenes are brief and well produced. Full tutorials with VCR controls tell you how to play, and you also get a promotional DVD that espouses the *Days of Wonder* philosophy and gives you a thorough overview of how to play several of their lines. **Ticket to Ride: The Computer Game** offers buyers another of those rare, overpowering values that come along only once in a while in the leisure world. A trip that's always been worth taking is now not to be missed.

It is strange to think that [*Deadlands*](#) is 10 years old, an anniversary marked by the release of **Deadlands Reloaded.** The fourth version of the game after the 1996 original, *GURPS Deadlands,* and *Deadlands d20,* it also brings two Origins-Award-winning games together and one of those back to its origins. **Deadlands Reloaded** is not a full RPG, but a supplement for [*Shane Lacy Hensley's Savage Worlds,*](#) the pulpish game engine derived from [*Rail Wars,*](#) the skirmish rules that were themselves a simplified version of the Deadlands mechanics.

Deadlands Reloaded is more than a retread of the original game, known as **Deadlands Classic.** Rather it is a distillation of over fifty supplements into one volume, providing everything needed to play within the Weird West, not of 1876, but of 1879. In providing a new entry point for fans old and new, **Deadlands Reloaded** spares the Marshal (as the GM is known) no secrets. What is really going on, who the big bads are -- and the Weird West is certainly not short of those -- and so on, are all included. **Deadlands Reloaded** is one big summary of the Weird West, providing rules and background, but nothing in the way of scenarios or campaign support. Unlike other *Savage World* supplements, **Deadlands Reloaded** does not include a plot point campaign. These will appear in future supplements, although several short scenarios appear on the publisher's website.

For those not in the know, the setting for **Deadlands Reloaded** is the Weird West, an alternate history that combines the classic Western and Horror genres. It extends the American Civil War by a decade, leaving the States torn in twain, and the West either disputed territory or still in Indian hands. The western continental coast has been shattered by an earthquake, leaving a maze of rocky islands disputed b the USA, the CSA, Mexico, Chinese Triads, and a fanatical Reverend. At stake is the control of Ghost Rock, a new glowing mineral that shrieks as it is burned, but can be used to fuel any number of devices from horseless carriages and rocket packs to Gatling guns and flamethrowers.

Ghost Rock and other minerals promise wealth untold, drawing potential prospectors from back East, and way out West all aboard the various transcontinental railroads driving across the continent to be first to get there.

Unfortunately the Weird West is a dangerous place for the unwary traveler. Not just form the territorial Indians, the unpredictable cowboys and outlaws, factions feuding for the Union and Confederacy, and so on, but also from a host of horrors. The least of these are the dead returned from the grave, some of them still on the side of law and order, others downright evil. Others come from Indian legend, like the Sasquatch and the Wendigo; others are more Wild West, like the sentient barbed wire Bloodwire, the Hangin' Judge, and the Nosferatu. It is creatures like these, and the other oddness of the Weird West, that is fodder for the *Tombstone Epitaph*, the Weird West's news sheet of disrepute.

This is a rich mix into which to play, and the character roles available are equal to the task. Gunslingers, Indian Braves and Shaman, prospectors, soldiers, secret agents, Chinese martial artists, holy men and women, voodoo priests, mad scientists capable of building steam powered devices, hucksters who can cast spells vial hands of cards, and hexslingers who casts spells via their six shooters. It is even possible to start play as "a veteran of the Weird West," though the character will be touched by the horrors he has seen and might possibly be jinxed, maimed, in debt, or even one of the Harrowed (the undead returned). All of these are represented by a raft of new Edges and Hindrances, many of them Professional or Arcane. This is in addition to those in Savage Worlds. Character generation is unchanged from Savage Worlds, but Deadlands Reloaded provides plenty of options for the party or posse.

Mechanically, *Deadlands Reloaded* makes some small changes to the *Savage Worlds* rules. It replaces the core game's Bennies -- or luck points -- with *Deadlands'* fate chips, which come in three colors of ascending power: white, red, and blue. Each player begins with a random selection, as does the GM or Marshal who uses them for all of his NPCs and Critters. One downside of using red chips is that the Marshal gets to draw a chip when a player uses one. Combat employs the "Way of the Brave" system that makes any fight more savage and brutal. Duels between hucksters and hexslingers have their own set of rules, participants trying to assemble the best poker hands to fuel their spells.

Over half of *Deadlands Reloaded* is for the Marshal's eyes only. It is here that he will really find out about the Weird West. This is all one big bestiary, history, gazetteer, who's who, and the truth rolled into one. In setting everything out for the Marshal, *Deadlands Reloaded* runs contrary to *Deadlands Classic* and games of its ilk such as *Brave New World,* where the setting's secrets are doled out over the course of the game's releases, which all feels very refreshing.

That said, there are one or two elements missing from *Deadlands Reloaded.* First there is no example of character generation, but there are plenty of sample characters besides the settings personalities. Second, there are no campaign or adventure hooks given, but then the actual setting is rife with details that any Marshal worth his grit should find something in this book. Neither of these omissions poses much of a problem. What does though is the lack of advice on running the game and on handling the mental effect of encountering the Weird West's horrors. It is obviously handled by a simple guts roll in *Savage Worlds,* but this should have been covered. *Deadlands Reloaded,* after all, is a horror setting.

Physically *Deadlands Reloaded* is a good looking book, decently written and fully illustrated . . . probably to a greater extent than most supplements, but then *Deadlands Reloaded* has a decade's worth of supplements to draw upon for its art.

Go back that decade and you have to remember that in its day, *Deadlands* was a big hit. It had a simple hook which so many RPGs these days seem to lack -- a combination of classic Wild West and horror -- that captured the imagination and made the game cool. Yet even if it was cool and its mechanics felt appropriate to the genre, those mechanics were fundamentally too clunky. is virtually a testament to that, an easier (derived) set of skirmish rules in being used for *Deadlands Reloaded,* by using the skirmish-rule-derived *Savage Worlds* (albeit with one or two complications in the use of a poker deck), shows that the Weird West can be run using a lighter set of rules without losing any of the flavor. With virtually everything to hand, *Deadlands Reloaded* is the definite guide and the perfect entry point to the Weird West.

Looking Ahead By Glancing Backwards Nervously (Part I)

And so, as 2006 has been torn into pieces over the course of 365 days and thrown into the dustbin of history, we as a world now turn our eyes toward 2007 to see if it can fare any better. Odds are slim, but I've got the inside track from the breeders that 2008 might be able to last an extra day.

Anyway, this is the time of year when various media outfits put on prognosticator hats and try to foretell the future. (We've even done it around here once or twice.) But I'm going to take a pass this year. My track record is only so-so, and -- frankly -- things don't change quickly enough in the gaming world to make many "interesting" predictions. (And even if they did, I'm not wizard enough to figure out what's gonna happen.) Instead, I thought I'd take my weekly words to think about how the gaming industry has looked to the future in the past -- at least as far as technology is concerned -- and how it worked out.

There's a saying about armies (at least in the U.S.; I don't know if it's a universal truism) that generals always plan to fight the previous war. Thus the Korean War was approached as it if were World War II Too, the Vietnam War was approached with the same mindset as Korea, and General Kenobi approached the Rebellion with the same tactics as he did the Clone Wars (which is to say he was really lazy and was ultimately twice as successful at getting himself half-killed).

This is also reasonably true of the gaming biz as well (and many other industries, no doubt . . . but this is a gaming mag, so what're ya gonna do?). In particular I got to thinking of the number of technological advances that have been made in the gaming world -- both from a business and fan-centric standpoint -- and how, ultimately, many of them either didn't pan out or provided benefits that were quickly fleeting.

The earliest example I can think of this was former computer-game giant SSI's release of *Dungeon Master's Assistant Volume I* in 1988. (*Volume II* followed in 1989.) Now, for the era -- I had them for the Apple][computer system -- these utilities were really useful, and helped the GM organize all his *Advanced Dungeons & Dragons 1st Edition* game information. Unfortunately, there was only one slight problem; the *2nd Edition* of the game was released in 1989. As such, gamers who wanted to be on the cutting edge of official rules (which, I believe, is a pretty darn large number) were purchasing computer software that was obsolete in a year or less . . . quite probably much less.

Curiously, something very similar happened with the release of the *Dungeons & Dragons CD-ROM Core Rules* in September of 1996. (As an aside, I note with amusement and awe that, over the course of seven years, the standard computer-storage medium size moved from 0.14-meg 5.25" floppy disks to 700-meg CD-ROMs . . . a 5,000-fold increase.) This product -- one of the earliest attempts at distribution of electronic rulebooks -- only contained a few tomes; notably missing were the *Player's Option* series that began in 1995 and the "Book of . . ." series (the earliest "splatbooks," which contained popular character options called "kits"). The *Core Rules CD-ROM 2.0* contained the *Player's Option* books but were missing the "Book of"s; those weren't added until 1999's *Core Rules 2.0 Expansion.* At last, all the main books were available in electronic format. And the next year, *Dungeons & Dragons Third Edition* appeared. (At least this time these rules were mostly accessible in electronic format via the freely distributable Standard Resource Document, which formed the foundation of the *d20 System* movement. Whether this movement was good or bad for the industry as a whole is up to future historians to sort out.)

And speaking of CD-ROM goodness, let's not forget White Wolf's *Vampire: The Masquerade* offering in August of 1997. (The revised edition of that game came out in 1998, making those rulebooks obsolete.) At least the November 2001 edition of that CD-ROM contained rules that were relevant until 2004's *Vampire: The Requiem* came out. (Heck . . . fans who didn't switch over systems will *always* find that system equally useful.) If it wasn't for that trend-bucking offering, it would seem the surest indicator of a new edition was a CD-ROM release of the old edition.

(I should also note that not all of TSR's CD-ROM offerings were less-than-useful. The *Dragon Magazine* archive is a prized possession even today, and the *Forgotten Realms Interactive Atlas* is an amazing achievement of technology

and research.)

Let's move on to another example, this one 100% devoid of CD-ROM references. Remember in 1997, when the *Star Wars* universe was having its big comeback? Sure you do. Remember the theatrical "Special Edition" re-releases of the original trilogy were coming (back when the notion of prequels was still firmly in the realm of "exciting rumors" rather than "soul-wrenching memories"), and the comics and RPG were in full force? You bet. And do you remember how cool West End Games' website was, capitalizing on all this hype? No? No wonder; West End Games didn't have a website until 2000. Admittedly this is because the downward forces affecting the company were in full force, causing them to declare bankruptcy in 1998. But I have to wonder: At the infancy of the Internet (two years after Amazon.com opened its doors and less than one year before *Pyramid* evolved into its online-only form), when people were desperate for content and hungry for *Star Wars,* how many potential fans didn't even know that there were volumes upon volumes of additional material waiting to be purchased? And how many would have been enticed by a $30-a-month website? Would it have made a difference to the company's fate? Probably not . . . .but who can say?

Expanding on that idea, I note that *many* companies didn't get online until late in the game (Alderac); many that did had lackluster online offerings. (White Wolf and Pre-Wizards-of-the-Coast TSR, I'm looking at you.) While this fact applies to many companies in the mid-to-late 1990s, the fact remains that the Internet is about information and community . . . two facts that are at the absolute core of the gaming experience.

Next week I'll look at a couple of counterexamples to this (which really, in my opinion, prove the larger point), return to the idea of information and community, and discuss why I'm interested in this phenomenon in the first place. See you in seven.

Panty Explosion: A Psychic Schoolgirl Adventure Game

Published by **Atarashi Games**

Written by Jake Richmond & Matt Schlotte

Illustrated by Jake Richmond

98-Page 4.06Mb Full Color PDF Document; $10
96-Page Full Color Hardback Book; $20

Obviously, ***Panty Explosion: A Psychic Schoolgirl Adventure Game*** wins the award for least tasteful RPG title of 2006, but was probably the only entry anyway. Fortunately, the game's subject matter is nowhere near as prurient, although it does involve Japanese schoolgirls. More specifically, it involves Japanese schoolgirls confronting various threats from mysterious government agents to traditional Japanese demons. Mysterious government agents because the Men in Black are particularly interested in psychic schoolgirls, and traditional Japanese demons because being a threat is what traditional Japanese demons do.

Of course, it might take schoolgirl psychic to defeat any one of these demons, but her powers and inherent oddness set her apart and mean that she will never fit into the Japanese high school's clique-bound society. In the meantime, every Japanese schoolgirl, psychic or not, has to survive high school, pass her exams, and deal with her own agenda, issues, and rivals.

Schoolgirl creation in ***Panty Explosion*** draws heavily from Japanese culture. Her player assigns the numbers 5, 4, 3, 2, and 1 to the Godai, or elements representing attributes. These are Earth (strength/stability), Water (adaptability/flexibility), Fire (passion/aggression), Air (wisdom/movement), and Void (communication/interaction). She must know her Blood Type, her birth sign under the Junishi or Chinese Zodiac, details of her Friends and Family, and her Hobbies. For each of these, plus her highest rated Godai, she chooses five traits, either positive or negative, representing her personality, plus various talents, abilities, hobbies, relationships, and possessions. Additionally, the schoolgirl needs a name, an agenda, and to decide her best friend and rival from amongst the other player schoolgirls. Finally, her player needs to decide if she is psychic or not. At least one student per game must be psychic.

So for example, Sasaki Chinatsu is Blood Type A, and being the artistic type, has the trait, "has won awards for her artwork." Born in December, her Junishi sign is the Boar. Known for its loyalty, her associated trait is, "Friends can always trust her." Her Godai values are Earth 4, Water 3, Fire 2, Air 1, and Void 5; so for her high Void, she has the trait, "Is working on a well-known Manga series." For her Friends and Family, Chinatsu has "Misses her father who is working away"; and for her hobby trait, she "maintains a website devoted to English-language rock bands." Chinatsu's agenda is, "Has a less popular friend who she wants to be more popular."

At the beginning of both a game and each session, the players must determine who the most popular and the least popular students are by a secret ballot. This is important because it determines the die type a student uses during conflict resolution. The most popular uses 10-sided dice, the least popular the 6-sided, whilst every other student uses 8-sided dice. A psychic schoolgirl is too odd to be the most popular. Problematically, the link between popularity and die type is not explained until after conflict resolution is explained.

Besides dice, conflict resolution also requires a character's best friend and rival. A schoolgirl is also limited to 15 dice in a conflict, equal to her Godai. Expended dice cannot be used again in a conflict, so a student must find another way

to win. For example, Chinatsu's friend is being picked upon, so she steps in and stares down the bully. This uses her Earth Godai, giving her up to four dice to use in an action. If the bully responds physically and pushes her, Chinatsu could use either unused Earth Godai to resist or Water Godai to dodge. Later on, she could try humiliating the Bully verbally with her Void Godai. Whilst the limitations on Godai dice constrain conflicts it also moves the game forward because each conflict has to be resolved before the dice are exhausted.

Whatever the die type, a student requires only a 5 or more on one die to succeed, so larger die types are better. A trait relevant to a conflict will increase the die type by one size. Conflicts are played out with each student taking actions in turn, until it is resolved or the participants run out of Godai dice and can take no further action. Interestingly, where typical RPGs have the GM narrate the outcome of a conflict, in *Panty Explosion* the narration is handled by whoever is playing a schoolgirl's best friend or rival. If the conflict failed, then the rival narrates; if successful, the best friend does do. The GM or (School) Superintendent handles narration for everything else.

Combat is handled through this same method of conflict resolution. With no hit points, damage effects are instead narrated, making it easily possible for a rival or the Superintendent to kill a character. The advice though suggests that this should never be arbitrary and should either serve the story or because the victim put herself in that situation.

Psychic powers are handled even more simply. A psychic schoolgirl rolls a 10-sided dice for any attempt to use her powers, the ability determining which Godai dice are used. For example, Levitation uses either Air, Void, or Water dice, whilst Make Heads Explode uses Earth, Fire, or Void dice. If the roll fails, another attempt can be made with a single die. Psychic power use is always disturbing, and accompanied by strange effects like temperature changes or flickering lights. Even if the roll succeeds, it is not a psychic's best friend who narrates the outcome, but her rival. The point is, however useful psychic powers are in confronting demons, their use is not a good thing with unnerving consequences and the rival should bring this into her narration.

It is up to the Superintendent to create the girls' school and potential opposition in the form of rivals, psychics, government agents, and demons. Although numerous demons are described, from the mind-reading skin-stealing Ama-no-jaku to the man-eating snow maiden Yuki-onna, they all work more or less the same. And the same rules apply if the students are facing a government agency or secret society. All get the same number of Godai dice as a student, plus two extra dice per unresolved Agenda, with a further two if the Agenda belongs to the Psychic student. In addition, the demon/agency/society gains another two dice each time the Psychic uses her powers. Which gives the demon an awful lot of dice to play with, but the dice are not intended to be used all at once. Rather they are a pool of dice that the Superintendent dips into over the course of an adventure as the story demands.

The Godai elements are further used in two similar fashions. First, in setting up and structuring a *Panty Explosion* game, for which the Superintendent selects Earth (the setting), Air (the story), Water (the Agendas), Fire (the Demon), and Void (the End). Second in building each scene, using Earth (location), Air (people), Water (mood), Fire (action), and Void (psychic). The Superintendent usually begins with setting the location, but the players are encouraged to suggest Godai elements for each scene. Thus a game of Panty Explosion follows a movie structure, with the story coming to a climax once the students have dealt with the demon. Along the way, the students must deal with their agendas as it is the only way to weaken the threat they face.

Plenty of background material supports the setting, primarily covering the life, society, and culture of the Japanese schoolgirl and her high school. Outside of this institution, there is an extensive description (though no map) of Tokyo, and of the Japanese faiths of Buddhism and Shintoism. This is all useful information, but here *Panty Explosion* ends, leaving the game missing three elements. First, there is very little advice for the Superintendent; second, there is no discussion of the genre; and third, no bibliography. *Panty Explosion* is not necessarily a difficult game to run, but advice is always welcome. The other omissions are more problematic, as indications of the source always help a GM understand a genre. Physically though, *Panty Explosion* is nicely done. The full color artwork is excellent if your tastes run to Japanese schoolgirls, and the book itself is presented as a schoolgirl's notebook.

As written, *Panty Explosion* is designed more for one-off rather than repeated play; there are no rules for character improvement, though a GM could create them. The one-shot nature also lends itself to *Panty Explosion* being run in the vein of Japanese or [J-horror](#) films such as Ringu, Dark Water, and Ju-on. And if that is the point of the game, it

certainly does not say that -- though it should. Despite its omissions (and its title), ***Panty Explosion: A Psychic Schoolgirl Adventure Game*** achieves its aim of presenting a storytelling RPG that can be run within the anime horror or J-horror genres. The GM or Superintendent will just have to conduct a little more research than he should.

Naval Warriors: The Officers And Men Who Fought The Great Square-Riggers

Part II: The Warrant Officers

by Nicholas Lovell

Captain Smallwood stood in full dress uniform on the quarterdeck of HMS Bellerephon. A fresh breeze plucked at his coat as the ship headed west under topsails and topgallants.

"And may I now introduce your standing officers, sir." Goodwin, the first lieutenant, continued briefing his new captain.

"Mr Dreskin, the gunner." A small man, with wisps of grey hair blowing in the wind.

"Mr Richmond, the carpenter." Old, probably mid-50s, with an earnest expression.

"Mr Bowers, the bosun." Powerfully-built and over six feet tall, Bowers towered over the crew. He had an easy authority, and Smallwood felt instantly reassured that the ship would be in excellent condition.

*"Gentlemen, it is my pleasure to make your acquaintance," Smallwood said. "I look forward to talking to you all later, to ensure that we maintain the excellent reputation that the **Bellerephon** has enjoyed for so many years."*

On a major warship, the warrant, or non-commissioned, officers were the backbone of the crew. Since the commissioned officers were frequently advanced due to political or family connections (although merit and gallantry played a significant part), the warrant officers were highly skilled, specialized, and crucial to the successful running of the ship.

The warrant officers were divided into two groups. The wardroom officers shared the wardroom with the lieutenants and marine commanders. They were of a higher social status than the other warrant officers, but often lacked social esteem in polite society compared with their commissioned counterparts. These also included men who were important to the ship but had limited sailing abilities, such as the surgeon and chaplain.

The wardroom warrant officers include:

Master: Responsible for all navigation matters. If the captain was an appointee due to his connections rather than his seamanship, the Master could become the real sailing master of the vessel.

The master would typically be a former midshipman or lieutenant who had passed the technical aspects of his exams, but had failed on the nebulous and informal measure of "being a gentleman." Some men who failed in this way would remain as embittered elderly master's mates or lieutenants, while others would accept their role as master as a recognition of their sailing expertise.

Surgeon: Medicine was very limited in the 18th and 19th centuries, and the surgeon's role was frequently limited to amputation of severely damaged limbs and the removal of bullets and splinters. Splinter wounds in wooden boats could be horrific, as a heavy iron cannonball could send shards of wood several feet long flying through the crowded fighting decks of a man of war. He would also carry treatments for syphilis (the "pox"), an ever-present disease after every landfall.

Chaplain: Often only carried at the behest of the Captain, and not every ship carried a parson. In the absence of a chaplain, the Captain would carry out the Sunday services and funerals himself.

Purser: Responsible for provisioning the ships, which could be a pivotal role in a long voyage. As the man in charge of all supplies on board, taking a cut was easy, and seen as a perk of the job. As such the purser was distrusted by many, if not all, sailors.

Other important warrant officers, although not of wardroom rank, include:

Gunner: Responsible for maintaining the cannon, overseeing the supplies of powder and preparing the charges for the great guns.

Boatswain: Pronounced bosun, was in charge of all rigging, sails and anchors.

Carpenter: a critical role in the wooden ships of the time

Sailmaker: made and repaired the dozens of sails used on a ship of war.

Armourer: the ship's blacksmith who was also the primary maintainer of the small arms and weapons. He reported to the gunner.

Master-at-arms: The ship's disciplinarian, he was also responsible for training the sailors in the use of muskets and pistols.

The gunner, bosun and carpenter were the three "standing" warrant officers on board ship. They were senior to the sailmaker, armourer, master-at-arms, and other warrant officers, and were theoretically attached to the same ship for its entire life. In practice, this was often not the case and they would move from ship to ship.

Marines/Soldiers

Many vessels carried soldiers or marines. They acted as a primary landing and boarding force where appropriate, and were also sharpshooters in ship-to-ship battle. A French marine mortally wounded Admiral Nelson at the Battle of Trafalgar in 1805.

Typically, the marines were commanded by a Captain and would have two or more Lieutenants. The Captain and the Lieutenants would mess with the naval Lieutenants and senior warrant officers in the wardroom. For game purposes, the Marines are soldiers with few specifically maritime skills, and as such, templates for them are outside the scope of this article.

The wardroom officers have individual templates, since they had specialist skills. The bosun and other warrant officers are based on either the Able Seaman or Ordinary Seamen templates found in a previous article.

Sample Character: William Bowers, Bosun

William Bowers ran away to sea at the age of 12 to escape the boredom of family life and a future as a tanner in the East End of London. In 27 years at sea, he has traveled around the world twice, and spent less than two years on dry land, six months of which was on the tiny Samoan island of Olosega.

Bowers, at the time a bosun's mate, was involved in a close-fought ship-to-ship action with a French frigate sent to harass the whalers and trading vessels in the South Pacific. When the ships crashed together, Bowers ran along the mizzen topsail yardarm and lashed the two vessels together. He then launched himself at the sharpshooters in the enemy's maintop, carrying a fearsome boarding axe. The two marines succumbed rapidly, but a French sailor unbalanced Bowers, who fell to the deck. Only his cat-like reflexes saved him as he twisted to land on the hammocks stowed along the waist.

Finding himself alone in the enemy waist, behind the mass of defenders repelling his fellow boarders, Bowers heaved himself up and single-handedly stormed the quarterdeck, the massive blows of his axe sweeping sailors and marines aside. Despite two pistol bullets and a wicked pike thrust to the thigh, Bowers reached the enemy officers. His first swing decapitated the First Lieutenant; the Captain, seeing that the English boarders had now gained control of the waist and faced with this berserk giant, hauled down his colors.

The surgeon recommended an extended period of shore-based recovery, otherwise he would not answer for the hero's survival. Bowers stayed for six months in the care of the villagers on Olosega, remaining after he was fully recovered until his ship returned after an extended cruise throughout Polynesia.

Now promoted to bosun of *HMS Bellerephon,* Bowers is a respected figure amongst the sailors. Those who have not seen him in battle have heard the tales, and few would run the risk of incurring his wrath.

William Bowers, Bosun   *125 points*

6'1" 240 lbs., a big man with strong upper body and arm muscles. Greying hair tied back in a pigtail. Easy air of authority

Attributes: **ST** 12, **DX** 12, **IQ** 11, **HT** 13.

Secondary characteristics: Dmg 1d-1/1d+2, BL 29 lbs., HP 12, Will 11, Per 11, FP 13, Basic speed 6.25, Basic Move 6.

Advantages: Acute Hearing 2, Catfall, Language (Samoan, accented, spoken only), Patron 5 (Royal Navy, 9 or less), Rank (Naval) 2.

Disadvantages: Code of Honor (Sailor's), Berserk, Duty (extremely hazardous, 12 or less), Enemy (French and Spanish Navies, 9 or less), Unattractive (scar from a pistol ball scored across his right cheek, barely missing his eye and past his hairline).

Skills: Axe/Mace-12; Boating (Sailboat)-12; Boating (Unpowered)-12; Brawling-13; Broadsword-13; Carousing-13; Climbing-12; Engineer (Sailing ship)-10; Gunner (Cannon)-14; Guns (Pistol)-13; Hobby skill (Macramé)-13; Knot-tying-14; Mathematics (Applied)-9; Musical Instrument (Fife)-10; Seamanship-14.

Quirks: Whistles sea shanties continuously; earnestly believes that an amulet given to him by a Samoan girl will protect him from harm in storms and in battle.

Vignettes in RPGs

by Lloyd Brown III

While long experience and many advice articles teach GMs that interactive storytelling is the epitome of the roleplaying experience for many, this advice minimizes the importance of one tool in the game master's workshop: the vignette.

The vignette is a short narrative, usually used to set a scene. The player characters aren't usually present. The players might not recognize any of the characters involved (if any). Vignettes don't advance a storyline. They don't characterize the player characters. At first glance, they don't seem to provide much aid to roleplaying.

The vignette's strength is scene-setting. In computer games, they appear as movie interludes before the game starts or as transition between acts. They signal the end of one chapter and the beginning of a new one. In RPGs, you can also use them to show back story.

Many campaigns often have problems from a literary standpoint when it comes to information. In a novel, the protagonist (and the reader) gain information in small bits throughout the story. In an RPG, the emphasis often lies in the conflict, and after the characters heroically defeat the villain in combat, they find his secret journal in which he explains in careful detail all his evil plans. In some cases, the villain explains the extent of his evil in a monologue that the characters politely listen to before they kill him (but it's in his journal, anyway, just in case the characters aren't polite enough to let him finish). In novels, this kind of heavy information load is called an "info dump," and it turns off the reader. It has the same effect on a roleplayer.

The vignette allows you to drop in bits of this back story incrementally, saving you from having to place an info dump at the very end of the adventure. When used best, the individual vignettes mean little until the players find the final piece at the end of the adventure.

Different Scenes of the Same Picture

A single vignette doesn't carry much weight. Vignettes carry the greatest impact when used to show different views of a larger image. For example, if you're running a long adventure series, such as the old *Temple of Elemental Evil,* you might plan a series of vignettes that show the Battle of Emridy Meadows, Prince Thrommel lying in state in his crypt deep in the temple, and other bits of back story.

To demonstrate the impact of multiple vignettes, consider the parable of the six blind men and the elephant. One feels the beast's hide and thinks it's a wall. One grabs the trunk and thinks he has hold of a snake. Another feels the tusk and thinks it's a spear. Without repeating the entire parable, the point is that each in part provides a deceptive picture. Only seeing the entire image reveals the truth.

For best impact, the final image comes not in a handout but in actual game play. Use vignettes to separate the minor elements from that huge info dump and reveal them one at a time. If you just reveal the key ingredients at the end of the adventure, then you don't have an info dump. You have a revelation.

Vignette Length

How long should a vignette be? The short answer is "long enough." The idea is to keep it descriptive most of the time, not narrative. Show a picture. A paragraph or two is usually plenty to convey the image you want to the players. If you make it too long, the players lose interest.

Keep your vignettes under five minutes in length. For writing, that means it should be no longer than 1,000 words

(since the average reading rate is about 200 words per minute). If you read or speak it to the players, your target should be about 400 words. These numbers indicate maximums; if you can convey the image you want with fewer words, the impact will be stronger.

When in doubt, make it shorter. Vignettes work best when they create more questions than they answer.

Steal Scriptwriting Vocabulary

To help convey the visual image you're trying to create, use terminology from movies. Players often understand what you're talking about as you use these terms, even if they couldn't come up with them on a vocabulary test.

- **Background.** The area in the image farthest from the viewer.
- **Cut.** An instant transition from one scene to another, with no special effects.
- **Dissolve.** A visual effect in which one scene is replaced by another. It usually indicates the passage of a considerable amount of time.
- **Fade in.** An image appearing slowly from black.
- **Fade out.** Losing detail and turning black.
- **Foreground.** The area closest to the viewer.
- **Offstage.** A voice or other sound effect that is heard but the origin of the sound is not within the viewer's line of sight.
- **Pan.** A horizontal camera move from left to right or right to left.
- **Tilt.** A vertical camera move. An example might be a tilt starting at a character's feet and moving up to the figure's face-at which point the viewer might recognize the character.
- **Wipe.** A visual effect in which the new scene replaces the old one, especially the horizontal wipe, wherein the new scene looks like it's just sliding over the old one from one side to the other. Star Wars popularized this visual effect. It usually represents a passage of time.
- **Zoom.** Coming in closer or zooming out for a larger view.

Creating Your Vignette

To quote Mies, "God is in the details." GM descriptions, especially of scenes in which the player characters are absent, tend to show a lot of "white space." Fill in these unremarkable corners with detail.

Mention the source of light in your vignette. A single candle indicates something about the character. Basking in bright sunlight portrays a different image. A silhouette framed against the setting sun shows yet a third. Examples include:

- Candles, one or more. The candles themselves might be fat, thin, tall, low, etc. They might lie on the ground, be set in tarnished candlesticks, or be set in a silver candelabra.
- A lantern, smoky or bright
- A torch, flickering, flaring, or steady
- Sunlight, through windows, from high overhead, at dusk or dawn, through cracks in the walls, filtered by a forest canopy
- Moonlight, full, partial, or blocked by clouds
- Starlight, no moon
- Flashlights, white or colored.
- Strobes
- Spotlights

Background noise is a good place to show detail. Running water, the break of the surf, the hum of machinery, the lowing of cattle, grass blowing in the wind, a wolf's howl -- each of these elements contributes mood or detail to the main image.

Describing smell can be a useful aid, but it isn't always appropriate. Players can imagine what a stable smells like, for

example. Mention odors when they contrast with the expected -- scented candles or exotic spell components, or wild animal musk.

Hand gestures and other human elements make excellent detail. In television or books, these natural and unimportant actions are called beats. For example:

"If he saw us, we have to do something about it," she said. As she listened to a comment from a figure offstage, she unfolded a newspaper and held it in front of her.
"Well, I'm not going to just sit around and wait." More talking from offstage.
"Forget it. You're an idiot." She flung the newspaper aside. "I'll be back in an hour."

The unidentified woman's newspaper handling was not important to the scene or the story. She wasn't loading a weapon or burying a body. It indicates the actions of otherwise idle hands during normal dialogue. It also serves to give the dialogue a realistic pace.

Other details include the volume of dialogue or ambient sound, the tone of voice a character uses, the speed of the image (a drowning victim in slow motion, for example), and even the level of detail. Using less detail, sparse sound, and muted colors can convey the impression of events that happened in the very distance past.

Many gaming products include short sections of flavor text to establish mood or setting. Using this flavor text as a model can inspire you in the right direction. If you're running an iconic game that allows you to use the text in its entirety, you might even be able to simply read the text to your players.

You can otherwise use a dramatic scene from your favorite novel, changing elements to fit your need. Note what the author describes and follow suit in your own version.

In the *Lord of the Flies,* by William Golding, the scene in which Simon first starts talking to the Lord of the Flies has a distinct surreal quality, as if Simon has just failed a SAN check. You could create the same effect by creating a similar scene in which you take a character out of his element, stress him with danger or violence, and then give a chance to relax in three previous vignettes, then describe this scene, replacing the Lord of the Flies with whatever ancient divine artifact or Thing Man Was Not Meant to Have Conversations With causes his transition into not-normalness.

Picture or Story

Short images or sequences of images work best for foreshadowing, while scenes work best for showing past events. Either a static image or a short scene can work for current actions taking place elsewhere. Picture the cinematics from the computer game *Diablo II* that depict the progress of Diablo across the fictional world through the eyes of the companion who travels with him. In the *Lord of the Rings* trilogy of movies, director Peter Jackson used images of the tower of Barad-Dur and various camera movements to remind viewers of the Sauron's constant menace, bringing a distant threat to the front for effect.

Vignettes as Handouts

Many players love handouts. A short vignette on paper allows them to read it at their own pace while one guy is still up getting snacks, one player is updating his character sheet for gaining a level last week, and one guy is dividing up the group's loot from the previous adventure. Handing out a vignette in the informal moments before you're ready to begin is one way to let players review it and digest it.

And then when you begin play, they forget about it.

Which is exactly the reaction you want.

You want them to take a few moments to consider the meaning and importance of what you're handing them and then give something else priority. They forget about the vignette until it becomes important again. It becomes important when you hand out a second vignette or when they recognize the element from the first vignette.

Spoken Vs. Written

Some people, even among gamers, simply don't like to read. If you have even one of these players in your group, you might wish to read or speak your vignette aloud instead of handing it out in written form. The oral vignette is a little different from the written version.

The oral vignette should be shorter than its written counterpart. Even the average reader reads far more quickly than most spoken English. To keep the imagery you're creating brief -- and therefore dramatic -- shorten the description.

The advantage of reading the vignette aloud is that you control the pace and the tone as well as the words. You can use body language. You can use a dramatic pause . . . where it's appropriate. You can. Emphasize. A single word.

Vignettes as Adventure Openers

One level of frequency involves using the vignettes only at the beginning of each gaming session. This use allows for a slow, big-picture pace. You might feature villains or locations that the characters won't encounter for weeks. If you have a layered adventure, in which each successive villain is a pawn for a larger villain, you could show vignettes featuring higher-ranking villains or even the final villain.

Vignettes as Pacing

While most of this discussion concentrates on using vignettes to reveal future information or back story, you can also use vignettes to portray events happening simultaneously. If the PCs are acting in concert with another group, you can show that other group's progress through vignettes. For example, the PCs might be part of an allied attack on an evil temple. While the main force is charging in open battle through the front door, the PCs might be sneaking in through a secret door to cut off retreat. A short vignette showing how the main force is making progress can show them the importance of reaching their destination.

Similarly, if the PCs are racing to beat another group, you can show them the other group's progress to spur them on. If they have to reach the hangar and fire up their spaceship before the evil minions find their dead leader and react, a vignette showing the minions picking up a black flared helmet might make them abandon caution and run like mad.

Vignettes as Dream Sequences

The uses of vignettes described so far have no in-game justification. The players (and, quite possibly, the PCs) suddenly have knowledge that they can't ascribe to any source. If that disturbs the group, you could have the images appear in the form of dreams.

Dreams offer advantages and disadvantages. One advantage is that they don't have to make sense. You can throw in random bits of stuff that don't matter at all, leaving the players to figure out what's important and what isn't.

One disadvantage is that the dreams still have to make some sort of in-game sense. Is the character receiving the dreams some sort of prophet or visionary? Is someone intentionally sending these messages? If so, who? Why?

Another disadvantage is that dream sequences are somewhat cliché. If your players have substantial gaming experience, they might be turned off by the "cheapness." If they haven't been subjected to this technique, you might be able to use it effectively.

Individual Vignettes

In movies and on television, directors use a montage to show the progression of time, usually spent in something boring but important. The archetypal example is sports training. Over the course of approximately one song's length, the hero goes from a barely-competent competitor to a world-class athlete, sparing the viewer the reality of years of dedication.

A vignette can similarly advance time. Think of it as your "fast forward" button for describing travel, a large battle, or a long period of waiting for something to happen. Describe a couple of brief scenes that demonstrate the major events and move on to something involving decision-making or interaction from the players.

In this case, the vignette is not part of a sequence designed to show a larger picture. You don't have to plan it out in advance. You probably introduce it verbally mid-game.

Whether you use it for back story, pacing, scene-setting, or all purposes, the under-used vignette can add a new element to your gaming. Use them like any other tool: in the right place, and at the right time. Your players will appreciate it.

Repo Men

for *GURPS*

by Eric Funk

This article describes two young men who work to repossess automotives for the financial institutions that own them; adventure seeds are included with variants to fit the pair into almost any campaign setting. Before getting to their information, however, it's probably informative to know a bit more about what they *do.*

When someone defaults on a car/boat loan, or is otherwise unable to meet the financial responsibility, the holder of the *lien* ("link") may have the legal right to take possession of the property, and sell or auction it to pay the debt. (People who claim to have no money are harder to sue!) Depending on local laws, the *lienholder* may not need to notify the "owner" until after it has been repossessed. If they do notify the client, then it may be a felony to purposefully hide the vehicle! In some localities, an aware client can prevent repossession if they are there to verbally oppose the action, or keep the vehicle in an enclosed private garage. It is thus in the hands of clever individuals to find the vehicles away from such protection or to convince the person (or another denizen of the residence) to grant access to the location. These professionals skirt the edge of the law and sometimes put their lives on the line to recover "stolen" property. The agencies for which such professionals work can track a bounty almost anywhere within the country. They are repo men. Their tools: surveillance gear and a tow truck. A team may have a list of targets to look out for in an area, waiting for the vehicles to become accessible.

All of this descends from land laws, which generally involves more money than a car. During times of hardship, including the Great Depression, people are sometimes able to do without money, bartering for food, fuel, and so on. Thus, banks could repossess vehicles, which still have some value. In the UK, a lienholder may need to obtain a court order if the debt is 1/3 paid off. If the debt is over half paid, the debtor has significant leverage from a legal point of view. In Scotland, a lienholder will need a court order to be allowed to repossess property, in most situations. In Australia, repo men cannot enter private property, and the lienholder will need a court order if the debt is 3/4 paid off. Another place to be careful in is Texas, where it is still legal to shoot trespassers after dark.

A "typical" case goes like this:

1. A request comes in.
2. The dispatch office locates the client. (This may be easy or hard.)
3. A foot team investigates the location (below) to verify the target vehicle is there, and to gauge the accessibility thereof.
4. If it can be easily retrieved, it is collected as soon as is feasible without interruption. If it seems difficult, the vehicle is tracked to a time when it is left on the street or in a public parkade.
5. The car is towed to the repo company's yard and the police are notified about the time it is retrieved.
6. As soon as possible, the vehicle is shipped to a yard for the *lienholder.*

A few items of note a reconnaissance team checks for include: pets, exterior security systems, and verifying the location of the vehicle. All of these might be accomplished by delivering flyers to the block with the target house; a "false" pizza delivery to a neighbor's house or going door-to-door selling cable or satellite TV subscriptions can also allow one access to the area. If the company has a high budget, the recovery firm might own a surveillance van mocked up to look like a Cable TV emissions detection van. Such a civilian vehicle has a good reason to circle a block several times.

Cast

Sam Kirkbridge grew up as a below-average student in a bad part of town. He did adequately in gym and learned

some practical martial arts. Doing well on his driver's test, he eventually apprenticed as a tow truck driver for an auto association. He was a good employee with a broad knowledge of the best ways to jack cars for towing. His worldview changed one night as he returned from his shift. Sam watched as an unmarked tow truck backed up to a neighbor's driveway; men lept out and started jacking the car. As Sam approached and asked what it was about, the men said they were taking it into custody for the "legal" owner. Surprised by their efficiency, he asked how he could find their agency. They replied that the number on the truck is the repossessor's registration number and to give them a call if he could find the business. In the short time it took for that conversation, they were gone with the car in tow!

After high school, Val Schneider drifted from job to job, eventually finding employment at a shifty car garage. Doing fairly well at this, he was surprised to find a tow truck "repossessing" one of the more expensive vehicles on the lot. The tow-truck driver tersely explained that the vehicle was being reclaimed by its real owner. Contacting the police, he found out that it was legitimate, and tracked down the company itself. The people there seemed impressed by his people skills and offered him a job. Val took the offer and tendered his notice of resignation. The car dealership folded three weeks later.

Both men received their certification and on-the-job training at about the same time. Eventually, they were assigned a truck of their own. After a brief conflict of attitudes, they are learning to work as a team.

Adventure Seeds

General Ideas

They need the adventurers to:

- help gain access across obstacles not otherwise interdicted by local law (ravine, river) or to neutralize other defense on private property (without damaging it).
- provide armed escort for repo work in the bad neighborhood.
- create a diversion on the other side of the property (just off it, to be precise) so they can remove the vehicle.
- delay the target vehicle on the spot without damaging it (while Sam and Val are towing other car, for example).
- solve a problem. While scouting a prospect, the repo men encounter Weird Stuff™, and cannot turn to any ordinary source.
- provide urgent repairs. A rare or otherwise valuable vehicle is damaged while towing, so spare parts, garage and mechanic has to be found quickly. Val and Sam may believe their jobs are on the line as repossession companies earn about 2% commission on the vehicle they repossess. If it is damaged, then the company may earn less. (As a variation, perhaps the vehicle is partially dismantled when they scouted it; the pieces need to be collected quietly and quickly.)

Number Six's Prius

Heroes often annoy large conspiracies. It is quite feasible for such a group to plant information at any level indicating that the PCs are derelict in their car payments. It may only slow down the heroes, but when a megacorp is scared, they may stop at nothing. Adventurers often have items in their vehicles that skirt legality, and it might happen that having it confiscated could make them nervous.

The Mighty Have Fallen

The target vehicle is held by someone rich, famous, or well connected. They have the local police in their pocket. These officers are less than cooperative, perhaps even warning the target! Obviously Val and Sam would need all the help they could get . . .

Witnesses

The heroes are too late for an event, but see a tow truck speeding away from the scene, perhaps with one of the villain's cars in tow. What did they see, and what tales will the car in storage tell? How will the adventurers get access to it?

Other Hooks

The adventurers could be (or work with) the actual Tracers who *locate* the vehicle, and see it recovered. This could even be a driving force in a campaign, with the more interesting adventures happening while the characters pursue these people. There are shows where hunters are seeking a person (or their property) through the entire series! Alternately, the heroes could be friendly (or not so friendly) rivals of this pair, hired to follow the same list of targets, looking for those legal to repossess. Rivalry could be in timing, value of vehicles, or in sheer numbers of recalls.

Sam and Val in *GURPS*

Both men have average appearances and have forgotten most of their high school classes. Recommended additions to both, depending on the campaign: Legal Enforcement Powers (Automotive Retrieval only -80%) [1]; Reputation (Police, Always) [+1 point per level]; Serendipity [15]; Special Rapport [5]; Weirdness Magnet [-15].

Cliffhangers/Over-the-Top

Val becomes a Gadgeteer or Smooth Operator, and Sal gets Drive! (see p. 232).

Cyberpunk

Repo works in the cyberpunk world shouldn't be limited to vehicles -- Sam and Val might be sent after any property that have been given in credit. This is especially true if the competition is very aggressive. As presented, the two may be successful against solo targets. Val could distract him with Fast-Talk, and Sam could ambush the target from behind with an electrolaser, tangler or chem attack. Against targets that are part of a gang, they need 50-100cp more, or help (such as the adventurers'). Instead of large tools, they might even be repossessing *cyberware* or *biomods*. This might require the skills Surgery (with the optional specialization "Removal"), and Electronics (Cybernetics). See also the "Organlegger" template from ***Biotech.*** If they are callous enough, they might even repossess vital components such as augmented hearts, kidneys, and so on . . .

Fantasy

Give Val Magery 2 or 3, and add spells such as Drain Mana and Stop Power. Sam could then benefit from Magic Resistance +25 or so (or an equal amount of cp). They might repossess magical items, which can easily range from $33,000 to $100,000. This includes golems, spirits, charmed monsters, undead servants, and -- with the Move Terrain spell -- castles. Unusually dangerous cursed items may require hazard pay!

Historical or Western

Anachronistic heroes that repossess horses, wagons, and cattle could make for a light (or oddly dark) setting for an adventure, or even a campaign. "Hello, Robin Hood Repossessing Service, LLC. 'We Take From The Poor and Give To The Rich.' how may I help you?"

Silly

Val and Sam have not settled their differences. This distracts them to no end, sometimes missing the opportunity to collect cars, and sometimes collecting the wrong one (such as the heroes')!

Space

Add more security related skills, as well as Computer Hacking. Once they are inside an airlock, they can secure it for the true "owner," and declare the other occupants "trespassers." See also *Traveller: Heroes 1: Bounty Hunters* "Repo Men," page 4.

Supers/Steampunk

Val and Sam might specialize in recovery of vehicles built with stolen funding. Another alternative is to specialize in the recovery of battlesuits and walkers. In either case, they could be armed with an item that replicates the Stop Power spell (page 179 of *Magic*).

Transhuman Space

Investigators that recover stolen cyber and bio shells will likely be armed with electrolaser rifles and tangler grenades. Agents will have to be careful to avoid Mugshot databases and Reputation networks, perhaps by wearing LCD suits with full helmets. Another option is a Vacuum Cleaner campaign, where the trick is getting close to a vessel. Somewhere between Silly, Ultratech, Transhuman Space, and Horror one finds the Repo Men facing off against Herbie the Love Bug or KITT from Knight Rider, or even the car from Steven King's *Christine* (see "The Car as the Star"). Technobabble Phrase Simulator

by Eric B. Smith

One of the fun things about sci-fi is the way the characters bandy about interesting sounding technobabble -- phrases with lots of scientific sounding words which often make no sense when closely examined. It can be fun to throw these phrases into a game, but tough to come up with an interesting sounding phrase. By rolling 1d100 in each of the columns of the following table you can generate a plausible-sounding technobabble phrase.

Bonus Website Exclusive!

A Walk In The Alternate Woods

"The Orcs were piled in great heaps, away from the mounds of Men, not far from the eaves of the forest. And the people were troubled in their minds; for the heaps of carrion were too great for burial or for burning. They had little wood for firing, and none would have dared to take an axe to the strange trees . . ."
-- J.R.R. Tolkein, *The Two Towers*

Ever since I read this brilliant [Omniscient Eye article,](#) I've been thinking about putting trees into games. I'm not sure I'm done yet, but I figured I'd toss four general types of leafy campaign goodness and see if we get anything like a gaming salad out of it. Each setting takes a different spin on sentient or supernatural Trees, and their relationships with humans (who, sessile campaigns being as limited as they are, are probably still going to be the PCs). Differentiating the Trees from the humans, while making sure that the campaign is all about the Forest, is the key here. It helps, in the first two settings especially, to remember that trees will have lifespans more suited for supernatural beings than human ones -- an old hickory is 300 years old, oaks live up to 600 years, hemlocks up to 800, cypresses can live for 1,800 years, and cedars over 2,500! These beings will seem more like dragons or vampires -- or elves -- than they will "people" in that sense, helping keep the alien-ness of the fantasy foregrounded. So with that . . . into the woods.

"[I]t was peculiarly appropriate that the head of the victor should be graced by a crown of oak leaves, for . . . the Capitoline temple of the god was said to have been built by Romulus beside a sacred oak, venerated by shepherds, to which the king attached the spoils won by him from the enemy's general in battle. . . . A chaplet of oak leaves would thus seem to have been part of the insignia of the old kings of Alba Longa as of their successors the kings of Rome; in both cases it marked the monarch as the human representative of the oak-god."
-- Sir James George Frazer, *The Golden Bough,* 13.2

The First Oak Emperor was, at the time, merely a sapling of the leading Oak King in central Italy. His human servants pollinated from Alba Longa to a new city called Rome, planting him atop the Capitoline Hill. He grew for 250 years, until he overshadowed his father and became Oak King himself; his acorns became the Second Oak Emperor and spread further out across Italy, defeating other Oaks and forcing them to bow their branches to him. In the 400-year reign of the Second Oak Emperor, the Pomegranate of southern Iberia, the Olive of Greece, and the Pine of Sicily all came under his shade. The Third Oak Emperor never knew shade, because his human cultivars raised him to dizzying heights indeed -- the Elm of Gaul, the Chestnut of Britain, even the Cedar of Lebanon and the Willow of the East all accepted Oaks into their groves. Only the Ash of the north resisted, luring the Oak Legions into his own sacred vale at Teutoberg and hacking them to pieces in an orgy of fertilization magic. (The stubborn Jews also resist, cutting down sacred Trees wherever they can.) But surely the Ash will yield in its turn -- the Third Oak Emperor is barely 100 years on the Capitol, and full of the impetuous sap of youth.

In this **GURPS Fantasy** setting, the Great Trees are openly the overlords of men, each grove having its own attendants, and each specific Tree with its own followers. The greatest of the Great Trees rule kingdoms and empires, through their priests and axe-warriors, and attempt to expand their roots into other lands where they can. The GM can follow this chain as far as she cares to; for example, it implies that mixed-growth forests are turbulent border zones driven by competing allegiances. Some Great Trees likely allow "colonies" of outsiders to flourish in their Land -- the Oak Emperor allows the Olive (now, admittedly, a subject stand) to grow throughout his realm. This can be as transparent as any fantasy cosmology, with trees explicitly replacing (becoming) the various gods and kings but with no other result on the rules or metaphysics. Or it can get as specific (and hence as flavorful) as you'd like. Maybe Trees (and their human priests) have powers over things made from their wood -- ships, and arrows, and door frames, say -- and the more general powers over weather, fire, lightning, and growth inherent in being Tree Gods. Blending this setting with the Tree Magic from **GURPS Celtic Myth** will create a whole lot of interesting options. It might even engender a sort of **RuneQuest** feel, as tree-priests (druids, say) must choose dominant Trees from which to derive the majority (or all!) of their powers.

MESS. As I did stand my watch upon the hill,
I look'd towards Birnam, and anon, methought,

The wood began to move.
MACB. Liar and slave!
MESS. Let me endure your wrath if't be not so:
Within this three mile may you see it coming;
I say, a moving grove.
MACB. If thou speak'st false,
Upon the next tree shalt thou hang alive . . .
-- William Shakespeare, *Macbeth,* V:v:40-48

Yes, the Romans had their oak priests, but they arrogantly allowed their cities to grow over-great, and they denuded their hills and vales for charcoal and building-timber. When the cold rains fell over the world, and the cities died back, the partnership between men and trees re-balanced. The greatest of the druids, Myrddin Wyllt, lived among the trees of Caledonia in the late 6th century A.D., and although (because) he was mad, he heard the trees most clearly. His *Prophecies* became the basis for the new order, as Merlinite monasteries spread throughout a dark and fearful Europe. Every manor would have its orchard, and its feudal lords would carefully control the right to clear forest. The trees shared their bounty, and drew up long-dead tree-coal from the deep earth for man to burn instead of them. Ogres howl in the North German Plain, and orcs rampage in the Hungarian grasslands, but the forest men are (mostly) safe from all but the deepest raids. Although the Byzantine (and Christian) South remains able to feed more people on its long-cleared farms, it can make little progress against the Merlinite North that is not hacked out with axes and charred with Greek Fire. Its writ runs no farther than Septimania in southern Gaul. More serious are the Inlet-Men, the *vikings* who take their food from the sea, and from Merlinite monasteries and farms on the coast. They have conquered the fenlands where trees grow ill in Anglia, and raided up to the eaves of the forests. Their god Odin, like that of the Byzantines, hung on the Ash-Tree and conquered its wisdom, and they do not fear the druids.

This setting makes the trees not lords but partners, allies, or even tools for human druids and wizards. It's deliberately historically blurry, an even more "generic medieval fantasy" world choice allowing a patchwork of minor counties throughout the European forest belt. Thematically, it reverses the standard fantasy tropes, however -- the Wood is essentially a good place to be, where your food-and-shelter magic is always strong and fine. Monsters (and adventures) happen in places there aren't trees -- the ocean, the sky, underground, the desert, the high mountains, etc. PCs might take individual trees as Allies, Patrons, etc., and roll activation numbers to get favors from their friends, or every PC might have Magery and one or two "letters" of Tree Magic, again per **GURPS Celtic Myth.** Or the GM might assign each Tree to a College and work things that way, or use Spirit Magic from **GURPS Spirits** and work through dryads -- the point is that the PCs all have access to the benevolent Merlinite tree compact. Unless, of course, you want to reverse things, and have the players be fine upstanding humans like Macbeth or Belisarius or Arpad, trying to cut their fellow men loose from the embrace of the inhuman Wood.

"We pushed them into and through the Wilderness. At night we slept with our guns in our hand where we stopped to lay down to try to sleep and meditate over the transaction of the day. We could not sleep well, the country being so desolate and God forsaken, that we hoped we would not get killed in such God forsaken country, and the Whippoorwills made the woods ring with their song. It seemed so desolate that we wished we could get out of this spot of the country. None of us wished to die here. The thought of dieing stared us in the face as the bullets flew thick around here, but we pushed ahead until we could see something like an open spot ahead of us. We thought we were nearly through the woods . . ."
-- Lorenzo D. Barnhart, Company B, 110th Ohio Volunteer Infantry, *Reminiscences*

The Battle of the Wilderness on May 5-7, 1864, was not the bloodiest of the Civil War, although it killed upwards of 3,700 men in three days. (A few hundred men went missing, and were never found at all.) But it was fought all among the cruel, stunted, impenetrable trees of the Spotsylvania Wilderness, and something in all that blood and all that death sorta woke the trees up. They grew up and choked the life out of Lee and Grant in the woods the next week, when their armies poured another 4,000 lives into the ground, and then trees elsewhere began to twist and whip around and grab what they could. The Pine Barrens of New Jersey, the Great Dismal Swamp in Virginia, and the Everglades all awoke, and the lumberjacks came pouring south out of Maine and Minnesota full of wide-eyed stories of threat and menace.

In this setting, the Trees are a separate evil species, neither lord nor friend. We're back in Grimm's dark woods, in other words. You can use any forest battle as the Awakening, from Teutoberger Wald in 9 B.C. to Huertgen Forest in 1944 to an unknown action in the Congo War in the apocalyptic year 2000. The best time to set the game is during the Awakening and right afterward, as that's when the question is at its most mysterious -- what woke the trees up? What kind of Growths lurk back in the woods? The GM should look for tree-like monsters from the Dark Young of Shub-Niggurath to Wood Dragons on down to Venus Man-Traps and Vampire Vines to infest the arboreal dungeon, and make sure that merely burning the forest doesn't actually work. (Maybe only "heart's fire," or axes made of "cold iron," will cut through the Trees' demon bark.) The other question, of course, is -- what is the other side in the war doing about it? Are they working with the Trees? Did they cause it? When the PCs inevitably meet the other side's teams in the depths of the Forest, will they share their hard-earned knowledge, or squander their ammo killing human beings -- and risk strengthening the Trees with every death?

"I remember this incident well. That had been a hell of a day. We had been working a really nasty part of the U Minh Forest. Just an hour or so earlier, my gunner and I had found a POW camp. It was an eerie place and then kind of sad since we could see the skinny tree trunks being used as bars and I can still see the backs of the prisoner's hands as they held the "bars" from inside. The trees around the camp must have been 100 to 150 feet tall, really up there. At first there didn't appear to be any cadre . . ."
-- Don Callison, D Troop, "Light Horse" 3/5 Cav, "Sunk Loach"

Every minute, they say, 100 acres of rainforest is clear-cut. To the men and women of Strike Force Ukko, that's a good start. They're the ones who know in their bones what we at the Company have known since 1913, when Teddy Roosevelt came out of the Amazon to report what he'd seen to the relevant authorities. (That would be us. Yes, that 1943 story is a cover. We've been around at least since the Airship Incident. Unless that was a cover, too.) The rainforest is like no place on earth, and it's not just a coincidence that it tends to produce cannibals and vampire bats and horrible, grinding endless warfare. (Anthropologists estimate that over half of all deaths in rainforest tribes come from battle. Half. And that doesn't even count the ones killed by the trees.) It's because Something grows in there, Something that was seeded there by Somebody long ago. What's worse (oh yes, there's always something worse) is that it can be trained by people -- or by things that were once people, anyhow -- to, well, grow things. Like drugs that let you rotate your senses -- including touch -- into a different dimensional manifold. Like flowers that will lower your IQ if you look at them in sunlight. Like fruit that will literally condemn you to Hell if you eat it. Like anything awful and fecund you've ever thought of. What's that you ask? *Of course,* our enemies have access to it. Why do you think we have to keep going back into the jungle, into the Philippines, and Nicaragua, and Guadalcanal, and Vietnam, and Haiti, and Colombia? Why do you think you've been assigned to Strike Force Ukko?

This **GURPS Black Ops** campaign frame is essentially one iteration of the "meta-stable" version of the previous setting. In this version, the Trees have gone from being a mystery to be solved to an ongoing background threat, alien tools or perhaps Secret Masters. Since the Trees are alien constructs, it's easier to explain why fire is only sort of helpful, although the Company surely has access to rocket-fuel-throwers and other VIEWs (Very Intensely Exothermic Weapons) in case of need. With a boatload of experimental weaponry and chainsaws, a PC team of elite killers (or even elite elite-killer-killers), and a mysterious blotch on a satellite photograph, your own private apocalypse is available any time you want it. But only if it's now.

Dataists Are Ever Searching for the Absurd

I recently read the novel *Digital Fortress* by Dan Brown, author of the mind-bogglingly successful *The Da Vinci Code*. (I paid a shiny quarter for it at a garage sale, so it wasn't that onerous an investment.)

Let me say that anyone who believes *The Da Vinci Code* contains any scholarly insight about the "truth" behind Jesus' life should be forced to become a computer scientist and read *Digital Fortress*.

I'll probably expand further on this somewhere else (most likely over on my blog), but for the moment I'll mention a couple of the jaw-dropping moments in this novel, which I swear I'll tie into gaming.

First, one plot point revolves around the possible destruction of the databanks belonging to the National Security Agency (NSA). According to one plot point, if power were shut off to the NSA's main computer, they would lose all their data . . . which, being one of the largest data-handling agencies in the United States, is a lot of data. (Why the NSA was keeping their data on something where info would be destroyed if the power were shut off, I'm not sure; perhaps the agency keeps everything on a really big RAM disk. But that's actually ancillary to the main point.) Anyway, they *want* to turn off the power, because it will keep Something Bad -- which I don't want to spoil, let alone try to think about again -- from happening to the main computer. However, the passage restating this conundrum clearly states:

> *"There was no way to stop it -- not without killing power and erasing every last one of the billions of bytes of irretrievable data."*

Hopefully all the techies reading this had the same cringe I did. "Billions of bytes." Or, as I like to think of them (along with the rest of the computer world) as "gigabytes."

Yes, if the NSA computer gets shut down, they'll lose gigabytes of data . . . about the same amount of data that I have on one DVD from my *Quantum Leap Season 1* set.

(Lest anyone think that this is merely a turn of phrase, or that "untold billions of bytes" might somehow encompass the data the NSA deals with, consider how right or wrong the following analogous sentence sounds to your ears: "If all taxes were repealed in the United States, the government would lose untold dozens of dollars.")

Example the second:

The plot of the book revolves around attempting to track down what happened to a mysterious person named Tankado, who has an accomplice that the protagonists are also trying to track down. That revelation led to the following exchange:

> *"A few times, in public, Tankado referred to his partner by name. He called him North Dakota."*
>
> *"North Dakota? Obviously an alias of some sort."*
>
> *"Yes, but as a precaution I ran an Internet inquiry using North Dakota as a search string. I didn't think I'd find anything, but I turned up an E-mail account."*

Yes, he did a search for "North Dakota," not expecting to find anything. I know this was written in 1998 -- and the Internet had been on the public mind for only four years or so -- but *come on* . . . North Dakota is one of the 50 states of the union; surely he'd expect to get a couple of hits.

In case you're curious, a Google search for the phrase "North Dakota" pops up over 58,000,000 pages, and even a one-word "northdakota" pops up 383,000 results. However, that's by today's standards; although I expect the number of hits in 1998 to be significantly less, I don't know *how* much less; as far as I know, that data doesn't exist.

And that's what today's column is about. Here are two (perhaps seemingly paradoxical) facts to consider:

We, in a modern society (and, presumably, those in a post-modern non-apocalyptic world where all information hasn't been destroyed) have access to a near-infinite amount of data.

There exists a near-infinite amount of data to which we do not have access.

The first fact is obvious to anyone who's ever researched minutia about, say, a popular TV show or movie. (An entire wiki-cyclopedia exists devoted to the *Star Wars* universe . . . a fact I stumbled across when I discovered that I had created something that became a part of that database.) If you were able to read every book, article, story, or magazine about The Beatles, it would probably take you longer than the entirety of their just-over-a-decade as a group.

But there are untold swaths of information that we just don't have a clue about. Either the information doesn't exist in an easily searchable format, doesn't exist in an aggregate form (such as a compilation of all birth certificates in a town) or doesn't exist, period. For example, have you heard of Albert Einstein, one of the most famous and influential intellectuals ever? Well, we'll never know what his last words were, because he said them in German and the only other person in the room -- a nurse -- didn't understand that language.

This lack of information in a usable format is why some areas of research are maddeningly challenging to sort out, such as global warming. Sure, the statistics show that the Earth has gotten hot over the past hundred years, but what about before that? (The answer, of course, is that we don't have reliable data available from before the past century or so to a degree of precision that makes any easy conclusions possible.)

And this is why any in-game scenarios that involve any degree of research should (if they strive for realism) take this fuzziness into account. I'm always amused whenever television shows depict information-mining as an exact science:

"We need to find that serial killer; we know that he was driving a dump truck."
""There have been 18,944 dump trucks active in the city in the past 48 hours."
"How many of them were driven by Scorpios?"
"Looks like 1,571."
"Okay; how many of them traveled on 435-West during daylight hours?"
"<typity-typity-type>That narrows it down to 724."
"How many of them stopped at Dazzlin' Donuts within the past 17 hours?"
"<typity-typity-type>241."
"All right; now, how many of them are driven by someone whose mothers have a maiden name that begins with 'R'?"
"<typity-typity-type> That did it! Driver Rex Deathkill, whose mother was Rita Rederring!"

(This is the same type of effect that allows for a 36-pixel-square black-and-white satellite surveillance photo to be digital enhanced to a perfectly recognizable human face, complete with distinctive birthmark.)

Many games feature information checks, where a successful skill check will reveal to the character what he wants to know. This is well and good, but it shouldn't even be necessarily obvious that a piece of information exists . . . especially if the information is being handled in an aggregate or compilation manner.

Also, as an aggregate matter, accumulating data for a specific purpose or conclusion -- such as finding your serial-killer dump-truck driver -- proves progressively harder the more steps you take. After all, one false search or assumption and you may well throw the target onto the "not a match" pile by mistake.

When compiling mysteries, you can tweak the ease (or lack of ease) of arriving at a conclusion with a few steps:

Names can be common, unique, or anything in between . . . even assuming it's a real name. For example, if the serial killer is Snepiron Tharside, then it's going to be a *lot* easier to assume that you found the right Tharside than if the investigatory target is "John Smith." (And is the information under "Jonathan Smith," "Johnny Smith," "Jonny Smith," etc?") Having information that results in too many hits is, in a lot of ways, worse than information that results in no hits; with too many hits, you can waste valuable time sifting through sand looking for the right grain. Trying to

research a common name, target, or idea will make the skill check more difficult and/or increase the time required to research it. Even knowing a trivial fact can be a pain if it's not the *right* trivial fact; knowing that a person is from a city called Oshkosh narrows it down a lot more than knowing he's from Oak Grove (of which there are 181 in the United States).

In general, the older a target is, the less information that has survived; however, any information that has survived is likely to be "better" (more relevant). In other words, there may be fewer facts, but those facts are more likely to be interesting and useful (presuming the information seemed important at the time; see below). This curve extends exponentially; we know much more about Ronald Reagan's life than we do Ben Franklin's, but if Ben Franklin left a treasure map in a French library, it'd probably be easier to track down than a similar document in Reagan's life.

The less important information was at the time, the less likely it was to survive; the greater the gulf between when information was created and when it was discovered to be important, the less likely it survived. Two famous examples of this are William Shakespeare (about whom there is a considerable dearth of information despite being one of the most famous authors in English history) and the list of Catholic popes. The latter is woefully inexact and holey (pun intended) despite being of import to one of the largest and longest-lived bureaucracies in existence.

Vast amounts of trivia exist in all eras; it is from this "dross" that rich gold can be mined. For example, some of the oldest cuneiform tablets that still exist have to do with tax records. (Today, most people shred their tax clay tablets after seven years.) If a large enough body of a hypothetical ancient language's tax records existed, it might provide an outline for some great cataclysm that befell the civilization: "Dr. Jonas, we've discovered that the Incamas paid increasingly more in tax each year until one year, when all records trickle to a fraction of their former glory. Don't you see?! Something big happened that year . . . three millennia ago, this month!"

The fact remains that humanity will always know several orders of magnitude more about the making of the movie *Willow* than it will about Jesus' teen years. But, owing to the vagaries of data, trying to discern what was going on in the Middle East in 10AD-20AD might prove to be as difficult as figuring out what Warwick Davis had for lunch on the third day of shooting. But regardless of what happens, hopefully in another 2,000 years humanity will have no record of *Digital Fortress.*

Mmm . . . Brains!

Published by Twilight Creations, Inc.

Designed by Reiner Knizia

Art by Dave Aikins

Layout, design, & editing by Kerry & Todd A. Breitenstein

Five specialty six-sided dice, 50 plastic brains (25 red & 25 white), five player cards in five colors, rules; full color, boxed; $15

The intentional irony of Twilight Creations' slogan "Where fun comes to life" is getting yet another workout. The company, noted for pastimes that all seem to involve zombies and various undead causing trouble for folks, has employed famed designer Reiner Knizia to create a dice game . . . that involves brains. Tasty brains. The kind of brains that make you say *Mmm . . . Brains!* (Emphasis theirs.)

The object of the game is to be the only corpse left with a supply of brains.

You and four other zombies have hit the mother lode: a pile of brains. Being undead, you have no table manners and fall to fighting over the tasty snacks. First you attempt to grab as many for yourself as possible, and then you try to take them from your graveyard pals. Players take turns rolling the specialty six-sided dice that come in the box as they salivate over the stack of 50 brains in the middle of the table. They (the dice, not the brains) are numbered one to five with each number in a different color -- one die, for example, has a yellow number one, a red number two, the three in green, and so on. On another die, the same colors are assigned to different numbers. Five dice, five numbers, five colors, an even spread, and a picture of a brain replaces the six. These shades correspond to each player (everyone gets a little card showing his color).

You want numbers of a single color when you roll because those are added together -- results of another hue are excluded from the math. The total is multiplied by the number of brains rolled. For example, if you got a red one and a red four, a yellow three, and two brains, the reds would add up to five and be multiplied by two brains for a result of 10 (the yellow die is ignored). You get to roll the dice three times, setting aside as you go any dice that give a result you like. Take that many brains from the supply and add them to your dessert menu. Everyone collects brains like this in turn until the central pile is exhausted -- then they turn on each other. The die-rolling mechanic is the same with one exception: The colors now represent whose brains you're stealing, so by choosing the colored results you like you can target certain players. If, through bad luck, you can't get someone else's colors to show up (or you're rolling a color not in use in a three- or four-player game), you have to give up that many tokens from your own stash. The last person left with any brains is the winner (and yeah, folks get a lot of mileage out of that joke during play).

Twilight Creations once again pulls off a win with their plastic molding -- the tiny little brains you get with the set to use as currency are darling. They come in white and red (to represent one- and five-brain denominations respectively), and are about the size of a pencil eraser. Hopefully this will make up for the thin nature of the player color cards, which fortunately don't have to do anything more strenuous than sit in front of each player.

The dice deserve special mention, and alas, that's because they're one of the game's two biggest problems. All those colors must have set the creators back a pretty penny, but they're almost impossible to read. Even in the best light, the

black and blue numbers are hard to distinguish (it's more of a midnight blue). If the yellow side comes up, you won't confuse it with another color because it's the only shade that's just this side of invisible on the white die. Throwing the dice is fun; reading them is painful.

The other big problem is game play: There isn't much to speak of. Rolling dem bones and selecting the results you want is kind of nice -- isn't it always? -- but really, there's little strategy to it during the brain-collection phase. Come the second phase, there's marginally more decision-making to be done as you target enemies for brain-depletion, but 99 times out of 100 your opponents can tell you what you're going to do. Considering the brain color on a die is the same as the five on that die (if you want to attack green, getting the green brain means that juicy green five isn't available), you could almost argue your dice are making as many decisions as you are. It's just a hair shy of completely random.

Mmm . . . Brains! looks simply adorable and Reiner Knizia's name on a box usually suggests something special, but in this case the best of his smarts are to be found in some other product.

Crisis in Freeport (for the *d20 System*)

Published by [Green Ronin Publishing](#)

Written by Chris Pramas, Robert J. Schwalb, & Rodney Thompson

Cover by Jonathan Kirtz

Illustrated by Toren "Macbin" Atkinson, Kent Burles, Britt Martin, & David Griffith

Cartography by Sean MacDonald

64-page b&w softcover; $16.95

With *Crisis in Freeport,* Green Ronin Publishing brings to a close the line that catapulted them to success with the release of *Dungeons & Dragons Third Edition* back in the year 2000. After just seven scenarios and a handful of other supplements, the *[Freeport: City of Adventure](#)* setting is no more. This is not to say that it is dead, but rather merely resting, for Green Ronin will return to it after moving its timeline on another five years and support it with a series of supplements that will not employ the *d20 System,* but instead be generic enough that they can be used with any system.

In the meantime, *Crisis in Freeport* has a job to do: Wrap up the storyline originally begun in the setting's first scenario, *[Death in Freeport.](#)* Who will be the city's Sea Lord, head of the Captain's Council? The last to hold the position was Milton Drac, but as was told in the original Freeport Trilogy, his rule was brought to an abrupt end by a band of heroic adventurers who foiled his attempt to summon an eldritch and ancient deity known as the Unspeakable One. Unfortunately he was the last of his line, and the city's Law of Succession requires that the Sea Lord possess Drac blood; the question of who would head the city was a thorny issue, and it is this very issue that will be settled in *Crisis in Freeport.*

Designed for a party of four to six characters of 7th to 9th level, *Crisis in Freeport* takes place some months after the events described in the Freeport Trilogy, but before those of either the Origins-Award-winning epic campaign *[Black Sails Over Freeport](#)* or the scenario *Hell in Freeport.* This is not to say that *Crisis in Freeport* cannot be run before either of those, but it needs to be more powerful in order to present a suitable challenge to the party. As is traditional, the scenario includes updated statistics for the same four sample characters that first appeared in *Death in Freeport.*

[SPOILER ALERT!]

Crisis in Freeport begins with a stupendous move upon the part of the Captain's Council; they revoke the Law of Succession that has governed the city for generations. No longer does the Sea Lord need to have Drac blood, and the position can now be filled by a member of the council. The resulting controversy, fanned by the release of a scurrilous newssheet, erupts into riots that sweep the city. Blood is shed as rival gangs take opportunity of the resulting chaos to attack each other and the authorities.

After saving a citizen or two and witnessing an atrocity or two, our heroes are called upon to investigate the kidnapping of Lady Elise Grossette, the Captain's Council member who raised the motion to repeal the Law of

Succession. She is also the leading candidate to be the new Sea Lord, and the party's patron believes that a council rival is behind her disappearance. Before that can be proved, the adventurers must locate and rescue her, the investigation quickly pointing to an Elf corsair with a well-known hatred of Humans. He has already fled the city though, in the direction of a nearby resort island. Hinting at the storm to come if they are unsuccessful, the characters must sail into the wind and rain preceding an oncoming hurricane. On the island they find a maelstrom of black-hearted pirates and in facing down the corsair will learn the identity of his employer.

With this information and the rescued councillor, the adventurers can return to Freeport where they are asked to locate the kidnaper's employer and bring him before his peers on the Captain's Council. This leads to an encounter in a somewhat oddly shaped establishment called the House of Serenity, and information that a continental power has been pulling the strings all along. Bringing him to justice and the election of a new Sea Lord marks the end of the scenario.

[END SPOILER ALERT]

Physically, the book is decently written, and as usual contains some excellent artwork. It is not as tightly edited as other titles from Green Ronin, though. In addition to the adventure, new rules detail the crowd as a monster and add the Corsair character class. Although the scenario makes reference to various books -- in particular, the ***Unholy Warrior's Handbook*** and the ***Advanced Bestiary*** -- none of are absolutely necessary to run ***Crisis in Freeport.***

Crisis in Freeport foregoes the eldritch and ancient horrors of its predecessors for a more action orientated, intrigue led adventure that contains some quite brutal scenes. It is perhaps a little too linear and very much built around an information chain, but the action and its sense of urgency should -- if not counter this -- at least make it less obvious to the players. It being a Freeport-set scenario, there is little in the way of monetary reward. Rather, the rewards come in the form of the standard Experience Points, plus fame and reputation. Yet it will be up to the DM to develop this and certainly the next supplement should address this when it appears. In the meantime, there is plenty of adventure to be had in ***Black Sails Over Freeport*** if this has not yet been played, while ***Crisis in Freeport*** brings this chapter to a quiet close rather than a rousing climax.

Masons

Published by [Rio Grande Games](#)

Designed by Leo Colovini

Art by Franz Vohwinkel

Game board, 33 walls, 30 towers, 60 houses, 15 palaces, four scoring markers in four colors, 60 guild cards, three six-sided specialty dice, & rules; full color, boxed; $39.95

Sadly, the name *Masons* only refers to the plain-vanilla builders of old, working to construct cities. Maybe there's another, secret game to be played, and when you reach the next circle of enlightenment Rio Grande Games sends you the *real* rule sheet. But don't worry; until then, the "mundane" version of this game does quite well, thank you very much.

The object of the game is to have the most points when the last stone is laid.

Players receive a small hand of cards and take turns putting up walls. (If you roll the dice before you put down your section of wall, you lose a point; do not deny your destiny as a mason.) The board shows a long stretch of land divided into triangles -- imagine a series of hexes with a point in the middle of each, and the hex is sliced like a pizza from the center to each corner. Every intersection has a circle. Walls must be placed along the lines, and towers on the points at either end. A die roll dictates the first tower's color, but the player gets to choose the tower for the other end.

The other two dice show what color houses will be placed in the triangular wedges on either side of your wall. If you only have one section (maybe you built along the coastline), you choose which of the colors shown you'll place. If two houses of the same color find themselves together inside the walls, they combine into a larger piece called a palace. The board fills with towers, walls, houses, and palaces until someone completes a city. If you encircle an area with an unbroken line of walls (it can be any number of triangular segments), it's called a city and a scoring round begins.

The guild cards you play determine what scores for you this time, and most of them focus on the just-completed city. No one actually "owns" the cities the players have built (most are the work of different players over several turns). There's a wide variety of items and situations that pull down points for you. You could choose to play a card that pays off for all the black tower pieces not in a completed city, for example, or all such along the coast, or all towers. You might go for a different color tower, or towers that are part of the finished city. Then again, you might score buildings of a certain size or color, or just get points for the walls themselves. You may only play a limited number of cards per completed city, so you have to decide what works now and what resource has yet to bloom.

Eventually the participants run out of pieces. When you exhaust the supply of any one thing -- houses, palaces, walls, or towers -- the game goes to one more card-playing round wherein everyone gets to choose whatever provides them with the best scoring opportunity. Whoever has overseen the most successful construction wins.

The components are nice, but it would be hard to make them "not nice" since all the playing pieces are made of wood. Well, not the cards or the board, but they're well-done too. The illustrations on the cards could stand some improvement (it's hard to distinguish between the white tower and the "not colored, because you can score for any tower" illustrations), but they aren't weak scraps of paper passing for cardstock like too many recent releases seem to favor. The board gets a little harder to read as the game progresses -- highlighted lines defining the borders of each fiefdom get built over -- but it only hampers you briefly as you score a couple of cards. Finally, it can be hard to get

hold of some pieces, not because they're too small but the playing surface just gets busy.

What looks like a bewildering resource management game turns out to be an incredibly simple set of rules. It all builds up quickly, true, and there are several ways to score, but that just keeps things interesting. Some players falling behind early in the game find catching up is an almost magical process even as the game enters its last turn or two. It doesn't hurt that laggers have the option of switching out some of their cards, but by skipping a scoring round anyone can manipulate their hand. Scoring ends close, play is fast, and the chance to play multiple games in one sitting is the norm. The action doesn't get old any time soon as there's always a new way to balance your card sets with your placement strategy.

Until the darker secrets of the society are unveiled to you, **Masons** is your gateway into the lives of those who toiled to create new cities. Hard work will win their favor. Or maybe that's just what they *want* you to believe.

Naval Warriors: The Officers And Men Who Fought The Great Square-Riggers

Part III: The Commissioned Officers

by Nicholas Lovell

"Mr. Barker! Pass the word for Mr. Barker!"

The young midshipman tore himself away from his position on larboard chains. Two cables to leeward, the schooner had hauled its colors and come up before the wind. It sat heavily in the water and wallowed in the Atlantic swell

"Mr. Barker!" snapped Captain Smallwood.

"Yes sir."

"Mr. Barker, you will take a prize crew of eight men and make for the nearest English port. Plymouth, I suggest. The master will give you our latest position. You have three minutes to gather your kit bag while we launch the blue cutter. Then you must be away."

"Aye, aye sir!" Barker saluted and ran, a skip in his step, He was 16 years old, and this was his first independent command. Plymouth was over 1,000 miles away, six or seven days with a fair wind.

He vaulted down the stairs and gathered his few belongings. For a week, the schooner would be his own ship.

This could be fun.

* * *

A ship-of-the-line with 74 guns might have as many as 600 crew. The commissioned officers -- the Captain, Lieutenants and Midshipman -- were the leaders and the authority for the men. They were crucial to the success of their ship.

The commissioned officers were identified as officer material at a very young age. They typically hailed from the upper and middle classes of society. It was unusual, although not unheard of, for an officer to emerge from the ranks of the ordinary seaman. It was a requirement, however, that not only were they literate, but also skilled with mathematics, as navigation in the 18th and 19th centuries required a understanding of the practical applications of spherical trigonometry.

The youngest officers were midshipmen and they were often terrifyingly young to modern eyes. It was not unusual for boys of 13 or 14 to have responsibility for ten or more experienced sailors. The midshipmen ran messages throughout the ship, commanded a gun section in battle, and might be required to take charge of one of the ship's boats (usually under the watchful eye of an experienced seaman as coxswain). Much of their spare time was taken up with lessons, both practical and theoretical. On board they would study navigation, seamanship, and -- possibly, depending on the captain's views -- classics and languages.

A midshipman aimed to become a lieutenant by the time he was 20. Older midshipmen, who failed the lieutenant's examination either through lack of sailing skills or because they did not pass as "gentleman," remained in the midshipmen's berth as Master's Mates.

The Lieutenants were responsible for carrying out the Captain's orders. They were watch-keeping officers, meaning

that they were in charge of the day-to-day running of the ship for the duration of one or more of the four-hour watches each day. On a large ship with a full crew, they might only take one watch a day, whereas on a smaller schooner or sloop, warrant officers might also have to take the duty. The senior lieutenant, based strictly on length of service, was called First Lieutenant and had the responsibility of ensuring that the ship ran efficiently on behalf of the captain. The more junior lieutenants were named by seniority (Second Lieutenant, Third Lieutenant etc), and a 104-gun ship-of-the-line such as *HMS Victory* could have a complement of as many as eight lieutenants.

Ultimate authority on board the ship belonged to the captain. He was responsible for both the success and failure of his crew. Most captains had been at sea for all their adult lives, starting out as lowly midshipmen. The captain was given his orders by the Admiralty and failure to carry out their orders, the loss of his ship, or accusations of cowardice could lead to court-martial and even death. In 1757, Admiral John Byng was court-martialled for failing "to do his utmost" to engage the enemy at the Battle of Minorca, and was ultimately convicted and executed by firing squad. Voltaire commented in *Candide* that in England, they found it wise to execute an admiral from time to time *"pour encourager les autres."*

The captain had absolute power on board his own ship, and was able to order floggings and many lesser punishments to those who challenged this authority. While many officers were respected -- and indeed loved -- by their crews, this unlimited authority could easily be abused, and there were many thoroughly unpopular captains.

The captain had no specific watch-keeping or other duties. He would usually take the con during battle, during storms, and potentially during complex or intricate maneuvers or in difficult waters. For most of the time he left the conning of the ship to his lieutenants and the master.

The Captain also benefited from the greatest luxury on board a warship: privacy. He had a cabin and a separate stateroom. Many captains were personally rich, and would lay in a wide range of cabin stores. This enabled them to invite members of the wardroom (the commissioned and non-commissioned officers) and the gunroom (the midshipmen and master's mates) for meals. For many of these men, particularly the gunroom, dining with the captain was not only a great honor, it was a rare opportunity to break from the monotony of shipboard diet.

The Captain was also the biggest beneficiary of the system of prize money. When an enemy warship or merchantman was captured, it would be sold. The prize money was distributed by eighths: two-eighths went to the captain, one to the admiral, one was divided between the wardroom officers (lieutenants, master, surgeon and marine captain), another between the principal warrant officers, lieutenant of marines and chaplain, another between the junior petty officers, sergeants of marines and midshipmen. The final two-eighths were divided between the remaining crew, with able seaman receiving a larger share than ordinary seamen, landsmen and boys. The system, much despised by the army, made many sailors, and particularly admirals and captains, extremely wealthy.

In the Royal Navy, once an officer reached the rank of Post Captain (which was based on a combination of merit and patronage), he would then be promoted strictly in order of seniority. Provided a Post Captain stayed alive, it was inevitable that he would become an Admiral. Becoming "made Post" was the ultimate ambition of nearly every British naval officer.

Commissioned Officers

Midshipman   *110 points*

You are a junior officer who has recently joined the finest navy in the world (whichever that is!).

Attributes: ST 11 [10]; DX 11 [20]; IQ 13 [60]; HT 12 [20].

Secondary characteristics: Dmg 1d-1/1d+1; BL 24 lbs.; HP 11 [0]; Will 13 [0]; Per 13 [0]; FP 12 [0]; Basic speed 5.75 [0]; Basic Move 5 [0]

Advantages: Patron 5 (major nation, 9 or less) [30]; Rank (Naval) 3 [15]; Status 1 [0].

Disadvantages: Code of Honour (Gentleman's) [-10]; Duty (extremely hazardous, 12 or less) [-15]; Enemy (utterly formidable group, 9 or less) [-40]

Choose 25 points of advantages and skills and -25 points of disadvantages from the midshipman list.

Captain   *150 points*

You are a master and commander with absolute power of your vessel and crew.

As Midshipman above, but with the following changes:

Advantages: Increase Rank to 6 [30]; Status 2 [0]. When the Captain is assigned to a ship with a full complement of crew, he gains an Ally Group (201-500, 12 or less, 75% of points) and his point total is increased by 96 to 246.

Disadvantages: Add Sense of Duty (Crew) [-5]

Skills: Replace skills with Administration IQ-1 [1]-12; Area Knowledge (home port) IQ+0 [1]-13; Area Knowledge (territorial waters) IQ+0 [1]-13; Area Knowledge (enemy's territorial waters) IQ+0 [1]-13; Astronomy IQ+0 [4]-13; Boating (Unpowered) DX-1 [1]-10; Broadsword DX+1 [4]-12; Cartography IQ+0 [2]-13; Gunner (Cannon) DX+1 [2]-12; Guns (Pistol) DX+1 [2]-12; Knot-tying DX+0 [1]-11; Leadership IQ+1 [4]-14; Mathematics (Applied) IQ-2 [1]-11; Meteorology IQ+0 [2]-13; Navigation (sea) IQ+1 [4]-14; Savoir Faire (High Society) IQ+0 [1]-13; Savoir Faire (Military) IQ+0 [1]-13; Seamanship IQ+2 [4]-15; Shiphandling IQ+1 [8]-14; Strategy (Naval) IQ+0 [4]-13; Swimming HT+0 [1]-12.

Optional Advantages, Skills, And Disadvantages

Choose 30 points of advantages and skills and -30 points of disadvantages from the midshipman list.

Sample Character: Charles Barker

Charles Barker was an effective corn merchant in Bristol most of the time, but he had a gambling streak which jeopardised his business. When a storm tore off the roof of his warehouse, destroying his inventory, it coincided with a long run of losses at cards. No longer able to fund the education of his second son, Thomas, Barker called in an old favour and packed him off to sea.

Thomas resisted the idea at first, and hated the first few weeks on board *HMS Pegasus.* However, before long, his natural cheerfulness reasserted itself, and he quickly settled in.

Mr Midshipman Barker is a popular member of the crew. When not on duty, he is often skylarking in the rigging, or, more discreetly, playing cards or dice with the men below. His great ambition is to attain independent command, earn lots of prize money, and return to Bristol to show his father how well he has done at sea.

Midshipman Thomas Barker   *110 points*

5'9", 110 lbs., a gangly youth with an infectious grin and an unruly mop of dark hair.

Attributes: ST 11 [10]; DX 11 [20]; IQ 13 [60]; HT 12 [20].

Secondary characteristics: Dmg 1d-1/1d+1; BL 24 lbs.; HP 11 [0]; Will 13 [0]; Per 13 [0]; FP 12 [0]; Basic speed 5.75 [0]; Basic Move 5 [0]

Advantages: Charisma [5]; Fit [5]; Less Sleep 2 [4]; Patron 5 (major nation, 9 or less) [30]; Rank (Naval) 3 [15]; Status 1 [0].

Disadvantages: Code of Honour (Gentleman's) [-10]; Duty (extremely hazardous, 12 or less) [-15]; Enemy (utterly formidable group, 9 or less) [-40], Impulsiveness [-10]; Wealth -- Struggling [-10]

Skills: Area Knowledge (home port)-13; Astronomy-11; Boating (Unpowered)-10; Broadsword-11; Cartography-12; Climbing-11; Gambling-13; Gunner (Cannon)-12; Guns (Pistol)-12; Knot-tying-11; Leadership-13 (includes +1 from Charisma); Mathematics (Applied)-11; Meteorology-12; Navigation (sea)-12; Savoir Faire (Military)-13; Seamanship-14; Shiphandling-11; Swimming-12.

by Paul Drye

Brasilia-1 is one of White Star Trading's most lucrative timelines. A snap to reach on Quantum-5, it's doubly interesting for being slightly ahead of Homeline in several fields of endeavor. The patents and techniques Brasilians use are easily understandable, and can be licensed cheaply when they're not stolen outright. Outtime investment runs into the hundreds of millions of dollars a year, and any number of fortunes are based on Brasilian businesses that are shells diverting items to Homeline.

Unfortunately for outtimers, the timeline is under a growing threat coming from the Amazon jungle. As Brazil is the industrial superpower here, the river of cash flowing between the two worlds may be cut off.

History

This world's history is the same as Homeline's until the 1600s, when the French Wars of Religion were settled by encouraging dissidents to move to the French colony in New France and, later, Louisiana. From there events gradually diverged. The British failed to break the French grip on the interior of North America and their own holdings broke into two pieces, one north of a successful Dutch colony and the other to the south. All European colonies were then lost to their overlords in the aftermath of the Russian Coalition War. In the modern-day, 1987, North America is subdivided much like Homeline's Central and South America.

Brazil (or, to use this timeline's spelling, Brasil) became the destination of choice for many European emigrants. Its frontier opportunities were available longer than any other's and its cities grew large to support the vast hinterland. While the greater distance from Europe slowed things down as compared to the Homeline USA, Brasil has just exceeded a population of 160 million, and is the most populous and advanced developed nation in this timeline.

Apart from the political differences, the most important change to history is technological. Brasilia-1 is a solid TL9 in biotechnology and medical science. Having the Amazon Jungle to the north of the world's most advanced nation for centuries has sparked all the timeline's biology-related techniques. Most other sciences and technology are roughly comparable to Homeline's; the exceptions are "big iron" nuclear and space science. For example, the first nuclear weapons on Brasilia-1 weren't set off until 1961.

The Trouble

It's been two years since the first reports of odd animal behavior came out of the western Amazon jungle. Individual animals would engage in an orgy of pointless violence against others, and would attack people if given the opportunity. The problem spread very quickly, both geographically and in the numbers of animals involved. In the last

few months the entire western half of the jungle, up to the site of Homeline Manaus, has seen constant ecological bloodshed, culminating in "frenzies" (to use the local parlance) over areas of several square miles. In them, every vertebrate animal attacks every other until nothing of them is left. Left behind are comparative deserts of only plants and insects, and a collapsing ecology in the sudden absence of many species. Outside the main area of trouble, sporadic outbursts have been seen as far downstream as the Atlantic coast.

The one exception to the phenomenon is humans, which have been unaffected directly even if no-one knows why. Unfortunately, they're certainly targets of opportunity for the suddenly voracious jungle and over a million refugees have flocked to the large cities in the affected zone, or to points east. Millions of other people are at risk. The resulting humanitarian crisis and economic disruptions have been immense. The latter of these consequences has particularly affected Homeline and drawn Infinity's notice.

Meanwhile, the Brasilians have been forced to mobilize their army for peace-keeping, and their entire medical and wildlife management communities have turned their attention to the issue. The events seem to be related to some infectious agent, probably carried by an insect vector -- maps of the outbreaks certainly suggest it -- but there's been no success in figuring out what that agent is. Part of the trouble is that it's not like any disease anyone's heard of before: broadly affecting so many species and having such an unusual effect on their behavior. One of the strongest rumors is that it's a biological attack, and some worry that the country may panic itself into war.

White Star Trading in Brasilia-1

Homeline has tens of thousands of outtime traders, and it still isn't enough to cover all the known potentially profitable timelines. White Star itself is already too large and too dispersed for much control, and under those circumstances keeping employees from pursuing far more lucrative goals than mere salaries is difficult. One strategy they use is to give outtime agents the latitude to invest and trade on their own behalf as well as for White Star, which at least has the advantage of keeping conflicts of interest out in the open where they can be regulated. Brasilia-1 is one of the timelines where White Star has adopted this tack; as a politically stable, moderately advanced world, it's safe to leave the traders here to their own devices and concentrate scarce human resources on more problematic situations.

This has had two unfortunate effects, one general to any place where this strategy is used and one specific to the new situation on Brasilia-1. First, the assignment to some timelines is so lucrative that there's a great deal of politicking to get them. In many cases, White Star ends up with people who are brilliant at infighting and less-than-ideal otherwise, particularly since an annoyingly large percentage of them have borderline sociopathic personalities.

The specific problem is that the tactic depends on the timeline being stable. If the situation goes pear-shaped, the agents certainly have the autonomy to react, but they usually don't have the resources to do it well. Since Brasilia-1's situation started deteriorating, Infinity's interaction with White Star's Brasilian operations has oscillated uncomfortably between the civilians screaming for help, then screaming again when Infinity upsets some of their apple carts in the course of trying to fix the problem. As White Star's people on the timeline are often rich and are invariably politically connected back home, it makes interventions simultaneously impossible to avoid and difficult to pull off cleanly.

In total, there are only a few dozen of White Star's people in Brasil (and more elsewhere on Brasilia-1). Despite their low numbers, they are in charge of running several small or medium-sized concerns that are integrated into the Brasilian economy, producing about 90% of their output as sales to the locals as a cover for the 10% they ship back to Homeline. All appear middlingly well-off, but possess considerable hidden wealth. They are interested in getting a solution to their new problems, and specifically not interested in losing their usual leeway -- it's the foundation of their current and future wealth. Several are profoundly interested in avoiding too much attention from White Star back home too, because their criminal sidelines will be revealed by on-the-spot scrutiny.

The Base of Operations

Most of White Star's infrastructure in Brasil is to the south and east in the large cities of the coast, particularly the capital of São Paulo, which is to Brasilia-1 what New York City is to Homeline. Since Infinity piggybacks on their

work, this has made it hard to get to the heart of the trouble.

In Amazonia, about all they've got is a few regional offices and small factories in Alto Solimões, the Brasilian town where Homeline has Manaus; these are entirely run and managed by locals who have no idea that they're working for anything other than a normal business. The last few months has seen a flurry of activity as White Star and Infinity have tried to put more Homeliners into the trouble areas.

Like its Homeline doppelgänger, Alto Solimões was built on the rubber trade during the late 19th century, but unlike Manaus it managed to dodge the following bust. It diversified into the chemical trade based on oil sands shipped down the Rio Negro, and has gradually become a high-tech industrial city that's a marked contrast to the jungle around it. Anyone familiar with Homeline Houston, Dubai, or Edmonton will find much familiar.

The Boto River Scouts

One tool the Brasilians have at their disposal is a group of genetically engineered Boto, otherwise known as Amazon River Dolphins. A freshwater species, they've been used for years in Brasil, and in recent times have been made more intelligent and better at communicating with humans. They're not legally recognized as persons under Brasilian law, which has been a bit of an issue with animal rights groups on Homeline, but so far White Star Trading has managed to fend off even the least bit of oversight in their interaction with them.

The Boto look much like other dolphins, through their skin shows rolls of fat when they bend, and their beaks are considerably longer than those of ocean-bound species. Their most notable characteristic is their color, which is typically gray only when they are young. As they age, a reddish flush spreads from their heads, and eventually turns the animal a remarkable light coral pink. Brasilia-1's animals are also notable for commonly wearing harnesses to carry equipment.

The Brasilian army uses the dolphins to scout the river, drawing attention to anything out of the ordinary that might not be noticed by humans. Similarly, they're used for security purposes, stopping or stalling interlopers and squawking back to base as needed.

The whole Boto project is a bit of a boondoggle. The money poured into it could have been used more effectively on traditional approaches to the problems the dolphins address. Still, they exist, and they've been thrown into the breach (along with every other resource the Brasilians can muster) ever since the frenzies began.

The Source of the Problem

Far up in the Andes, a Peruvian biotech lab molders away, a victim of a civil war almost two decades ago. In the chaos that engulfed its final days, it was abandoned without the usual clean-up. One of its experiments, a study of prion diseases, is ultimately responsible for the changes in the Amazon. A few particles from it were swept by rain into the nearby Marañón River, which winds its way down through the mountains before reaching Amazonia and forming part of the river system there.

After escaping into the wild, the disease infected monkeys in the Peruvian section of the jungle, and was of no consequence until recently. Then one of the various strains of the prion managed to jump to lice on the monkeys and from there into the vast number of insects in the area. The infection causes no symptoms in non-vertebrates, but with a huge reservoir of disease to play with, natural selection has been spitting out further variations that are gradually conquering every other living thing in the jungle.

When infected, any animal with a midbrain (essentially mammals, birds, lizards, amphibians, and fish) has the prion settle in that region and start affecting the animal's response/reward system. Violence becomes enjoyable, as much as eating and reproducing. This is counter to the long-term survival of the animal, but the prion can circumvent Darwin's inevitable displeasure by infecting other animals before its host dies. The result is a cycle of boom-and-bust violence depending on how many animals have massacred themselves in any area.

The Brasilians haven't managed to discover the prion infection because of one safeguard the Peruvian scientists built into their work: the protein that forms its "body" unfolds below 78°F and resumes its identity as a normal chemical in the brain. The warm tropics are ideal for it, and it can exist in colder climates in warm-blooded animals, but if it is in a corpse and brought to an air-conditioned lab it ceases to exist.

One further safeguard makes the prion less dangerous, and explains why humans are never co-opted by the jungle. When it was engineered, the researchers added a sequence to it that prevents human infection while being simultaneously critical to its reproduction. If a strain of infection develops that can enter *H. sapiens,* it will be unable to spread from its host.

Even on the off-chance that the adventurers discover or trigger the discovery of the prion, Brasil's troubles are not over. Their biotech can cure the infection in any individual, but there are roughly a billion animals infected, give or take an order of magnitude. It's a little like the difference between knowing tsunamis are caused by earthquakes and actually being able to do something about it once one is on its way.

Characters

D.F. Ramos: Ramos, as everyone but his mother calls him, is a first-generation immigrant to northern Brasil from Spain. He has lived in the region ever since he was 19, when he came here on a student visa and fell in love with the jungle. After dropping out, he kept a series of odd jobs and used the money he earned to explore up and down the river. Starting about 10 years ago he started becoming more known as an advocate for environmental conservation. He's good at this in a wooly-headed sort of way: his passion for nature outshines his scattershot approach to things.

Now that this crisis has hit, his failure to think through what he wants is coming back to bite him. He thinks the Amazon would be better in many ways if it didn't have any people in it, so in some ways he's happy to see it "fighting back," as he puts it. On the other hand, he's profoundly pained by the suffering of refugees, being a kind soul at heart, and is very distressed that the jungle treats him with as much hate as the worst environmental offender.

Ramos is a latter-day granola type, immersed in the loose, new-age spiritualism of Brasilia-1. He generally acts for the best, and will even display remarkable personal bravery while he does it, though he often gets a wild hair in his head about what is the proper way to move forward with his goals.

He cuts an outlandish figure, in Andean-style ponchos and leggings with a black Elvis pompadour and scraggly moustache. He talks loudly and is intensely friendly with everyone who hasn't offended his sensibilities. For all his cartoony aspects, though, he has very good knowledge of the forest, and good instincts for when things aren't right.

Lúcio Eliseo: He is a *general de brigada* in the Brazilian Army, and the man in charge of relief activities for Alto Solimões. He is also, quite frankly, over his head and is over-compensating for this with aggressiveness. He'll have nothing to do with "science fiction," as he calls it; his tendency is to solve most problems by shooting a few rapid rounds at it. Unfortunately, if Infinity agents try to approach problems on Brasilia-1 through official channels, they'll run into the general's desperate enthusiasm. On the other hand, if they tell him what he wants to hear, he can be very useful.

Lúcio's personality is quite brittle, and he likes to feel in control. If the situation turns sour in Alto Solimões and he faces violence personally, he's likely to crack up completely. Until then, though, he goes out of his way to keep a perfect façade up.

The general is a big, beefy man with watery blue eyes and a thick unibrow.

Morella: One of the Brasilian river dolphins, Morella is notable for her astonishing acquisitiveness. She's got a conservative streak, and resents not being a regular dolphin (and to heck with the mental consequences if she hadn't been engineered). She takes this out by sequestering every interesting object she finds, sticking each in some underwater location where it won't be discovered by land-dwellers.

Her name means, loosely, "Brownie" and comes from her distinguishing feature: a discolored brown spot of skin on the left side of her head. Otherwise she looks much like any other dolphin.

Morella has become one of Infinity's best moles in the Brasilian relief attempts. Her avariciousness makes her a great target for bribery, and she enjoys knowing that she's messing with her supposed employers. She doesn't know what White Star really is, but doesn't care. If it comes down to it, she might even want to come over to Infinity's side as a local agent if the opportunity arises.

Adventures in the Writhing Jungle

A Thousand Furlongs of Sea: A strange series of events on a pre-industrial timeline has uncovered a strange plot to, presumably, destabilize it. The Habsburg emperor's wife was attacked by a lion tamarin she had been given as a pet by a White Star trader. When examined closely, the chain of transactions that got the monkey there leads back to Brasilia-1 -- the attack was not deliberate, but rather a coincidental infection of the animal. However, the creature had been bio-engineered to give off powerful abortifacent drugs in its shed fur and skin, the best guess being that someone was playing a long-term game to prevent an heir to the Habsburg Empire. Investigators need to go to Brasilia-1 and track down what is going on.

NIMBY: Feelings are understandably high in Amazonia, and while hospitality can be obtained, it generally must be arranged in advanced. Most people understand that humans are immune to the jungle's influence, but no-one knows why this is so and everyone worries that it won't last. Surprises are accordingly viewed with suspicion.

In this environment, the adventurers are resting in a small village well into the wilderness when a straggling group of refugees arrives. They're not locals, and appear to be from somewhere rich and developed, probably a science mission of whatnot from the coast. The villagers turn against them and are about to drive them out when it becomes apparent to the adventurers that these are White Star's people. Apart from the moral obligation to help their compatriots, things might go badly for them at home if word gets back that they didn't help the refugees.

Red Sky In Morning: A socialist revolutionary group has had its back pressed against the wall by the Colombian government they oppose, and chosen the Amazon as apparently the lesser of two evils. While it's likely they won't live long, until they are killed by the wildlife they present an extra threat to workers in the region. After some of Infinity or White Star's people are kidnapped (or killed), enough pressure has been put on the Brasilian government to offer the rebels an amnesty. The carrot is an airlift back to civilization; the stick is the fury of the jungle. White Star has had the PCs assigned to make the offer, and it is hoped the insurgents have been sufficiently disillusioned by their experience in the forest to accept it.

Take Me To The River: White Star has sprung for a clandestine expedition to a frenzy. The group are transported (with associated scientific or military people as needed) on short notice to a site 60 miles west of the town of Tefé; this is deep in the jungle between the Amazon and its tributary, the Juruá. In other words, it's the back of beyond even by Brasilian standards.

It's hairy enough getting there by air and retrieving biological specimens for transport back to civilization. Additional complications come from the Caliph-tech stasis boxes the group has been provided in an attempt to keep the specimens as pristine as possible. As far as the PCs are concerned they're powered by unknowable magic, and are correspondingly balky in primitive, TL8+ hands. Everything starts to go really wrong when, not long after the return journey starts, a huge flock of birds deliberately flies into their transport and they crash land in the middle of the jungle.

Using the Writhing Jungle in Other Settings

Fantasy campaigns often use jungles (and associated quasi-Mesoamerican peoples and pyramids) as adventure settings. This is usually an attempt to mine 19th- and early 20th-century adventure literature for ideas, but what these modern takes often miss is the uneasiness the jungle provoked in the original authors. Western culture has swung back towards

a nature-loving perspective after a long post-Romantic period lull, and modern readers usually fail to understand how much Burroughs, Kipling, Conrad, and others position the jungle as an adversary. Too many Discovery Channel documentaries and modern medicines have softened attitudes.

With that in mind, the malicious Amazon of Brasilia-1 can be used to turn nature into an active enemy to counter that it's no longer perceived as one. This is equally true for pulp campaigns that are more directly based on 1920s and 30s forms. Players are likelier to play threatened pulp characters well if they lose their modern-day complacency about the wilderness.

Sci-fi games can be a bit trickier to integrate with the Writhing Jungle. If one is playing the more-traditional type of science fiction, such as *Traveller* or any of the TV- or movie-license games, the jungle can be dropped onto a planet wholesale. Harder science fiction has more trouble, though. While the basic concept of "the ecology hates you" can be used (and is a fairly common sci-fi trope), the reason the jungle has gone insane will need to be re-examined. As presented here, the technobabble relies on Earth's biology. Using prions and targeting midbrains is problematic when transposed to an alien form of life. If the GM is willing to forgo the nasty surprise that solving the riddle doesn't solve the problem, this is not an issue, but otherwise it will be necessary to come up with an explanation that fits this need.

The Omniscient Eye

How Do I Fund Something Really Flipping Expensive?

The article [How Can I Live on the Moon?](#) begs the question: "How do I get people to give me loads of money for a big project?" (As opposed to happening to save the life of a grateful multi-billionaire who is caught by the villain-of-the-week.)
—Eric Fun

Lots of people -- and a higher proportion of player characters -- come up with ideas for major projects which would save the world or just make them very rich. But they don't have enough money to do it themselves. The Omniscient Eye will explain how you can convince people to give you a billion dollars to build your great idea.

Commercial Investors

If your project will produce huge profits, you can share them with commercial investors in return for their fronting the cash. The hard part is convincing them that the project is more attractive than the other opportunities out there and that your financial projections can be trusted. Investors don't just want a big pile of profit. They want it sooner rather than later and with as little risk as they can get away with.

"Sooner" can be the tough part for many mega-projects. A factory producing billions of dollars in revenue every year can be less profitable than leaving money in the bank if it won't start operating for a decade or two. Investors apply a "discount rate" to future revenues to weight them against near-term ones. So a billion dollars 20 years in the future is equal to 200 to 400 million dollars five years from now ([Net Present Value](#) is the technical term). This makes investors very sensitive to schedule uncertainties; one year's delay can reduce their profits by 5-10%.

Investors vary in the amount of risk they're willing to accept, and the higher the risk the more potential profit they demand. Bankers want almost none. Venture capitalists will accept 90% of their projects failing as long as the tenth makes them a fortune. Inventors worry about whether the technology can work, but investors worry more about whether you can deliver on your promises for schedule and budget, and the bigger picture issues of whether the government will screw things up or customers turn their noses up when actually given the chance to buy one.

Start-ups have resumes scrutinized closely. Established companies are judged by their performance on similar projects. If some specific skills are missing the investors may require hiring someone to cover the gap as part of the deal, or to be the investors' "agent" on the inside. There's also a firm awareness among venture capitalists that the skills for implementing an idea aren't the same ones for coming up with one, so the financing deal may include having someone new put in charge of the project (if your gadgeteer PC has the social skills needed to coordinate over a thousand people he's probably safe from this). You may have to defend the technical viability of the project against conventional-wisdom consultants.

"Political risk" is a catchall for anything the government might do to step on the project. Key facilities could be torn down to make way for a road. Safety regulations can drive up costs or prevent deploying the product. Subsidies can give competitors an advantage. Worst case is the government deciding to do the project itself, eliminating all chance of making a profit and establishing a constituency who don't want the government to stop.

Some companies labor long and hard to produce good which stay on the shelf unsold. That's "market risk," the danger that people or companies won't need the product or a competitor will deliver a better version first. A warning sign of a market risk is an entrepreneur basing sales on 0.5% of the population of China buying the gadget. Something more certain, such as specific companies or a narrow niche such as "left-handed redheads age 23-26" provides confidence that customers will actually hand over cash. Going for corporate customers provides a better defined target but, as in

the case of one of the author's former employers, the customer can go bankrupt before buying. The most common hazard is to guess wrong about what customers want; Betamax had better image quality, but customers preferred the longer recording times of VHS tapes.

Even if your potential profit outweighs the risks you're not guaranteed an investment. You're competing with everyone else who wants to raise money. During the dot-com bubble companies had to promise greater profits to get investors' attention. You're not just being compared to other ventures in your own industry or market but to everything out there. Money moves quickly. Investors can switch from rockets to gravel pits overnight. A world event such as 9/11 can change investors' tolerance of risk and send them scurrying for safer opportunities.

Government Funding

Governments have different incentives for funding projects. What a project must do to earn support is meet the official and unofficial needs of the government. The official needs are the obvious ones: national defense, civil order, public health, transportation infrastructure, and so on. The unofficial ones are the personal desires of the decision-makers. Kings want personal glory and rewards for their supporters. Elected officials want to keep being re-elected, usually by providing voters with jobs. Bureaucrats want job security. To win support a project needs to satisfy both needs for each decision maker . . . and there's going to be a lot more of them than you expect. Even in an absolute monarchy, the king will listen to his tax collectors, generals, priests, and other advisers before making a decision. If they don't have reasons to support your project they'll oppose it to protect their own share of the royal revenues.

Democracies can be even more complicated. Trying to convince the US government to buy a new weapon system requires persuading serving military officers, defense department bureaucrats and political appointees, the White House budget staff, the permanent staff of the appropriate congressional committees, and a majority of the congressmen on those committees (The President? Only useful to help persuade the above. If the lower-level folks want a program badly enough there's no stopping it from the White House, as proved by the V-22). Actually getting the money requires formal reviews and approvals within the executive branch at multiple levels, any one of whom can stop the process dead, then majority votes from four congressional committees (the House and Senate each have separate authorization and appropriations committees; one approves the project and the other approves giving it money). There are some ways to bypass this process by creating budget "earmarks" but that won't get you a billion dollars. Recently jailed Congressman Cunningham only provided contracts in the tens of millions to the people who bribed him.

The Apollo Program had one official goal -- man, moon, decade -- but answered many different needs. Outdoing the Soviet Union had clear national defense benefits. The research involved had many economic benefits. The prestige of a first for the human race added to the historical place for JFK and LBJ. And key congressmen had thousands of well-paying jobs brought to their districts to keep their voters happy. That's the broad level of support you need to get a billion-dollar project funded by the government.

One danger is the temptation to add features to a project to bring in more supporters. Each one increases the complexity of the project exponentially, driving up costs and taking more time. If the budget goes beyond what your supporters have the votes to get you, you'll have to cut out a feature to keep going, and that costs you a supporter. Each time a supporter is lost there's less support to keep the budget funded, and competitors will probably cut it to divert money to their own projects. Soon you get a "death spiral" until the project is cancelled or reinvented in a stripped-down form which still pleases a critical mass of supporters. NASA's space station spiraled down from a research center and exploration base to the minimum needed to maintain employment at the NASA centers in key congressional districts.

Other Options

Multinational corporations can fund billion-dollar projects if they want (Microsoft could do that from its spare cash) but rarely sponsor outsiders. Most companies that large have internal approval processes almost as convoluted as the Federal government's. The more nimble ones will consider your project if it ties in to their core business, but even if they don't reject you they would want to control the project completely. If you're willing to become an employee and see your brainchild run by the sponsoring corporation that can still work.

You might try to fund your project by asking for donations or investments from many people instead of just a couple of big investors. If 10,000,000 each chip in a hundred dollars you'd be set. The problem with that is anybody can describe a neat idea and ask for contributions. It's easier to leave town in the middle of the night than deliver on the idea. Which is why the US Securities and Exchange Commission has strict rules on who can invest in a speculative venture, and other laws constrain what can be described as a charity or nonprofit when asking for contributions. You'd need a nationwide reputation for trustworthiness (and some good lawyers) to raise funds this way. In societies with different laws you'll still need to deal with the problem of con artists piggybacking on your efforts. Established major charities can raise money in the billion-dollar range but convincing them to donate to your project would probably be harder than the commercial or government options given the restrictions they operate under.

If you can't get lots of people to give you money, you may get a whole bunch to give you some labor. The Linux operating system was developed by volunteers, many highly talented professionals working on their own time. But that was in the software world. Developing a complex system requires a cycle of design-build-test, each cycle modifying the design to fix the problems identified by the tests. But in software the "build" step consists of pressing the compile button. In other fields it costs up to millions of dollars to get a prototype which can be tested (an experimental aircraft, scale model of a machine, etc.). So the volunteers can help create designs, but without a cheap build option they can't test them. This eliminates the biggest benefit of "open source" development, many eyes making bugs shallow. Without testing there's no way to tell which design suggestions are worthwhile so choosing among them becomes horribly difficult. Open source isn't a practical option outside the software world.

In the end a friendly billionaire may be your best bet, though they're not too likely to sponsor you with so many other people demanding their attention. The best role model may be Jeff Bezos: Become a billionaire first, then build your rocketship with your own money.

Starting With a Script

A [month or so ago,](#) I began a series about how I ran adventures using pre-generated scripts to begin each adventure. As Something Completely Different, I thought a sample of an actual script might prove useful.

The setup: This was a *Star Trek* mini-series set in the era between the original series and *Star Trek: The Next Generation.* (For the future historians among you, it was set around the same time as the *Enterprise-C,* as seen in the episode "Yesterday's Enterprise.") The premise was that the heroes were testing prototype equipment that would find its way onto the *Enterprise-D* (such as the holodeck) as well as stuff that would be left on the cutting-room floor (such as seat belts on the bridge -- they locked up during one scene, and the heroes were momentarily trapped as they figured out how to escape from the "helpful" devices).

The mini-series was six episodes and featured six PCs, which were split among three players (as outlined in a [classic column](#) from years past). In broad strokes, the characters were:

Player 1

Captain Kaelin: Strong-willed, tough-as-nails female captain of the *Discovery.* (I note this was many years before *Star Trek: Voyager's* Captain Janeway.)

Commander Kasik: A half-human, half-Vulcan second officer, albeit one who (for the most part) parted ways from his Vulcan heritage to devote himself to a world of emotions. (Again, I note this was a year or two before *Star Trek V.*)

Player 2

Councilor Trais: The prototype for the concept of having a shipboard psychological officer. A member of the J'naii race (the androgynous humanoids introduced in the *Star Trek: The Next Generation* episode "The Outcast"), she finds the gender issues that surround many day-to-day human interactions to be very confusing and not really worth it.

Frankie Olanov (Chief of Security): Beautiful but deadly, Frankie (as she likes to be called) is highly skilled yet prefers to try to disarm foes with a smile first. Frankie has Roma blood in her ancestry, of which she is particularly proud.

Player 3

Doctor Kelly: Competent yet fun-loving and casual medical doctor who's usually pretty easy-going unless provoked. Imagine if Scotty had become a doctor instead of an engineer.

Supervisor Gordon: The "by-the-book" bureaucrat who is responsible for making sure equipment is used responsibly and overseeing the *Discovery* project's main mission (prototyping equipment in real-world situations). Considered by most to be a pain in the butt, but that's only because he is.

Important NPC

Engineer Carl Ellis: A barely competent engineer, Ellis was chosen because the folks who came up with the *Discovery* project wanted the equipment pass or fail on its own merit, not because a super-engineer was able to *make* stuff work. (Also, from a metagaming standpoint, the GM didn't want the players turning to the engineer for a technobabble solution whenever the situation got grave.) A laid-back fellow who speaks with a quick Southern drawl, Ellis doesn't realize he was decided upon because of lowest-common-denominator concerns.

Okay; now that we've got the preliminaries out of the way, here's a sample script from that era. Keep in mind that I wrote this over a decade ago, and there are many things I'd no doubt change about it given many years' of writerly growth. (In general, the players read their own parts -- including voice-overs -- while I read any NPCs and stage directions.)

[Scene: Discovery Hallway. A black-helmeted, armor-clad figure runs down the corridor. He is armed with a large energy weapon, and is looking left and right at the juncture. A door on the side of the corridor opens, and Doctor Kelly sees him.]

Kelly: There he is!

[The figure turns left and keeps running. Doctor Kelly goes back to the medical bay and emerges with a Type 2 phaser.]

[From another corridor emerges Frankie Olanov in full Federation garb, armed.]

Frankie: Drop your weapon, now!

[She shoots at the figure, who dodges. The figure rolls to the side and shoots Olanov. She is knocked back against the far wall and slumps to the ground. Dr. Kelly rounds the corner and goes to her; the doctor sees that Olanov is unconscious. He starts shooting at the fleeing figure. The figure continues to run, turning a corner.]

[At the same time, Captain Kaelin is walking in the corridor. The figure turns the corner and sees her. The figure is startled, and raises his weapon and shoots the captain.]

[Nothing happens.]

[Looking down at the weapon in the figure's hand, the Captain pulls back and punches the figure in the head. The figure falls to the ground and Olanov and Kelly catch up to the figure.]

Frankie: Oh, my god!

[Frankie runs over to the figure and pulls off the helmet. It's Kasik!! Frankie helps Kasik to his feet.]

Kaelin: What the hell is going on here?!

Frankie (stammering): Um, er . . . training exercises.

Kaelin: Training exercises?!

Kasik: Well, there wasn't anything else pressing to do . . .

Kelly: And after Gordon imposed even stricter Holodeck rules . . . Well . . .

Frankie: We were bored.

Kaelin: And so . . . what the devil were you doing?

Kelly: Well, we've set up this sensor vest [gestures to Kasik's garb] to register low-level phaser bursts.

Frankie: At its lowest level, the phaser emits more light than anything else. As such,

we've managed to jury rig an impromptu phaser-tag game.

Kaelin: You mean, you're using the most advanced personal armaments the Federation has developed . . . as glorified flashlights? [no response] Whose idea was this?

[All, more or less together]

   Frankie: I think it was Kasik who had the basic idea.

   Kasik: I believe Dr. Kelly thought of it originally.

   Kelly: Frankie told me the idea over a game of chess.

Kaelin: Enough!! Kasik, as First Officer, I expected more from you.

Kasik: Among humans, isn't it customary to expect the unexpected?

Kaelin: Who else did you coax into this buffoonery?

[A figure rounds the corner, dressed in full Federation battle garb, with helmet. He shoots at Kasik, whose vests beeps in response. He flips up the visor and sees the Captain. The figure is Ellis!]

Ellis (stammering): Uh, I think I hear the plasma couplers . . . uncoupling. Bye!

[Ellis flees.]

Frankie: Y'know, Captain, this is what happens when free time and boredom collide.

[In the interim, Gordon has walked around the corner and is standing with the group.]

Gordon [to Kasik]: Is that the prototype sensor vest?

[Scene: Discovery ship shot, flying through space (warp speed)]

Kaelin: Captain's log, stardate 20701.4. We are en route to the Shuttlecraft *Aristarchus,* where we will pick up three Federation archaeologists from a recent excavation on Exxis VII. They say they have discovered some important artifacts, and must be escorted to safe Federation territory. I must say that I am . . . [icily] thrilled to be once again a ferry for galactic travelers.

[Scene Discovery Bridge.]

Frankie: Captain, the *Aristarchus* is within range.

Kaelin: Open a hailing frequency. [The frequency opens] This is Captain Kaelin of the starship *Discovery.*

[The viewscreen shifts; the interior of a shuttlecraft is shown. The (presumed) leader and another officer are onscreen, with a third crewman in the background.]

***Aristarchus* captain:** Captain Kaelin, I am Dr. Periduenne; I must insist that we be taken aboard your ship immediately. The fate of the entire Federation . . . [he looks down to his instrument panels] What the-?!

[Shot: Outside *Discovery.* The shuttlecraft explodes.]

Icosahedron Adventures

Alphabet Enemies
Twenty-Six Nonstandard Nemeses
(Part One: A through H)

by Owen K.C. Stephens

Some campaigns call out for unusual foes. They may be part of a character's background, or ongoing enemies not connected to the overall metaplot of the game. This series of articles presents 26 unusual enemy ideas designed specifically for a *d20 System* game involving magic (though useable in either modern or sword-and-sorcery settings). Each is described in terms of how they relate to their primary foe (listed as "you," on the assumption they are background elements for a PC, though they could as easily be used as foils by GMs). The foes are presented with just a smattering of game rule notes, since they require customization to be appropriate for any game (and can thus be more easily ported to other game systems). Many are specifically designed to be recurring opponents, with built-in reasons for them to survive your efforts to get rid of them, without in turn killing you.

These potentially problematic people are all designed to be "quirky," which can easily slide to "comic relief" if not handled with care. If that's appropriate for your game revel in the oddity. If not, look at these as starting points of ideas to develop more serious supervillains.

Arcanis Vehementer

The *Arcanis Vehementer* is a uncast spell, researched at the dawn of the discovery of magic, but never used by any sorcerer or wizard, ever. So long has the spell sat in the realm of the theoretical, its potential energy growing and evolving, it has become a thinking creature. So much power is stored in the *Arcanis Vehementer* that if it ever is cast, it will happen only once. Unfortunately, no one knows what the spell will do. Not even the *Arcanis Vehementer* knows what will happen when it is cast, but it has no purpose without that act occurring (which will also destroy it). It has become a rogue magic, able to unleash great devastation, or healing, or oddity, but even the most advanced divinations have failed to determine which.

And it's chosen you to cast it, because you are last of the bloodline of the researcher that created it. You may be the last person *able* to cast it.

Whenever you prepare spells or use magic in any form, the *Arcanis Vehementer* can communicate with you. It can do this with anyone, but it has no power to do other than communicating with spellcasters. The spell is determined to force you into a position where you'll have no choice but to use it. To this end, it has begun telling other spellcasters the misleading truth that you have a great, secret spell. Since divination doesn't work on the *Arcanis Vehementer,* they are lead to believe you have some *useful* magic secret. Evil and greedy spellcasters everywhere are now gunning for you, and the rogue spell trusts you'll eventually get into such a deep predicament, you'll cast it in the hopes it will save you. Of course since you may be the last person able to cast it, if you're incapacitated the *Arcanis Vehementer* will do what it can to save you (ensuring you'll have a chance to cast it later, possibly to escape).

B-Team

They don't mean to cause trouble. In fact, they idolize you and all your friends. Maybe you saved their village from orcs, or drove a gang out of their neighborhood. However you did it, you and your comrades became this group's idols. So much so, they decided to take on your careers, appearance, and adventures. In fact, they claim to be you, the ultimate in flattery-imitation.

The problem is, they're not very good at it.

You first hear from an underground newspaper (or bard) how a group very much like you fouled up a rescue mission. Then you discover your funeral was a few days ago. Then you're attacked by spellcasters who blame you for their library accidentally being burned to the ground while you were guarding it. The B-Team never approaches you themselves -- they know they're not worthy. And they do grow in power as they (barely) survive adventures (and replace those of their number who don't). But they always manage to bite off more than they can chew, thus constantly causing problems it takes your group to solve (or be blamed for getting it wrong). You'd love to meet them, if only to wring their necks, but they're always one step ahead of you, making a new mess you need to fix.

Clan Defete

Clan Defete is an ancient fighting family with dozens of lines and hundreds of members. Each takes the clan name as their surname (Mathis Defete, Charles Defete, etc.), and works tirelessly to spread the fame and reputation of the Defete clan. Of course, young Defete members often fall early in their careers, and must be avenged by older, more dangerous kin. To ensure senior members aren't constantly avenging the deaths of junior Defete family (which is a task beneath their considerable talents), each clan member has a specific kinsman, only slightly older, who is assigned to bring down whoever kills them.

And you just killed a junior clan member.

He was a thug, just starting his career and working for bad people you had to stop. But the Defete clan doesn't care why, they just know you took one of their own and now you must be killed. If you kill a 1st level Defete, a 2nd level comes looking for you, And when you kill that one, a 3rd level Defete is "activated." It's nothing personal, but it's going to haunt you until you finally face the 20th level grand master warrior of the Defete clan, whose identity is kept secret to all but the few 19th-level Defete warriors.

Doppelsword

Somewhere along the way, you picked up the curse of the doppelsword. Maybe you cheated a smith when ordering a weapon. Maybe you raided the temple of a god of war. Maybe you picked up a cursed pack of chewing gum. Whatever the cause, now you're cursed. But at first, you're not going to notice.

The doppelsword physically exists, in some museum, tomb or lost battlefield. But it can also be in a second place at once, making another weapon magical. Your curse makes you the target of that second sword. Any time you are attacked by sword-wielding foes, there's a 25% chance one becomes the avatar of the doppelsword. The appearance is always similar -- a bronze blade with black crosspiece and hilt, wreathed in flame, but the style of sword can vary. The doppelsword itself is a near-artifact weapon (+1 flaming burst, ghost touch, keen, wounding weapon of speed), but when its avatar manifests, it has only a +1 bonus for every 2 levels or hit dice of its wielder. Thus it might appear as a +1 flaming weapon in the hands of a 4th level warrior, or a +1 keen weapon of speed when used by a 10 HD giant. Once the sword's wielder is no longer fighting you, its sword returns to whatever it was before the doppelsword manifested.

The curse goes on until you find the doppelsword and destroy it or ask its forgiveness (if you know how the curse befell you). After that the doppelsword disappears to a new locale, and begins haunting a different target.

El Novia

You found her lying in an abandoned temple, dressed for a wedding but bloodied and nearly dead. You nursed her to health, listened to her story of betrayal, and heard her passionate plea for revenge. Maybe you helped her take down those who wronged her. Maybe you just took her to a place she could heal. Either way, you thought your dealings with her were over. She did need help, but her wild-eyed mania suggests she's not the sort of girl you want to get involved

with. Besides, and she's a kobold (or a Capulete, Black Wizard, Jet, werewolf, Scientologist -- whatever makes her socially inappropriate to your circle).

But now that her other business is done, she plans to marry you. Little things like species, religion, and gender don't matter to her. She's going to make you her life-mate, and there's no way of talking her out of it. In her eyes, you are already promised. And until you agree, she's going to make your life miserable. She won't actually harm others that you show kindness to; she's not evil. In fact, she may befriend them, to get to know you better. But she plans to be next to you, singing love songs, driving off potential competition, and trying to get you drunk enough to wed her, until you agree, or her fixation moves on. And that's not going to happen until someone else saves her . . .

Fool's Guild

They are a shadowy organization, with roots that tie to dark sorcerers, early organized crime, and bands of itinerant wandering entertainers. Once little more that a brotherhood of minstrels who used hand-signals to identify each other and pas notes about local laws (and comedy preferences), they have grown into a secret society that charges itself with keeping the world safe. Through comedy.

Part ninjas, part clowns, the Fool's Guild are a movement designed to keep common folk safe through two methods. First, any time an individual or group becomes so self-absorbed they forget the concerns of the lower class, the Fool's Guild takes them down a peg. The methods for doing this vary from spreading rumors and performing parodies to direct pranks designed to make the offenders look like fools, and thus gain some much-needed humility. Second, the Fool's Guild ensures that certain secrets Man Was Not Meant to Know are kept secret, by making popular fantasy fiction that features such secrets as truth. No one really believes there's an invisible map of a secret stash of Mason gold on the back of the Declaration of Independence, because the Fool's Guild made sure a popular movie featured exactly that.

You may have stumbled across the truth of one of the Guild's "secrets," or you may have just gotten too big for your britches. Either way, a Character Assassin is sent to ruin your good name, or at least drag it through the mud a bit. By carefully spinning what version of your history gets around, the assassin ensures anyone making a Gather Information check about you hears a story of your embarrassments before your successes (and it takes a check with a DC 5 higher than usual to figure out which is a more reliable version of the truth). As a result, you must argue against such a perception if you want to be taken seriously, which can be off-putting. When you make a Diplomacy check to establish the initial attitude of NPCs you meet, you must take a -5 penalty if you don't want them to think of you as a dolt. (On the other hand, you gain a +5 bonus to Bluff checks to seem incompetent.) And, of course, you suffer the occasional cream pie to the face in public.

The Fool's Guild has been doing this for centuries, and knows its way around both the media and practical jokes. They won't give up until either you show signs of losing your big headedness, or you give up on whatever "secret" you've stumbled across.

Gwordi

Gwordi is a minstrel group of demons and undead, dedicated to bringing their harsh message of doom and drum solos to the whole earth. And somehow, you've offended them. Perhaps you didn't realize when you complained about the sounds of cats mating that it was actually Gwordi tuning up. Maybe you summoned their drummer-elemental for a fight when they were playing a set. Maybe you just remind them of a harsh royal critic. Whatever the reason, they hate you.

But Gwordi can't just kill you -- that's not artistic. Driven by their bat-winged muse, they need you to suffer the fate of one of their lyrics. Drown in a sea of boiling blood, perhaps, or have your liver eaten by your pet (returned from the dead, of course). Though the members of Gwordi are powerful (select fiends and undead several CR higher than the campaign), they simply refuse to kill you unless it's in a mockery of their own death-doggerel lyrics. This often results in complex plots even their powers can just barely manage, and generally come with lots of foreshadowing.

Hyor, God of Slightly Unfair Contests

Hyor is the last existing deity of his pantheon (having arranged for the final confrontation that destroyed his brethren to slightly favor him). By overcoming dozens of foes in your career you've attracted his attention. As a result he wishes you to become his champion. This would mean additional power (any +3 LA or +4 LA template, such as half-celestial), but it would also mean your Patron god would want half of all battles you face from now on to be slightly unfair against you, resulting in his divine intervention ensuring the extra power doesn't compensate for what he arranges to aid half the foes you run in to.

If you refuse, Hyor takes the news poorly (like any snubbed god). Now he wants *all* your contests to be slightly unfair, to show you why you should work for him. And it's going to go on like this, until you manage to rig things against the god of uneven odds (embarrassing enough for him to leave you alone even if he remains undefeated), or manage to get his attention focused somewhere else.

Candamir: The First Settlers

Published by [Mayfair Games](#)

Designed by Klaus Teuber

Art by Tanja Donner

English translation & rules development by Guido Teuber, William Niebling, S. Coleman Carlton, Robert Carty, Will Niebling, & Pete Fenlon

Full-color boxed game with board, 49 wooden pieces (four sets of characters, discs, and victory point cubes in four colors & one six-sided die), four character boards, 48 exploration tiles, 12 potion tiles, eight equipment markers, four endurance markers, 16 experience markers, 90 resource and ingredient cards, 29 movement cards, 22 adventure cards, eight character cards, two card holders, & one shuffle cards board; $49

What does Hollywood do when one of its most popular franchises seems to run out of steam? They turn back the clock and do a prequel. The same trick seems to work in games. The Catan series hasn't stopped producing big dividends for Mayfair Games yet, but there's fertile ground further back in *Candamir: The First Settlers.*

You came to the island nation for a new life, but everything's gone wrong. The ship sank, everyone aboard barely dragged themselves to the shores of Catan, and you've but a precious few items to forge your new lives. By working together, you hope to tame the new world.

The object of the game is to be the first settler to place his tenth victory point cube on the board.

One half of the board is the wilds of your new home: a burgeoning settlement in the middle of grasslands, a river running through it, deep forest and imposing mountains on either side. The other half is a close-up of the village. The homes of your neighbors (well, four of them anyway) are shown, with a list of what supplies they want. Players are actually characters this time, with stats, possessions, and skills. Stats are used in challenges -- for example, to avoid a snake, roll a six-sided die and add it to your agility -- and equipment and experience hidden about the board combine to improve these. Skills let each character break the rules somehow, moving faster in forest, trading resources more profitably, and so on.

Each turn presents a choice: explore or "build and brew." In exploration, you scout out tiles on the board, select a space for your destination disk, and move there by drawing a card for each step. The movement cards show what lies in each direction. If the shortest route to your token runs afoul of a bear or other hazard, you must decide whether to go a less perilous (but more circuitous path) or brave the risk. Other spaces may be empty or contain valuable ingredients. Some arrows point to a question mark, indicating an exploit chosen from the face-up adventure cards beside the board (this deck is layered to offer tougher challenges as the game progresses). When you reach your disk, your travels bear fruit: If the space has a tile you collect the rewards listed on the back, and if it's one of the outlying camps you get a resource. You return to the village with these and other supplies gathered from killing wolves and such along the way.

In the settlement, you may "build and brew." Ingredients combine into potions that heal wounds, boost skills, or

inebriate your opponents. Resources create items like swords and chests for your neighbors, and these are the way to victory. Every time you forge a good, you place one of your victory point cubes on a corresponding square at a satisfied neighbor's house. They only want certain things at certain times (everything is arranged in ordered columns), but if you give enough to one person, they'll let you place an additional cube on their abode. If you place all your cubes first, you win.

Although the cards are a little thin (bad news for the movement deck, since it gets shuffled regularly), the usual European standards are otherwise followed. The board folds out (the individual Catan hexes go atop the board this time), and it packs a lot of serviceability into a small and manageable surface. The orderly arrangement and utility of the pieces and characters is an extension of the game's overall mechanical elegance.

The forms and functions of this product are a marvel, and that means a good time for the gamers who get hold of a copy. The movement cards require shuffling too often, and there's perhaps a little too much abstraction to the action (and man, by the endgame, *everyone* is trying to unload ore on you), but that allows players to concentrate on the fun parts. The strategy is limited to the play and not a lot of underlying machinations, keeping it firmly a trading game and not some sort of bloody economic warfare. It's simple to learn, it's easy to play, and there's an answer for pretty much any question. Are opponents too far ahead? Stem their movement with mead. Low on tiles? Camps and adventure cards offer more resources.

A fine follow-up in the Catan tradition, ***Candamir: The First Settlers*** (named after a homebuilder on the island who seems to be everywhere and constantly in need of assistance from one form of jeopardy or another) dovetails its elements nicely, and the overall result does not disappoint.

Oshi: the Game of Influence

Published by [Wizards of the Coast](#)

Designed by Tyler Bielman

Illustrated by Daniel Egneus

Nine-inch square wooden board, 16 plastic game pieces in two colors, & full-color rules; $24.95

Released just in time for Christmas 2005, *[Tsuro: Game of the Path](#)* marked WizKids' entry into the boardgame market, and despite being relatively light in terms of both skill and strategy, the game was both enjoyable and quick to play. It also looked, and felt, very good, and it was clear from the production values that WizKids were intent on giving us something that also looked good on your coffee table.

WizKids now follow this up with a second title aimed at the same spot in your living room. *Oshi: the Game of Influence* is like *Tsuro,* simple in scope, light in play, and possesses an oriental theme. Unlike *Tsuro,* it is strictly a two-player game. Unlike Tsuro, it is not as good looking. Unlike *Tsuro,* it is not as pleasing to the touch. Unlike *Tsuro,* it actually requires some thought, offering more depth in terms of strategy.

The theme for *Oshi: the Game of Influence is Chinese* rather than Japanese. In addition to giving the first Emperor of Japan the "sanshu no jungi," or Imperial Regalia, the Goddess Amaterasu gave him another gift, that of Wisdom. This was in the form of the game "Oshi," or "Push." What it taught the emperor was that influence was a power to be used cautiously because used unwisely it could lead to defeat.

Wizkids' *Oshi* models this concept with a chess-like variant in which the aim is not to take your opponent's pieces, but to force them off the edge of the board. To do this, each playing piece possesses a range and power over other nearby pieces that when brought to bear, can push them off the board. This is their influence.

The game consists of a wooden board marked with a nine-by-nine grid of squares and two sets of identical plastic playing pieces, one in white and the other in red. Each piece is sculpted to look like a Japanese pagoda. Each set consists of four pieces just one-story high, two two-story pieces, and two three-story pieces.

The height of each piece determines its ability, and thus its influence. A one-story piece can only move one square, a two-story piece just two squares, and the three-story three squares. As part of its move, a one-story piece can also push an opposing piece one square back; a two-story piece can push opposing pieces two squares back; and a three-story piece can push opposing pieces three squares back. On his turn, a player moves just one piece in an orthogonal, that is, not diagonal, direction.

Oshi sounds incredibly simple, and simply put, it is. Yet it is not simple to play. This is a game of push rather than push and shove, since once a player has executed a move and pushed an opposing piece back, his opponent cannot just reverse the move and push back. In this way, the obvious stalemate is avoided. Nor is *Oshi* a game of lightning strikes to expel an opposing piece; rather, each player marshals his forces in to a cohesive whole before the two blocs clash. Keeping each bloc together and staying away from the board's edge are the keys to winning.

Unfortunately, *Oshi* fails to live up to the high standards set by *Tsuro.* Once you get past the nicely done gatefold rules folder, the game is physically disappointing. The rules and the back cover of the box depicts an attractive wooden

board with beveled edges, but this is not what you get. Instead, the board is a plain slab of wood with the grid and starting positions marked on it. All of the playing pieces are of ordinary hard plastic that is nothing like the ivory style effect seen in the rules and on the back cover. The result is that **Oshi** feels and looks cheap, and unlike **Tsuro,** you would not want to display this game on your coffee table.

In terms of play, **Oshi** feels very similar to [**Abalone,**](#) a game that used marbles instead of plastic playing pieces, and was played over 61 holes arranged in a hexagon. Although play is slightly different, the principles are the same -- force an opponent's pieces (or marbles) from the board. And where the pieces in **Oshi** can move just four directions, in **Abalone,** pieces can maneuver and push in six directions.

I liked **Tsuro.** It was simple, very quick to play, pleasing to the touch, and fun. However, after seeing the high standard set by **Tsuro, Oshi** is a disappointment. However, its play is more tactical and more thoughtful. True, its play is more tactical and more thoughtful, much of that being due to the physical feel of the game, but really, **Oshi: the Game of Influence** fails to offer much in the way of depth and once tried offers little that demands repeat play.

Support Your Local . . . Huh?

I'm going to play devil's advocate . . . and what better way to do so than with a nice massage?

Let's say that you're new in town, and you check out a friendly local bank to open an account. You discover that the bank only offers 0.2% interest on its accounts, but they make an effort to know the names of all their clients, they give everyone who walks through the door a nice massage, and, for customers of the bank, they give *really* good massages. You like everyone at the bank, and they like you.

Across the way, the internationally known GloboMoneyBankCorp offers impersonal service, will refer to you only by your designated number ("Enter and be processed, Customer 24601."), offers no special perks, and is cold and lifeless all to heck. But they do everything you expect a bank to do, and -- oh, yeah -- they offer 6.05% interest on their bank accounts.

Now, honest question: What would you do?

Would you give all your money to the friendly local bank? If you routinely keep $5,000 in the bank, that decision will cost you a few hundred bucks a year.

Do you give some of your money to the friendly local bank, but open an account at the impersonal, more fiscally rewarding bank? If so, what ratio do you divide your savings among? Again, a 50/50 mix of your $5,000 savings will still end up depriving you of over a hundred dollars a year.

Or do you just go ahead and put all your money in the account that will give you the best return on your money? And if you do, do you still go into the other bank and take advantage of that free back rub?

Of course, long-time readers (and those who're plugged into the comics or gaming world) probably recognize where I'm going here.

For years, there's been a general trend toward shouting, "Support your Friendly Local Game Shop!" (Most recently I've heard this from none other than **Wil Wheaton**.) The volume of this rallying cry seems to be in direct correlation to the danger that the Friendly Local Game Shop is in, compared to the health and prevalence of the alternatives: online stores, chain booksellers, and so on. But compare the situation with the FLGS to the bank example described earlier. Many of the advantages a FLGS offers are, like the bank's back rubs for those who walk through the door, available for anyone regardless of whether they spend money: the ability to browse through new products in person, the ability to chat with a customer-service person about new stuff, the ability to put a posting looking for gamers on the store's thumbtack board, and so on. (Whether or not this is an ethical use of the store's resources, I'll leave out of this column.) Many of the other benefits, like the middle-of-the-road bank example, can be realized by dividing funds between the FLGS and more frugal alternatives; if the game store only allows common gaming space for paying customers, then you can buy the cheap-o stuff from the store and save up the expensive purchases for some discounter's venue. (Again, I'm not saying whether this is right or wrong . . . merely that there's nothing against it in the rules of most places that I've seen.)

So -- and, once more, I note that I'm playing devil's advocate -- what is so special about the FLGS that it requires special protection?

One common argument that I often hear is, "If you don't support your FLGS, it may not be around when you need it." Of course, the converse is not necessarily true; you might spend all your money at the FLGS and they *still* won't be around a year later.

(Even worse is the conundrum presented to those with substandard FLGSes: Do you spend your money there in the hopes it will do better, or do you take your business elsewhere and help contribute to its overall decline?)

And, just so we're clear, we are talking real money here. Let's say you spend $500 a year on games at your local FLGS. (That's less than $10 a week, or one nice $40 game a month.) Now, let's say you have options of saving 20% on that budget. (I've seen discounts go as high as 30% or more, often with no sales tax, but 20% is a nice workable number.) That means you're spending $100 a year for the ability to use your FLGS. Is what the FLGS provides really worth that amount for the services it provides? [SHAMELESSPLUG] $100 would buy a *Pyramid* subscription for you and four of your best gaming buddies. [/SHAMELESSPLUG] It would go a long way toward a weekly mocha at the local coffee house, entitling you to use *their* premises for gaming. It would buy *more games,* for pity's sake!

Or, it could go toward supporting a store that may or may not be around in a year. And if they go away, then many of the perks you enjoyed -- service reps who know your name and can make recommendations, the ability to see new arrivals -- go away with them. (Now, for many folks there *may* be benefits: instant gratification, utilization of game space, or other perks that they've weighed in their mind and gone, "Yep; that's worth the extra percentage that I pay." But I wonder how large that target group is.)

I recently learned that the first editing "job" of my wife -- the internationally renowned supermodel line-editor Nikola Vrtis -- was helping her father with the photocopied newsletter of the local Commodore 64 club. See, back in the early days of the computer, hobbyists would get together and chat about various ideas, tips, and tricks with like-minded computer users.

For the most part, these computer clubs have all gone the way of the dodo, at least compared to their heyday (back when computer magazines had type-in-yourself programs included). Why? Is it because people didn't support the Commodore 64 enough? Is it because people didn't heed the warning calls and support their computer clubs enough? Or is it because alternate forces -- interest in different computers, the rise of the Internet -- led to the obsolescence of the humble Commodore 64 group?

Let's look at another example. If you're a fan of independent, classic, or old movies, the fact is that there has never been a better time to be such a cinema buff. Is this because like-minded film fanatics arose to the warnings that giant movieplexes were about to crush their beloved two-screen art-house theatres? Errr, no, not exactly; said cozy theatres were almost universally squashed like bugs on the windshield of capitalism. So why is this such a good time for film freaks? Because the home-theater revolution has enabled non-blockbusters to be viewed with better visuals, better sound, orders of magnitude more choice, and fewer uncomfortable seats and sticky floors than their cinematic counterparts. Likewise the rise of refrigeration made daily visits from the milkman a relic of a bygone era for most of the developed world, and the existence of Netflix has caused a drastic change in the video-rental landscape.

The fact remains, many FLGSes *are* in trouble (as is perhaps the very idea of the FLGS itself), and it's hard to stand fully behind a system of merely hoping people do something not in their best fiscal interest, for the hopes of some nebulous may-or-may-not-happen (or may-or-may-not-be-worth-it) benefit.

In my mind, having a demand for something that isn't being met by existing options tends to lead toward the creation of options that *do* fulfill those needs. For example, the traditional-model used bookstore has been under enormous financial pressures in recent years. However, there has been a new breed of super-used-bookstores (such as the national Half Price Books chain) that offer better selection, better prices, and a better atmosphere than most "traditional" used bookstores.

Again, playing devil's advocate, perhaps supporting the FLGS is the worst thing that can happen to gaming, in much the same way that clinging to the relic that was the two-screen movie house would have led only to a substandard movie-viewing experience. Perhaps there is Something Better lurking around the corner, only waiting to emerge should it becomes obvious that the traditional FLGS model is doomed.

("Like what?" you might ask. Well, darned if I know. But let's toss out an idea. Returning to our local-computer-group model discussed earlier, I note that taking half the money our hypothetical gamer saves -- $50 -- and pooling it with only a few similarly minded regional gamers should go a long way toward creating a self-sustaining gaming club and/or quarterly mini-conventions where gamers can socialize, network, learn new games, and do many of the nebulous things that we *wish* FLGSes would do now but may not be.)

Regardless, although I am a fan of FLGSes, I'm also a fan of providing food for the family, and I'm not a huge fan of spending money I don't have to for vague no-immediate-benefit reasons. (I'm also a poor example; owing to working within the industry for some capacity for over a decade, I haven't paid full retail for most of my geek gear in ages.) I've tried sifting through my brain for any other examples of industries or hobbies where customers are expected to act against their own self-interest in support of something that doesn't provide a concrete user benefit without much success; even places such as slot-car stores often offer access to its super-cool tracks, which is a concrete benefit for its users. And so, I ask: What would it take for more people -- including myself -- to feel good (emotionally, spiritually, fiscally) about supporting their FLGS?

Again, I'm just playing devil's advocate. And devil's advocate is one game where everyone knows the rules, but no one can agree on a winner.

Murphy's Rules

After-Action Report: My *HeroQuest* Game

"A kingdom for a stage, princes to act
And monarchs to behold the swelling scene . . .
Into a thousand parts divide one man,
And make imaginary puissance;
Think when we talk of horses that you see them
Printing their proud hoofs I' the receiving earth;
For 'tis your thoughts that now must deck our kings,
Carry them here and there, jumping o'er times,
Turning the accomplishment of many years
Into an hour-glass . . ."
-- William Shakespeare, *Henry V,* Prologue, 4-32

Every time I've taken this column from the scribbles and scrawls behind my own GM screen it seems to go over well, so once more into the breach! This next Applied Suppressed Transmission, like the previous examples, summarizes my own RPG campaign in design and practice. This iteration, we went for an almost fully "character-driven" structure, and fell into Shakespearean tragedy. Whether that's good or bad is not for me to say, but everyone seemed to agree that although they wouldn't have done it that way again if they had it to do over, they didn't regret doing it one bit. So with that Hamlet-like assessment in mind, here's how my Shakespearean Dramaturgy Game played out.

We ran about 17 months this time, from August 2005 to January 2007, finishing up in a long Martin Luther King Day session. I started off with three players and added a fourth last fall when she moved to Chicago, playing as always for about four hours every Monday night that we could manage it. This time, it was Josh's turn to pick what we played, from a menu of choices that we'd mulled over toward the end of the last game. He wanted to take a shot at the Shakespearean Dramaturgy Game that I've been threatening to run ever since *HeroQuest* came out, so that's what we put together. But since we'd done a very GM-driven "mission structure" game last time, I wanted to let the players help not just shape their story but flavor the metaphysics. I decided to try a Lexicon game, which we ran for about six weeks ahead of time using some modifications. You can see for yourself that everyone ran out of steam a little before halfway through -- in future, I'll try even more blatant player bribery if I decide to build another Lexicon, because I think it's worth it. The great advantage to the Lexicon is that players get to "request" material for the game setting by inserting it into the Lexicon, and I get a more natural-seeming background of conflicting occult theory. Plus, everyone got to ponder and absorb some wacky Shakespearean occultism without the pressure of a direct game context.

"Whenas a lion's whelp shall, to himself unknown, without seeking find, and be embraced by a piece of tender air; and when from a stately cedar shall be lopped branches, which, being dead many years, shall after revive, be jointed to the old stock, and freshly grow: then shall Posthumus end his miseries, Britain be fortunate, and flourish in peace and plenty."
-- William Shakespeare, *Cymbeline,* V:iv:143

With the Lexicon underway, I dove into the questions of system and setting. I knew that I wanted to run this game as *HeroQuest,* since Gloranthan heroquesting is, essentially, dramaturgy -- changing the material world by ritual performance. But rather than ascend to the Hero Plane to re-enact the myths of Glorantha, my player characters would ascend to the Green Realm (a term I borrowed from Northrop Frye's study of Shakespeare's comedies) to re-enact Shakespeare's plays. Some plays or bits of plays already grant boons or change conditions on the ground (the Three Murderers Working is one I mentioned a lot in game); others need to be changed -- a happy ending for *Lear,* a triumphant return for Prospero, that kind of thing. (In retrospect, I should have put a little more skull sweat into firming up the still-nebulous heroquesting rules, and perhaps written one or two "rotes" as examples. But eventually, we worked it out.) Now, the only question was when to set the piece.

It couldn't be Shakespeare's time -- I wanted the "lost knowledge rediscovered" vibe. I put some thought into a Hollywood 1930s setting, complete with alchemically-ground camera lenses using quintessential silver nitrate film

stock, and we may yet use that setting if we play a sequel. But I decided to go with my first instinct and set the game in the 1750s, during the great rivalry between David Garrick's Drury Lane Theatre and Spranger Barry's Covent Garden. As I did more research (I got a huge boost of theatrical gossip from Mary Nash's biography of Susannah Cibber, *The Provok'd Wife*) I found more and more arcane hints: David Garrick built a temple to Shakespeare in his garden. He had been a wine merchant before suddenly revolutionizing Shakespearean acting with almost his first performance -- and like I need to tell you that Dionysos is both the god of wine and the founder of Greek theater. (Another actor, Charles Macklin, killed a man in a fight over a wig -- obviously a dramaturgically powerful prop.) Under the name Bacchus, Dionysos was also worshipped by the Hell-Fire Club -- so now I had my bad guys. I stirred in Madame Geneva, Saint-Germain, and everything else fine and good about the era of powdered wigs and knee-breeches, hid the good parts, and popped the rest into a handout. The stage was ready, it just needed actors.

"We will with some strange pastime solace them,
Such as the shortness of the time can shape;
For revels, dances, masks, and merry hours . . .
Away, away! No time shall be omitted,
That will betime, and may by us be fitted."
-- William Shakespeare, *Love's Labour's Lost,* IV:iii:324-329

In retrospect, it's not entirely my fault that the dramaturgy had such a steep learning curve. Faced with a game about the Shakespearean theatre, my players of course decided to play a cat-shaman and King of London Thieves, a cross-dressing spy for the French, and the second in line for the Manticore Throne of Britain. (Descended from Richard III. Really.) As a result, it was initially much easier for the PCs to get what they wanted by caper adventures, political string-pulling, and the occasional savage murder than by doing all the hard work of dramaturgy. Similarly, all three players had their own magics without dramaturgical help -- feline shamanism, Diana cultism, and being a great bloody manticore. Hence, there was plenty of action on the streets, which I can't say I objected to. I just popped open my *A to Z of Georgian London* (essentially a book version of this map) and went to town. We found that there's always a Rat Alley or Red Cross Street or something equally evocative just around the corner, and riffing on the names and churchyards gave a really great improv urban-fantasy vibe to the game and the setting. When all else failed, they could get chased by werewolves (of London, naturally).

But I made sure to dump one of the Three Caskets (from *The Merchant of Venice*) right in their lap, the Silver Casket of Comedy, which (I hinted strongly) was one of the artifacts created by the occult circle around Shakespeare to first open the way to the Green Realm. Eventually, the players (and I) figured out the magic -- they put on *Midsummer Night's Dream* as proxies for the "rude mechanicals," who get a gift of a purse from Duke Theseus at the end for their play. By clever dramaturgickal linkage, they turned that Green Realm purse into a real-world Patent Royal -- suddenly, they were the co-owners of the Drury Lane Theatre. An ambitious attempt to repair the Manticore Lord's conventional reputation by means of the "masque" from *The Tempest* backfired thanks to Hell-Fire Club sabotage, player perversity -- and a string of very unfortunately timed fumbles.

"Our revels now are ended. These our actors,
As I foretold you, were all spirits, and
Are melted into air, into thin air;
And, like the baseless fabric of this vision,
The cloud-capp'd towers, the gorgeous palaces,
The solemn temples, the great globe itself,
Yea, all which it inherit, shall dissolve
And, like this insubstantial pageant faded,
Leave not a rack behind."
-- William Shakespeare, *The Tempest,* IV:i:147-155

This, looking back on it, was probably the point at which the Manticore decided to turn evil. I've never actually had a player decide to go over to the dark side, and we all talked it out on a meta-level once the danger became apparent to everyone. But you couldn't say it's not Shakespearean, and it added a good tragic arc to the game just as the PCs began to figure their way around the dramaturgy and start holding their own in the Green Realm. (I kept the Green Realm

denizens fairly weak, since the ***HeroQuest*** conflict systems aren't the most forgiving, and because I'm a firm believer in not penalizing players for doing what you want them to do.) They survived *A Comedy of Errors* and *Merchant of Venice* (having the Silver Chest helped a good bit there), although an attempt to denature the Manticore using *All's Well That Ends Well* ended, well, badly. They mounted a few more occult capers, decapitating the Hell-Fire Club, recovering the Golden Chest of Tragedy from under Bedlam, and stealing the [Alicorn](#) of Britain from its [Sonnet Guardian.](#)

By then the fourth player had joined the group, and she decided (huzzah) to play an actress-dramaturge (and Prosperpine cultist) of dubious loyalties. She provided much-needed dramaturgical muscle, and still more meta-game confusion. She worked for the Ministry, the shadowy agency of Men In Black Cloaks devoted to the Hanoverian Throne, who kept [severed heads](#) alive deep in the Tower of London and held the Lead Casket of History tightly in their grip. She started out play as a double agent, working with the PCs, and briefly became an erstwhile triple agent for the Manticore, until it all came down to the climax in the fifth act. The manticore PC, having seized control of Drury Lane, was planning to open the Pit of the Manticore using *[Titus Andronicus.](#)* But the other PCs had gotten ahold of a manuscript copy of *[Love's Labour's Won,](#)* and threatened to use its untapped powers of closure to remake the Green Realm themselves. The manticore couldn't hold back. Like his ancestor Richard III (whose curse the actress-dramaturge ritually put on him) he rode into a trap and went down under the purifying Alicorn and the arrows of Diana. Exeunt omnes, to a death march.

Next game is ***Truth & Justice***. And nobody is playing a manticore. And it's back to mission structure for a while. But man, any game where you get to recite Shakespeare for Hero Points -- that's a game worth playing.

A Mélange of Magical Creatures II

for *GURPS*

by Eric Funk

We have traveled [before](#) to the realms of the weird, in search of the strangest of the strange.

Underduck

"This bird must have confused earth primitive plainsmen more than any other marine creature. It is no wonder that many legends describe it as flying in a parallel or mirror world."
-- "History of Early Coastal Cultures" by Doctor Natius Flynn, Professor of Alternate Anthropology

The underduckdoes not, in itself, appear unusual. This species also migrates in flocks, builds nests, and lays eggs in reeds. The main feature that makes these aquatic avians stand out is that they do all this underwater. Underwater and upside down, to be exact. To them, the surface of the water is as solid as stone, except to its beak, which they use to hunt bugs that live on the surface. Sometimes they prey on small eels. Like a whale, the avian body requires the water pressure to maintain integrity. However, not being buoyant, they slowly "fall" to the surface. It uses the underside of the reeds, building nests upside down in reeds.

Encountered

These animals can be met in any campaign where the adventurers encounter the sea coast. Underducks migrate with the seasons as the surface cousins do.

These animals are classified as minor pests, sometimes damaging ropes as they eat the seaweed off them. They can cause nets to be "stuck," so many nets have a *repel avians* spell on them. It also keeps mundane sea birds away. If caught, the only way to take it out of the water is to put it in a pail or equivalent, then to let the water out through a small hole, or dump it on the deck.

Industrial Uses

"Whenever we take a noble to the crystal shoals, it seldom fails that the dignitary will spot the game birds, and draw a bow. He will suddenly look down and see extra 'reflections' in the water. Seeing that the ducks are closer, the noble will then discover that water is quite dense, and that it bends light."
-- Giles Teron, First mate of the fast rigger *The Gyrfalcon*

Coastal alchemists have discovered a variety of uses for underduck byproducts, ranging from water-repelling coats to shoes that let one walk under water, to a local popular sandwich. The most ambitious project to come out of this line of research is the tracked cargo vehicle that rolls under a lake to deliver cargo all year round. It would use wheels, but the waves offer a great hazard. One wizard claimed to have developed footwear that enabled one to walk on the ceiling, but by the time his colleagues arrived, his window was open, and the man was nowhere to be found.

Adventure: Follow Your Nose

In a freeport, word is out that a pirate captain has captured an underduck that migrated this way across a known "unnavigable" reef. He is preparing to set out when the season comes for ducks migrate back. A privateer captain hires the PCs to "relieve" the pirate of it, replacing it with a lookalike underduck. No matter whether the adventurers are successful or not, they are asked to come along on a mission to follow the path. The one fact the patron fails to

mention is that a *second* team was also hired to fulfill the same mission on the same night. GMs looking for a random timeline can roll 1d use the following table. The other party is in the middle of some sort of mayhem (perhaps they are just knocking out guards and more shouting will alert the remaining watch).

In any case, both groups get paid, and there should only be minor confusion regarding who has the right duck. If the GM likes, both groups could continue to challenge each other as they continue on the quest. Complications can exist in the fact that the duck in its water can weigh a lot. Carry too little water, and it will suffocate.

Underduck

Appearance: As a grey-brown duck.
Category: Avian
Diet: Omnivore
ST 2; **DX** 14; **IQ** 4; **HT** 14.
Will 12; Per 12; Speed 7; Dodge 10; Move 3 ("Ground").
SM -2; 8 lbs; DR 2, 10 vs. electricity.
Traits: Acute Vision 1; Aquatic; Crushing Attack (1d, sonic); Extra Hit Points +1; Flight (Winged, "Underwater", "Air" Move); Peripheral Vision; Phobia: Claustrophobia (Enclosed spaces); Restricted Movement: Water's meniscus is as stone; Restricted Manipulators; Temperature Tolerance; Wild Animal.

Quantum Sheep

"Originally bred because of a princess that had problems with bad dreams keeping her awake. First, being in an age of prosperity, her mother, the Queen, declared that she should never use the same pillow twice. Since that did not cure the problem, she had her best mages make a self-sustaining supply of enchanted wool to help the princess to sleep. Upon her passing, the kingdom had a great surplus of magic wool, ensuring its prosperity for years to come. Of course, the feature the animals are now renowned for was not in the original designs, and not 'discovered' until much later.

"If you don't believe that, then the next most likely origin is that the sheep's predators were becoming smarter, and could count. Thus, by some fluke, they developed this ability, which became dominant in the survivors.

"I want an eight page essay on the origins of this animal on my desk by the end of next week."
-- Professor Alei Firkin, *History of Magical Garments* Chapter III.

Outwardly indistinguishable from ordinary sheep, these herbivores are highly valued in the magical textile industry. Demanding high prices, these creatures are hard to manage due to their special ability: counting 3 or more of these "slumber sheep" can cause a person to fall asleep (Save vs. Will or HT, whichever is higher for each sheep after the second). The range in yards at which a person is in danger is equal to the number of sheep squared.

A small variety of defenses have been developed over the years. A person is safe as long as one does not actually count the sheep. This can be enforced by hypnotism, a Geas spell, or a spell linked to blind the person if they start counting sheep. Spells that protect against gaze attacks also defend against this effect. In magic-poor areas, these sheep are usually shepherded by innumerate people, or solely by dogs.

Encountered

These mildly dangerous animals are normally kept in fenced pasture, away from the large highways. Some noble houses keep small flocks to tend lawns just outside the main house at night to keep thieves away. If the animals need to be counted, it can be done using a gate that turns a gear or drops a large seed into a jar, or with an innumerate person making marks on a paper for each sheep. It can be part of rural festivals to see how many one can count before succoming. Reproductions are safe, unless one uses psychometric powers to look backward (see page 78 of the ***Basic Set***).

Industrial Uses

"That's how the old joke worked: when a stranger entered the bar, and asked about the 'sleep sheep,' a patron would instead point them toward normal sheep . . . Normally after having a few drinks first, they would get frustrated, become convinced they are somehow immune, or just pass out on their own, and the sheep would eat their hat."
-- Tvold Bragden, recalling his experiences at the Sandman tavern

The primary use for the wool is as a base for enchantments, offering a discount on damage resistance for the wool itself, and on self-repair (see page 118 of ***Magic***). The wool also makes for great pillow, conveying the effects of the Deep Sleep advantage (see page 101 of the ***Basic Set***) and temporarily alleviating sleep-related disadvantages by one category (e.g., Nightmares (12) becomes (15) while such a pillow is used.) The most unusual use, suppressed by governments out of fear and embarrassment, is that of the offensive use of such sheep in times of war. A tale is whispered by infantrymen about a rout in which an entire flank was disabled by a huge flock of sheep cresting a hill. A cavalry charge by the enemy where the riders wore blinders to that side broke the lines and took the leaders.

Adventure: Counting Zzzs

The heroes need to delay a noble from attending a conference without injuring anyone. Their patron can supply modest numbers of quantum sheep to aid them in this endeavor. The sheep are to be deployed along the routes the noble is to take.

Quantum Sheep (a.k.a. Slumber Sheep)

Appearance: Sheep of mottled colors
Category: Mammal
Diet: Herbivore.
ST 12; **DX** 13; **IQ** 4; **HT** 15.
Will 10; Per 10; Speed 7; Dodge 10; Move 7.
SM 0; 200 lbs; DR 2.
Traits: Affliction (Sleep) 1 (HT; Emanation; Malediction: Long-range (Limitation: Square root of (number of sheep) in yards); Sense-Based); Domestic (or Wild) Animal; Hooves; Quadruped; Temperature Tolerance 2; Weak Bite.

Temporal Beaver

"How does this wand find distortions? It was part of a beaver dam holding back the tides of darkness. That makes it attuned to the subtle changes in space-time. It did-will work, or so I told myself."
-- Professor Wen of the Department of Impossible History

Just as mundane beavers obstruct the flow of rivers to create ponds in which to build their homes, so do temporal beavers obstruct the flow of time into a pool, both physically and meta-physically. Using sticks and ceremonial magic to stake out and reinforce an area, time becomes placid and calm. In these pools of slower, more predictable time, these beavers move freely, easily dodging foes and enabling them to take the first choice of their foods.

Finally, like their cousins, they dislike the "sound" of ruptures in space-time and actively seek to silence them by damming them off. Teleporting mages are too fast, but longer-use gates are "in danger." Where such occur, soon a temporal beaver will arrive, and pile twigs over the portal, completing a ritual magic that stoppers the gate.

Encountered

If the PCs open lasting, or frequent gates, these animals can show up, and stop the magical effect. Heroes may also encounter a pile of twigs, and innocently cut through them, unleashing an unspeakable horde from another dimension (or location on this plane).

Well-meaning citizens concerned about the "time trap" inherent in the pool of time should beware: Being caught downstream of a broken dam is dangerous, with a person being hit with anywhere from 1d to 6d years of time all at once, depending on how old the dam was.

Some wizards have sought to make trained pets or familiars out of temporal beavers. This has met with mixed success as the animals have a strong instinct to seek out and close any planar instability in their proximity. While this is good for planar wardens and guards, the average experimenting wizard will be pressed between the benefits of an early warning, and the pile of sticks over his pentagram or faerie ring.

"Some places keep these animals in moats to warn them of impending problems! If they try to get in and pile sticks, let them! A hole in space or time is likely to open up!"
-- Note from the Department of Temporal Happenstance.

Industrial Uses

These creatures are rare or misidentified enough that they have not been caught in large numbers. A few speculated uses include using the pelts as clothes to protect against aging spells and washes of time, and using the tail to press food that becomes frozen in time. Finally, some hermits and oracles spend time in meditation in the beaver ponds. They claim the calmer waters give them a clearer view into the infinite. (A GM might allow a +1 on rolls to view another time.)

A few daring entrpreneurs have discovered a use for the pools of time. First, one places a barrel of newly-made wine, or a forgery next to beaver's home. From a distance, using magic or a long rope, one breaks the beaver dam. The rush of time can age the items without the signature of magic. Others have built a dam around structures to slow the time within, sometimes to slow monsters or the course of a poison.

Adventure: Time Heals All

To stop a horde of rampant evil creatures, an old man prescribes a cure: find and capture as many temporal beavers as possible, safely transport them to the portal at the heart of the evil, and protect them as they stopper the hole in space. Difficulties lie in safely transporting them, and protecting them from the evil horde while they scavenge for wood.

Temporal Beaver

Appearance: Small, brown herbivore.
Category: Mammal.
Diet: Herbivore.
ST 4; **DX** 12; **IQ** 4; **HT** 12.
Will 12; Per 12; Speed 6; Dodge 9; Move 6.
SM -2; 20 lbs; DR 1.
Traits: Amphibious; Detect (Time/Space Distortions, Precise); Breath Holding 5; Immunity (Time changes); Peripheral Vision; Semi-Upright; Temperature Tolerance 2; Wild Animal.
Skills: Survival (River)-13.
Knack: Control Gate (close only) and Suspend Enchantment (Gate only).

Lafamorphs

"There we were, on the trail of a wyvern that was poachin' cattle from the local farms. Then, I spotted movement to one side.

"Was only a pink rabbit. I moved quietly. It was then that a man behind me stepped on a twig. That branch snapped, piercing the quiet with such a sound that the hare darted across our path and into a tunnel. The warren must'a been

under our feet! No time to worry, because Jarne spotted the lizard coming this way! We ready our weapons, and look for cover. That pink bunny musta surprised the rest o' its kin, 'cause the next thing you knew, the ground shook, and we all felt the air burn a little. Lost a bit 'o me mustache. Anyway, we were moving toward the large beast at the time, and just before closing, a pink 'stone' shot through the air, hitting the drake on it head. While both were stunned, we took the opportunity to run the lizard through. Of course, the lord o' the land took its **head.***"*
-- Overheard in The Wyvern's Tail tavern

References to these pink rabbits date back to some of the earliest bestiaries, suggesting that they are either naturally occurring, or one of the first experiments at hybridization. The mammals generate a mild electric shock when startled. It is not enough to damage someone, but it is surprising if not expected. This effect can easily set off flammable materials.

Lafamorphs' warrens are typically built near the top of a hill, with straight runs leading down to a central chamber. From there, they have many twisting tunnels. The main tunnels to the antechamber are unusually straight, and through firing become hardened into coarse ceramics. Being small and straight, any rabbit, or other creature for that matter, will be launched a good distance in the air! The odd time that an extra large charge builds up, sometimes ceramic shards are accelerated as well.

Encountered

Often demanded as a familiar by young female mages, these creatures are seldom granted as a linked animal, but are not uncommon as pets, especially with the availability of Purify Air and No Smell collars. Despite the fire hazard, many pet owners eschew the collars for the slightly sweet smell of the rabbits' odor, provided that the pet is kept out of doors.

Industrial Uses

"Sure, they're cute, they stink, are frightened of loud noises, and get into everything. Despite that, this **rat***'s electric shock restarted my heart when I had a stroke. Now I won't part with him."*
-- Luis Fyid, gang member, recovering at a healer's after a stroke.

The nitrous oxide gas the rabbits emit is heavier than air, and thus easily captured for later use. In a fire, it enables a forge to burn hotter, and can also be used as an anesthetic. The critters' fire-resistant pelt is toxic, so mitts must be lined with a different fur on the inside. Some call packed lafamorph fur "asbestos," but this may be a misnomer. The tunnels of the warren become fired, and thus can serve as crude, yet thick ceramics, making for adequate piping for some purposes. Uses in Enchantments include Resist Fire, Stench, and Shocking Touch.

Adventure: Not to be Taken Seriously

The adventurers are invited to infiltrate an unusual cult to find out their plans regarding the small town they are passing through. Among other rituals, mundane and otherwise, the heroes will be expected to keep a poker face while holding a lafamorph and being told jokes. This may require several Will rolls . . .

Lightning Bugs

"I fell backward down the hill, clutching my arm. The bandit raised his sword to impale me, and charged down the hill. Just then, the wind shifted, and what appeared to be fireflies drifted in front of me. While my hair was on end, the bandit took a beating in crackling energy. Just after the bugs had passed, I pickup a dropped sword, and bade him surrender."
-- Kev Larsin, *The Battle of Widon Hill*

Some specimens of the creatures that are popularly called "lightning bugs" are not, in fact, insects, but a form of silicon-based life. As they pass through the air, they collect a strong static charge, which they use to deter and injure predators. When the bugs are angry, getting within 2 hexes of a swarm nets one a tingling feeling of an electric charge. Getting within 1 hex of a swarm nets one a stun effect, and 1d "shock" penalty in the next round. Entering the swarm gets one an attack of 1d electrical damage, with double the shock penalty for the next round. The Reach of metal weapons counts to shorten the range of this effect.

Encountered

These insects are primarily attracted to locations, objects, and trees that have been struck by lightning in the last month. A person who has used a lightning-related spell in the last day, or over 10 Air spells in the last week, might also find themselves attractive to these pests. Some cities have found that lightning bugs like flying through magnetic fields around power transmission lines, and are attracted to broadcast power sources from 10 times usable range.

"The only safe way to catch a swarm of lightning bugs is to use a metal butterfly net that is tethered to the ground by a wire. One must be sure to get them all in the net at the same time, otherwise the stragglers can cause muscle spasms."
-- Urfa Quirn, *Entymology of non-insects*

Industrial Uses

While some druids use lightning bugs to tell which trees have been struck by lightning, some TL5+2 cultures could use them as an early leap to semiconductors or advanced TL3+3 power storage devices (as per power cell, but the mass is the insulated plug at the top of a jar; the bugs inside can be incited to discharge by flipping a switch revealing a pheromone, or just by shaking it . . .)

Adventure

The entrance to a public place has become infested with several swarms of lightning bugs. The PCs must discover what attracted them, remove it, and then remove the bugs. Once the immediate threat is gone, they should try to find out who did it, and what the distraction allowed them to do.

Dream Spiders

"Just as we can build bridges between worlds, so can bridges be built between dreams. If enough bridges are built, we get a network, a web. Now what will be caught in these webs? Class?"
-- Professor Atwin, *Lectures on **Geography of the Mind***, 22nd Printing.

While some people sleep, they say they have connected with other people's dreams. There is debate whether a tether remains while a person is awake, whether daydreams are so connected. An unresolved question is how far the network reaches, how far geographically one can travel in dreams and leave messages.

Some also have claimed to have "stepped off" as they traveled the "blur" between dreamscapes. There, most recounted some form of winding connected tunnels. Wandering the outer surface of these tunnels is described as being semi-random, connecting spheres of dreamscapes. A few wizards have gone mad exploring these areas, but many reported seeing giant spiders.

Encountered

Dream spiders are only found on the webs between dreams, never entering the dreamscapes, or the web tunnels, themselves. Encountering one and not getting out of the way may cause one to be "nudged" by the spider back the way one came. Attacking it can cause the spider to cut the thread, weaving a new one.

Mages are the only ones to have reason to fear from dream spirits, and that's only if they are rude. Each night, make an IQ+Magery roll to wander into others' dreamscapes. Only Magery with Communication and Empathy is added to the roll. A critical failure means an encounter with a dream wasp, a Critical Success, an encounter with a dream spider. Most will not realize they have done so. The Dreaming skill would be very useful in this research (see p. B188).

Industrial Uses

"I resolve to crack the mystery of these so-called 'dream spiders,' and will not rest until we have a book on them."
-- The last public speech of Ytri Rulik, Adept of the Mind

The dream network could be used to connect dreamers over long distances, acting as a fast message service. The dreamscape could also be used to no good, should mages discover a way to tap a person's thoughts. If found in enough quantity, the dream silk can be used in lightweight armor, rope, and aircraft material. The carapace of the spiders can be used to make ultradense material, ultralight plate armor, and strong shields. This is all speculative, of course; as so far, few have claimed to bring anything out of the land of dreams. Being part of a dream network could also be a justification for such advantages as Racial Memory, Wild Talent, or even Mechanical Telepathy!

Adventure

A wizard claims to have discovered a way to bring back dream creatures. He will put a special variant of the Beacon spell on his apprentice, who will then

Combat in the Dreamlands

For a simple dream combat system, consider the following:

- Dream ST is equal to the user's Will.
- Damage is recalculated from Will instead of ST.
- FP remains the same, and is used instead of HP.
- Dream DX becomes Per.
- Dodge is Per / 2 + 3, modified as normal for mental advantages and disadvantages.
- Move is Will / 2.
- Dream HT becomes Will.

fall asleep. If and when he succeeds in achieving a state of lucid dreaming, and enter the web between dreams, he will activate it. At this signal, the master will open a gate to this dream world. There, the heroes are to kill a dream spider, signal the mission is done, and pull the body back. The catch is that they need to keep the apprentice near, who will be able to do nothing but concentrate on lucid dreaming, or calling for help. The heroes will be "translated" properly using normal attributes and skills. (If the apprentice is injured or distracted and wakes up, it will be nearly impossible to get back; the mage will have to fall sleep again, and then try to find the adventurers. Only then can the master get a gate to them.)

The Truth?

The truth is that the spiders are setting webs to catch creatures that devour peoples' dreams. These parasites typically take the form of large flying insects, such as wasps (see below). Unfortunately, encounters with these "wasps" are almost certainly fatal for the unprepared, so few have returned at all with any solid facts.

Complication: The heroes discover, after killing several dream spiders, that the creatures are essentially good and beneficial to humanity, performing a vital function by keeping dream parasites at bay. If the heroes have a sufficient conscience, they should be open to suggestions by clerics -- or other authorities on morality -- on how to atone for their evil deed and to right the wrong they did. Commence the next adventure in the realm between the dreamscapes . . .

- Attack rolls use any combat skill, based off of Perception.
- Combat costs dreamers FP instead of HP. At 0FP, the dreamer drops into a coma, which breaks when the subject reaches full FP.

"Will" in this section can be replaced with the Will-based Dreaming skill if one wishes. A Per-based Dreaming roll can also replace Per.

In Nomine: These dream beings are simply ethereal spirits. They are currently neutral, but the followers of Nightmares have seen an upsurge in ethereals taking the shape of large spiders.

Zombie Trees

"Indeed, one could hardly tell that this was the site of one of the most grisly battles in this nation's history, fought less than two score years ago, save for the copses of corpse-trees growing here and there. They feed on death, and I wouldn't be surprised if some of the walking dead visit this place at night. In any case, soon the local chapter of Knights Rampant will be holding their semi-annual campout to surprise these visitors. And on your left . . ."
-- Tour of the Lington Downs

These deciduous trees are found to grow "naturally" in cemeteries, on battlefields, on sites of mass murders, and in other death-aspected areas. Its papery stark-white trunk is even paler than a birch tree, and its pale green leaves are distinguishable as they turn bright red in fall. Also called "corpse trees," they have a very bad reputation as harbingers of evil, and the sight of one tree alone is considered an ill omen by many.

Because of this, they feature prominently in ghost stories and urban legends. They say watering the zombie tree with blood doubles its growth rate and if its fruit are planted in graves, they cause the dead to reanimate! In addition, hearsay says these trees cause children to injure themselves a block away.

Encountered

These trees are banned in some areas, while other governments move and sequester any such plants into secure orchards. Monopolizing the official supply of this plant gives them an edge against undead: obey us, or die as criminals. A few vampires have discovered that a zombie tree stake run through a vampire's heart will cause a seeming of "death," but instead will be in suspended animation, and unhurt, other than the actual (non-vital) impaling damage until the stake decays or is removed. Some rumors indicate that implanting or ingesting the pale wood could grant an undead super powers.

Industrial Uses

"Giving a man a 'last cigarette' made from the leaves of this plant almost guarantees they return as a revenant to finish whatever obsessions they have.

"But no one actually believes in that voodoo stuff, right?"
-- Last diary entry of Judge Traigman just before sentencing the Raith brothers to be hanged.

The truth that few realize is *why* these trees actually do draw necromantic energy out of the environment, and collect it. It is so that the elements can be collected and destroyed along with the evil energy. If this were done, the amount of positive energy in the world would increase slowly, making it harder and harder for undead to exist.

Some undead (and other afflicted souls) claim that smoking these leaves helps put off the cravings for human blood, counting as a daily dose. In *GURPS* terms, it is likely to be just as restricted as blood, so a regular supply can count as a mitigator with a secret . . .

Adventure

The PCs are contracted to remove a zombie tree and to "dispose of it such that every piece is burned." As they prepare to cut it down and dig it up, they are approached by several agents independently, each seeking to acquire parts of it. Some offer cash, others offer chances to meet people, yet others appeal to their sense of mercy to help innocent victims of an undead curse keep from menacing the populace while they look for a cure. In any case, the slighted parties will not be amused if they are denied. Some will even negotiate for the entire tree, intact!

Common Threads

With the proper alchemical distillation technique, the "essence" of almost any magical creatures can be extracted and made into an elixir (ointment or powder, see page 213 of ***Magic***). This could be applied to the skin or dried and mixed with a combustible to function as a cigarette or incense.

Beyond Fantasy

This article describes seven creatures, most of which could appear to physically exist in a hard-science world, even if the more wondrous aspects could not. There can be fish that look like birds, and sheep could exist that emit sleep drugs that only take effect after a certain concentration. The temporal beaver could be a hoax, and rabbits with piezoelectric charges can emit nitrous oxide. People can dream similar things, and once the tale of one creature gets out, others can report to have seen it, especially a creature as universal as a spider. In the native traditions of some countries, there are herbs that can make a body seem to be dead to the untrained eye. Social undeath can be ritually caused by someone wakened from this state . . .

Many thanks to my beloved for the introduction to the creatures of her nightmares, as well as all those on sjgames.pyramid who applauded the last exposition of fantastic creatures.

Special thanks to Bevan Thomas and Christoph Sticherling for their expertise in necromany, explosives, and temporal happenstance which allowed them to make time to help corral and catalog these critters.

Transelven Space

or, Space: 999

for *GURPS*

by Eric Funk

Beginnings

It was a well-guarded secret that the elves had developed a working space drive centuries -- if not millennia -- ago. Always launching at night, keeping the labs and workshops deep in their territory, their missions were not known to the rest of the world. The elven space program was changed forever when a diplomatic mission involving the elven Prince was shot down and had to make an emergency landing in the center of the largest human kingdom in broad daylight during an international trade conference. The secret was out. The release of the Prince was quick and cordial, while diplomats stalled as top researchers raced to examine his crew and ship. Meanwhile, a security fiasco leaked the human's findings regarding the Wheel, the key to space flight, to all the other major powers. Thus began a worldwide race for space.

While the elves were the first to break the bonds of *terra firma,* they warned the humans that there are terrors Beyond and that it should not be taken lightly. The elves decided not to share maps to slow the humans' exploration, hoping that mankind would listen to reason. Considering the elves to be trying to scare them with fire side stories, the human nations raced onward to the stars. The perceived insult only encouraged mankind to send cheap, manned probes as far as they could in space. Aghast at the humans' bravado, they had not told the men exactly *why* the elven designs employ stealth. The nations had always assumed it was against being detected by men. The fools. The aliens now knew Terrans were moving amid the spheres . . . As probes were being destroyed in the inner and outer system, a few of the wiser nations approached the elves, and begged them for advice, allowing them to set a council to coordinate space research and efforts. The elven translation of the council name is the Necessary Advisory Space Authority. The elder race accepted this as it gave them some influence over the reckless humans.

"Technology"

The elves claim to have invented the "Wheel" propulsion system that makes modern space travel possible. The "Wheel" is the helm of modern space craft. It requires Magery 0 to operate the vessel, and the level of Magery is a bonus to skill rolls to pilot the spacedrive and maintain the device. The most advanced Elven ships use Moon Dust as fuel, Jovian rocks as anti-ballast in the upper deck, and are ornately decorated. Modern "Age of Prosperity" researchers are beginning to date their discoveries and some disagree with the claim that the elves were the first to invent the device.

The Wheel is a high-impulse, low-maneuverability drive. It has such poor handling that to perform fancy maneuvering requires landing in water. Landing on land is a slightly awkward action, but it certainly eases maintenance, access, and transfer of goods. It is certainly in genre to hold

Glossary

- **Age of Prosperity:** A vague term used liberally to define a prior "Golden Age" for other planets in the Solar System when a species develops space travel.
- **Glacial:** Ice-based quasi-elementals invading from the outer reaches of the solar system.
- **Lift Rock:** An anti-gravity substance that keeps the continents of the gas giants aloft. It is mined and refined as anti-ballast in modern ships.
- **Luminal:** Fire-based quasi-elementals invading from the Sun.
- **Moon Crystal:** An artificial gem made from Moon Dust in zero gravity. It can enhance golem cognitive ability. The larger the crystal, the greater the boost.

boarding actions while two vessels descend into the atmosphere. A large rowboat or skiff was found to be the smallest size vessel possible that one can outfit with a "Wheel," with no maximum dicovered as of yet.

- Couriers and raiders can get as far as 1 AU per week (0.14 AU per day)
- Typical warships and merchants can travel 1 AU every 2 weeks (0.07 AU per day)
- Colonial vessels and long haulers can reach 1 AU every 4 weeks (0.04 AU per day)

For ships, see p. SW102, page 464 of the **Basic Set,** and **GURPS Fantasy,** page 142. A simple conversion rule to fine the speed in millions of miles per day is to take the ship's speed in miles per hour, and divide it by two. (For example, 10mph becomes 5 million miles per day.) One million miles per day is about 0.01 AU per day. Actual speeds will vary by ± 10% for age and quality of the model and individual ship. Many messenger vessels ply the space ways as there is no instantaneous communcation between spheres.

> **Moon Dust:** Magic-rich dust originally found by refining megatons of lunar regolith used to power space ships. It was recently discovered that unrefined dust from the Great Red Spot holds the same properties.
> - **Moonraker Pike:** A ballista pike fastened above the skyscraper sail to protect the crow's nest.
> - **Strake:** Armor for the whole ship. A magical protective shield, it extends protection over the entire vessel, including rigging, masts, and open deck.
> - **Wheel:** Magical control for a space ship.

Example distances 01 Jan 999
(calculated with NASA's [Horizons](#))

Earth-Moon   0.0024 AU
Earth-Venus   0.627 AU
Earth-Mars   2.37 AU
Earth-Jupiter 6.22 AU

In addition to propulsion, elven artificers lay claim to designing modern ship armor, called "strake." It protects the entire vessel with DR1 or more and keeps in air. The only downside is that it impedes all fast motion through it. Thus archers must place their lead hands outside to fire unimpeded. Basic cargo ships have DR1, couriers and trade ships have DR2, and warships have DR3+. Each point of strake DR also stops 1 rad/s. This encourages the use of swords and bows in boarding actions.

Solar System

This setting assumes a generally "cinematic" lens is on, each asteroid has at least 0.1G. In general, objects as small as mile-wide asteroids have normal air pressure, although space has "thin" pressure (see page 429 of the **Basic Set** and page 137 of **Compendium II**). This means that unpowered ships do slow to a halt, and then drift with the solar wind. The temperature in the "vacuum" of space is -40°F. Solar wind brings mana, but also "mana sickness" (see radiation, page 435). Although the long-term sickness (and genetic damage) it causes can be cured with magic, and HP lost must be healed by rest.

Terra

Terran nobles are beginning an unspoken contest about who can import the largest floating island from the gas giants. Some Terran nations are building floating air facilities out of imported rocks. Few forces can directly harm such floating fortresses. Each country has launch facilities as close as possible to the equator to save time on launch (but see "Beanstalk," below).

Terran Orbit

Terran orbit is starting to become crowded with fortresses and factories, and the Terran countries have had many armed conflicts. The difference comes in when an invader stops by to cause trouble, be they pirates, or the alien Luminals or Glacials (see below). Only then can human prejudices possibly disappear, at least for the duration of the conflict.

Luna

The moon actually rotates, but it is half-covered in black "soot." This residue is suspected to have originated in the destruction of the Fifth Planet (see Asteroids, below). This soot causes the immediate area to be any kind of higher aspected mana. Thus there is a growing industry that continually sifts through the regolith for "Very High" mana dust. Machines must go through thousands of tons of regolith to obtain a handful of "Moon Dust." Despite the abundance of fuel, there are relatively few port facilities due to the difficulty of defending them. This may change with the completion of some new artillery in the near future, but nations often fail to come to each other's aid. The permanent settlement, "Startown," is built on the North pole, so that the magistrate can always signal a base orbiting Terra.

Sun

Mission Control for the Luminals (see below). The surface is very hot, perhaps 200°F.

Mercury

This planet appears to be tide-locked with the Sun. The side continually facing the Sun is quite hot (120°F/50°C), and the dark side is quite cold (-4°Fz, making the respective territories perfect for colonies of the Luminals and Glacials, respectively. In the twilight region is a green band with a lush ecosystem that is often torn in places as the war between Lumiunals and Glacials damages regions. The ecosystem adapts quickly and regrows to recover from the damage, but it is losing overall. There is some evidence that Mercury was once a larger garden world, but its "life zone" was removed, and the planet's rotation was stopped.

Venus

Vast stands of trees reach into the clouds in the temperate and tropical zones of this jungle planet. Between the tall trunks are low plains. This trend is reversed in the colder latitudes, with the occasional stand of trees. There are traces of an ancient civilization, with many scarred ruins seemingly at random, some under huge, ancient trees. Toward newcomers, the indigenous halflings are shy, the centaurs, stoic, and the giants and minotaurs are hostile. The port of Aphrodite is a small trade center in a clearing made by a meteorite. It is built as a fort to protect it against frequent raids by giants and minotaurs. There is evidence of an ancient city under the settlement, but no entrance has yet been found. The settlement is adjacent to a large plain controlled by a powerful tribe of centaurs. See Races, below.

Mars

There are many ruins of a different, but not completely dissimilar, ancient civilization on this rusty desert planet. These settlements are often buried under sand or contemporary settlements. Local legends and elven lore indicate that Mars was once green and lush, but an ancient war shattered the ecosystem. The goblinoid races are currently rebuilding their civilizations, but are slowed down by the reptile men at every turn. The largest spaceport, dubbed "Ares," is an extension of the largest goblin city. The current landing areas appear to be over the ruins of an ancient spaceport. The site was selected because it was flat, non-arable land. See Races, below. See also *GURPS Mars*' "Dying Mars," replacing the races presented therein with the fantasy races above.

Moons: Phobos is unremarkable. Deimos has traces of prior habitation, including an anchor for a beanstalk.

Asteroid Belt/"The Fifth Planet"

The belt is a wide area, with enough room for everyone, and is too big for any one group to claim or patrol. There is a growing industry mining valuable ores. The more cautious and timid groups tow objects back to Terra, Mars, or Callisto for dissection in safety. Several armageddon cults are based here, and seek to bring destruction to other habited worlds. Evidence suggests that the asteroid belt was once a high-mana planet, creatively called the Fifth Planet. Ever so rarely is an artifact found, often part of a furnace or a wall. This spurs a fine inspection of the region, rarely netting anything new.

Jupiter

This majestic planet has many features. Landing on its main ring can offer an observer a great view of the floating continents below, and the Jovian moons above, especially the four largest (see *Gallilean Moons*, below). Most of the floating continents are as large as any found on Terra, but some are as small as a house. The land masses float at a variety of altitudes, based on the ratio of "lift rock" in them. This causes a certain amount of antigravity lift, causing the mass to naturally float to a certain altitude. If one tries to move it up or down from this point, it feels just as heavy as solid rock. Experiments show that the rocks also keep a certain altitude on Terra, although the math and ratios are not yet understood. The refining of this mineral is an important aspect of ship construction, but quickly dooms the island to fall to the deep clouds of Jupiter. Thus as the ore is extracted, it is kept on the island until all the machinery is removed, as once it goes, the island plummets.

The Great Red Spot is where the most concentrated mining efforts are, despite it being three times larger than Terra. The best research indicates that this is where the core of the Fifth Planet fell when that world was destroyed (see above). The red dust is a Very High mana compound very similar to that found in minute quantities in the lunar regolith, but it is very risky to try to harvest it from the storm. It is still attractive, despite the distance, as this is pure, and needs no refining.

Radiating its own heat, Jupiter's air is warm and dry. Despite this, there are rain storms at high altitudes. The tops of most rocks are covered in plant life and soil. Habited regions tow and anchor islands together, and link them with ramps and bridges. No one is sure where the occasional new island appears from, but they appear to surface from the Deeper altitudes, bare and without greenery. Descent into Jupiter will mean that the air pressure will soon become Dense (see page 429 of the *Basic Set* and page 137 *Compendium II*).

Gallilean Moons

Io: This volcanically active moon is the farthest stronghold of the Luminal people. They fiercely guard its airspace. As the geography changes quickly, there is little known about this moon today.

Ganymede: This moon is complicated. For some unknown reason, its seas are inhabited by a variety of war-like aquatic creatures. The Glacials claim its surface, but cannot control its watery resources. The aquatic combatants fight equally against each other as they undermine the Glacial facilities. Terran forces have been trying to contact the aquatic races, but have barely been able to identify them (see Races, below).

Europa: This body is the little sister to Ganymede in most respects, including the smaller-scale war within it.

Callisto: The outermost of the major Jovian moons is a lonely planet without life or unusually abundant resources to call its own. It is, however, the only safe place in the Jovian system for Terran nations to build supply outposts, however. From here, protected convoys escort vessels to and from the floating islands below. Although Jupiter's Main Ring is inside the orbits of the major moons, it is too hard to defend.

Saturn

The second-largest gas giant in the solar system has a composition similar to that of Jupiter, but the rings have many levels and can be inhabited.

Titan: The moon of Titan has an ecosystem. It is the farthest body out that has recognizable life. Thus, it is the farthest Terran colony on a rocky biosphere. It is the last staging ground for exploration (or invasion) of the outer system. A well-fortified multinational outpost is under construction. Alone together, away from Terra, these settlers fear a common foe from the deep.

Uranus and Neptune

These two brothers share features similar to those of Saturn and Jupiter, but their floating islands are mostly composed of ice. The temperature at "normal" pressure is on average 20°F, and drops to -75°F at "Dense." There is no life here as Terrans know it (but see Races, below).

Triton: The Neptunian moon, Triton, has a tundra ecosystem, populated with penguins, polar bears, and other anachronistic animals. The average temperature is about freezing 32°F.

Pluto

There is some evidence that Pluto was once a larger garden world, but its "life zone" was removed, and the planet was split in twain -- Charon is only half the diameter of Pluto. Today it is a last resting place for many creatures, a dumping ground for abominations that cannot be destroyed. The "cemetery-zoo" is spread across the opposing faces of Pluto and Charon (e.g., the sides away from the tide-locked hemispheres). The Glacials taunt fate by stealing life from sleeping immortals to fuel ships (see Races, below). It is a pressing question among philosophers as to who placed these creatures on Pluto. The elves have evidence that they have added to the collection, but cannot prove that they laid all these cryonauts to rest. That said, not all are immortal abominations, some are self-imposed exiles, and others are prisoners.

Beyond Pluto

No Terrans have explored this far out. There do not seem to be unusual levels of mana nor much light. Discovery of a garden world out here, a "Planet X," could certainly change opinions, however. Using a modern astronomical chart, heroes could explore objects unknown in the previous centuries, such as [136199 Eris](a.k.a. "Xena").

Dramatis Personae

The Call to Adventure is strong, and almost any character could arise to leave the safety of Terra. Soldiers, prospectors, and housewives could each be doing their national duty, on the run, or just sick of their neighbors. Any standard fantasy race could be seen, be they elf, dwarf, or halfling. Apart from the starfaring Terrans, the humanoids on Mars and Venus are found in modest numbers on Terra, but the Terran and foreign groups have no memory of each other.

Other Terrans

Terran industry is making and ever increasing use of golems. While the most basic golems are unimaginative, humans have "reinvented" the golem, allowing increased levels of intelligence through Moon Crystals. The larger and more complex the crystal, and the less specific the orders, the more adaptive it is. The most recent models seem to be alive, and some claim to be self-aware. There is much debate regarding the nature of Artifice Intelligence. Human researchers have also replicated the elven technique to store the spirit of a (usually) willing individual in a golem. These "ghosts" need not eat or breathe. The most complicated procedures use the Simulacrum spell to make a seemingly-organic form.

Beyond Artifice Intelligence, a GM may wish to play up the local biomods and cybermods with some cyberpunk tools and Gene-weaving spells. Thus, Terrans of all sorts can have mana-powered implants, human and animal-aspected bio-implants, self-powered sensing and communication items, spell wands, and biological-bodied Artifice

Intelligences. Life on Terra can be a typical fantasy setting, or possible rebuilt using a Transhuman culture, with tiny permanent Gateways to send messages and people instantly across any distance. Dream nets could connect sleeping people together in communal Virtual Kingdoms over almost any distance on the planet.

Neighbor Races

All the races found on Terra's sister planets of Mars and Venus are also found in relatively small numbers on Terra. Philosophers ask how this is possible. Some point to teleport failures, others to massive banestorms. The most recent theory gaining popularity is that some "Age of Prosperity" ships visited the three worlds, and stranded the passengers -- or their crew. Martian Races include goblins, hobgoblins, kobolds, reptile men (see Gabrook, page 21 of **GURPS Banestorm**). Venusian Races can include centaurs, halflings, minotaurs, giants (see Lorn'dil, page 22). The aquatic races under Ganymede and Europa may be from Olokun (page 22). See also **GURPS Fantasy**, pp. 106-111.

Alien Races (See The End for Templates and Secrets)

Luminals

It is certain that these fiery beings started their exploration of space from the Sun. They have permanent cities on the Sun, Io, and the hot side of Mercury. Whether or not they actually evolved on the Sun, or simply chose it as their arrival point in the system is a matter of hot debate. Their ships are shaped like flaming birds and manta rays. Unproved rumors include: "to kill a Luminal, drop a bucket of water on it" (*False*). "Luminals cannot stand the dark" (*partly true* -- they dislike absolute dark).

Glacials

It is suspected that these beings of living ice originated their exploration from Neptune. They also have permanent cities on Uranus, Pluto, Ganymede, and the dark side of Mercury. While their most advanced settlements appear to be in the floating ice islands of Neptune, it is uncertain if they are native to the planet. Instead of eating food, a Glacial must absorb a similar amount of water. Terrible stories abound regarding Glacials absorbing victims' fluids. Their ships are shaped like silvery crystal fish. When confronted with food and drink, Glacials may try to eat and drink it, and become confused when they cannot. Unproved rumors include: "Glacials are immune to gaze attacks" (*False*), "Glacials are unusually vulnerable to sound" (*False*).

Adventure Seeds

Fe Fi Fo Fum: The alchemist Ythtic has started to grow a large plant with the intent of growing it into orbit. This "beanstalk" absorbs sunlight and a special nutrient bath, gaining miles of height every day. The researcher has built an enchantment into the plant such that one will transport from one end to the other with no additional energy cost. The large amounts of energy are stored in the plant. With every day's sunlight, the plant grows taller, and different organizations grow more nervous. There are many questions on people's minds, such as "What would happen if the plant should fall, or worse, succeed?"

Spin Around the Black: A courier ship needs testing of a new Wheel drive. It has the latest improved maneuvering engines using wind creation spells at the Jet Propulsion Laboratories. The new design needs some shaking down. The path is a simple swing around some asteroids at a Trojan point. Engineer and Pilot characters will have a chance to shine. The trip itself involves some minor breakdowns, with a major one at the farthest point. While the engine is down, the group is ambushed by some pirates! At some point, the patron will reveal that she has *stolen* the ship, but is not a pirate. She works for a rival corporation. They may be able to save the ship, but can they save themselves?

Raiders of the Lost, um, Ark: An archaeologist finds some ruins which he claims were once a large precursor space ship. He claims that the ship is of goblin or halfling ships design because the crew stations are all less than five feet in height. On the bridge can be found intact Moon Crystals. Were the crew simply short LAI golems? What weapons and

wealth might be aboard?

Extra Spice: A junior military officer from an antagonistic military loudly claims the wreck in the name of his government. He is proficient in loud speeches, and will certainly hamper any PC efforts as he can.

Sleeping King: The heroes are sent to recover someone who has become the last heir to a crown, currently asleep on Pluto. The adventurers will have to contend with competitors who are willing to risk detection by the Glacial bases on Charon. An issue that did not occur to the Patron is whether or not the heir wants the job after all these years.

Baby (Monster) on Board: The adventurers pick up some semi-valuable ore as a consolation cargo. During the flight, a baby void beast hatches (ST 15, Bite: 1d (imp), see the end). It senses the strake shield as a solid barrier, and will lunge at any warm body that gets in its way.

Extra Spice: At the last moment, a GM could choose to have the beast bond to the least likely PC, as a source of roleplaying tension.

Asteroid Mining: The PCs are to help a small group of prospectors out on the Main Belt. Aside from cultist squatters, claim jumpers, pirates, and alien invaders, they must be alert for the slim chance of untold treasures being found in the asteroids, as such would certainly carry a price.

Island Hopping: A Great Red Spot mining station on Jupiter was soon to be threatened by a new floating island. The PCs' patron has dispatched a team to quickly mine and "drop" the island so that it misses the outpost. The team has not reported back nor finished their mission. The adventurers' mission is twofold. The primary goal is to change the course of the island, preferably by mining some Lift Rock. This will save many lives. The secondary goal is to rescue the men from the first mission. The heroes find the area quiet. After the crew debarks, and explores a cave, tentacles reach out and try to kill them! Damaging the tunnel tentacles in any way will reveal that the veins of the creature are heavy in Lift Rock!

Follow-Up: Millionaires have been bringing new islands to Terra. The bare ones are ready to be renovated . . . The race to Terra can be as fast or slow as necessary.

Hot Pursuit: A rebel Luminal scientist wants to defect. The heroes have been chosen for their reputation, disposability, and so on, as they will be beset by Glacials, Luminals, and other nations . . .

The Thin Blue Line: Terran forces have been trying to contact the aquatic races on Ganymede and Europa, but have barely been able to identify them. The heroes are given underwater gear in magical cities and equipment. The group must sneak past enemy lines and contact aquatic allies. The first challenge is to find them.

Cogito Ergo Sum: After leaving a small outposts, the adventurers discover a stowaway on board. It is a golem with an expensive-looking artificial body. It seems to trust the PCs, and confesses that it is a golem on the run. The next port the ship arrives at is all abuzz about a huge reward for a certain unarmed golem, returned intact. Can the fugitive trust the PCs now? After all, they're only human (probably).

Alien Secrets and Templates for *GURPS Fourth Edition*

Glacials

The Glacials are the last survivors of Pluto, who took these icy forms to escape to the depths of Neptune. Later, the first exploration of Pluto is instinctive, but their origin has been forgotten, even by themselves. Their reputation is largely undeserved. It started due to a well-publicized survivor of a raid witnessing some starving Glacials feeding . . . Few individuals have "normal" Magery. Many have Magic Resistance, and a few have Magery 0.

Appearance: A sharp-looking slender golem made of ice.
Category: Elemental-kin, ice.

Diet: water.
ST 15; *DX* 8; *IQ* 10; *HT* 12.
Will 10; Per 10; Speed 5; Dodge 8; Move 5.
SM 0; 400 lbs; DR 2.
Traits: Body of Ice; Dark Vision 5 (Shifted); Infravision; Pressure Support 2; Reputation -3 ("Eats Sentients"); Unaging (Accessibility: temperature colder than -40°F); Very Fat.
Notes: Few Glacials actually have "Phobia (fire)," but all are generally aware of their weakness, unless they are Overconfident.

Luminal

The Luminals have a complex caste system. The most militant are the dominant, warrior caste. The few researchers, poets, thinkers, and meek construction crews rarely leave fortified bases. Most individuals have Magic Resistance, and the rest have Magery 0, or rarely, Magery 1+.

Appearance: Glowing humanoids with fiery orbs for eyes.
Category: Elemental-kin, Fire.
Diet: Thermovore.
ST 8; *DX* 9; *IQ* 10; *HT* 11.
Will 10; Per 10; Speed 5; Dodge 8; Move 5.
SM 0; 130 lbs; DR 2.
Traits: Body of Fire; Bright Vision 5 (Shifted); Perk (Feature: Flashlight); Pressure Support 2; Spectrum Vision; Unaging (Accessibility: temperature hotter than 175°F)
Notes: Few Luminals actually have "Phobia (water)," but all are generally aware of their weakness, unless they are Overconfident."

Void Beast

Appearance: A Dark-grey manta-like creature with a prehensile tail.
Category: Space monster.
Diet: heroes.
ST 40; *DX* 12; *IQ* 2; *HT* 12.
Will 12; Per 12; Speed 6; Dodge 10; Move 6 (Ground).
SM +3; 4 tons; DR 5.
Traits: Chameleon 3; Flight (Space Move 12); Enhanced Move 10 (Space Move 12,288 y/s or 0.6 million miles per day); Ichythoid; Metabolism Control 10; Teeth (Fangs: Impaling).
Features: Native Pressure: Thin; Native Temperature: -40°F
Skills: Stealth-13.
Notes: Must match speeds to attack with "normal" Flight.

Variants

Transhuman Space

Most of the Transhuman Space books can be used whole cloth, provided that the GM make the conversion of terms such as Moon Dust for helium-3, Moon Crystals for computers, golems for cybershells and ghosts for Ghosts.

Gritty

To become more gritty, the ships can colonies all are now fully enclosed. Life support is provided by "air rock" and heat exchangers. Space combat is by grappling and boarding. Ignore the "Recommended physics" under *Solar System*.

The Omniscient Eye

Can I Be a Warrior Princess?

It's common in fantastic medieval settings and in some alternate histories (*Ash* by Mary Gentle comes to mind) for there to be adventurous women warriors and soldiers. Aside form an exceptional person like Joan of Arc, how plausible would this be in real medieval societies form our world? Are there examples from period literature or legend that would also support such characters in the medieval paradigm?
        --Sasha Pixlee

Someone once said "Anyone who uses the phrase 'as easy as taking candy from a baby' has never tried to take candy from a baby." Likewise, anyone who uses the phrase "you fight like a girl!" has probably never fought a girl. Fighting has been an overwhelmingly male profession for most of history, but there are many myths and legends concerning woman warriors. Classical antiquity has both the Amazons, a race of warrior women; and Athena/Minerva, a goddess representing martial virtues and wise strategy; and stories of fighting women appear in many other places around the world. But is there any reality corresponding to the myths? As it happens, even if we ignore borderline cases like women being pressed into service to defend in a siege or women in non-combat roles supporting fighting troops (for example, carrying ammunition), there is.

History is replete with examples of women leading armies. One of the earliest was Hatshepsut, ruling Egypt in the 15th century BC. Hatshepsut led an incursion into neighboring Punt at the head of a large army. One peculiarity of her reign is that the Egyptians, like many other early civilizations, believed that only men were fit to rule, particularly when it came to leading armies, so they had to find a creative way of getting around her femininity. Consequently, she was depicted wearing a false beard and other markers of maleness. When she fought, she did so under the legal fiction of being male.

Later female generals did not have their femininity masked. Since political and military leadership went hand in hand, any country where women could become rulers sooner or later had a woman leading the troops. Boadicea, who led an unsuccessful struggle against Roman invaders, is one of Britain's earliest national heroes. At the opposite end of their empire, the Romans faced Zenobia, the queen of Palmyra. Warrior queens, princesses, duchesses, and other women leading troops appear scattered through the Middle Ages and into modernity. If the lord of the manor was abroad or incapacitated when his castle was attacked, it was often up to his wife to lead the defense. There are also a number of cases where a woman, using an ineffective husband as a figurehead, had to take direct control of the troops. A few women led their own sides in dynastic struggles, fighting their brothers, male cousins, and even husbands and ex-husbands. For example, Urraca, sole heir to Aragon in the early 12th century, spent years in the field in an ongoing attempt to recover lands lost to her first husband after their marriage was annulled.

However, just because they're leading armies doesn't mean they're actually swinging swords. Many war leaders, male or female, led from at least a few ranks to the rear and surrounded by bodyguards, the better to see what was happening on the battlefield, issue orders, and preserve their own precious skins. And even if they did lead from the front, they wouldn't necessarily have been effective fighters. Joan of Arc is a perfect example. Despite the legends which grew up around her, she was ultimately just a teenage girl with religious visions and no martial training, whose value was as a rallying point and morale booster, not a killer of men. There's no indication that Joan ever weilded a weapon. Still, a few definitely did know how to defend themselves. Matilda, countess of Tuscany in the 11th and 12th centuries, is said to have learned martial skills as a child just as a noble male child would have, and appears to have put herself on the front line several times. And even without formal training, a noblewoman could easily have applicable skills of riding and archery, acquired for the popular pastime of hunting.

A frequent theme in stories is women warriors who start

their martial careers disguised as men. The most famous is probably the Chinese girl Hua Mulan, who went to war disguised as a boy in order to save her father from military service. Similar women-in-disguise stories appear elsewhere; there are, for example, several instances in Scandinavian epic poems. It's unclear just how often that might have happened in the real world, though. Any woman who disguised herself was, after all, trying to keep a secret, so presumably most instances of it would have gone unrecorded.

Still, some few examples do crop up, with the turn of the 18th century being the golden age for transvestite women in uniform. Two of the best-known examples are the pirates Mary Read and Anne Bonney. They enjoyed long (as such things go) and fairly successful careers as pirates, dressing as men until they were captured. A few women disguised as men appeared in the Scottish dragoons around that time as well.

And, to finally reach the real point, on some rare occasions, women did openly act as regular soldiers. The hotbeds of this kind of activity seem to have been the northwestern and eastern fringes of Europe. In addition to having a long tradition of warrior queens, the Celts had a long tradition of women on the front lines. On the other side of the continent, there are indications of female warriors, in the form of images in contexts which suggest actual events or graves containing the bodies of armed women, among Scythians and Hittites.

Actual fighting women occasionally cropped up elsewhere through Europe and Asia, even during the intensely patriarchal Middle Ages. Women fought in the Crusades, much to the dismay of Pope Clement III, who issued a bull prohibiting it (though it apparently didn't work, since there are passing mentions of women fighting in later Crusades as well). An account survives of a woman of Pozzuoli who went around fully armed, fought, slept in the field like any other man, and could beat her male companions in competitions of strength. The evidence of English muster rolls indicates that a handful of women turned out during troop levies, some providing their own arms. A few knightly orders even admitted women, though exactly what their role may have been is unclear.

Though female warriors have very much been the exception rather than the rule, they also appear to have been hard to stop. There were repeated attempts through the history of western Europe to remove women from the battlefield, but until the establishment of heavily regulated modern armies, those efforts were largely unsuccessful. For most of history, and particularly in tribal and feudal systems, the organizers of large armies simply don't have the authority to impose conditions on their troops, be it armament, age, or sex. So if a few women appeared when troops were mustered, as occasionally happened, local commanders might be disinclined to turn them away, either for lack of other troops or because of a social awkwardness in turning them away. And when an officer brought unusual troops with him, they were his responsibility, not that of commanders higher up the chain.

So what does this mean in a game? Mainly that, while woman warriors are definitely unusual, almost always appear alone rather than in groups (though even here are exceptions; 17th century Dahomey saw the formation of a seldom-used but well-trained female bodyguard for the king, and one shogun's mistress is said to have commanded an all-female troop of cavalry), and can excite considerable interest, they're not, in many historical settings, impossible, nor even so rare as to be utterly unique in their own time. And since characters who appear in adventures tend to fall into the unusual-but-not-impossible category, that should be just fine for most games. There are few circumstances which are strongly correlated with warrior women, perhaps simply because they're so rare overall, but two things do appear to make them a bit more likely. The first is broad-based ideological struggles. Women warriors appear to be more common where an ideal is at stake. The Crusades are one example, but they also appear more frequently during insurrections. The second is states of weakened authority. Women leading feudal armies appear to be a consequence of their throwing off, being relieved of, or never having been under the authority of a husband or father, female bandit chieftains and pirate captains are far more common than female police and naval officers, and women warriors appear more often in less centralized tribal societies than in massively hierarchical states. So long as nobody is there to stop

Novelty Act

Just as women occasionally appeared on the battlefield, they sometimes appeared in the Roman gladiatorial arena. Mentions of female gladiators and charioteers appear sporadically through the 1st and 2nd centuries AD until they were banned by Septimius Severus. They competed both against one another and against men. Though it may have been just another example of the Romans' love of unusual gladiatorial battles, at least some of them were doubtless competent fighters.

her, you can put a woman on the front line just about anywhere.

Tatters of the King: Hastur's Gaze Gains Brief Focus Upon the Earth (for [Call of Cthulhu](#))

Published by [Chaosium, Inc.](#)

Written by Tim Wiseman

Cartography by Antony Fentiman

232-page perfect bound black and white book; $27.95

During the final years of the 1920s, the winters are cold, and the star Aldebaran is visible in the clear night sky. A malign influence falls upon the Earth, felt by the sensitive and the weak willed; it finds expression in the output of the artistic set. The lure of the stars is seen in poetry, painting, theatre, and even radical science, sometimes as a thrill, at other times as a taint that drives men to madness. The medical profession doesn't yet have a name for this "sympathetic madness," but there are those who can explain it. The Earth has fallen under the gaze of the Great Old One known as Hastur, and his cult seeks to either bring the doomed city of Carcosa or his avatar, the King in Yellow, to Earth.

[SPOILER ALERT!]

This is the stage for Tatters of the King, a new campaign for ***[Call of Cthulhu](#)*** set during the game's classic 1920s period that will take the investigators on a journey beginning in Britain and traveling to Italy, India, and Nepal, before climbing to a final confrontation above Tibet on the Plateau of Leng. Compared with ***Delta Green*** or ***[Realm of Shadows,](#)*** *Tatters of the King* is hardly the most radical release. Compare it though to earlier campaigns such as ***[Shadows of Yog-Sothoth](#)*** or ***[Spawn of Azathoth,](#)*** and ***Tatters of the King*** is different, progressive, subtle, even delicate, and shows its predecessors to be heavily structured, almost clumsy affairs.

The first difference is its choice of Great Old One, Hastur being often overlooked in Chaosium's ***Call of Cthulhu*** canon, having only appeared in scenarios such as "Tatterdemalion" from ***Fatal Experiments*** and "Tell Me, Have You Seen The Yellow Sign?" from ***The Great Old Ones.*** Known as "He Who Is Not To Be Named"; associated with the City of Carcosa, the King in Yellow, the Lake of Hali, and the Yellow Sign; and revered by an reputedly abhorrent cult, Hastur as an entity is ill-defined within ***Call of Cthulhu.*** Indeed, for ***Tatters of the King*** the author draws not from the core rulebook, but from John Tynes' approach to the Great Old One, first discussed in ***[Unspeakable Oath #1](#)*** and developed further in ***[Delta Green: Countdown.](#)*** Thus Hastur is not a personification, but a force of entropy, one that beguiles as much as it disturbs and disrupts.

The second difference is the campaign being set in the United Kingdom for its first and second parts, beginning in London. There is nothing to say that characters of other nationalities cannot travel there, but penned by an English author, ***Tatters of the King*** is the game's most anglophilic supplement since ***The London Guidebook*** and ***Green and Pleasant Land.*** Both of these supplements would be helpful in running the campaign, but since they are out of print, the book includes an appendix describing the London and United Kingdom of 1928. Although the third part of the campaign will take the investigators to foreign climes, the setting of its first half in England and Scotland is not only

refreshingly un-American, but also adds much to its mood and feel.

Designed for four to six characters, *Tatters of the King* also has one particular requirement and one suggestion. One of its characters has to be an Alienist (a now obsolete term for a psychiatrist or psychologist), whilst another should be an artist of some kind. The first is necessary because the campaign proper begins with the Alienist being asked to consult on the mental well-being of an asylum patient, whilst an artistic character will enable the investigators to move in creative circles.

Tatters of the King is structured into three parts and a prologue. The latter opens in October 1928 with the investigators attending an amateur production of an avant-garde play that ends in hysteria, disarray, and affray. It also exposes them to the Yellow Sign, thus opening them up to a series of dreams that will haunt them over the course of the campaign. Book I: The Madman and the campaign proper opens with the Alienist being consulted on a patient, Alexander Roby, who was committed following the unsolved murder of his father and sister. During the interview, Roby becomes animated and mentions not only the events of the play seen mere days before, but alludes that he and his friends know something far more.

It transpires that Roby was involved in some kind of cult, one that still has an interest in him and soon after, in the investigators. Shadowed by the cult, hints of its activities come not just from the investigation, but in dreams and from an anonymous benefactor, pointing to deadly arcane rituals performed in the past and another to come. This is to be held in a place familiar to long time *Call of Cthulhu* devotees, *Shadows of Yog-Sothoth's* Scottish village of Cannich. What they discover is not the village, but Carcosa itself, brought to Earth but not yet made permanent. Preventing both this and the summoning of Hastur to Earth brings the first part of the campaign to a halt . . . at least temporarily, for another difference is that the campaign contains a six months gap between parts.

This period gives time for pause and reflection, perhaps even an opportunity for the Keeper to run other scenarios, but it still leaves the campaign half done. The intermission ends with the appearance of the investigators' anonymous benefactor and the reappearance of Aldebaran over the British night sky. Book II: British Gods reveals him to be both a member of the Hastur cult and of another group based in the rural gloom that is Goatswood, deep in the Severn Valley. More amenable to the investigators, this cult reveals that the Hastur cult has not been stopped and remains a threat. The clues point East.

After Book II's bucolic interlude, the campaign picks up pace for Book III: The Upper House. More clues are found in Milan, where the investigators learn that the cult has gained the inadvertent aid of Italy's fascist government. The campaign comes to a climax after a hardy trek into the Himalayas onto the Plateau of Leng. There they confront the last of the cultists, all too rational and determined to bring the King in Yellow to Earth. And if they stop him, the manifestation of Hastur will turn to the investigators.

[END SPOILER ALERT]

The emphasis throughout the campaign, and its strength, is its atmosphere. Tatters of the King is permeated by an ethereal quality, a dreamlike feel that seeps from the pages. You can almost sense the quiet tension and madness underlying almost every scene that only comes to the fore during the sequences in Carcosa and the downright alien place above the Earth. Potentially an incredibly difficult scene to stage, it is very well handled and the Keeper will have no problem conveying its madness. The subtle feel also extends to the campaign structure, which still follows the onionskin format, but its layers are more slivers than chunks.

Despite the campaign's quiet hysteria, encounters with the Mythos are far and few between. Similarly, moments of violence happen rarely. When either does, such scenes are all the more effective and dangerous, because the investigators are unlikely to be as well armed as they might in other campaigns. Tatters of the King is more mannered and civilized with the emphasis on investigation and interaction with all of its NPCs, cult members included.

The other major difference, and it is an important difference, between *Tatters of the King* and almost any other campaign before it is that *Tatters of the King* transcends the pulp format and style of its forbears. This shows in the mood and feel, in the choice of Great Old One, and in the low-key nature of the cult and its members, who do not chew the scenery or set hordes of cultists on the investigators.

Physically, **Tatters of the King** is Chaosium's best-looking book for years. Ashley Jones' art is suitably dark and quietly twisted, whilst Anthony Fentiman's cartography, with its architectural feel, is perfection following Chaosium's constant cartographic fumblings. Fentiman should do all of Chaosium's maps from now until the End Times. Tim Wiseman's writing is similarly good and constantly works to be helpful.

Yet **Tatters of the King** is not perfect. Its story is linear and perhaps too subtle in places, clues not always being helpful or easy to interpret. It is also easy for the players to become distracted (for example, by the events in Goatswood), but perhaps the author can revisit there in a sequel.

After this, I very much look forward to seeing the author's next work; it is fair to say that Chaosium has not put out a book as good as **Tatters of the King** since ***Unseen Masters*** and ***Beyond the Mountains of Madness.*** This is as mature and as subtle a campaign as **Call of Cthulhu** has received in years, and it would truly spoil its delicacy to play it in the game's sometimes pulpish mode.

The Zorceror of Zo

Written by Chad Underkoffler, with additional material by Andrew Byers and Scott Kane

Art by Fred Hicks, Greg Holkan, & Scott Kane

Edited by Eric A. Burns

Published by **[Atomic Sock Monkey Press](#)**

104-page PDF, $15 (One Book Shelf)
202-page digest-size softcover (print on demand), $30, includes PDF (Indie Press Revolution or One Book Shelf)

I grew up with fairy tales. My mother read me to sleep with a story most every night until I was eight, and long before that I was devouring them on my own. Not long after that, I was allowed a library card and carried on further. I was particularly fond of the *Oz* books, with their simple plots, vivid settings, and recurring and *evolving* characters. I even had the privilege of (carefully!) handling and reading some of my grandmother's hardcover *Oz* volumes. I don't know if anyone grows up like this any more, in the age of the graphic novel, the iPod, and the game console, and it's difficult to decide what to make of the recent wave of fairy tale-themed games (*[Grimm,](#) [Deliria,](#)* **Faery's Tale,** and others. With **The Zantabulous Zorceror of Zo** (that's how the cover reads, in plain tribute to Baum *et al*), auteur Chad Underkoffler tells us exactly what to make of his game and goes on to tell us how and why it came to be. It's a fine game, but it's an even better story.

Let's lay these cards out for all to see right now: I like Chad, I've enjoyed his work, I've liked the Prose Descriptive Qualities (PDQ) games (either Chad's or other peoples') very much, and I'm not going to waste our time here recounting for a third or fourth time the mechanics of the game engine. See these reviews of *[Dead Inside,](#) [Monkey, Pirate, Ninja, Robot, Truth & Justice](#)*, *[Questers of the Middle Realm](#)* from Silver Branch Games, or **Ninja Burger** (second edition) from Aethereal Forge.

What sets **The Zorceror of Zo** apart from its kindred is that it uses "The Good Parts Version" of PDQ. (That's an homage to William Goldman's *The Princess Bride,* an exemplar of a modern fairy tale.) Consider an average roleplaying game (or wargame): hundreds or thousands of paragraphs, but only a few score used regularly and reliably. "The Good Parts Version" reflects the core elements of PDQ, mostly drawn from the **Truth & Justice** incarnation, with the components seldom used in play discarded. Hero Points remain, with their uses tailored to fairy tale conventions: Spend them to boost your actions, help you recover from damage, or to "retroactively edit" a scene to be more interesting. Powers and Stunts are disposed with as inappropriate to the genre, and the overall presentation of the rules streamlined to its simplest form. It's still PDQ, but it's the parts that actually get use.

How do we know they get use? This game's subtitle reads "A Fairytale Role-Playing Game," but another subtitle on the credits page reads "(a PDQ campaign in actual play)." And that's how we know, and how this book is able to reach over 200 digest-size pages (of rather large print, true). We get 15 pages of the masterful description of genre and feel that we've come to expect in ASMP books. We get an eight-page overview of the Land of Zo, just to establish a frame of reference for what's to come. The rules and an example of play dialogue take up 35 pages, and a discussion of making characters occupies another 30 (and provides many NPCs and more background to the Land of Zo). A chapter

on gamemastering takes a bare 10 pages, but this section is more about the high themes of gamemastering in fairy tale lands. Chad even manages to shine a light on the darker shadows without causing the shadows to enlarge and take matters into their own hands. There, we've summed up half the book, and no one would have faulted Chad for stopping there with a lean, light, focused game book. But *The Zorceror of Zo* is more, so much more.

The balance of the book recounts the campaign, from late-2005 until mid-2006, in which Zo was created, developed, and matured. "For a *hundred* pages? Half the book?" you might grouse. Be honest, reader; you've always thought your campaigns would make great books. You might even have kept prose recaps of game sessions. Adopters of more web-based models might know no other way, gaming in chat or via blog or journal. What makes this account special, and worth the investment, is the detail in which Chad and his players recount the life of the campaign: from the give-and-take of creating the key player characters, to the sly manner in which the GM seeds plot elements into the campaign, playing out the line until the events of the grand climax come, totally unexpected but totally foreseeable . . . the "First ZoZ Campaign" provides the finest example of how a roleplaying campaign is executed that I've ever read. And you get it twice, as the author includes transcriptions of his notes on the sessions and you can see where things went as he expected and where the players careened well away from the path anticipated. The players get their say, too, providing "commentary tracks" alongside the author's account.

Kudos to Fred Hicks for creating a layout which fuses the conventions of an ASMP book with the sensibility of a classic storybook. The art is mostly simple line-drawings in a genial vein, with the occasional more elaborate piece or manipulated photo for variety. I smile every time I turn a page and a whimsical imp (either in line or in silhouette) dances in the margin. The cover image is very appealing, with the "replica binding" effect we've become familiar with from the *Dungeons & Dragons* line but far less gaudy. A color map of Zo on the back cover evokes the traditional map of Baum's Oz. (The map is reproduced somewhat larger in and among the obligatory forms and charts appendix.) The print version carries the same level of quality as the printed version of *Spirit of the Century* from Evil Hat (another book distributed via Indie Press Revolution), and it does not feel or look cheap. Regarding the PDF version, it offers 12" × 9" pages (reproducing two pages of the print product per page). If you choose to print on letter-sized paper, the pages will necessarily be reduced, but since the typeface is generously large, the result is still amply readable.

This is, I think, the key merit of *The Zorceror of Zo:* it is an intensely personal work in a way few game books show, crafted by a man who loves both fairy tales and adventure games and who found a path to combine the best of both with astonishing fidelity. And then he shared it with us. It's not a free sharing; craftsmen deserve to be paid for their craft. But the value in the specific examples and demonstrations make this book worth the effort of printing out, or the expense of ordering the print-on-demand edition.

Those *Oz* books I grew up with were passed to me when I graduated high school. The tome of stories from which my mother read was handed down at the birth of my first child. I think it's high time to teach my daughters about fairy tales. Fortunately, *The Zorceror of Zo* encourages and approves of such efforts. Hail Zo!

Putting Together Flashback Pieces Like a Jigsaw

Over the past few days I saw the *Saw* trilogy; I'd seen *Saw* but hadn't seen the need to see more *Saw* 'til I resaw the first *Saw;* then I saw *Saw II,* too, and made it three for three I saw by seeing *Saw III.* It's a good thing I saw these three before, because this Halloween there will be four to be seen when *Saw IV* makes the scene with scenes so *Saw* they need to be seen before they can be believed.

But, wordplay aside, the *Saw* series is something like the gory morality plays of the movie *Se7en,* only about half as thoughtful. (Perhaps the movie series should be renamed *Thr33-p.int-fiVe.*) But, from a gaming standpoint, it's interesting to watch ("How would PCs react to *this* situation?!"), and the second movie has the shtick where the [antagonist surrenders to the cops](#) early on, so it can't be all bad.

Now, the second and third installments in the *Saw* howevermanyology do something interesting that isn't done very often in movie sequels. See, sequels usually chart entirely new territory; they take place a week, year, month later . . . or whatever. They may add to the storyline, but they usually don't return to previous ones, at least directly.

In comparison, *Saw II* and *Saw III* both make return visits to the first *Saw,* replaying scenes but adding new information, unknown details, and startling new secrets. ("Startling" here being synonymous with "What the heck?!") It would be akin to having a scene in *The Empire Strikes Back* where you flashback to Han, showing what he was doing in Mos Eisley in the previous movie before Luke and Obi Wan showed up.

Like I said, in movies this is relatively uncommon. I seem to recall that *Superman II* had an extended version of the trial of the Kryptonian villains, and I think the *Lord of the Rings* movie trilogy hopped around a bit between movies, especially with various subplots. (I'm sure there are others.) But, in general, movies usually act as compartments, where scenes from one don't intermingle with others.

On the other hand, this technique is pretty common in novels and comics, where the desire to squeeze in "one more scene" into a previously popular installment can prove irresistible. For example, one of the Batman Halloween specials depicts a flashback scene where the young boy Bruce Wayne begs his mom to wear her pearls before they go out to the movies that night, because he thinks she looks pretty in them; although she's reluctant at first, she eventually agrees. (For those not steeped in their Batman lore, the pearls were the thing that the killer was interested in.) And on *Star Trek: Deep Space Nine* they revisited the old "Trouble With Tribbles" episode, explaining what happened "at the same time" (thanks to time funniness).

And it's also popular in cross-media properties. For example, the game *Star Wars: Dark Forces* depicts how the plans for the Death Star got into Princess Leia's hands before *A New Hope.* (It apparently involved a lot of running around and shooting things in pixelated grid-like spaceship dungeons.) It's often used in all media to fill in (seeming) plot holes or oversights: "How did Dr. Avalon survive that acid bath?" or the like.

And, finally, it's fairly common in the gaming world. Speaking from personal experience, I know I've gone back to the trough many a time following popular adventures; for example, in a Supers campaign I once created a catalyst-character called The Enforcer (written about at least [once before](#)), where -- in the campaign origin story -- I specifically left a hole of two minutes in the establishing scene. (Big Bad Guy shows up, Big Bad Guy teleports away for two minutes, Big Bad Guy shows back up to get his butt kicked.) At the time I established that hole, I had no specific plans for it; however, afterwords two players worked in their own visitations, and I incorporated that hole into two future adventures. In short, it's a good thing two minutes works out to 120 combat rounds in *GURPS,* because he was plenty busy in that time.

Tapping previous adventures is also not unique in the professionally retail world. There are adventures such as ***Return to the Tomb of Horrors, Return to the Temple of Elemental Evil, Ravenloft II: House on Gryphon Hill*** (which had rules for playing it concurrently with the first installment), and ***Goldfinger II: The Man With The Midas Touch.*** And plenty of company's metaplots have shoehorned in previously unknown details of a game world (***Aberrant,*** I'm looking at you).

The advantages of using this technique are fairly obvious. By riding the coattails of a previously popular tale, you're most of the way toward re-conjuring the warm fuzzy feelings from that first installment. Likewise it can help stories feel more connected; if the heroes learn that there was a previously undiscovered secret passage in the remains of the villain's base that leads to new adventure, it has an immediate "ah-ha!" hook that it wouldn't have otherwise: "Ah-ha! This adventure couldn't be plopped down wholecloth in another universe, because it's set in *our* defeated villain's base!"

However, there are also pitfalls. First, there's always the danger of tainting the previous tale if the new addition raises too many eyebrows. For example, the Batman Halloween tale described earlier greatly disturbed me when I read it; it transformed Batman's origin from "Yes, Bruce, your parents were killed" to "Yes, Bruce, your parents were killed . . . and it's basically your fault." Likewise, attempts to explain away plot holes (unless they were *really* bothering the players) often results in less satisfaction, not more; as a reader, I didn't necessarily want an explanation as to why Bruce Wayne's mom was wearing pearls . . . and now that I have one, it feels in some ways clunkier than not having any answer at all.

Second, from a gaming standpoint, it can raise questions among the gaming group, which can lead to trouble. In our passageway-hidden-in-the-villain's-base scenario, a player might raise the question, "Why didn't we notice this development before, and/or why weren't we able to interact with it?" The more outlandish or PC-affecting the add-on is, the more backlash there can be. ("Wait; you mean when I was revealing our secret plans to my mother last month, he was actually the shapeshifted form of our evil arch-foe? Did I get a perception check to notice that? Did she have *all* my mother's mannerisms down? Don't I have some detect-evil-type ability?")

If you're going to try to incorporate a future "revelation" story into an adventure, probably the best advice I can offer is to try to come up with that hook first; even if you don't necessarily know what that revelation is going to be (like me with my missing two minutes), at least there exists a ready-made hole. And the more you can plot out ahead of time, the more clues and foreshadowing you can drop, which leads to more of an "ah-ha!" when things fall into place. Barring that, keep an open ear for the players; they're often better at finding (or fabricating) such possible hooks than GMs are in creating them in the first place: "Okay, gang; there might be an underground passageway here, so make a note to explore this area thoroughly later."

Playing with the past is always a dangerous prospect, but it can be worth it in certain circumstances. But be careful; if the PCs find themselves back in a filthy washroom with a hacksaw by their feet, hopefully their first thought is one of dread rather than "Not again . . ."

Dwarven Masters

Three New Prestige Classes for the *d20 System*

by Richard Farrese

Dwarven Battle Priest

Dwarves make crafty smiths and fearsome warriors. When they join the clergy, they often become fervently dedicated members of the deity they serve. In some dwarven temples, clerics aim to achieve a balance between the faith and respect they have in their god and their races natural resolve, fervor, and physical endurance. Trained properly, these priests learn how to fight as efficiently as the mightiest warriors of their kin. These martial skills, combined with the divine blessing of their chosen deity, make the men and women who join this highly specialized clergy extremely resourceful on the battlefield. These people are known as dwarven battle priests.

Regiments of battle priests composed of six to a dozen members are not uncommon in some of the major dwarven temples. These warrior-priests typically serve a deity associated with warfare or the defense of the dwarves and their culture. They generally lead and train groups of warriors hired to protect the temple they serve, but many of them travel the globe in search of adventure. Ever seeking to further the cause of the god they venerate, dwarven battle priests are fearless combatants equally adept at killing than at healing. Among the dwarves, they are considered highly respected members of society, and warriors view them as indispensable allies on the battlefield.

Only dwarves may become battle priests, but both males and females are accepted into the Venerable Order of Battle Priest as each of the regiments are officially called. Battle priests usually hail from the ranks of the cleric or paladin professions. The vast majority of them have at least some levels in the cleric class. Multi-classed fighters, rangers, and even some rogues are sometimes accepted into the Order, but members of other professions seldom are.

Hit Die: d10

Requirements

To become a dwarven battle priest, a character must fulfill all the following requirements:

Race: Dwarf
Alignment: Lawful good, lawful neutral, neutral, or neutral good
Base Attack Bonus: +5
Skills: Knowledge (religion) 8 ranks
Feats: Combat Casting
Spellcasting: The ability to cast at least five divine spells per day.
Special: The character must be an active follower of a dwarven deity offering its priesthood access to at least one of the following domains: Protection, Strength, or War. The character must also have access to at least one of these domains and be able to cast divine spells from this domains spell list.

Class Skills

The dwarven battle priests class skills (and the key ability for each) are Climb (Str), Concentration (Con), Craft (Int), Diplomacy (Cha), Heal (Wis), Intimidate (Cha), Jump (Str), Knowledge (history) (Int), Knowledge (religion) (Int), Knowledge (the planes), Profession (Wis), and Spellcraft (Int).

Skill Points at Each Level: 2 + Int modifier

Class Features

All the following are class features of the dwarven battle priest prestige class:

Weapon and Armor Proficiency: A dwarven battle priest is proficient with all simple and martial weapons, armor (heavy, medium, and light), and shields (with the exception of tower shields). Note that armor check penalties apply to the Climb and Jump skills.

Spells per Day: A dwarven battle priest continues to get access to more powerful divine magic while gaining levels in this prestige class. When he acquires a new even-numbered level, the character gains new spells per day as if he had also increased a level in the divine spellcasting class he belonged to before he added this prestige class. He does not, however, benefit from any other advantages a character of that class would have gained (such as improved chances of controlling or rebuking undead creatures). This essentially means that he adds half his dwarven battle priest level to the level of whatever other divine spellcasting class he has, then determines the spells per day accordingly.

If a character had more than one divine spellcasting class before he became a dwarven battle priest, the player must decide to which class to assign each even-numbered level of dwarven battle priest for the purpose of determining divine spells per day.

Invigorate (Ex): A dwarven battle priest is a paragon of virtue on the battlefield, standing side by side with brave warriors on the frontline and risking his own life to protect his comrades in arm. Beginning at 1st level, he can bolster the morale of allies engaged in combat by chanting a traditional dwarven hymn. All friendly characters within 30 feet of the dwarven battle priest and able to hear his voice benefit from a +1 morale bonus on all saving throws as well as a +1 morale bonus on weapon damage rolls. For dwarven allies, these morale bonuses augment to +2.

It takes the dwarven battle priest a full round action to activate this ability, and its effects lasts as long as he continues to chant plus 1 round for every level he has in this prestige class, or until combat ends (whichever comes first). Deafened allies and those who move out of range lose the benefits granted by this ability. Invigorate may be used once per day at 1st level, twice at 4th level, three times at 7th level, and four times each day at 10th level. This is an enchantment (compulsion) effect.

Turn or Rebuke Undead (Su): A dwarven battle priest gains the ability to turn or rebuke undead as a cleric of the same level. If the character already has the ability to turn or rebuke undead (from another class), levels of dwarven battle priest are added to his cleric or paladin levels when turning or rebuking undead.

Combat Healing (Ex): Although he generally prefers to stand on the front line, the dwarven battle priest often takes on the role of combat medic in times of war, dispensing healing to his wounded comrades as easily as he would slay his enemies. Upon reaching 2nd level, whenever he makes a Heal skill check or a Concentration skill check when casting any cure spell, the dwarven battle priest may take 10, even if stress and distraction would not normally allow him to do so.

Favorite Weapon (Ex): A dwarven battle priest takes pride in his deitys favourite weapon. During the course of his career, he continues to vigorously train in its use. A 3rd level dwarven battle priest gains a +1 competence bonus on damage rolls made with his deitys favorite weapon. This bonus augments to +2 when the dwarven battle priest reaches 6th level and to +3 when he attains 9th level. If the god worshiped by the dwarven battle priest does not have a determined favorite weapon, it is up to the GM to decide which weapon this deity would consider his favorite. Note that most dwarven deitys favorite weapons are axes, hammers, or maces.

Healing Expert (Su): As he gains experience in this prestige class, a dwarven battle priest becomes a veritable expert at dispensing healing. Beginning at 5th level, he adds +1 to each dice he rolls when casting any cure spells. This bonus increases to +2 when the dwarven battle priest attains 10th level.

Align Weapon (Sp): Upon reaching 8th level in this prestige class, the dwarven battle priest gains the spell-like ability to align weapon, as the spell of the same name. He uses this ability at a caster level equal to his own caster level or his

dwarven battle priest level (whichever is greater). A dwarven battle priest may use align weapon a number of times per day equal to his Wisdom modifier (a minimum of once each day applies).

Dwarven Battle Priest Advancement Table

Level	Base Attack Bonus	Fort. Save	Ref. Save	Will Save	Special	Spells per Day
1	+1	+2	+0	+0	Invigorate 1/day, turn or rebuke undead

Dwarven Warmaster

Famously recognized for the strong suits of armor, the sharp axes, and the wondrous battle hammers forged by their master smiths, dwarves are also known as sturdy and relentless warriors. Feared by their enemies and considered indispensable by their allies, dwarven warriors are known for their natural fighting abilities, their rigorous training, as well as the discipline of their units on the battlefield. Among the most highly trained and truly gifted dwarven warriors are those who have the potential to win fame of mythical proportion. The dwarven warmaster is one such individual.

In dwarven society, the Order of Warmasters is one of the most respected organizations there is. Sworn to uphold dwarven interests, defend the ancestral lands of their people, as well as maintain the highest standard of discipline and battle readiness, the members of the Order are equally known for both their ruthlessness on the battlefield and their loyalty to the dwarves. Many believe that none other group in the world train better warriors, and the prowess of the dwarven warmasters in battle seems to support this theory. In times of war, warmasters lead dwarven warriors in battle, and many are high-ranking officers in their kings army.

Only dwarven warriors of unblemished repute are considered potential candidates of the Order of Warmasters. Because of their martial aptitude, dwarven fighters make excellent recruits, but many warmasters also hail from the paladin class. Rangers who have proven their worth in combat as well as clerics of martial dwarven deities are sometimes accepted in the Order of Warmasters, but people from other classes seldom are.

Hit Die: d12

Requirements

To become a dwarven warmaster, a character must fulfill all the following requirements:

Race: Dwarf
Alignment: Lawful good or lawful neutral
Base Attack Bonus: +6
Skills: Sense Motive 4 ranks
Feats: Cleave, Power Attack, Weapon Focus (any)
Special: The Order of Warmasters is an extremely select group of highly trained, fervently dedicated, and remarkably disciplined warriors. In order to become a dwarven warmaster, a character must have proven himself many times in battle. He must have won at least one of these battles in the defense of a dwarven community. Once he has done this,

someone from the Order of Warmaster may approach the character and offer to sponsor him into the group. If he accepts the invitation, the character receives special training and may take on levels in this prestige class.

Class Skills

The dwarven warmasters class skills (and the key ability for each) are Climb (Str), Craft (Int), Diplomacy (Cha), Intimidate (Cha), Knowledge (history) (Int), Jump (Str), Sense Motive (Wis), and Spot (Wis).

Skill Points at Each Level: 2 + Int modifier

Class Features

All the following are class features of the dwarven warmaster prestige class:

Weapon and Armor Proficiency: A dwarven warmaster is proficient with all simple and martial weapons, armor (heavy, medium, and light), and shields (including tower shields). Note that armor check penalties apply to the Climb and Jump skills.

Aura of Fearlessness (Su): The Order of Warmasters is well known for training fearless warriors who regularly risk their lives to save those of others. Beginning at 1st level, a dwarven warmaster is immune to fear (magical or otherwise). Each ally within 10 feet of him also gains a +4 morale bonus on saving throws against fear effects. When he reaches 4th level, a warmasters aura is so strong that all allies within range also benefit from a +1 morale bonus on all their Will saving throws. The warmaster himself also benefits from this bonus. For allies within range, this morale bonus stacks with the +4 bonus granted against fear effects. At 7th level, and again at 10th level, the bonus to Will saving throws rise by +1.

This ability functions while the dwarven warmaster is conscious, but not if he is unconscious or dead.

Battle Readiness (Ex): A dwarven warmaster is trained to anticipate his opponents movement in combat as well as attacks from hidden or unseen sources. The special training he receives from the Order of the Warmasters hones his ability in battle to new heights. At 1st level, a dwarven warmaster gains a bonus on all Sense Motive checks made to resist an opponents feint in combat. Each time someone uses the Bluff skill to attempt a feint against him, he gains a bonus on his opposed Sense Motive check equal to his dwarven warmaster level + his Intelligence modifier (if positive).

Dwarven Legend (Ex): The Order of Warmasters is a highly respected one among the dwarves and the members of this group are considered honorable and just. As early as 2nd level, the dwarven warmasters reputation grows. When dealing with a dwarf who knows of his membership in the Order (including another warmaster), the warmaster gains a +1 circumstance bonus on Diplomacy and Intimidate checks. This bonus augments by +1 every other levels the character gains in this prestige class (+2 at 4th level, +3 at 6th level, +4 at 8th level, and +5 at 10th level).

Unshakable Resolve (Ex): A dwarven warmaster is not only well trained to fight his enemies and defend himself properly in battle, but he is also extremely resolute. Beginning at 2nd level, his resolve is so great that he can re-roll any failed attack roll or saving throw. Use of this ability can be declared after the result of the first roll is revealed, but before it actually takes effect. The dwarven warmaster must accept the result of the second roll, even if it is worse than the original. Unshakable resolve is usable once per day at 2nd level, twice per day at 5th level, and three times each day at 8th level.

Weapon Specialization: At 4th level, the dwarven warmasters rigorous training in the use of arms grants him the Weapon Specialization feat in a weapon with which he already has Weapon Focus. If he already has the Weapon Specialization feat for a weapon, he may instead choose to gain an additional +1 bonus on damage rolls with this weapon. Otherwise, provided he meets the prerequisites for it, he may select Weapon Specialization in another weapon.

Damage Reduction (Ex): As he gains experience, the dwarven warmasters combat training and natural hardiness bestows him the extraordinary ability to shrug off some amount of injury he receives with each blow or attack. Subtract 1 from the damage the dwarven warmaster takes each time he is dealt damage. The dwarven warmasters damage reduction augments to 2/ at 6th level and to 3/ at 9th level.

Deadly Smite (Su): When he attains the summit of this prestige class, a dwarven warmaster may strike a tremendous blow against one of his enemies. Once per day, he may attempt a deadly strike instead of one of his normal melee attacks against any one of his foes. The dwarven warmaster gains a +4 bonus on this melee attack roll and, if the attack succeeds, he deals 1 extra point of damage per character level. This extra damage is not multiplied on a critical hit. If the dwarven warmasters attack roll misses, the deadly smite is used up for that day.

Ex Dwarven Warmasters: A dwarven warmaster must be of lawful good or lawful neutral alignment. A character who becomes nonlawful or evil cannot gain new levels as a dwarven warmaster. Such a character retains most of the abilities granted by this prestige class, but loses the bonuses granted by the dwarven legend ability. His aura of fearlessness also loses the effects it has on allies. The ex dwarven warmaster remains fearless and he still benefits from the bonuses to Will saving throws granted at 4th, 7th, and 10th level, but the aura has no effect on his allies until he becomes lawful good or lawful neutral again.

Table: The Dwarven Warmaster Advancement Table

Level	Base Attack Bonus	Fort. Save	Ref. Save	Will Save	Special	Spells per Day
1	+1	+2	+0	+0	Aura of fearlessness (+4 vs. fear), battle readiness	
2	+2	+3	+0	+0	Dwarven legend, unshakable resolve 1/day	
3	+3	+3	+1	+1	Damage Reduction 1/

10	+10	+7	+3	+3	Aura of fearlessness (+3 Will save), deadly smite	

Thunderer

Ancient dwarven legends recount the tales of the brave heroes of olden times. The men and women of this era forged the underground kingdoms of their people with their blood, sweat, and tears. The heroes of old also defended the dwarves against countless enemies, and thus ensured their peoples survival. Over the course of several generations, they had to overcome what must have seemed like insurmountable challenges. To defeat these odds, the ancient dwarves uncovered secrets only they could hope to master. One of the better-guarded secrets of olden days is kept by the Sacred Order of Thunder and Lightning.

This small, reclusive, and highly selective clerical order trains their members to unlock the mysteries of thunder and lightning. Their clerics worship a variety of gods, but they typically venerate the dwarven All-Father, believed to have carved the dwarves from bare rock before breathing life into them. High ranking members of the Sacred Order teaches younger clerics of their group how to call upon the forces of thunder and lightning, as some heroes of ancient times are said to have done.

The vast majority of those who become thunderers hail from the cleric profession, but some druids of dwarven blood are sometimes accepted into the ranks of the sacred Order. On occasion, loyal paladins and devoted rangers also join the group, but individuals from these classes usually do so late in their career.

Hit Die: d8

Requirements

To become a thunderer, a character must fulfill all the following requirements:

Race: Dwarf
Alignment: Any
Base Attack Bonus: +3
Skills: Knowledge (religion) 8 ranks
Feat: Combat Casting
Spellcasting: The ability to cast a minimum of 3rd level divine spells, including resist energy or protection from energy.
Special: The character must be accepted into the Sacred Order of Thunder and Lightning, and a thunderer of at least 3rd level must introduce him to the basic mysteries of the prestige class.

Class Skills

The thunderers class skills (and the key ability for each) are Concentration (Con), Craft (Int), Intimidate (Cha), Knowledge (nature) (Int), Knowledge (religion) (Int), Knowledge (the planes), Profession (Wis), and Spellcraft (Int).

Skill Points at Each Level: 2 + Int modifier

Class Features

All the following are class features of the thunderer prestige class:

Weapon and Armor Proficiency: A thunderer is proficient with all simple weapons as well as with the light hammer and the warhammer. He is also proficient with all types of armor (light, medium, and heavy) and with shields (except tower shields).

Spells per Day: A thunderer continues to get access to more powerful divine magic while gaining levels in this prestige class. When he acquires a new even-numbered level, the character gains new spells per day as if he had also increased a level in the divine spellcasting class he belonged to before he added this prestige class. He does not, however, benefit from any other advantages a character of that class would have gained (such as improved chances of controlling or rebuking undead creatures). This essentially means that he adds half his thunderer level to the level of whatever other divine spellcasting class he has, then determines the spells per day accordingly.

If a character had more than one divine spellcasting class before he became a thunderer, the player must decide to which class to assign each even-numbered level of thunderer for the purpose of determining divine spells per day.

Thunder Strike (Su): The most important secret of the Sacred Order of Thunder and Lightning is divulged at 1st level. Like some of the greatest heroes of old, the initiate thunderer learns to charge his mace or hammer with supernatural energy that echoes as loud as thunder. When attacking with any bludgeoning melee weapon with which he is familiar (but typically with a mace, light hammer, or warhammer), the thunder may choose to deliver a thunder strike. After a successful melee attack, the thunderers weapon produces a powerful, thunder-like sound that can deafen the target of the attack as well as all living creatures within 10 feet from the thunderer (including his allies). The target of the attack must make a successful Fortitude saving throw (DC 10 + the thunderers class level + his Strength modifier) or be deafened for 24 hours. All other living creatures within 10 feet must also succeed at a Fortitude saving throw (DC 10 + half the Thunderers class level (round down)) to avoid becoming deaf for 1d4 rounds.

Thunder strike may be used once per day at 1st level and one additional time each day every other odd-numbered level thereafter (twice at 3rd level, three times at 5th level, and so on). Use of this ability must be declared before the attack roll is made. Failing an attack results in one wasted use of the thunder strike ability for the day.

Electricity Resistance (Su): When he attains 2nd level, the thunder becomes able to ignore damage dealt to him by electricity. He gains electricity resistance 5. This resistance to the electrical element augments to 10 at 4th level, to 15 at 6th level, to 20 at 8th level, and finally to 25 when the thunderer reaches 10th level.

Read Electrical Currents (Su): The thunderers understanding of thunder and lightning continues to grow as he gains experience. At 3rd level, he gains the supernatural ability to read the subtle electrical currents that rides through the air. This ability makes him more intuitively aware of his surrounding. The thunderer gains a +4 insight bonus on any roll or check made to avoid being surprised.

Call Lightning (Sp): Upon reaching 5th level, the thunderer gains the spell-like ability to call lighting, as per the spell of the same name. This ability is used at a caster level equal to the thunderers caster level. A thunderer may use call lighting once per day at 5th level and one additional time each day when he attains 10th level.

Thunder and Lightning Attack (Su): Eventually, the thunderer learns how to charge any bludgeoning melee weapon he is proficient in with a surge of crackling electricity. At 9th level, he may declare any one of his thunder strikes as a thunder and lightning attack instead. When he does, a surge of blue sparks begins to crackle upon the face of his weapon. With a successful hit, the target of this special attack takes and additional 8d6 points of electricity damage, in addition to any other damage normally dealt by a thunder strike. A successful Fortitude saving throw (DC 20 + the thunders Strength modifier) reduces this extra damage in half. Lightning strike is usable once per day.

Sexual Content in Roleplaying Games

by William H. Stoddard

People have talked about including sex in roleplaying games for a long time; in the days when Phil Foglio was writing and drawing *What's New,* "sex and *D&D*" was one of the strip's running jokes. But the discussion hasn't led to well-developed methods for including sex in roleplaying games, or to a common understanding of what the options are. This article is intended as a step toward such a common understanding.

Ratings

Roleplaying games are mostly based on popular entertainment, whether it's found in books, movies, television shows, comics, or computer games. Sexual encounters, desires, and relationships are a big part of most forms of popular entertainment. Having methods for portraying them in roleplaying games widens the range of genres and themes that a campaign can be based on. Some players and GMs will want to explore that wider range; others will prefer to focus on fights, mysteries, or perilous journeys. And some may want to choose the level of sexual content that fits the genre and source material of a specific campaign.

Broadly defined, roleplaying games can approach sexual content in five ways:

Level 0. *Minimal.* Characters are defined as male and female, and this affects their appearance, their names, and perhaps their clothing. But it makes no difference to their goals or behavior. They go on adventures together and pay no attention to which of them are male and which female.

Level 1. *Background.* Characters can be defined as having relationships, usually with NPCs, or as wanting to have them. Those NPCs can serve as dependents, allies, or even enemies. For example, a superhero may have a girlfriend or boyfriend who needs to be rescued, or feel a dangerous attraction to a supervillain. But the actual sexual part of the relationship stays in the background; its only function is to motivate the character's adventures or explain why that person is involved in them.

Level 2. *Negotiation.* Characters pursue sexual encounters or relationships during play, through courtship, flirtation, commercial transactions, or other methods. Play focuses on whether the character's invitation is accepted or declined. Once that's been determined, the story jumps ahead to the aftermath, or sideways to another character's activities.

Level 3. *Outcomes.* When characters agree to engage in sexual activity, the players roll dice to determine how well things go. Each encounter is resolved by a single dice roll, which covers all the activities engaged in, giving an overall rating on "Was it good for you?" If appropriate, the GM can ask for or make additional dice rolls for pregnancy or contagion.

Level 4. *Full Detail.* When characters engage in sexual activity, the players roleplay the full details of the activity, either as pure improvisational narrative or using game mechanics.

Choice of Approach

Which of these approaches to sexual content to take depends on several considerations.

In the first place, the chosen level should suit the preferences of the players. Players may prefer to avoid or limit sexual content for a variety of reasons, ranging from lack of interest in the topic to ethical convictions about explicit material to personal embarrassment. GMs running games for players who are younger than 18 also need to consider the wishes of their players' parents.

In the second place, the chosen level should suit the genre and the source material. A game based on classic four-color comics would normally be at level 0 or 1; one based on the novels of Jane Austen would be at level 2 but certainly not level 3 or 4; one based on modern realistic fiction would be at least at level 3.

In the third place, the chosen level should be appropriate to the mood the GM wants to convey. In particular, the explicit detail of level 4 normally tends to distance the players from the activities being portrayed, producing moods such as bawdy humor or coldly clinical horror. The softer focus of level 3 is actually better suited to creating a romantic mood. The same campaign might include scenes at different levels for different purposes.

Every one of the levels *can* be used to run roleplaying games, for some players and for some campaigns. The important thing is to choose the right one.

Erotic Themes

The reasons for running a campaign with low levels of sexual content don't need much explanation. Roleplaying games, by and large, are mostly adventure stories, and sexuality isn't the main focus of most adventure stories. But because high levels of sexual content are less common in roleplaying games, the potential rewards from including them may be less apparent.

At the very simplest level, sexual incidents can be included simply for entertainment value. This isn't much different, in spirit, from including random incidents of violence or danger for entertainment, in the style of "wandering monster" encounters in classic dungeon crawls, or street crimes or bank holdups in superhero campaigns. Some players find it entertaining to have their characters flirt with or bed the tavern girls, or be paid court to by aristocratic hosts or wandering bards. GMs may choose to support this taste simply to amuse their players.

In some groups of players, this may raise a problem: a casual sexual encounter may gratify the one player whose character is involved but leave the others bored on the sidelines. One way around this is to offer the entire party an occasional "shore leave" scenario focused on how they spend their down time between adventures, either as a group (involved in anything from a wild party where couples occasionally wander offstage to an explicit orgy) or each on his own pursuits, which may or may not be sexual. If players prefer individual sexual adventures, it's a good idea to keep them brief, much like fights with casually encountered foes, and to make sure that any player who's interested in such scenes gets a chance to play them.

It's also possible to make sexual scenes entertaining for the other players by running them in a bawdy style, with a chance of humorous mishaps and misunderstandings. Creative interpretations of critical failures can be extremely useful for achieving this sort of mood! Be careful, though, not to force characters into sexual situations their players don't find enjoyable, and not to make humor an excuse for humiliating them. If the bawdiness isn't fun (or at least tolerable) for everyone, it's better to leave it out.

A more sustained use of sexual content can be as support for adventure plots. Threatening the hero's love interest is a classic motivation in such plots, and many game systems have rules for dependents that can be applied to lovers or spouses. Heroes of adventure stories may have to deal with rivalries for their love interests, either from the villain of the story or from a trusted companion. Flirtations or sexual encounters can be a way to gain information or favors; the hero who woos his jailor's daughter is a classic of the swashbuckling genre, for example. Or the PCs themselves can be the target of such activities, in genres such as spy thrillers. Such encounters can be played out at level 2, with the actual sexual acts kept off camera, or at level 3 or 4, showing whether the physical encounter went well or badly.

In a setting that adheres to traditional sexual morality, sexual encounters and relationships can themselves generate plots. Threatening to reveal a liaison can be a real threat against a woman, or against her lover, if he's not just a heartless seducer. The relatives of a seduced woman may come looking for vengeance, becoming enemies of the seducer. PCs may themselves be caught up in such situations, or they may be asked to help other people deal with them. In an investigative campaign, conflicts of sexual morality may lie behind a crime -- and the desire to conceal sexual incidents may create obstacles to investigation of crimes. Dramas of sexual morality can be found in genres from grand opera to classic Hollywood film noir, just waiting to be borrowed by an ingenious GM.

Finally, sexual content can be used to broaden the focus of a campaign beyond action/adventure. Sexuality can be a focus of worldbuilding, an aspect of characterization, or a source of mood.

One of the pleasures of worldbuilding is presenting players with exotic settings that have their own internal logic. Every system of human customs includes rules about sexual conduct, and people who adhere to those customs usually care strongly about those rules. Showing a group of players a world that follows unfamiliar sexual customs is a powerful way of making the difference of the setting real to them. What if they have to deal with a world with matrilineal inheritance, where paternity has no effect on inheritance, "illegitimacy" is an abstraction, and there is no cultural expectation of female chastity? Or one where bisexuality is commonplace and expected, as in ancient Athens? Or one where the ethic of chastity is taken seriously and both men and women are actually expected to follow it? Fantasy or science fiction premises can offer a wider range of exotic customs; suppose, for example, that people who want children routinely buy fertilized ova ready for implantation, with no more genetic relationship to them than a modern farmer's crops for this year (grown from agribusiness-supplied seed) have to his crops for last year?

As far as character interaction is concerned, sex is a powerful human motive and thus a good topic for characters to negotiate over; flirtation, seduction, and courtship all can be occasions for entertaining dialogue. Sex also creates bonds between characters -- between PCs and NPCs, or between one PC and another. Characters who have such bonds can find themselves in dramatic conflicts, such as loyalty to their country or their cause versus devotion to a lover or spouse. Sexual content can add a dimension to an action/adventure campaign, or be part of the foundation of a campaign that focuses on human relationships rather than adventures. An entire campaign can be built on the efforts of young, unattached people (such as most adventurers!) to find suitable mates.

Finally, because sex is emotionally charged, it can have a big impact on the mood of a campaign . . . that is, on the emotional state that pervades it and lingers in its players' memories. Whether sex is treated humorously, or romantically, or clinically will help shape the players' sense of a campaign as comedy, chivalric adventure, or horror. How explicitly sexual situations are treated, from a discrete "fade to black" to exact physical details, should be considered carefully in attempts to convey a mood.

Game Mechanics

A campaign at level 2-4 may well need to have game mechanics for its sexual content. Asking players to "just roleplay" such scenes has the same difficulty as for any other social interaction: It makes it difficult for players to play characters with social skills better than their own -- which is the same kind of problem as if combat rules required actual knowledge of the martial arts and made it difficult for players without such knowledge to play skilled combatants. This problem may be more acute with sexual content, because shy or socially awkward players may find such scenes especially difficult to play out. Having a workable system of game mechanics helps level the playing field.

The system of rules that follows is designed for use with *GURPS;* GMs who prefer other systems can use it as a model for suitable rules in such systems. It's primarily designed for sexual content at level 3, but can be adjusted to fit level 2 or 4.

The basic model for sexual encounters involves three stages: flirtation, foreplay, and consummation. Each requires a skill or attribute roll. Flirtation goes from the first expression of interest to the first physical contact; foreplay covers embracing, kissing, caressing, and similar acts; consummation goes from there to the completion of the sexual act.

In *GURPS* terms, flirtation is an Influence roll. Like other Influence rolls, it represents an attempt to get a better reaction. The obvious skill to use is Sex Appeal -- but it's not the only possibility. Other options are Savoir-Faire, for the elegant or witty aristocrat; Fast-Talk, for the slick seducer; or Diplomacy, for an approach that explores the other person's interest, while leaving the other a way to say no graciously. GMs may also allow a roll against Dancing to appeal to one's partner by being a good dancer.

The published rules specify that a successful Sex Appeal roll produces a Very Good reaction; other successful Influence rolls produce Good reactions. Based on this, a Very Good reaction produces willingness to seek out physical

contact actively; the person influenced will lean forward to kiss the other person, or hold hands, or lead him to a private alcove, or the like. A merely Good reaction produces a more passive interest; the target of the Influence roll won't take the initiative, but will be receptive to further moves by the suitor.

The rest of the spectrum of reactions can also be defined, both for use with failed Influence rolls, and for suitors who don't attempt an Influence roll, but just come right out and ask. An Excellent reaction indicates willingness to consummate the attraction. A Neutral reaction shows that there is no interest, but also no offense. A Bad reaction shows offense; the person approached will turn away in disgust. A Very Bad reaction indicates screams, slaps, or insults; a Disastrous one indicates lasting hostility (-4 on all future reaction rolls).

This scale of reactions is designed for establishing a new relationship. In an already existing relationship, the threshold may be lower; between husband and wife, a Good or even a Neutral reaction might be enough for sexual relations. Conversely, a celibate, or a heterosexual approached by someone of the same sex, might need an Excellent reaction even to passively accept physical attentions in the first place. Neither situation is best handled with reaction modifiers. A substantial bonus to reaction modifiers between established couples would imply that such couples were *more* likely than newly met people to feel strong passion, and would make the use of skills such as Diplomacy largely pointless between such couples; neither assumption seems accurate. Conversely, a substantial reaction penalty for, say, approaches to a person with an incompatible sexual preferences would imply that such approaches commonly led to hostility or even violence, which isn't necessarily true -- and it could be overcome by a successful Influence roll, which seems unlikely.

On the other hand, reaction rolls to determine whether someone is interested in sex should have their own special modifiers:

- +1 if what's being asked for doesn't include consummation in any form
- -1 if what's requested is novel or scary
- -1 if the encounter would have to be kept secret to avoid a bad Reputation, loss of Status, or acquisition of Social Stigma;
- -3 if such an encounter would occur openly and could not be kept secret;
- +1 if the suitor has Sex Appeal at any *any* level;
- +2 if the suitor has Sex Appeal at level 20+;
- +1 if the character being approached is tipsy, or +2 if drunk.

In addition, pay close attention to modifiers for personal appearance and behavior, skills (such skills as Carousing and Dancing can give +2 to reactions with a successful roll), and appropriate or inappropriate behavior. Such modifiers can provide the GM with a way to reward players who come up with good dialogue or who describe dramatically appropriate behavior. GMs also have the option of bypassing reaction rolls and simply assigning a favorable reaction if the player roleplays brilliantly . . . provided that the roleplaying is consistent with the character's personality, of course!

Once initial agreement has been reached, the next step is foreplay. Defining this in game mechanical terms is a bit odd. It has at least two participants, and usually both will be active and ought to make skill rolls; but they aren't working against each other, so making the situation a Contest doesn't work. Instead, GMs can apply the following process:

The skill used in foreplay is Erotic Art. This is defined as applying to "advanced sexual techniques." For basic sexual techniques that are commonly known in a particular culture, allow a +5 skill bonus -- that is, the default roll is made against DX. Characters trained in Erotic Art get the benefit of their training even in using basic sexual techniques. For foreplay, skill bonuses for bodily flexibility don't apply, and there is no Acrobatics-5 default.

With basic sexual techniques, each partner's roll determines his own gratification, but not the other's. With advanced sexual techniques, however, one partner's margin of success can be used to offset the other partner's margin of failure. That is, part of the advanced study of Erotic Art includes knowing how to identify a partner's erogenous zones, how to gauge his or her responses, and other aspects of ensuring that the kiss is mutually pleasurable. Note that this works somewhat like a Quick Contest, but instead of comparing margins of success, it compares one partner's margin of success to the other partner's margin of failure.

The difference between basic and advanced sexual techniques can be a bit subtle. It's partly *what* is done: a lover with Erotic Art will be aware of less culturally prominent erogenous sites such as the back of the neck or the inside of the elbow. But it's also largely *how* it's done: an approach that gives one's partner time to become aroused, rather than rushing ahead, can be much more effective without using any specific unusual technique.

Foreplay involving more than two partners is trickier to manage; all skill rolls are made at -2. However, if it is treated as an advanced sexual technique, two (or more) of the participants can both transfer their margin of success to the third. A lover with Body Language skill gets +1 to Erotic Art; one with Body Language at 20+ gets +2.

Finally, successful foreplay can lead to consummation. (It doesn't have to; characters can choose to stop at foreplay -- but Lecherousness makes a self-control roll necessary to do so.) Consummation requires mutual rolls against Erotic Art skill, in the same way as for foreplay, and with the same +5 skill bonus for basic sexual techniques. A level 4 treatment can get specific about "to do what, and with what, and with whom" (in the words of a classic limerick); a level 3 approach generally won't. Skill bonuses for bodily flexibility apply, and the Acrobatics-5 default is available. Note, in particular, that basic sexual acts provide personal gratification, but advanced techniques for such acts allow using one partner's success to offset the other's failure.

Players make want to have their characters try for a "second round." This should require HT rolls from both participants, to see if they've recovered enough. Further additional acts should require a cumulative -4 penalty per act after the second. After a critical success on Erotic Art, apply an additional -6 penalty! A character who is tipsy must start rolling vs. HT the first time, rather than the second; a character who is drunk makes all these rolls at a further -2!

With human characters, women's arousability may vary more widely than men's. GMs running fairly explicit campaigns may allow Multiorgasmic as a Perk (allowing repeated gratification during a single act, and reducing the penalty to -2 per added act) or Nonorgasmic as a Quirk (allowing gratification only on a critical success). Both traits are rare in human males, though a man with skill in Erotic Art might take Multiorgasmic, representing mastery of exotic Tantric rituals or the like.

The Harder Stuff

Some sexual themes may provoke unusually strong reactions from players, and should be handled with care. That's not to say they can't be included in games -- but GMs are advised to make sure of their players' reactions ahead of time, or to allow an escape route for players who don't want to pursue such a storyline.

The most obvious of these is nonconsensual sexual encounters, from sexual harassment to outright rape. Either letting PCs commit such acts, or making them their victims, has obvious problems; these become especially acute when one PC is allowed to force sexual acts on another PC. On the other hand, being the target of such an assault can be a powerful dramatic role for a player who can accept it. Players may be more willing to take the part of victims who fight off their assailants, or find protection against them from other characters, or gain revenge, privately or legally. GMs who expect their players to react to sexual violence with shock and horror may introduce it deliberately for that effect; GMs whose players treat it casually are better advised to avoid such themes.

Present-day American law assumes that adolescents below a certain age -- commonly 18 -- are incapable of consenting to sexual activity, and that any sexual acts they're involved in are nonconsensual. Historically this idea is a novelty; most cultures have assumed that anyone past puberty was ready for sexual relations and, typically, ought to be married (as in *Romeo and Juliet,* where Juliet's mother thinks her daughter, at 14, is ready for a husband). And even in present-day American society, adolescent sexual activity is actually very common. GMs whose players prefer realism in historical or historical fantasy campaigns may explore such relationships; other players may prefer to assume that adolescents are off limits.

Prostitution may be nonconsensual, in societies where pimps and brothels recruit by abduction or buy slaves, or use lesser forms of duress such as buying contracts of indenture or recruiting addicts. Or it may be simply a job, pursued by "working girls," glamorous courtesans, or professionals with advanced degrees. In the latter case, GMs portraying an exchange of sex for money should bear in mind that whatever the buyer thinks of the transaction, the seller is

thinking about money; sexual allure is a consciously cultivated business asset. Prostitutes don't form part of a typical adventuring party, but in a campaign of "everyday people in a difficult situation" (in such genres as horror or postapocalyptic), they may have useful skills.

Another challenging topic for many campaigns is same-sex relationships. Some players will be uncomfortable with them; for others they may involve more wish fulfillment than GMs want to deal with, especially with lesbian characters and all-male player groups. On the other hand, they were commonplace in historical societies such as ancient Greece and Rome, and may be so again in future societies, if current trends continue. They can help create a sense of cultural distance in portrayals of such societies, for players who like exotic settings; they also can be suitable for player groups that accept same-sex relationships as normal. In a campaign set in a society where same-sex acts are illegal, they can be treated tragically. Note also that this theme can be combined with prostitution: men and adolescent boys who work as prostitutes often have customers mainly or exclusively of their own sex.

Finally, some cultures have occasions of ritual license, either as public holidays or as private orgies. These may be either culturally sanctioned relaxations of the usual rules, or highly ritualized ceremonies for religious, mystical, or magical purposes. The first treatment can be included in a "shore leave" episode in a longer campaign. The second can be either something creepy that secretive cultists do, or a special ritual carried out by PCs for compelling supernatural reasons -- perhaps with partners chosen by lot or divination, or under the influence of trance-inducing drugs. Again, portraying a society that has such customs is a way to create a sense of cultural distance.

Related to these themes, GMs should bear three notes of caution in mind in portraying any sexual encounters. In the first place, players hate faits accomplis. Simply telling a player, "They overpower your character and have their way . . .," without allowing the character to fight back or resist, will produce an unhappy player; having it happen in a session when the player is absent is even worse. So is dictating a character's emotional responses -- for example, telling a player, "His approach is so appealing that you can't resist it." Reaction rolls are for NPCs; players generally want to decide how PCs react, based on what the GM tells them about the encounter. If the PC is the target of an influence roll, the player should get to decide what a Good or Very Good reaction means under these circumstances. After all, a woman who's the target of a man's Sex Appeal skill could be a nun, or happily married, or a lesbian, or simply very careful of her reputation.

In the second place, players are there to have fun. Entangling them in scenarios that spoil their fun, or letting other players impose on them or harass them, defeats the purpose of the game.

Finally, the game is supposed to be fun for everyone. Giving one PC a private adventure can be acceptable to other players, if their characters also can have private adventures (which need not be sexual!), but any one such adventure should only take up a modest amount of play time. Devoting an entire session to erotic encounters is usually too much of a good thing; if it's done at all, it should involve all the PCs, either as a "shore leave" episode providing a break in their usual adventures, or in an entire campaign that's mainly focused on romantic, sexual, or soap operatic themes (for example, some genres of anime). In a more standard action/adventure campaign, GMs should keep things in balance between the different players.

A Note from a Secret Admirer

by Reverend P. Kitty

From simple notes passed in class to perfumed poems delivered by courier, the anonymous love letter has remained the medium of choice for those too shy or embarrassed to profess their feelings directly. Of course, this makes such a letter into a ready-made platform from which sub-plots can be launched like Cupid's arrows, right into the already complicated life of a given PC.

To set this up, choose at least one option from each section below, or roll 1d on each to determine things randomly:

The Note

How well did the sender hide their identity? An admirer usually hopes that the recipient will deduce their identity and seek them out, but not all are willing to make it easy.

1. **Unfathomable:** There are absolutely no clues as to the sender's identity. The letter is typed, lacks fingerprints, was anonymously dropped off or sent through a remailer, has had Remove Aura cast upon it, etc. They don't *want* to be discovered, possibly because they're sure they'll be rejected, are worried about the note being intercepted, or are teasing and will be sending another note later. If this was chosen randomly, roll 1d; on a 4-6, treat this as **Obscured,** below.
2. **Obscured:** The sender has gone to lengths to remain secret, but a few clues remain. Skill rolls (at default if necessary, and possibly at a penalty) will be required to uncover basic information, which will require additional resources to investigate further. For example, Forensics may reveal fingerprints, Psychology may build a very rough profile of the sender from handwriting and phrasings, or social skills may get a vague description of whoever dropped it off from nearby witnesses. Even a critical success should not reveal too much about the writer's identity.
3. **Concealed:** IQ and Perception rolls can uncover a handful of clues; appropriate skill rolls should get a bonus and will reveal more detailed information. Alternatively, the GM can determine a meaningful clue or two and feed it to the players, trusting them to work out the details. Either way, the facts should still not reveal the sender directly, but they should help to narrow down the search greatly. The envelope might be of a brand only sold at one scrapbooking shop, may be sealed with wax that few noble houses use, or may have been sent via inter-office mail at a local company. When combined with another clue, such as the scent of an unusual perfume, the PC may be able to find his potential suitor with simple footwork.
4. **Amateurish:** Perseverance will eventually uncover the truth. If the sender dropped the note off, witnesses got a good look. If it was sealed, a hair became stuck in the glue or wax. If electronic, the database which stores email addresses of the senders is easily hackable. The paper may have impressions from letters written on top of it, including part of the sender's address. A critical success on any appropriate roll should reveal the sender's identity immediately, if plausible; otherwise, the player(s) should get closer with every new approach until they eventually figure it out.
5. **Blatant:** The admirer either has no clue of what secrecy entails, or is only retaining anonymity because it's fun. The envelope may have a return address label with the name scribbled out, or the letter may have been written on the back of personalized stationery, or the note may have been hand-delivered by the writer's known servant. If this was chosen randomly, roll 1d; on a 1, treat as **Amateurish,** above, on a 6, treat as **Open,** below.
6. **Open:** The letter is signed. This implies a straightforward and confident admirer; bear in mind that this may intrigue certain players but put off others, particularly those who live to unravel threads.

The Admirer

Who sent the letter? Specifically, what kind of person, relative to the PC? The options below can be combined: if rolling randomly, roll an extra 1d here; on a 5-6, add a second entry.

1. **Former Rescuee:** Someone who the PC or party has saved, protected, or otherwise helped in the past. This doesn't have to involve literal life-saving; for example, a single mother may have benefited from a charity organization started by the character.
2. **Inappropriate:** Depending on the world's social structure, someone of a clan, house, race, nation, religion, gender, or social standing which society, or at least the PC's clan (et al) deems "wrong" for him to date. (For warring clans, etc., see **Enemy,** below.) Even if the player disagrees with society, the complications of dating this person will be significant.
3. **Equal:** Someone on roughly the same standing as the PC, whether socially, economically, or within a certain class. Alternatively, they may be a coworker, friend, or someone with whom the character has a friendly rivalry.
4. **Superior:** This can mean one of two types of suitors. In a stratified society, the admirer is of a higher class than the PC, such as a Duchess pursuing a freeman; in such a case, there is a danger both in refusing *and* in acquiescing! In a classless world, this represents a celebrity (though not necessarily an international one) or extremely wealthy suitor; either way, dating will certainly attract the interest of the press.
5. **Enemy:** While one's hated foe is unlikely to come calling for love, a member of a rival organization, group, clan, etc., may certainly grow to respect and admire the PC over time. If this is genuine (see *The Secret*, below), the sender may have to step quickly to avoid reprisals from their own allies.
6. **Unknown:** While the suitor obviously knows the PC, the reverse is not true. This often represents a bystander smitten by the character's actions, though as the fame of a given adventurer grows, more people will begin falling in love with his image, if not his true self (see **Projection,** below.)

The Secret

Beneath the wrapping, it's important to know what's really going on with the sender.

1. **Genuine:** No trick; the sender is real, sane, and actually wants to date the PC. This can make for an interesting subplot for groups which enjoy social interaction, but some players may not see the "point" of developing a relationship that isn't part of a hook or plot twist.
2. **Obsession:** The admirer is genuine, but more than a bit unbalanced. Any encouragement will result in a stalker; a lack of response will ensure more letters in the future; outright denial may cause things to get ugly.
3. **Projection:** The writer is assigning qualities to the PC that may not exist. Unlike **Obsession,** above, they aren't insane, just desperate to fill a (usually emotional) need. This may be the White Knight Syndrome, where they assume that the PC can save them from a bad situation, or outright denial about the PC's flaws or abilities.
4. **Ulterior Motive:** While they may harbor genuine feelings for the PC, the sender wants something beyond romance. This may be as mundane as a marriage for money and status or as unusual as a need to consummate with the PC to give birth to the Antichrist.
5. **Frame-Up:** A variant of **Ulterior Motive,** above, in which the writer is masquerading as another person. Determine who the second person is and *two* levels of secrecy (*The Secret*, above). The more secretive represents how well the true sender covered their tracks; the other shows how easy it will be to find the misleading clues.
6. **Mistaken:** The admirer intended the note for someone else; determine who. If the addressee isn't clearly labeled, this can cause an interesting misunderstanding. If this is an obvious misdelivery, it will reveal something going on that the party was not formerly aware of. Either way, it's important to select an interesting sender and (intended) recipient; finding out that your landlady has a crush on the person in the apartment next to yours is barely worth the game time, unless she's also a spy and this may be your one way to influence her.

Example

In a *Banestorm* game set in Tredroy, the GM decides to roll randomly, getting a 2 (Obscured), 2 (Inappropriate), and 6 (Mistaken); rolling for the intended subject gives 3 (Equal). He decides that the Muslim daughter of a North Tredroy official has fallen in love with a prominent (Christian) member of the Mercenaries' Guild. Her mage fumbled a teleport

roll, accidentally delivering the note into the PC's hands (literally!) while wiping its aura clean. The note, with its Arabic handwriting, could certainly be leveraged into influence or money, but only if the group can figure out what's *really* going on . . .

Bella Sara

Published by [Hidden City Games](#)

Five horse and/or energy cards, rule card; full-color, foil-wrapped; $1.99

If you have a 10-year-old girl -- or if you are a 10-year-old girl -- read on. If you're not, you might want to move on to the *Shooting the Moon* review down below. We're about to enter the saccharine world of *[Bella Sara.](#)*

Hidden City Games says there's a demographic of society not yet hooked by the collectible card game phenomenon, so it's reaching out to the kiddies, and since the subject matter is ponies and horses it would seem to be targeted at the girls. Each card has an illustration of a horse; a name (things like Charlie, Blackie, and Kio); a set of symbols at the top (horseshoes, hearts, some flowerish-looking thing); a quote at the bottom (more on that below); and an alphanumeric code. There are also energy cards that offer equipment like halters and riding hats. These allow the cards to be used in a variety of ways.

Among the games provided in the package: Leonardo's Game is really just warmed-over Crazy Eights. Different symbols appear at the top of each card, and in numbers from one to four. Each player draws seven cards from the top of his deck and they alternate turns playing something that corresponds. Your play has to match in the type or number of symbols -- if the person before you put down a card with four horseshoes, you have to play a card with four of any symbol, or any number of horseshoes. If you can't find a match in your hand you draw another from your deck. Whoever empties their hand first wins.

Moonlight's Game is similar, but with elements of speed and recognition added in. Everyone takes the top card off their deck and flips it face-up on the tabletop simultaneously. If you see a match -- again, symbols or the number thereof -- from your card to a rival's, tap the table. Whoever taps first gets to keep their card in a bonus pile. After at least one player has been through his deck this way three times, everyone totals the symbols on the cards they got to keep; the high score wins.

The final game is Bella's. It involves flipping over a card at random and meditating on the meaning of the card's quote. As these excerpts all read like daily affirmations ("Make time to listen to your friends" or "The wind blows. The sun is shining. Surround yourself with positive friends"), it's a pretty Zen load of noodles. They should appeal to the younger set, but at the same time pragmatic advice like Hercules' "Don't be afraid to ask for help" is juxtaposed against Shaman's bewildering (and borderline megalomaniacal) "You are more powerful than you realize. It is safe and good for you to be powerful." Parents, if they start trying to call the shots regarding their veggies, you've been warned.

There's also an on-line component to this operation. Assuming you're not in a diabetic coma, the card codes can be entered in for your account and your stable of horses will grow (and become better equipped or have more energy if you add the halters and whatnot to your stash). You can clean and feed your horses, keep a journal, treat the animals to an apple, and check your blood sugar level. There's a small town to explore, and some games to play if you can get your computer in lockstep with the website.

The illustrations on the cards are wonderful, like something right out of a storybook. Some are drawings, while others are quality paintings, and there's a nice selection of pictures for the foil-wrapped covers, too. The same respect hasn't been paid to the quality of cardstock, nor to the symbology -- for a game that relies on one's speed of recognition, it's painful to make out what and how many are depicted (those could be flowers, they could be machine cogs). The art is lovely, yes, but its size could have been reduced for the sake of playability.

Bella Sara's games aren't particularly clever or new, and have some questionable quirks (you count symbols for the

winning total in Moonlight's table-tapping game, not just the number of cards you took). The slack can be used for someone to come up with more house rules and games, but then again "flexibility" could be synonymous with "aimless." The website's functionality is a bit slow in some cases and unreliable in others, but it delivers what it promises and it's free. It's pretty clear, however, this is meant as a gateway game. There's not as much out there as one might think for the little ones, and even less directed at the girls, so there's certainly a chance that this kind of gamble could pay off big if a *Yu-Gi-Oh!*-style word of mouth is generated. The price is right for that kind of marketing, and no huge investment is required (even the most "demanding" game requires only four packs per player). It's not for the adults and it does what it can for a child's sense of self-worth. At worst, the kids have a game they can call their own to play with the 'rents, and it may be the first step toward cultivating your own crop of opponents for *World in Flames.*

Shooting the Moon: All Is Fair in Love and War is a sequel of sorts to ***[Breaking the Ice: A Game of Love For Two.](#)*** Both share similar themes -- the course of true love -- but where ***Breaking the Ice*** took two people on three dates to find love between them, in ***Shooting the Moon*** three people are involved. This is a more adversarial game in which two rivals pursue a shared Beloved. It can be run with two players, each taking the role of two Suitors vying for the attention of a shared Beloved, or alternatively with three players in which case the third takes the role of the Beloved.

The Suitors have a shared goal, the Prize, something unique to the Beloved. Their attempts to gain this Prize will drive the story forward. If the Beloved is playing, her goal is to achieve a Dream, some kind of ambition. Suitors and Beloved race each other to their Prize or Dream, all the while throwing Hurdles into the path of their rivals. Overcoming a Hurdle gains Suitor or Beloved points towards these goals, while every Hurdle encountered will force a character to change and grow, a process to which all of the players contribute. It is the interplay between the characters that drives the storytelling of Shooting the Moon onwards.

The first thing to decide is the setting, which can be anywhere the players are happy with, from a fairy tale land to corporate cubicle culture. The five example games cover office politics, pirates, classic fantasy, high court intrigue, and space opera. These also form the basis of the various examples throughout the rule book.

Right from character creation, everything is done in a set order: Suitor 1, Suitor 2, and the Beloved. Character creation is a collaborative process, starting with selecting six descriptive attributes for the Beloved. From these are derived antonym and synonym pairs that are divided as attributes between the Suitors, one taking the antonym in a pair, the other the synonym. For example, in a space opera game of rival smugglers, the Beloved has the attribute "pretty." From this are derived the attributes Attractive and Ugly. One Suitor chooses one, while the other goes to his rival. Finally each attribute is modified with a condition, thus Ugly becomes "Ugly but eloquent," and Attractive becomes "Attractive but nervous."

A Suitor must also have three traits, a Person (rival, ally, or acquaintance), a Place, and an Object assigned to him. Finally, each Suitor also has a Conflict, which will complicate his pursuit of the Beloved, but grant bonus dice when brought into play. Finally, the players have to explain why the Beloved is available and what problem is she facing, her Opportunity, and her Obstacle. The very last thing to be done is to set the Beloved's Dream. This interactive process of setting up the game and creating characters sounds far more complex than it really is, but it is not easily explicable because it is not as obviously direct.

To win either the Suitor's Prize or the Beloved's Dream, the players must accrue points won by overcoming Hurdles over the course of three turns each. During a Suitor turn, the Active Player narrates his character's actions, while the other Suitor's player becomes his Opponent with the task of throwing the Hurdle, which must relate to the active Suitor's or the Beloved's traits, or to some aspect of the story told so far. At stake is not only the pursuit-advancing point, but also a new trait -- negative and related to the Hurdle if the Opponent wins, positive if the Active Player wins the turn.

For his Hurdle, the Opponent gets to roll five six-sided dice, but the Active Player can gain up to six dice by narrating three responses to the Hurdle. Each response must relate to the Suitor or Beloved traits or attributes, or involve some degree of flirtation between the Beloved and the Suitor. Once three responses have been made, both dice pools are rolled, the highest result being the winner. If the Beloved and Active Player win, they each gain a check towards their goals and a new trait of their choice. If the Opponent wins, the Active Player must take the trait of his choosing. If there is a tie, then the Beloved gives a trait to each the Suitors; or, if in a two-player game where the Beloved is an NPC, the dice are re-rolled.

The Active Player and the Beloved can still gain from a loss or a tie, but the stake increases. The Active Player can either take another of the Opponent's suggestions or involve his Conflict or the Beloved's Obstacle. Choosing any of these options gives more dice to be rolled and added to the pools already on the table. The outcome is the same as with the first Hurdle.

If there is no Beloved player, the points available rise with each successive set of Suitor turns. Once each Suitor has had three turns, the story proceeds to the end game. If there is a Beloved player, the points available do not rise, and the Beloved gets her own three turns. These work the same way as Suitor turns, but the Beloved sets a Hurdle that threatens both Suitors. Further, the more challenging the Hurdle, the greater the number of points towards goals that are available and the more dice the Beloved has to roll.

Once everyone has had three turns, the end game is played out. Everyone counts up the points gained to give one final dice pool. To bring every die in his pool, a player must tie in his Suitor's or Beloved's traits, Conflict, Obstacle, or Dream; any flirtation between them; or some element of the setting. The winner of the dice rolls narrates how his goal is achieved and what happens to the others involved in the relationship.

Like **Breaking the Ice,** this is a storytelling game designed to be told in a single session. Mechanically, ***Shooting the Moon*** shares much with **Breaking the Ice,** but is fundamentally more complex. This is to be expected when a third person is added to a relationship. It's not unnecessarily complex, but it's not as obvious as **Breaking the Ice,** and more examples would have helped to explain the game. Thankfully, **Shooting the Moon** is an interesting development of **Breaking the Ice,** which is no surprise given that it is the middle part of a trilogy, with the third part -- ***Under My Skin*** -- to follow. It is easily as flexible in terms of setting, as evidenced from the included sample games, so it can do Cyrano de Bergerac as well as Allie McBeal. It does not possess the charm or the innocence of **Breaking the Ice** though, and there is a darker feel to this sequel. Nevertheless, ***Shooting the Moon: All Is Fair in Love and War*** is another good vehicle for exploring a more complex aspect of the romance genre.

The Torturer's Apprentice

An Adventure of Pain, Necromancy, and Romantic Comedy
Part I

for *GURPS*

by Matt Riggsby

This is the first part of an adventure, written for *GURPS* *Fourth Edition* and appropriate for a group of more than three characters built on a modest number of points. It involves multiple mistaken identities and carrying a human body a considerable distance, so fewer characters would be impractical, and vast cosmic powers would short-circuit most of the challenges, so high-point characters wouldn't be much fun. The adventure also involves lots of lying but very little fighting, so socially functional characters are a must. Since it opens with the PCs in chains and without equipment but doesn't require that the PCs know one another or work together for any reasons external to the adventure itself, it is well-suited for a one-shot or for the beginning of a campaign.

Once Upon A Time

Pity poor Yusif al-Lakmah. Yusif was a foundling left by mistake on the back steps of the dungeon (the kitchen door, probably the intended destination, was a bit farther down) of the palace of Emir Khudseen Bey, mercurial ruler of the city of Amanapur. Khudseen Bey is the sort of ruler who orders mass beheadings one minute, then showers surprised visitors with gold the next. Being in a rare moderate mood, he decreed that the child be raised by the man who found him: Idi the executioner.

As the boy grew, Yusif's surprised adoptive father taught him the only trade he knew. Although Yusif had none of Idi's natural talent and dedication to craftsmanship, the foundling became an almost competent executioner, torturer, and jailer. Close enough, in fact, that Idi has felt comfortable leaving the dungeons in the hands of his assistant from time to time while he went to visit his sister, who lives in a village some 30 miles distant. Meanwhile, Yusif fell in love. As usual, that's where the trouble began.

While tidying up some loose limbs, Yusif happened to catch a glimpse of Yasmin, the Emir's daughter, as she strolled through the courtyard, and was immediately captivated. Alas, as a commoner, an orphan, and a torturer, it would be unthinkable for them to communicate, much less carry on a romantic relationship, but Yusif was determined. He approached Festus Magister, the Emir's resident physician and wizard, for a love potion. Festus was happy to oblige, in return for appropriate payment . . . in this case, a few prisoners to help with his magical research.

This was a price Yusif was more than able to pay. The next time Idi went for a visit with his sister, Yusif picked a few condemned prisoners chosen at random and sent them along to the wizard's tower. Now he's got a potion which will make anyone love him. But how can he give it to someone of whom he's never been within 20 feet?

Part the First: In Which Our Heroes Learn That Love Hurts

The PCs have been arrested for violating one of the Emir's whimsical decrees (wearing orange, the favorite color of the Emir's deceased mother? Such disrespect!) and are awaiting execution. But Yusif has a way out for them. If they help him win the love of Yasmin, he'll let them go. After all, he's the jailer. Who else would know?

What Yusif needs the PCs to do is to sneak him into the palace's harem and help him slip the love potion to the princess. The central problem is that the

palace is strictly segregated. Only eunuchs and harem girls are allowed in the harem; Yusif isn't a harem girl, and becoming a eunuch would defeat the purpose. Even if he had the nerve to pass himself off as a eunuch (which he doesn't), he would be recognized and stopped before he could even get close. But with a few disguises and the right passwords, the brave, worldly PCs could smuggle him through the guards and into the harem; turnover at the palace is high enough that a few new faces won't be immediate cause for suspicion. All the heroes have to do is to get him into the harem, carry him around until they find the princess, and keep a lookout for him for as long as it takes for Yusif to slip the potion into the princess's food or drink.

By stealing laundry, Yusuf has managed to obtain a number of outfits which won't attract too much notice within the palace: no more than two servants' outfits (plain but flowing robes), no more than one guard uniform (oversized pantaloons, a brief vest, a scimitar, and a very large turban), and harem girl outfits (several layers of colorful but translucent veils, blouses, and pantaloons) for everyone else. The servant and harem girl outfits can conceal knives and other small items, but only the guards can carry swords, and armor is generally out of the question; by strange coincidence, the only clothes which fit the largest, strongest member of the group is a large harem girl outfit. Veils are compulsory only for harem girls, but PCs may be comforted to know that, in this windy city in the desert, it's not unusual for a scarf or other headdress to cover at least part of the face to protect it from blowing sand.

Once Yusif has convinced the PCs to help him (if he doesn't, there's little point in carrying on), they must figure out how they'll get him into the harem. The palace is amply provided with rugs he could be rolled up with, baskets and barrels he could curl up in, and other vessels for the creative. One of the grand festival dishes of Amanapur is a roast ox stuffed with a roast lamb, stuffed in turn with a roast duck, stuffed with a roast chicken stuffed with several baked swallows, each of which is stuffed with a gold-leaf-coated fried almond. It is entirely possible that an oxladukhenallowmond is being prepared in the kitchen at that very moment. Depending on what they carry him in, they may be able to whisper back and forth with Yusif, or might only be able to communicate with a series of coded knocks (one for yes, two for no . . .).

Yusif can also outline the path the heroes must take. The palace is shaped like a capital C made of five squares. Each square serves a particular purpose and is connected to one or two of its neighbors by guarded gateways. They're currently in the square at the top right, a series of rooms around what is called the "service courtyard." This section of the palace houses the dungeon, the main kitchens, the main laundries, stables, and storerooms. A gateway connects the service courtyard to the adjacent square (at the upper left of the C), the public courtyard. The public courtyard is where petitioners wait for an audience with the emir, tradesmen come to sell or simply deliver their wares, and bodies of the emir's troops who serve as the city's police go in and out of the palace. It is, in short, the front entrance and waiting room of the palace. The palace's main gate is at the center top of the square. The public courtyard connects to the "forest of the throne," a many-pillared room where the emir holds court at the center left of the C, which in turn connects to the semi-private "citadel of the pen," an area of courtiers' apartments and offices at the lower left of the C. That, finally, connects to the harem, at the bottom right of the C. The palace is equipped with a tower (occupied by Festus Magister) at the very upper left of the C, just off the public courtyard, and another (occupied by the private apartments of the emir) at the lower right, just off the harem. The PCs must make their way around the C and into the harem, with Yusif in whatever container he

I Am Outta Here

So why shouldn't the PCs just stuff Yusif in the nearest iron maiden and take their leave? For one thing, there are any valuable possessions they once had. Those are now under lock and key somewhere else in the palace, and they need Yusif alive and cooperative to get them back (which he certainly will, should everyone survive, but not a moment before they've completed the proposed mission; Yusif isn't a *complete* idiot). Second, getting out of the palace isn't as easy as it sounds. The doors to the dungeon are locked on *both* sides, requiring an outside guard to unlock them. Again, they need Yusif to see the light of day. To sweeten the pot, Yusif can promise to *try* to get them a more substantial reward, but he and the princess may have to leave the palace and live the life of paupers once they declare their love for one another, so he can't make guarantees.

And they shouldn't even try to beat Yusif into submission to get his cooperation. He's driven by True Love, making him nearly impervious to coercion. Just as importantly, he is, despite a lack of natural aptitude, a trained torturer and will be more appalled at the PCs' poor technique than their brutality. He might even offer some pointers.

happens to be in. Simple? Sure it is . . .

Two Dinars!

No sooner do the PCs leave the dungeon (with Yusif presumably in tow) than an elderly servant woman runs up to them and starts shouting at one of the PCs with a covered face. The near-sighted, hard-of-hearing old lady is convinced that the hero, who happens to be wearing a distinctive outfit, is someone she loaned some money to a few weeks ago, and she wants it back. The sum isn't huge, but it is more than pocket change, and in any case, the PCs don't have any money on them (Yusif doesn't either; crime may not pay, but neither does punishment). The adventurers may distract or evade her (for example, losing her in a crowd, giving her a purse full of pebbles which she won't count until later), but only temporarily. Unless they manage to pay her off, she will reappear from time to time, demanding her money in the same shrill tones.

Pass the Parcel

Once they get out of the service courtyard, the heroes must cross the public courtyard. And today, it's crowded. A party of religious pilgrims has come to ask the emir's blessings before setting out (and has brought their camels with them), scores of hopeful merchants and tradesmen have brought bundles of wares to try to sell to the notoriously open-handed emir, a minor nobleman has brought a pair of elephants with him as a gift for the emir in hopes of influencing him, and apparently a lot of people are dissatisfied with the city's lesser judges and have come to appeal to the emir for new decisions on their cases. Getting through the dense crowd with a 150+ pound bundle of Yusif won't be easy.

And it doesn't get any easier when the elephants start acting up and the people closest to them try to scatter. In the subsequent confusion and jostling, it's almost inevitable that the PCs will drop Yusif. When they do, they'll first have to find the bundle, box, or roast ox he's wrapped up in. And after they've done that, perhaps after they get out of the public courtyard and into the forest of the throne, they'll have to realize that they've picked up the wrong bundle, go back into the crowd, and exchange their bundle for the one he's actually in. Without, of course, giving anything away.

Peel Me a Grape!

The forest of the throne is far less densely packed than the public courtyard. Lit by skylights but kept cool by a tiered roof held far overhead by countless pillars, this is the room where the emir holds court. At this very moment, he sits on a pile of cushions at the far end of the chamber, doing the business of government while scribes copy letters and examine records, courtiers await the emir's convenience, commoners stand in line awaiting a hearing, and guards police the proceedings. Although the room is fairly quiet, with most people speaking in whispers, there are enough people going here and there that the adventurers shouldn't be conspicuous.

Shouldn't, that is, if the biggest, strongest adventurer weren't wearing an outfit which belongs to the emir's favorite wife. When the heroes get about half-way across the room, the emir calls on them to halt. When they've had a moment to absorb the shock, the emir calls his "dear Zukelia" over to sprinkle rosewater over his brow. It may not be clear just who he's talking to, but since the emir will keep talking to "Zukelia" if a group of harem girl-clad PCs approach him, it should be easy to figure out.

Although the emir is relatively liberal, letting the women of the harem walk

If All Else Fails

At some point, despite their best efforts, the PCs may be unable to maintain their disguises or to keep Yusif hidden. If that happens, chaos erupts. Any guards in the vicinity when the adventurers are unmasked will attempt to capture them and any bystanders around at the moment can identify them to other pursuers, but the PCs will have to take to their heels and stay ahead of the guards until they can think of something else to do. Word of a problem will make its way to the palace gates faster than the PCs possibly can, and they'll end up locked in. There are alternate routes out of the palace, but they can be problematic. If some bright player thinks of heading for the harem, which will keep non-eunuch guards from following, skip to "Follow That Princess!"

around the palace if accompanied by a guard, he's not about to let one be unveiled in public, so "Zukelia" has nothing to fear there. However, the emir will want her to stay close, feed him the occasional tidbit from nearby trays of sweets, and perhaps cuddle a bit.

And then, growing tired of work, he'll ask "her" to sing for him. The real Zukelia is an accomplished player of the oud (a sort of lute) and a reasonably good alto. It seems unlikely that the PC dressed as Zukelia is either. A smart character might come up with a plausible excuse for "Zukelia" not to sing (she has a sore throat, she's saving her voice for a grand performance tonight, etc.). If that happens, the emir will indulgently accept the excuse and send "her," with a parting affectionate swat on the rear, off to the harem to rest.

Pardon?

The guard post between the citadel of the pen and the harem is a post of considerable honor among the harem guards. It is held, with great dignity and ceremony, by Fuad, the most senior of the eunuchs. Fuad is 87 years old. Not only is he afflicted with the nearsightedness so common in Amanapur, he's nearly deaf. Consequently, an attempt to get into the harem will go something like this:

Fuad: What's the password?
PC: The wind blows sand through the tower.
Fuad: Nearly seven.
PC: Um . . . I said, the wind blows sand through the tower!
Fuad: Sandals don't cover your toes! Everyone knows that! Now what's the password?
PC: Open the door, you fool!
Fuad: It may be a token detail to you, but it's a post of great honor!

Conspicuous shouting can continue in this vein for quite some time. The way to get past Fuad is for "Zukelia" to get in his face and shout the password at him. He still won't quite make it out, but he'll recognize Zukelia if "she" gets close enough.

Follow That Princess!

Finally, the PCs find themselves in the harem. Nothing stands between the heroes and their goal . .. except for knowing where the princess is. Yusif has never been in the harem, so he doesn't know the layout, and none of the eunuchs or harem girls know exactly where the princess is. At every room they enter, they're sent on to the next. ("She was just in the garden, but she was talking about going to read in the library.")

Unlike the outer parts of the palace, though, new additions to the harem are uncommon, and the women there will be curious about any newcomers, and why "Zukelia" isn't speaking. The longer the PCs stay in the harem, the more likely it is that they'll arouse suspicion; for each room they go into, make a roll against Fast Talk at -1, cumulatively per room, to gracefully back out before someone becomes insistent that the PCs identify themselves. With any luck, the adventurers will figure out that the princess is working her way around the harem in the direction they've been going, and by running around the harem in the opposite direction, they're more likely to intercept her before it's too late.

They can catch up with her in the harem's baths, a low-tech swimming pool and spa. Surrounded by damp, largely unclad women doing one another's hair (and surrounded by a number of guards, reminding them that this is a place where trespassers are messily executed), they can try to figure out how to get Yusif and his love potion close to the princess.

There are a few major obstacles to their objective. First, the women in the baths are just as inquisitive as elsewhere in the harem. They'll be particularly suspicious if the PCs dressed as harem girls don't take off their veils and relax for a while; they'll also extend several invitations to swim. Second, although Yasmin, at the center of a knot of servants and other ladies, has a cup of melon juice beside her (certainly a nice receptacle for a potion) but seems disinclined to drink from it.

Third, after a minute or two, the heroes will hear a voice behind them pointedly demanding "What are you doing in my dress!" The real Zukelia has entered the baths and spots the one wearing one of her favorite outfits. Discovery is now inevitable. When it becomes clear that something is up, the guards become very interested, if not downright hostile, and it may be time for a frantic chase scene. Yusif, realizing that this is as close as he's going to get, struggles out of his bundle to help. And when Yasmin finds that a group of prisoners has been carting around the assistant torturer wrapped up in a basket (or rug or barrel or, by now, rather cold roast ox), she's furious. At the PCs. How dare they treat her beloved so poorly! He could have smothered inside that basket/rug/well-cooked but unappetizingly cool carcass! If they can calm her down, perhaps by throwing Yusif at her, the story will become all to clear: while walking through the courtyard one day, she spied a handsome young man tidying up some loose limbs . . . and Yusif's love potion is obviously unnecessary.

Given a few minutes, Yasmin can calm things down, calling off the guards and quieting the screaming harem girls. She's the princess, so people will listen to her, and the romance of the situation gives her the sympathy of her fellow harem inmates. As long as the heroes haven't led a chase back out into the more public parts of the palace or chopped up too many guards, the situation can be contained. The party has Yasmin's gratitude (and Yusif's, for what it's worth) and tentative support from the rest of the harem, though Zukelia is a bit miffed. Everyone can live happily ever after.

For a few minutes. Until Yasmin's favorite elderly servant woman runs in and announces "The father of the princess's betrothed is arriving!"

* * * *

Next time: A complicated situation becomes more so.

The Circle of this Forest: *As You Like It*

"Under the greenwood tree
Who loves to lie with me,
And turn his merry note
Unto the sweet bird's throat,
Come hither, come hither, come hither:
Here shall he see
No enemy
But winter and rough weather."
-- William Shakespeare, *As You Like It,* II:iv:1-8

"Men have died from time to time, and worms have eaten them, but not for love." Not the most saccharine of sentiments this Valentine's Day, but then Rosalind is not your average fainting heroine. (Even though she does, as it happens, faint.) No, she's a cross-dressing minx with a secret, which makes her an androgynous, alchemical ideal for our traditional Valentine's Day examination of Shakespearean romantic dramaturgy. So into the woods with us, where love is all around, and everything is *As You Like It.*

"And thou, thrice-crowned queen of night, survey
With thy chaste eye, from thy pale sphere above,
Thy huntress' name, that my full life doth sway.
O Rosalind! these trees shall be my books,
And in their barks my thoughts I'll character . . ."
-- William Shakespeare, *As You Like It,* III:ii:2-6

Orlando is the youngest son of Sir Rowland de Boys, kept "rustically at home" by his cruel oldest brother Oliver. Orlando demands his birthright, and Oliver throws him out, attempting to have him killed in a wrestling match to boot. The match takes place at the court of Duke Frederick, who has himself usurped his brother's birthright and exiled the rightful Duke Senior to the Forest of Arden. Although Orlando wins the wrestling match -- and the heart of Rosalind, daughter of Duke Senior -- he nevertheless flees into the Forest with his old retainer Adam. Frederick also banishes Rosalind and his own daughter Celia, and they take to the woods accompanied by the clown Touchstone. To disguise herself, Rosalind dresses as a boy, "Ganymede."

In the Forest, they meet the unhappy Silvius, who loves the heartless Phebe, and a number of other pastoral character types. Orlando, meanwhile, has encountered the greenwood court of Duke Frederick, ornamented by the melancholy lord Jaques. Fed and sheltered, he now turns to love, wandering the forest nailing bad poetry about Rosalind onto the trees. "Ganymede" encounters Orlando, and promises to cure his love by pretending to be Rosalind. Phebe, meanwhile, has fallen for "Ganymede." Not to be left out, Touchstone woos a shepherdess named Audrey. Orlando, who has a tardiness issue, promises to faithfully keep his appointments with "Ganymede" and wanders off.

He doesn't appear, but instead his brother Oliver suddenly shows up with a bloody handkerchief and a wild story, both for "Ganymede." It seems that Duke Frederick had ordered Oliver to track down Orlando, but Oliver fell asleep. Fortunately, Orlando came along and drove off a serpent and a lioness, saving Oliver's life at the cost of a mauling that prevented him from keeping his meeting with "Ganymede." Rosalind decides enough is enough, and tells Orlando as "Ganymede" that he will marry Rosalind the next day, when Oliver (conveniently) will marry Celia, with whom he has (of course) fallen in love. For good measure, "Ganymede" also promises Silvius that he will marry Phebe, and promises Phebe that she will either marry "Ganymede" or settle for Silvius. And indeed, the next day she reveals her true identity. The disappointed Phebe marries Silvius, the joyous Orlando marries Rosalind, Oliver marries Celia, and Touchstone marries Audrey, because why not? Even Duke Frederick, offstage, has met a holy hermit and renounced his throne in favor of Duke Senior. Jaques vows to follow Frederick into religious retreat, and Rosalind "conjures" applause from the audience in an epilogue.

"LE BEAU: I will tell you the beginning; and, if it please your ladyships, you may see the end, for the best is yet to do;

and here, where you are, they are coming to perform it.
CELIA: Well, the beginning, that is dead and buried.
LE BEAU: There comes an old man and his three sons --
CELIA: I could match this beginning with an old tale."
-- William Shakespeare, *As You Like It,* I:ii:50-53

Shakespeare took the basic story of *As You Like It* from the 1590 novel *Rosalynde: Euphues' Golden Legacie* by the poet-adventurer Thomas Lodge. Shakespeare added Touchstone, Jaques, Audrey, and some minor characters, and changed the hero and villain from "Rosader and Saladyne" to Orlando and Oliver, "Alinda" to Celia, and "Montanus" to Silvius. He also removed the battle scene in favor of Duke Frederick's sudden (and offstage) conversion. Lodge based *Rosalynde* on the medieval *Tale of Gamelyn* (wrongly attributed to Chaucer at the time) and wrote his novel while on a sea voyage to the Canary Islands commanded by one Captain Clarke. The precise date of that voyage is unknown, but some time between 1585 and 1588 is a best guess. Likewise, estimates of the date Shakespeare composed *As You Like It* range from 1593 to 1599, although the scholarly consensus is 1598. This would put it at the tail end of the "pastoral" genre of shepherd-heavy poetic romance, appropriate for a play that is essentially a sendup of or self-referential commentary on the pastoral -- Shakespeare's *Blazing Saddles* or *Scream.*

"A lioness, with udders all drawn dry,
Lay couching, head on ground, with catlike watch,
When that the sleeping man should stir; for 'tis
The royal disposition of that beast
To prey on nothing that doth seem as dead . . ."
-- William Shakespeare, *As You Like It,* IV:iii:90-94

The other big hint on the date of *As You Like It* is its repeated references to [Christopher Marlowe](). Marlowe was killed in a safe-house in 1593 by members of one or the other Tudor secret services, although the cover story was that he died in a fight over the "reckoning" at a tavern. And what do we find in Act III? Touchstone pointlessly mocking Audrey's dull soul with this: "When a man's verses cannot be understood, nor a man's good wit seconded with the forward child Understanding, it strikes a man more dead than a great reckoning in a little room." To drive the point home, as it were, the line also refers to one from Marlowe's *Jew of Malta,* "infinite riches in a little room." And again, Phebe's lament over Ganymede quotes Marlowe (the "dead shepherd") directly: "Who ever lov'd that lov'd not at first sight?" Since that quote appears in the poem *Hero and Leander,* not published until 1598 (though Shakespeare could have seen it in manuscript), that's another argument for a later composition.

But how did Shakespeare know about the "reckoning"? That language appears only in the official (not public) Coroner's Inquest into Marlowe's killing, and at the time, Marlowe's death was ascribed to a "quarrel over lewd love," or even the plague! Curiouser and curiouser. Marlowe of course was briefly an "exile" in France -- as was Thomas Lodge, by the late 1590s -- while he worked as a spy for the Privy Council. The name of the clown Touchstone -- the stone that tells gold from dross -- could well refer to Marlowe's activity overseas as a counterfeiter. Further, there is a very peculiar passage in which Touchstone tells the shepherd William (the only character so named in all Shakespeare's works) "Now, all your writers do consent that *ipse* [himself] is he; now you are not *ipse* [myself] for I am he." Touchstone [Marlowe] says that "William" [Shakespeare?] is not Marlowe, because Marlowe is . . . who? "He?" And what to make of the "royal" -- but barren -- lioness (an extremely dangerous reference to Queen Elizabeth?) who threatens Oliver but will prey "on nothing that doth seem as dead"? What, or who, "seems as dead" but is actually alive? Marlowe, perhaps, faking his death and hiding in the Forest of the Ardennes? Or something else, in some other forest?

"But, my good lord, this boy is forest-born,
And hath been tutor'd in the rudiments
Of many desperate studies by his uncle,
Whom he reports to be a great magician,
Obscured in the circle of this forest."
-- William Shakespeare, *As You Like It,* V:iv:33-37

The play is about searching out just such a mystery, being literally a "romance of the Rose," a quest for Truth in Arcadia. Both Duke Senior and Orlando are seeking Rosalind, and neither knows she is there "obscured in the circle of this forest" with them. She calls claims her uncle is a forest magician (Merlin? Another Marlowe parallel?), and tells the audience "My way is to conjure you." She notes that "in Pythagoras' day" she was an "Irish rat" (driven out by rhymes) and is described by Orlando as a kind of composite female goddess "of many faces, eyes, and hearts." (A cherub? A shoggoth?) She is simultaneously woman and boy, male and female, the Sacred Androgyne and Red Elixir once more. She brings Celia (from *caelus*, "heaven") down to earth. She takes the name "Ganymede," the bearer of the Cup, but hers is a specifically pagan Grail, based not only on love and wildness but sanctified by the ancient god of marriage, Hymen. Orlando senses this, and appeals to Hecate (the "thrice-crowned queen of night") for her love. Like Hecate (and the Duchess of Malfi) she reduces her lovers to "Irish wolves against the moon." If we could but find Rosalind in this wilderness, this "desert," what would she be?

As always, Shakespeare makes it tricky for us, resorting to his old standby mystagogical method of twinning. He has two Olivers -- Orlando's brother, and the country vicar "Sir Oliver Mar-text" (Marlowe-text?) -- and two Jaqueses. Jaques is the name of Orlando and Oliver's middle brother, who appears (unlike the melancholy courtier Jaques) with the good news about Duke Frederick's conversion. Orlando is himself twinned with his brother (Orlando and Oliver were boon companions in the fantastic pastoral *Orlando Furioso,* and Oliver keeps Orlando's appointment with Rosalind) and with his father, "old Sir Rowland," since "Orlando" is Italian for "Rowland." Finally, Celia is "coupled and inseparable" with Rosalind, again twinned "like Juno's swans." Four sets of "twins," and four loving couples: Orlando and Rosalind, Celia and Oliver, Phebe and Silvius, and Touchstone and Audrey. The god Hymen specifically identifies Touchstone and Audrey with "the winter [married] to foul weather," which implies that the other three couples are the other three seasons.

"They say he is already in the forest of Arden, and a many merry men with him; and there they live like the old Robin Hood of England. They say many young gentlemen flock to him every day, and fleet the time carelessly, as they did in the golden world."
-- William Shakespeare, *As You Like It,* I:i:41

This seasonal sweep is evident also in the songs, which begin with "winter and rough weather" and "blow, blow, thou winter wind," and end with "sweet lovers love the spring." Rosalind, of course, is still stirring the pot: "Men are April when they woo, December when they wed," which reverses the winter-wooing to spring-wedding motif of the play. Shakespeare amps up the time-confusion with "no news but the old news" -- Duke Senior has been both recently exiled and gone since Celia was young. Time stops in the Forest of Arden, which though it feels "the seasons' difference . . . the icy fang and churlish chiding of the winter wind" also sports olive groves and palm trees! Oliver is saved under a "bald" oak, while Orlando rests under a live one "like a dropp'd acorn," and Duke Senior sings "heigh-ho, the holly!" (Oliver and Orlando are surnamed *de Boys,* "of the forest.") Oak Kings and Holly Kings aplenty. Summer and winter contend throughout -- not only young Orlando versus old Oliver and old Duke Senior versus young Duke Frederick, but young Silvius debates love with the old shepherd Corin.

The parallels are even clearer in the play's ultimate source. In *The Tale of Gamelyn,* Gamelyn (from the Norse *gamall,* meaning "old one") fights his older brother and locks him up for a week of feasting -- a clear reference to Saturnalia, Yule, Twelfth Night, all the mid-winter feasts at the coming of the new king -- and then is imprisoned in his turn. He frees himself, beats up churchmen (more Misrule) and flees into the woods, where he replaces Robin Hood as King of the Greenwood. He then returns to the town, hangs the sheriff and his brother (in a grand combination of Herne and Mister Punch) and then returns to the forest to marry. Gamelyn is both old and young, both King and outlaw. He, Shakespeare's model for Orlando, is the Green Man.

"What shall he have that kill'd the deer?
His leather skin and horns to wear.
Then sing him home.
Take thou no scorn to wear the horn;
It was a crest ere thou wast born:
Thy father's father wore it,
And thy father bore it:

The horn, the horn, the lusty horn
Is not a thing to laugh to scorn."
-- William Shakespeare, *As You Like It,* IV:ii:11-19

Not just green . . . scarlet and green, like the holly. Gamelyn (or Gamwell) is also an alias of Will Scarlet in the 17th-century ballad "Robin Hood Newly Revived," another connection to Robin Hood for our play. (Likewise, in the 1938 Errol Flynn version, "Will Gamwell" is the Merry Man in scarlet.) In that ballad, Will Scarlet, "young Gamwell," kills his father's steward, loses his inheritance, and flees into the Forest. In "Robin Hood and the Prince of Aragon," Will both fights a giant and marries the rightful heiress, just like Orlando. Will Scarlet is often twinned with, given the name of, or otherwise confused with Will Stukely (or Will Stutely); where "Will Scarlet" is the youngest, rashest Merry Man, "Will Stukely" is the oldest and wisest. And get this: Will Stukely is depicted as Robin's old *steward.* Will Scarlet has thus, in some deep sense, killed Will Stukely, a kind of self-devouring serpent, shedding Lincoln Green for the bright scarlet of sacred blood. But like Orlando and Oliver, they are two sides of the same coin, twins and emblems of each other.

And here's where things get really strange, so stay with me. Another Will Stukeley, an antiquarian, excavated Stonehenge beginning in 1719 and apparently converted to Druidism in the next decade, eventually claiming to be "Arch-Druid of Britain." He became, in other words, the steward -- the guardian of the property, the legacy -- of the Forest King. And what is *As You Like It* actually concerned with? Orlando's legacy, his inheritance, his "one thousand crowns" from Adam. That's why the real climax isn't even the marriages but the reading of Duke Frederick's will -- his legacy. Duke Frederick leaves Orlando not his money, but "a love that your true faith doth merit," which is to say, Rosalind. In between, Orlando has been hanging odes on the Druidic hawthorn, finding "tongues in trees, books in the running brooks, sermons in stones" -- which is to say, uncovering (and inscribing) the Truth hidden at the center of the forest, which he sums up as, of course, Rosalind again.

Shakespeare is thus telling the story of the secret of the Rose, the hidden Druidical wisdom, the "golden legacy" of the British past, perhaps as uncovered by John Dee in Wales, by Lodge in the Atlantean Canaries, or by Christopher Marlowe in Jesuit libraries in Rheims. He is talking about the True Kingship, the crest of the deer, the crown of Robin Hood, of Herne, the Horned Man, that "thy father's father wore." Marlowe spread it to the School of Night, who sent it to [Roanoke](#) (Rowan-Oak) on the good ship *Roebuck* (flagship of the horned king's hidden navy?) under Captain John Clarke in 1585. (Another passenger on Clarke's 1585 voyage -- one John *Stukely.*) Was this the same "Captain Clarke" upon whose ship Thomas Lodge wrote his novel? Lodge broke it open, and he had to flee to France. Worse, Marlowe had to be killed (or exiled again) to settle the "reckoning," the debt owed for the Golden Legacy. Marlowe, and the whole secret Forest Kingship, had to "seem as dead," if it was to evade the lioness and her serpentine secret police, the snakes in Shakespeare's Edenic forest. It had to hide in the wilderness under the care of a faithful shepherd . . . or steward. But, Shakespeare says, the seasons will turn, the Will will be read, and eventually the King will come into his own again, and everything will be just as you like it.

"Love? What is Love?" the Gamazoid Asked the Captain

Back in my days as a swinging single (for sufficiently large values of "swinging"), I tried my hand a few times at the online dating scene, which can be a useful gambit if you're a guy working in an office consisting solely of other guys.

Anyway, one interesting aspect about online dating is that, despite a common language, words themselves don't mean the same thing between folks online. I think by far my favorite common phrase I encountered from written personals was from women professing to be "not into games." Now, as someone who considered (and considers) himself to be "into games," this led to something of an interesting conundrum, since I'd often feel like I needed to explain myself to potential dates: "Okay; I'm into games, but I don't think I'm into the kind of games that you're not into."

A similar situation arose whenever I'd talk about my hobbies. Since the Internet is such a diverse breeding ground of interests ranging from the commonplace to the criminal, making sure everyone was on the same page during conversations: "Okay; when you say you're into 'fantasy roleplaying,' do you mean 'pretending to be a naughty nurse who sleeps with people' or 'pretending to be an elf who kills people'?"

Of course, that words have multiple meanings isn't that unusual; there are only so many words in existence compared to the number of things or actions. But what's interesting is the gulf between what people intend by their words and how they are interpreted.

For example, say to various groups of people some version of, "Say, do you all like card games?"

- One group might think you mean games such as poker, spades, or hearts.
- Another group might think you mean games such as *Munchkin, Lunch Money,*
- Still another group might think you mean games such as *Magic: The Gathering, Yu-Gi-Yoh!,* or *Bella Sara.*
- And a final group might think you mean, "Your dog said to kill your parents." (Admittedly, that group is probably less than 10% of the general population.)

Or how many times have you been misunderstood when you told people you liked roleplaying games? "Oh, you mean like *Final Fantasy?*" or "Oh, is that like *World of Warcraft?*" or "What's that? Rex says to kill dad?"

Even when folks seem to be using the same words to mean the same thing, there's still plenty of room for interpretation or misunderstanding. For example, let's say a GM offers to run a sci-fi game. If the GM is assuming that to mean something like *Transhuman Space* while one player wants *Shadowrun,* another player is expecting something like *Fading Suns,* and still another is looking forward to a *Star Trek*-esque game, there's probably going to be a disconnect. (On the other hand, the player looking forward to a *Paranoia* game will likely be happy. Any game becomes like *Paranoia* in the hands of the right players.)

Likewise I've seen plenty of gaming ads looking for "serious gamers." Does this mean people who are really into roleplaying? Serious munchkins? People who actually show up consistently regardless of their gaming style?

Or how about "beer and pretzels" games? Is there any general consensus as to what this means? (According to Wikipedia, *WizWar* is considered an example. Given that game's complexity, I think I'd need a *lot* of beer and pretzels to get it to qualify. Only replace the pretzels with more beer. And replace the beer with shots of Jack Daniel's.)

If the desire of language is to be understood -- admittedly not always the goal -- the easiest way to avoid these problems is probably through the use of examples, analogies, and metaphors. For example, telling folks you want to run a sci-fi game isn't very helpful. Telling someone you want to run "a sci-fi game that's two-thirds *Blade Runner* with one-third *Sky Captain & the World of Tomorrow*" should give the prospective player more to go on. Or telling the gaming group that you consider *BattleTech* to be a beer-and-pretzels offering should help them make an informed decision.

Of course, perhaps the quintessential example of the multiple meanings of language is the word "love" itself. For example, you may love your wife, your brother, and pancakes; but you almost certainly don't use the same meaning of "love" for all three (unless you're a refugee from a Faulkner novel). And, depending on *how* you love something, it's probably best to demonstrate with some chocolates, football tickets, or maple syrup, as appropriate.

And so, on this Valentine's Day week, we again look at some of the various ways that "love" and "gaming" can intersect, with a handful of articles from our Baker Street irregulars. (We're even going to spill a bit over into next week's issue . . . as the helpful "Part I" should enclue.)

So even if you're a naughty nurse who's not into games but loves beer and pretzels, hopefully you'll find something this week to spark your interest. Presuming, of course, that we call all agree on what "spark" or "interest" are . . .

The Torturer's Apprentice

Part II
In Which A Funny Thing Happens To the Heroes On The Way To The Harem

for *GURPS*

by Matt Riggsby

And so our story continues . . .

For the past several months, the Emir has been carrying on negotiations with the fierce desert chieftain, Sheik Yabutti. The sheik and the emir exchanged hostages, one of Khudseen's brothers for one of the Sheik's sons (Rakhim al-Nayat al-'Ang, his sixth and youngest). Now, a long-term treaty has tentatively been concluded. Sheik Yabutti is on his way to Amanapur and, after a lavish feast, the treaty is to be formalized by Yabutti's son, the hostage, being engaged to Yasmin. Yasmin, however, will refuse the marriage.

To this, Yusif adds what he calls "the bad news." Since the sheik's son was, technically, a prisoner, he ended up in the dungeons of the Emir's palace with no ceremony or fanfare. Not knowing who the prisoner was, Yusif sent him along for Festus Magister's magical experiments. Not only is an engagement standing between Yusif and Yasmin's happiness (and between the PCs and the door), Rakhim's confinement could lead to a serious diplomatic incident.

Yusif again appeals to the PCs for assistance. Without their assistance, he says, Yasmin will not know happiness and the city will be threatened (not so much a problem if the heroes aren't from the area, but a considerable issue if they are). He won't be so crass as to mention that if Yasmin is exposed, there will be no one to shield the PCs from the emir's considerable wrath, but the party should be smart enough to figure that out. What they need from the advengturers, he and Yasmin decide, is assistance recovering Rakhim and keeping up appearances until the betrothal ceremony is complete. After Sheik Yabutti has returned to his desert home, Yusif and Yasmin can make a quiet escape.

While Yusif helps Yasmin pack some veils for their planned flight and exile, the PCs are given the job of visiting Festus Magister's tower, finding Rakhim, and escorting him back to the dungeon. They should try to convince him that Yusif had to move the prisoners to the wizard's tower while the dungeon was being cleaned, and now that that's done, he can move back. Before they go, they can, if they desire, change clothes. They can find enough eunuch guard and eunuch servant outfits for everyone. Yusif is also happy to recover the heroes' gear at this point, although it may take some time. He has to talk to the sergeant of the guard, who was responsible for depositing their belongings with the quartermaster . . . Yusif has little idea how long it'll take, but in the event it will be a matter of hours.

Goodnight, Sweet Prince

Getting into the wizard's tower won't be a big problem. Servants are in and out of every place in the palace all day and night, bringing in food, sweeping the floors, washing this and that, taking away rubbish, and so on. Getting all the way up to Festus Magister's chambers and laboratory is somewhat more difficult. Festus doesn't like being disturbed, and most servants are sensibly terrified of the potentially hazardous nature of most of the items in the lab. Festus reacts to most of the PCs with barely suppressed annoyance and condescension, but he will take aside for a moment the one contacted by the Halvavin. Festus tells him "It shall be at the third horn. Hakim and Aref are on their guard, but make sure that Mansoor knows as well. Now be on your way!" If the hero indicates that he has no idea what the magician is talking about, Festus will give him a long, hard look and send him away anyway, having marked him as a problem.

The unfortunate adventurer will be attacked by lone assassins with poisoned daggers up to three times, if he makes it that long, before dinner.

More difficult than getting in to the tower will be getting Rakhim out without Festus knowing, since the magician keeps track of his zombies. What Yusif didn't know is that Festus Magister knew about the impending treaty far in advance and recognized Rakhim when he was delivered. Festus killed him and reanimated him as a zombie. He's working on a plot to take over both Amanapur and the desert tribes, using the zombie Rakhim as a pawn and his fellow members of the Halvavin as hired killers.

About the only things the heroes have going for them are that zombie-Rakhim will take simple orders from just about anyone, the body is still fresh, so he looks unhealthy but not notably dead or rotten to the casual glance (long term viewing or close inspection will raise suspicions, though; several parts have been cut off and stuck back on with wax), and that if they get him out of the tower, Festus Magister can't make a huge fuss about it for fear of attracting suspicion to himself as well. If they can distract Festus long enough to get a shambling prince out of the tower, they've got breathing room.

Guess Who's Coming To Dinner?

Once they get to the public courtyard, they run into more tumult. Sheik Yabutti has arrived. The PCs can try to head for cover, but since Rakhim is dressed in his distinctive desert nomad garb and any number of people around the palace recognize him (Yusif, who doesn't get out much, is in the minority), it will be very difficult to keep him hidden. And if he's found, people will want to bring him forward to greet his father. This is scarier than it sounds, if the heroes play their cards right. Rakhim can shamble around and moan a bit. In the noise of the crowd, his father wouldn't be able to make out his words anyway, and if the PCs have made it this far, they're probably smart enough to think of the "Rakhim is ill" ploy on their own, letting them whisk the young man away.

For the next few hours, the challenge to the adventurers is to keep Rakhim on the move so that no one can get too close a look at him. "He's not feeling well" will only go so far, and Festus didn't have the chance to disguise his more visible joins. They might briefly stash him in a spare wardrobe or chest, but inevitably someone will appear needing something out of that container, and the PCs will have to explain what Rakhim is doing in there. Well-wishers will want to wish Rakhim well on his engagement, the politically ambitious will want to get their foot in the door with the next generation of leadership, masters of ceremonies will want to be sure he knows what he needs to do tonight, and so on. Comparisons to _Weekend at Bernie's_ in a turban are, alas, appropriate. They can _not_ stash him in the harem, no matter how much Yasmin would be willing to help. Disguising Rakhim as a eunuch is difficult at best, and a dead body shambling around the womens' gardens and baths is probably more than Yasmin would be able to keep under wraps.

Everyone of any importance in and around Amanapur attends the celebratory dinner that evening to announce the treaty and the betrothal of Yasmin to Rakhim. With enough Fast Talk and Savior-Faire roles, the PCs can stick close to Rakhim and act as his servants for the evening, keeping most other people at bay; they can even arrange to get him dressed in his elaborate robes for the evening. The seating plan is also reasonably favorable. The emir and several of his wives have a low table where the emir had been holding court

The Plot, Such As Is

Festus Magister has long wanted to seize power, but lacked the means until Yusif delivered Rakhim to him. Once the betrothal is formalized (for which Rakhim doesn't actually have to say anything), he plans to claim that the young man has come down with a terrible illness. Then, as the region's foremost physician, he can be the sole mediator between Rakhim, or what the world believes is Rakhim, and the rest of the world. Once the emir is dead, he will push the wedding forward as an emergency measure (Yasmin, alas, can't rule in her own right, but Rakhim could inherit the throne through her) and assume effective control of the city. Anyone who finds out about the plot is to be quietly killed as well.

Festus Magister is a senior member of the Halvavin and has several nearsighted assassins to help him with his plan. All are dressed in similar garments. One of the PCs has been given one of their outfits, which is why he's been mistaken for an assassin himself. The beliefs of the Halvavin consist mostly of being mystical and obscure for their own sakes, but their goals are secrecy and the acquisition of power.

earlier that day, the sheik and a handful of his people have a separate table to the emir's left, and Yasmin and Rakhim have a table to themselves to his right, all set with vast candellabras to provide enough light to properly show off the jeweled garments everyone is wearing. They're on display, but won't be approached closely. The rest of the room is filled with other low tables and over a hundred dignitaries, with servants circulating throughout with vast trays of saffron-colored rice, spiced eggplant, dates and other fruit, and remarkable quantities of roast animals stuffed into other roast animals.

Between the head of the candles and general wear and tear, Rakhim is also going to have trouble holding himself together. Festus Magister didn't have time to properly reinforce Rakhim's sealing wax joins. The more he moves, and the hotter the room gets, the greater the chance something will fall off. The food is also a problem. Although he won't digest, Rakhim can be told to eat the food put in front of him. However, he's also been opened up and sealed closed across the belly, so if he eats and drinks too much, he may split open, or at least start leaking copiously. The more exertion zombie-Rakhim has been through that day, the greater the chance that he'll start falling apart.

As the meal progresses, the heroes may notice that several servants dressed identically to the one contacted by the Halvavin staying close to the emir. They circulate through the diners, pouring drinks and clearing away dishes, but move in ever-tightening circles near the emir's table. A fanfare is blown at the beginning of the meal and a second when a grand celebratory elphoxladukhenallowmond is brought into the room. Just after that, one of the identically dressed servants whispers into the ear of the "Halvavin" PC, "Salah, when do we strike?" The heroes could try to hustle him into a dark corner and beat a confession out of him (indeed, they could try that as soon as they figure out that the assassins are all dressed the same), but sooner or later they'd have to explain their own presence to somebody.

If the PCs don't attempt to stop the assassinations (or if they somehow manage to covertly dispose of all of the assassins) and Rakhim hasn't fallen part by then, the emir rises to announce the betrothal of his daughter. After brief preamble about friendship between the people of the city and the people of the desert, his brotherly love for Sheik Yabutti, and so forth, he formally declares Rakhim's intention to marry his daughter. He orders Rakhim to arise and make the traditional ritual gestures which will make the betrothal official: bow to the Sheik to show his respect, to the emir himself to show his obedience to his new father-in-law, and to Yasmin to show his love. On the third bow, the horns blow again, the assassins (if any are left) spring into action, and Rakhim's head falls off.

The Aftermath

Clever PCs will realize that saving the emir's life can only work in their favor. That's particularly the case now, when the eunuch guards around the room will be prevented from reaching the emir by the screaming crowd of revelers shocked by the disintegrating desert prince. Besides, combat-oriented PCs should be spoiling for a fight by now; the GM may as well give it to them.

Once the chaos is over, the heroes are still probably going to have to explain themselves, particularly when Yasmin declares her love (as she most certainly will) for the torturer's apprentice. The emir can't very well have his daughter's head chopped off, but he'd be more than willing to have anyone else connected with the enterprise slowly tortured to death, and never mind the logistics of who's going to do that while Idi is away and Yusif is the only professional in that area in easy reach. Moreover, the sheik is upset at just about everyone, and the emir needs some way of appeasing him or risk a war. If the PCs were involved in saving the emir's life, they may be able to talk their way out of execution with some favorable influence rolls, but it would be nearly impossible to avoid acquiring the sheik as an Enemy.

Very clever heroes, however, might remember that Yusif still has a potion which will make the person who takes it love him. That "love" manifests in whatever way is appropriate. Had Yasmin not already been in love with Yusif, it would have been a strongly romantic love. For an older man without a son, it would be very paternal. Slipping that to the emir will get him firmly on Yusif's side, and therefore the party's side, but leave the problem of the sheik. Getting it to the sheik would give them a way out of both problems. Sheik Yabutti would be willing, and indeed eager, to adopt Yusif and marry him to Yasmin. This

gives Yusif sufficient leverage to beg clemency for the PCs, who thereby get out of it alive.

But not necessarily scott-free. If the GM is inclined to add a coda, someone will note that they're still guilty of whatever crime landed them in the dungeon to begin with. If so, the emir commutes their sentence to a week's imprisonment, to be spent eating oxladukhenallowmond while restrained on lovely carpets by chains of gold (which they may keep when they are released). After several days of this most unusual punishment, Idi returns while Yusif is off being prepared for his lavish wedding to Yasmin. Seeing his dungeon turned into a pleasure palace, he'll demand to know what's going on. Needless to say, whatever the PCs tell him, he won't believe it.

Eunuch Guard

ST 14; **DX** 12; **IQ** 10; **HT** 12.

Damage 1d/2d; BL 39 lbs.; HP 14; Will 10; Per 10; FP 12. Basic Speed 6; Basic Move 6; Block 0; Dodge 9; Parry 9 (Broadsword).

Disadvantages: Bad Sight (Nearsighted).

Yasmin, keeping Rakhim's secret until circumstances require him to fall apart, saving the emir, and keeping the peace between Amanapur and Sheik Yabutti.

In addition, the first PC to observe that they are in Khudseen Bey's company deserves a character point, as are the first one to realize that, as court physician, Festus Magister is the doc of the bey, the first one to sing lyrics from K.C. and the Sunshine Band, and anyone who intelligibly claims that the sheik's sixth son is sick.

Quirks: Neutered.

Skills: Broadsword-12; Savoir-Faire (Military)-11; Soldier/TL3-12.

Except for Fuad, who is hardly combat-effective, the eunuch guards are large and tough.

Halvavin Assassin

ST 11; **DX** 12; **IQ** 10; **HT** 10.

Damage 1d-1/1d+1; BL 24 lbs.; HP 11; Will 10; Per 10; FP 10. Basic Speed 5.5; Basic Move 5; Block 0; Dodge 8; Parry 8 (Knife).

Disadvantages: Bad Sight (Nearsighted); Fanaticism (Order of Halva Eaters).

Skills: Disguise/TL3 (Human)-10; Holdout-12; Knife-13; Savoir-Faire (Servant)-11; Stealth-12.

The Halvavin assassins carry fine-quality knives coated with a slow but powerful poison. If an attack penetrates DR, roll against HT-5. The poison does 1d additional damage over the next hour, and an additional 1d after an additional hour for every point by which the HT roll is missed (missing the roll by 4 would mean 5d damage over 5 hours). HT rolls for additional attacks are at a cumulative +3, and the poison will wear off the knife after three or four attacks, whether the penetrate DR or not. A successful Physician roll for each hour the poison is in effect will negate that hour's damage.

Yasmin

ST 9; **DX** 10; **IQ** 11; **HT** 9.

Damage 1d-2/1d-1; BL 16 lbs.; HP 9; Will 11; Per 11; FP 9. Basic Speed 4.75; Basic Move 4; Block 0; Dodge 7; Parry 0.

Advantages: Appearance (Very Beautiful); Destiny (Be happy with Yusif) (Minor); Status 3; Wealth (Wealthy).

Disadvantages: Bad Sight (Nearsighted); Social Stigma (Second-Class Citizen: Women).

Skills: Artist (Calligraphy)-11; Gardening-11; Intimidation-14; Leadership-10; Poetry-11; Sewing/TL3-11; Singing-10; Swimming-10.

Small and pretty, Yasmin has nevertheless learned some lessons about making people do what she wants. When she stamps her little foot, people listen.

Emir Khudseen Bey

Size Modifiers and Strength Scores for GURPS Fourth Edition

by K. David Ladage

According to basic physics, the mass of an object increases with the cube of its linear dimension. That is to say that if a human were hit with a growth ray and doubled in size (with all proportions remaining equal) then that human would suddenly be 8× as heavy ($2 \times 2 \times 2 = 8$).

This is all well and good, but how strong should/would this individual be?

Well, according to the same principles of physics, the strength of an object increases with the area of its cross section (or, in simpler terms, with the square of its linear dimension). That is to say that our human above that doubled in size (again, assuming all proportions remained the same) would find themselves only 4× as strong ($2 \times 2 = 4$).

This leads us to a basic rule of thumb for the baseline (i.e.: average) strength of a human-proportioned individual at the various size modifiers that looks like this:

SM	ST	Cost	SM	ST	Cost
-10	1	-90	0	10	0
-9	1	-90	+1	15	45
-8	1	-90	+2	25	120
-7	1	-90	+3	35	175
-6	1	-90	+4	50	240
-5	1	-90	+5	75	325
-4	2	-80	+6	100	360
-3	3	-70	+7	150	420
-2	5	-50	+8	250	480
-1	7	-30	+9	350	680
0	10	0	+10	500	980

Cost is the point cost of the strength listed, with the size modifier reduction applied.

If you are making a Giant with SM +5 (about 45 feet tall), and you want this giant to be semi-realistic, then ST 75 will achieve an individual that is about in proportion to a typical human being. However, to be realistic, you would need to throw on some serious limitations based on the fact that this individual's strength-to-mass ratio is pretty poor.

This individual is about 55× as strong as a typical person, but weighs about 420× as much. Pound for pound, this is only about 13% as strong as a typical man.

Keep in mind that page 19 of the ***Basic Set*** indicates that such considerations should never be forced onto a character. Still, this giant is dealing an average of 28 points of damage with a punch! The strength-to-weight ratio may not be an issue.

There is another option, however.

A typical ST 10 individual, according to ***GURPS,*** weighs in at 150 pounds. ST 10 provides a Basic Lift of 20 pounds. This is about 13% of the weight of the individual. If we scale strength to the mass of the character, so that they have the same proportionate strength (pound for pound) of a human being (the way most fantasy giants seem to work) then the chart looks more like this:

SM	ST	Cost	SM	ST	Cost
-10	1	-90	0	10	0
-9	1	-90	+1	18	72
-8	1	-90	+2	39	232
-7	1	-90	+3	65	385
-6	1	-90	+4	111	606
-5	1	-90	+5	205	975
-4	1	-90	+6	316	1224
-3	2	-80	+7	580	1710
-2	3	-70	+8	1250	2480
-1	6	-40	+9	2070	4120
0	10	0	+10	3535	7050

Cost is the point cost of the strength listed, with the size modifier reduction applied.

If you are making a Giant with SM +5 (about 45 feet tall), and you want this giant to have the same strength (pound for pound) as a typical human being, then ST 205 or so will accomplish your goal. This is not realistic, but it is hard to argue realism when you are simulating a giant that lives at the top of a beanstalk . . . on a cloud.

This individual is about 420× as strong as a typical person, and weighs about 420× as much as a typical person. In addition, this giant is dealing an average of over 70 points of damage with a punch!

Figuring out what ST scores to hand out to a giant creature is sometimes rather difficult. You need to know what your goals are. Most of the time, the realistic method of calculating strength is preferable (just hand-wave that whole strength-to-mass thing and move on). However, if you want to have some seriously scary, put the fear of the supernatural into your players fun for a change: try the second option.

Just be ready to run!

Can I Have a Glass of Water and a Breath of Fresh Air?

How well does boiling salt water to catch the condensation work, and did Age of Sail mariners have any methods of purifying salt water?

In a purely technical sense, boiling salt water and catching the condensation works extremely well. Distillation of salt water works because the water will turn into steam and boil away at a much lower temperature from the salt, which is then safely left behind; the salt component of this solution boils hotter than the temperature needed to melt glassware! When you collect the steam and allow it to cool and condense, you will have fresh potable water. The technique can, though, consume a lot of fuel.

For "the Age of Sail," we'll take a broad definition, synonymous with the "Age of Discovery." It was the time when trade and warfare was dominated by sailing ships, starting in the 16th century and extending to the 19th century when steam ships started to dominate. Through most of the Age of Sail in the Western world, staple items including potable water were carried aboard ship in wooden barrels. After extended storage, the water in these barrels was often foul and undrinkable due to bacterial growth and vermin infestation. Aside from collecting rain or foraging for water when you were near dry land, this was it as far as having drinkable water on the ship. Although heat distillation of salt water was available as a technique in the western world since at least the time of Aristotle, it was used primarily as an alchemical method, most commonly employed in the distillation of spirits rather than in the production of potable water.

There was no common way for water to be desalinated on board a ship for many years. In 1758, Dr. James Lind, the person responsible for establishing that citrus fruit is an effective preventative for scurvy, repeated Aristotle's observation that if you boiled salt water and collected the steam, the water was fresh and tasted like rain water. He proposed the use of solar energy to heat the water, but this method was very slow and ineffective for producing the quantities of water needed on a naval vessel. Only when a new and more efficient type of shipboard stove was introduced in 1810 did there come the possibility of distilling fresh water on a useful scale.

Shipboard distillation appeared somewhat earlier in the east. During the beginning of the Edo period (early 17th century) in Japan, sailors invented a water purification system called a Ranbiki. This distiller consisted of an earthenware pot containing salt water which was placed on a fire. A bamboo pipe served as a condenser and was attached to the lid of the pot. On top of the condensing pipe was a pan filled with more cool salt water. As the water in the earthenware pot boiled, the steam traveled through the bamboo pipe and was cooled by the water surrounding the pipe, causing it to condense and collect as potable water. As the water in the pan on top became too hot to allow effective condensation, it was placed in the earthenware pot and allowed to boil. This system was quite efficient because, instead of wasting heat, it recycled it, allowing the distiller to run continually and reducing the amount of fuel it consumed.

The key to efficient distillation of water, then, appears to be the efficient distribution of heat, a science Europe only seriously developed late in the 18th century as a consequence of developing early steam engines. It's little wonder then, that once steam distillation became practical and efficient, the sailing ships distillers were installed on were soon replaced by steam ships.

So, to answer the question, mariners did have some methods of purifying salt water, but the effectiveness and usefulness of these techniques varied depending on where you were in the world. In the West, it was possible but not very practical until very nearly the end of the Age of Sail, while in the East, it appeared earlier and was somewhat more common.

What's the maximum amount of air that can be squeezed into an air tank, for use by divers or astronauts? This can either be ordinary air, some oxygen/helium mixture, or pure oxygen for use in some kind of rebreather system. Is this capacity likely to increase as technology advances, or is it pretty much fixed? If it can be improved (without assuming "super-science"), will improvements be gradual, or will it be drastic?
    --Peter Knutsen

A human breathes air at the rate of about 4.2 liters per minute at rest, up to 120 liters per minute during heavy exercise. For a first pass, this is the amount of gas we must supply. Standard air tanks will withstand pressures up to 3,000 psi (200 atmospheres), and a normal "80-cubic-foot" tank (the measure expresses the amount of air it holds at ambient pressure, not the actual internal volume) will provide air for between twenty minutes and eight hours; that tank will weigh about 35lb empty and 41lb full (16-18kg). This is a size of tank which is quite convenient for most people, though smaller and larger ones exist; weight, volume and duration scale more or less in proportion.

Of course, this is for an open-circuit breathing system, which is highly inefficient. The only gas a human actually requires to survive is oxygen, at a partial pressure between about 16kPa and 50kPa, and -- while inhaled air normally contains 21% oxygen -- exhaled air still contains about 15-16% oxygen. Only about 5-6% of the supplied gas is actually used. A rebreather system will scrub carbon dioxide out of the exhaled gas and allow the addition of new oxygen from a pressurized source, either pure oxygen (as in the earliest rebreather sets) or with a gas mix suitable for the ambient pressure (as is more common now). Medical oxygen sets normally supply two liters per minute; the scuba tank would hold enough for nearly nineteen hours on the surface.

Current carbon dioxide scrubbers are chemical in nature (using soda-lime or other substances which will absorb carbon dioxide), and this will gradually be used up. Other techniques will predominate in long-duration rebreather systems; in 1969, the S-1000 cryogenic rebreather set used a liquid oxygen tank, and used the cooling caused by its expansion to freeze carbon dioxide out of the exhaled air stream. Storage technology has since advanced to the point that liquid oxygen reservoirs are available for home medical use (not condensing oxygen out of the air, but keeping it cold indefinitely once filled from an external reservoir).

It is of course possible to store gases at higher pressures, though for reasons of safety this is not often done (especially when pure oxygen is involved). The required thickness of the tank wall scales linearly with pressure, and the weight of the tank is roughly proportional to pressure squared and to the 2/3 power of internal volume; for the same air capacity, a larger low-pressure tank will be lighter than a small high-pressure one. One problem for scuba divers is that the large low-pressure tank will have a low density; most divers already need to carry weights to achieve neutral buoyancy, and a low-density tank made from high-tech materials will just mean that more weight needs to be carried. Even in the present day, many divers prefer heavy steel tanks to light aluminium ones for this reason, and don't tend to use tanks larger than 120 cubic feet in capacity.

What About Pressure?

The total pressure of a gas mix depends on the "partial pressures" (effectively, concentration) of its ingredients. Ordinary sea-level air has a partial pressure of 0.21atm oxygen and 0.79atm nitrogen -- total, 1.0 atmospheres -- and obviously these partial pressures increase when it's compressed. Humans can safely breathe oxygen at partial pressures between about 0.16 and 0.50 atmospheres; for periods of a few hours, it can be allowable to go as high as 1.4 atmospheres, though reactions to oxygen toxicity vary widely between individuals. However, the range of total pressures at which

For use in less dense environments, where mass will still be a factor, stronger materials would certainly be useful. Carbon nanotubes offer significant possibilities, with a wall just thousandths of an inch thick and tanks weighing only a pound or two even for the largest size it would be practical to carry. At this point one can effectively discard tank weight as a consideration. So how much gas can fit into this supertank?

When sufficiently compressed and cooled, gases liquefy and then solidify; for pure oxygen this happens at the surprisingly low pressure of 450 atmospheres. The density of solid oxygen in its various forms was measured in 1978; its densest form weighs 780 kg/m^3, equivalent to a gas pressure of 550 atmospheres (at a temperature below 24 Kelvin). Even with miraculous weightless insulated pressure tank technology, something the size of a modern scuba tank won't ever hold more than about 9kg of solid oxygen. So how long will that last?

On the basis of inhaled and exhaled oxygen percentages, we can calculate the amount of oxygen actually consumed, from 4.5 mg/s in normal conditions to 130mg/s under heavy exercise; that's what a truly optimised system will have to supply. The ultimate rebreather, with 100% efficient recycling of all exhaled gases and total removal of carbon dioxide and with a solid oxygen tank the size of the scuba tank, would be able to supply oxygen for nearly 23 days of rest or 19 hours of heavy exercise. The stored oxygen would weigh about 20lb. The local gravity might well allow more mass to be carried; the sheer bulk of the system is more likely to be the limiting factor, though someone not doing physically demanding tasks (stretching and bending) might reasonably expect to carry up to twice as much as this.

humans can operate is very much wider; the Apollo program's pressure suits ran as low as 0.25 atmospheres, while scuba divers using specialised equipment have descended below 1,000 feet (30 atmospheres). (Other gases have their own toxicity problems at high pressures; this is why helium is used rather than nitrogen as a diluant gas for deep dives.) Clearly the gas mix must be designed for the pressure at which it will be used; currently divers carry multiple tanks with different gas mixes, with oxygen typically 10% of the mix for the deeper stages of a dive, but with advancing technology it seems likely that this will be replaced by a dual-tank system of oxygen and diluent gas which is mixed on the fly.

A diver who isn't using a hard suit also has an increased air consumption, because he has to inhale air at the same pressure as the water surrounding him in order to prevent his chest from collapsing. At 60 feet down, the pressure is nearly three times what it is on the surface, and a given air supply will only last one-third as long. However, the total oxygen actually consumed by the diver does not increase by anything like as much; an efficient rebreather will only show a slight loss in duration at depth.

An alternative to an oxygen tank is of course a true oxygen regeneration system, perhaps using highly-active algae driven by photosynthesis to convert exhaled carbon dioxide back into oxygen as fast as the wearer can breathe it. This has mostly been considered in the larger context of a closed-environment space station, but U.S. Patent 5,614,378 suggests that a unit about the size of the scuba tank ought to be able to keep one person supplied with oxygen indefinitely as long as he remains in sunlight.

Contenders: A Roleplaying Game of Blood & Sweat, Pain & Hope

Published by [Prince of Darkness Games](#)

Written by Joseph J. Prince

52-page digest-dized b&w softcover; $15

Let me begin by making a confession: I have no interest in the sport of boxing. I have never seen a movie about boxing. Not *Rocky*. Not *Raging Bull*. Which begs the question, why would I want to play an RPG in which the protagonists are boxers, let alone review it? My answer would be that I should be able to review any game, and that after reading through *Contenders: A Roleplaying Game of Blood & Sweat, Pain & Hope* by JJ Prince just once, I knew that I wanted to play the game.

So with one person missing from our regular Friday night gaming group, I extracted *Contenders* from a gaming pile and after a second read through, I wrote out some character sheets, and found an ordinary deck of cards. Once everyone arrived, I explained what I was planning to run. Normally in such situations I get out a board game so all but one of the group were reticent to try *Contenders.*

In *Contenders,* each player takes the role of a boxer trying to climb out of the gutter and into the big leagues by fighting in the ring. If his HOPE is strong enough, a fighter can make it, but PAIN and despair, both of which drives him to fight harder, might drag him back into the gutter. He draws HOPE from those he knows, his CONNECTIONS, and from winning fights, but gains PAIN from losing fights and when his CONNECTIONS are failed.

Contenders can be set at any time, but lends itself to a gritty urban feel. Suggestions include Depression-era New York, 1970s South London, and behind the Iron Curtain. For ease though we selected the default setting of Desert City, a bright-lights, deep-shadowed, Las-Vegas-inspired boxing Mecca.

Character generation is a quick and easy process. Each Contender has two sets of four traits. The first four are PAIN (physical pain, and mental despair and rage); its counterpart HOPE, divided into two pools, Contender and CONNECTION pools; CASH, representing time, effort and money; and REP, a fighter's reputation. Each attribute begins at 1, between which a player divides another two points.

The other four are in-ring traits: TECHNIQUE, a contender's boxing skill; COVER, his defensive skill; POWER, hitting strength; and CONDITIONING, his physical fitness. Again each begins with a value of 1, between which a further 6 points are divided.

Besides assigning points, each player must explain who his Contender is, and why he wants to fight. He also needs a connection from whom he can draw HOPE and for whom he has a fear. For example, my character July Washington has a sick mother who could get better, but his fear is that she will die. Finally, each player creates four NPC Contenders to provide the game's opposition.

The aim of playing *Contenders* is to increase a pugilist's REP to 10, by participating in -- but particularly by winning -- fights. A boxer must also spend time training, working, building connections, promoting bouts, and even threatening other contenders or their connections. This is done in scenes without either dice or a referee . . . both factors that initially perplexed several of my players.

Simply, the players take turns narrating scenes that involve their Contenders, either as straight narration or roleplayed with the other players handling the NPCs. An ordinary deck of cards is used to handle any random resolution, with red

cards drawn counting as successes. A player draws for his Contender whilst the player to his left draws for any opposition.

Scenes come in six types. Connection scenes let a character create a new connection or invest in an existing one. This takes CASH and will increase the connection's Hope value, but if it goes wrong, will increase a contender's PAIN. Work scenes gain a contender a little CASH, but more can be earned by doing something shady or dangerous. CASH can also be spent to train and improve an in-ring trait, but an NPC boxer's trait must also be increased. Promotion scenes let boxers and their NPC managers set the terms for a fight and allow them to face off beforehand. Threat scenes enable a contender to attack a rival outside of the ring or threaten another contender's connection. Although costly, successfully threatening a contender's connection can deny him HOPE.

Mechanically, scene resolution is simple. For example, July Washington, having injured his back during a Work scene, opts for another more dangerous work scene, radical medical research. Desiring 4 CASH, I drew four cards, whilst Dave on my left, drew cards equal to July's PAIN, also 4. If I drew more successes or red cards then July would get paid, if Dave drew more, July would not and would gain a point of PAIN. If we draw an equal number of successes, July would gain both the PAIN and the CASH. Most scenes work in a similar pattern, so for example, July later invested that CASH in a CONNECTION scene, taking his sick mother to an expensive doctor. Unfortunately, the diagnosis was poor and he lost the CASH and gained more PAIN.

Fight scenes are more involved. Each round a fighter sets his style -- Aggressive, Balanced, Defensive, or Dirty. This determines potential Dominance based on TECHNIQUE for that round and how much damage based on POWER, can be inflicted if successful. COVER can block some damage, but the more damage done, the greater number of Victory Points the judges will award the fighter. Victory Points won are directly levied from the loser's in-ring traits, the bout being won by the boxer with the most Victory Points.

Fights use the same card drawing mechanics and can be extraordinarily tense, with every turn of the card counting. It is possible to knock a boxer down, knock him out, or even win on a technicality. Narration rights for a round are won by whoever draws the highest ranked card. It is thus possible to lose a round and have to narrate it, but if a player has narration rights and the opponent used dirty tactics, he can describe the referee spotting this. Winning the bout gains a fighter HOPE, CASH, and REP. Losing will also gain a fighter CASH and REP, but not as much, plus PAIN.

Playing *Contenders* is a progression, a player initiating scenes to gain CASH for training and investing in Connections in preparation for the fights in the ring. Play progresses until the Rep of one boxer reaches 10 or a boxer loses all of his connections through Threat scenes. This triggers the end game, wherein everyone gets one more scene before going into one big fight night between the Contenders. This is followed by an epilogue scene for each fighter. These vary according to the values for each fighter's HOPE or PAIN traits, if HOPE is greater, the boxer triumphs, if not, his story ends in tragedy. Apart from playing the NPCs, the Contenders' stories do not cross unless agreed upon or a Joker card is drawn, in which case it is mandatory.

Contenders, like [*My Life With Master,*](#) possesses the same escalating narrative structure. In comparison, although as strongly themed, *Contenders* is not as tightly focused. This allows room for greater player input and opportunity to roleplay outside of a player's own character. Of course we are playing many of the sport's clichés, but even if we have no interest in boxing, we are likely aware of these clichés.

Playing and explaining *Contenders* is made particularly painless by the linear layout of the easy-to-read and comprehend rule book. The simple mechanics do capture the desperate feel of the down at heel boxing world. As to my players -- Dave looked forward to playing; Louise hated the genre and was reluctant to play, as was Jason, who thought it sounded too much like a board game. It could be played like that, but once they got past the idea of not having a referee they enjoyed being able to roleplay numerous characters and having an input throughout the game. They also came to care about the fate of their Contenders.

If you cannot get past its subject matter, *Contenders* could easily be imagined much as *My Life With Master* can be run as "My Life With Momma" or "My Life With Tony Blair." Thus is it could become a game about politics, gladiators, or Sumo wrestlers with a simple redefinition of the in-ring traits. *Contenders'* simplicity gives it this potential adaptability. If you can cope with the RPG's subject matter though, *Contenders* offers a pleasing storytelling

vehicle that neatly handles its twin themes of hope and pain. I should also end with a confession: I still have no interest in boxing. **Contenders** has not made me want to watch a boxing match or movie, but I would play **Contenders** again -- it is an easy game to pick up and play, does not require a GM, and its stories can be told in a session or two.

Aquadukt

Published by [Uberplay](#)

Designed by Berhard Weber

Game board, 112 building tiles in four colors and styles, eight mountain tiles, five glass beads (wells), 36 blue wooden sticks (canals), 20-sided die, rules; full-color, boxed, two to four players; $27.99

Water means life, and you can't build a civilization without it. You won't actually be building a whole empire in *Aquadukt,* but the water is still paramount in this simulation of Roman farm life.

The object of the game is to supply more of your houses with water than anyone else.

The board shows the wide open country where you and your competition build your new villas. It's divided into 20 tracts comprising still smaller plots -- just big enough for you to place one of your housing counters on it. Everyone has a selection of new homes, distinguished from each other in color and style. These tiles show the buildings in "denominations" of one through four, and these are kept in separate stacks.

On your turn, you have three options: place houses, uncover a well, or lay canals. If you start new houses, roll a 20-sided die to determine in which section you may place a tile. So long as you're happy with what comes up, you can roll for three such constructions. If you don't like the location you roll (and there's some strategy as to what might be a good placement), you don't have to place that token but your turn ends there.

To start supplying homes with water, someone has to dig a well. These springs are placed at the intersections of those squares, so they're usually the second thing placed. You don't have to place them next to existing homes, but that's naturally the way it turns out (and the more work anyone has to go to for water, the fewer opportunities you'll have for scoring). A well doesn't supply anyone in and of itself, so the next step is to lay down canals. Little wooden blue sticks are placed along the lines separating the housing squares to show where the gutters run, bringing the life-giving aqua to citizens.

Now for the wrinkles. If you roll a number, you can put a home on any square on that numbered stretch of dirt, but when all the squares there are filled up, a check is made to see that everyone's getting water. Only those homes with a canal running along one edge of the tile are supported. Someone may opt to "double up" the canal pieces, which extends this support to two spaces, but that's a drain on the supply of canal pawns. If a counter isn't supported, it is removed from the game…bad news if you haven't hooked up your pipes yet, but you may also choose to play the spoiler by sacrificing one of your houses to fill up a section and force a tile exodus. Since emptied squares may be reoccupied later, this may afford you a chance to get into an area you covet.

You can only play the counter of your choice away from the water sources; if a canal has already been established where you're about to build, you must play your lowest-valued tile beside it. Putting down higher values requires a leap of faith and a little work. Only two canals may come out of any well, and no two gutters may cross or meet each other. For a little extra worry you can add mountains to the board, forcing players to work around them. When the last canal piece is laid, the round is finished and whoever has the most points worth of legally supplied housing wins.

Who knew German game-makers even knew what 20-sided dice were? But lo and behold, this game uses one. All the pieces here work out just fine, with snazzy wooden canal pieces, even snazzier glass beads to represent wells, and the

quality tiles you'd expect. The board is the weak link; the borders of the numbered areas are hard to spot sometimes, and when housing piles on it's an even tougher call.

Fans of pure strategy may lament the heavy use of the die roll to determine where you can and cannot build, but it's really not that bad. You may not get to place where you'd ideally like, but you still get to select the make-or-break moves that drive the game. Your decisions are relevant and the random elements only complement play; they don't replace good planning, thinking ahead, and adapting to the moment. *Aquadukt* takes only a half-hour or so to play, and while the mechanics may wear too thin to keep you playing it constantly, it's sound enough to be pulled out every so often when you want to take another trip to the well.

* * *

Here's a classic puzzle that I always found interesting:

Let's say you're on a trip along a 10-mile road. For the first five miles, you go 30 miles an hour. How fast do you need to go for the remaining five miles to average 60 miles an hour for the full trip?

For those who haven't encountered this one before, I'll give you a few minutes to try to figure it out.

Back?

Great.

The answer -- which I reveal now to those who didn't bother with the pencil and paper -- is that it's impossible. It takes 10 minutes to go the first five miles, and to average 60 miles an hour for 10 miles would mean the trip takes 10 minutes. In other words, you've run out of time to meet your goal before you're half-way done.

Now, there are a few different ways I could take this interesting mathematical predicament (for example, by pointing out that 87% of all lateral-thinking puzzlers involve ice: ice daggers, hanging by standing on an ice block, freezing plastic jugs of water and cutting away the plastic), but I've got an avenue that fits in with my events for this past week.

See, this past week has involved the trip from our home in Indianapolis to visit my parents in Ft. Lauderdale. Since we were traveling with a five-month-old, we decided that going via car would be the better option, since it's a lot harder to pull the vehicle over to deal with an unhappy baby if the vessel in question is a plane.

Anyway, at some point during our driving I turned to the missus and said, "Consider that a trip of 1,000 miles . . . would barely get us to Orlando." Unfortunately, while we built in a considerable buffer into our trip, we were also off by an additional two hours each day of travel; as a result, we ended up in a car (or at a rest stop, or in a fast-food joint . . .) for 26 out of 48 hours, which was off by about four hours from our estimation (and about 10 hours over the MapQuest estimate). The trip was, in short, long.

Now, here's where I'm going with both our initial puzzler and the anecdote above: I hypothesize that *extraordinary* successes are much less impressive in many cases than *mundane* failures, especially when it comes to matters of time. For example, let's take our MapQuest road trip example. in this case, the projected time of the trip was about 16 hours. I submit that -- if I'd rolled the equivalent of a Critical Success on the Drive Across Country roll -- I'd only succeed by an additional 10% or so . . . in other words, about 1&frac;2/3rds hours. On the other hand, a fairly mundane failure *added* almost 50% to the total; I could easily see that failure having ballooned to a 100% or more increase over the

original projections. As a separate example at the extreme of this ideal there's Brooks' Law, a.k.a. *The Mythical Man-Month,* that states adding engineers to a software project makes that project take *longer.*

When it comes to time, it's much easier to lose it than it is to gain it. I believe the opening puzzle above illustrates this quite nicely; the fundamental problem with that challenge is that the hypothetical traveler runs out of time. As another real-world example, my daily commute to the Job Of Unspeakable Madness typically takes 30 minutes. If I'm early, it's by no more than five minutes. But several times I've been later than expected, and it's usually at least 10 minutes, and often 20 or more. (Once it took over twice as long to get home as it should have.)

As best I've been able to find, there's typically only one way out of this conundrum, and that's the radical overhaul -- in other words, doing things sufficiently differently from what has been done before. Thus we could easily shave many hours off the Florida trip by flying (which would take probably 12 hours, at the most), or having my parents fly or drive up to visit us (less than a one-hour trip to the airport and back for us). My job commute could be greatly reduced if we moved our household.

Now, the 64-dollar question is, what does this have to do with gaming?

Well, a lot of games allow for increased benefits of results for a spectacular-enough degree of success. However, sometimes these systems produce exaggerated results on greatly successful maneuvers, especially when matters of time emerge; surgeries that would take hours to complete are done in a quarter of the time, trips are done at double-speed, and intricate rituals just fly by.

But, in some ways, this short-changes the creative process for characters (and, by extension, players -- for those who enjoy that sort of thing). Going with the hypothesis that it requires a radically different approach to shave a non-trivial amount of time off a project or task, some games might benefit from trying to determine what that approach *is* (or at least coming up with a possible explanation). The alternative is to allow the somewhat incongruous result that doing something in a traditional or suboptimal way can result in significantly-better-than-expected results . . . which quickly becomes absurd. ("Okay; I know the bad guy went north, but we're going to drive due south; since the world is round, we only need to roll *really* well to catch him!")

If a player rolls really well with a stated goal of trying to accomplish something faster, I think it would be entirely with the GM's rights to request some explanation for how that task was done more than 10% faster. For example, let's say a player wants to translate an ancient manuscript, and he's on a deadline. The GM determines that doing a full conversion to English would take an average of three days, but the player doesn't have time for that . . . the breakneck unfolding of modern conspiracies frequently involve centuries-old documents. The hero, hoping for results in just a few hours, pokes his player-self for ideas of how to speed this up. The player might propose that the PC is going to translate the first sentence of each page, looking for anything interesting. Or maybe he's only going to scan the whole thing, looking for a few specific words and phrases ("Masons," "Grail," "Big League Chew") and translating around those sections. (Personally I'm of the school of thought that says this shouldn't be a "true" test of the player's knowledge, but rather a challenge to come up with any justification or flavor description to do better than expected. If the player makes an assertion that shorter paragraphs in ancient manuscripts are often the most important ones, and he rolls well enough, I'll work that detail into the game, by golly.)

Of course, some tasks have a variable level of time. For example, solving a physics problem that requires a flash of inspiration entirely hinges on when lightning strikes the scientist's cranium; that could take minutes, hours, days, or never. But all too often tasks have a presumed standard length to them, beyond which it's devilishly difficult to make any advances. For example, if the GM determines that the standard difficulty of a physics problem requires brute-force computation to arrive at an answer, and that difficulty is based on solving the product by hand, then the player might propose that he's trying to do aspects with computer software to speed things up. (I'd give a bonus if the player could figure out a way to rope other PCs into the act: "Okay; did anyone here take trig or better? Great; start double-checking these columns.")

And requesting how a player is going to crank up the pace introduces the possibility for more plot options down the road. For example, if the players decide that they're going to try to buy time in a cross-country chase by driving like maniacs -- breaking every law, placing lubber and land in danger -- then I may well try to work that information into a

future game . . . perhaps introducing a matchstick-chomping sunglasses-wearing police officer who's made it his life's duty to track these folks down.

Of course, many games benefit from the speed and simplicity of letting the dice dictate the results. And lots of players would rather not fight with trying to come up with an explanation, especially if they're playing a character with skills vastly different from their own knowledge. ("How the heck do I know how to repair the engine in less time? Just . . . turn the wrench-thing faster!") But for some groups, coming up with explanations for how things are done faster, more efficiently, or more dramatically can be a real boost.

Presuming, of course, that your gaming group has the time.

Lemuria

by Paul Drye

Eduard Seuss was one of those 19th-century geniuses who, despite working in a science that was then missing a important information, still managed to grope his way close to the truth. His greatest discovery was the lost supercontinent Gondwana, the Earth's southern lands during the heyday of the dinosaurs.

What he got wrong was how his continent came to an end. Living before anyone took continental drift seriously, he assumed that the lands between South America, Africa, and India were flooded by the oceans. Another scientist, Philip Sclater, gave a name to the supposedly lost region between India and Madagascar: Lemuria. Eventually science ruled out its existence, though the name lived on in occult publications as a sister to Atlantis.

Seuss' luck held posthumously, though. Modern bathymetry showed a large underwater plateau in the southern Indian Ocean; drilling brought up rocks that had been formed on dry land. For all the wrong reasons, the 19th-century geologist had been right. There once was a Greenland-sized mini-continent in the area, driven up by a hotspot under the oceanic crust then subsiding 20 million years ago when the hotspot moved on.

This was all vaguely interesting from a scientific standpoint, but had little practical effect until the discovery of parachronics. Then reports began trickling in from Infinity agents that, every now and then, a timeline would still have land in the region. In a few cases, it can't be ignored.

The Basics

All Lemurias are located in the southern Indian Ocean at about latitude 48 degrees south (at one end) to just inside the Antarctic Circle in the south. On Homeline, this area is quite cold and uninhabitable, but the presence of Lemuria alters the situation: the cold circum-Antarctic currents are disrupted and the climate is several degrees warmer than it would otherwise be. The weather in Lemuria is comparable to Homeline's Newfoundland, shading more towards Greenland as one approaches the south pole.

The mini-continent was built up by a series of volcanoes and related uplift events, making the land quite rugged. This is less obvious in the east, where the coast is sheltered from the prevailing winds, and trees and rivers have rounded things off. In the west, frequent gales have produced extensive moorlands and bogs. No matter where one goes, however, the land is doused by rain and periodically salted by ash. Lemuria has some of the richest temperate farmland on Earth, and so is often a target if the world has a colonial period.

This happens often, as most Lemurias are on high inertia timelines. By definition, Lemurian timelines diverge from Homeline at least 20 million years before the present, but most have carried on down the same historical path. Humans evolve, nations arise, Europe rules the world briefly, and industrial technology follows. There are a few Lemurias on

lines where things have gone in a radically different direction, but there is a selection effect keeping those of minor importance. On a timeline filled with people it can become a place on the level of, say, Canada or Australia, and so be worth visiting under some circumstances. Without a world of societies around it, though, it's just a cold and isolated island; there's no particular reason for Homeline's colonists to go there, or Infinity's agents to investigate it.

Getting There

When it became apparent that there were several Lemurias to be explored, Infinity created a station to do it. It's not easy to use, so Infinity will try to start the journey in Homeline's South Africa, or Perth in Australia, then use indigenous transport to get the rest of the way. On pre-industrial timelines, however, this is not an option. People must be sent from a corresponding location on Homeline.

Unfortunately, there's very little dry land in the right place for them to work with; Homeline's "Lemuria" is all but submerged, with only the icy Kerguelen Islands and the even colder and smaller Heard and McDonald Islands poking above the water. The former is a French possession, but when the need for a Lemurian station arose France was already oversubscribed to parachronic ventures. The new station was placed in the Australian possessions instead. A formerly obscure scientific base at Atlas Cove on Heard Island received an influx of cash and personnel, and is now home to about 50 people.

The settlement is otherwise useless, far too isolated from the rest of the world for trade, and too unpleasant for tourism. Infinity personnel consider the glaciated island a punishment post; even in the summer, the daytime high is barely above freezing.

People headed to any Lemuria via Atlas Cove must go by ship from Perth. Supplies are run out that way (a 2,200 nautical mile journey) once a month, and in an emergency the ship may raise anchor outside of its normal schedule. There are no port facilities at Atlas Cove, just a lee under Mawson Peak, an active volcano. The transport will huddle in the lee, and the last few hundred yards of the journey will be on a neoprene dinghy to the cove's beach of volcanic shingle. It may take a few days after arriving at the coast before this can happen, though, as the weather is usually rainy (or snowy) and very windy, making landings dangerous until the skies clear.

Notable Lemurias

Albany-1: A Quantum-7 timeline that is a front in the Time War, Albany-1 is largely under the control of Centrum but has been targeted by Infinity as ripe for revolution. Lemuria is this world's equivalent of Australia, the place where the United Kingdom set up shop after the American Revolution; in the current year of 1844, it is home to some 1.1 million people. It is also the developed nation which seems most likely to rise up against the incipient British-led world government being backed by the Centrans. The United States is already fighting, but is heavily blockaded and it's hard to see how they can end the stalemate. With the Royal Navy over-stretched, though, distant Lemuria -- locally called New Scotland -- has a chance to break away.

While New Scotland is a colony of the United Kingdom, it's groaning under the burdens imposed by the War of Consolidation, and political tensions are high. Infinity has infiltrated several local groups and started passing on money, goods, and logistical help, trying to leveraged the trouble into outright rebellion. Meanwhile, British and Lemurian agents are fanning out from the capital at Albemarle, looking to stem the tide.

Lemuria-2: The first Lemurian timeline was found on Quantum-4 (the name Lemuria-1 was taken by a weird outlier in Q6 where Theosophy is true in all its bizarre glory); Lemuria-2 is very similar to 1930s-era Homeline. The primary difference is Lemuria itself, somewhat like Papua New Guinea or Central Africa on Homeline, the "final unexplored frontier," though a more classically gothic one than the green hells of Homeline's last blank spots on the map.

Lemuria was connected to the rest of the world's continents only when it was near the south pole, so it's long been impoverished for mammals and reptiles. Like New Zealand, birds have filled in many ecological niches. From the standpoint of Lemuria-2's Western explorers -- and for Homeliners -- one of the most interesting things about this

land is its pseudo-dinosaurs, re-evolved from birds in the last 50 million years or so. Crossed with the Malayo-Polynesian settlers who came here in the 11th century, Eyland -- as it's called here -- has a distinct "Lost World" feel.

Lemuria-4: When the first Infinity agents arrived here, local year 1983, it was four days after the most sensational event in that timeline's history. Deep in the southern Indian Ocean, Lemuria -- it's coincidentally called that here -- appeared from nowhere. Until that time, Lemuria-4 had probably been a historical echo in Quantum-6, but the sudden shock of Lemuria kicked it up to Q7, where it was rapidly discovered by both Homeline and Centrum.

This Lemuria is one of the bigger anomalies in all the infinite worlds. A substantial portion of it is enclosed in a force field of some kind, extending in a dome some 800 miles in diameter and 22 miles high. Seismic information indicates that the full structure is an ellipsoid extending the same distance below the ground. The portions of Lemuria outside the dome are unremarkable, but deep within it are a series of what appear to be city-sized industrial locations full of imposingly advanced-looking buildings. Vast automatons move within them, and spectrographic tests made by satellites flying overhead pick up puffs of weird gases like sodium hexafluoride.

When Lemuria appeared, tensions between the timeline's United States and Soviet Union increased dramatically, especially when they came to the conclusion that there may be alien technology within; Infinity thinks it's probably advanced human, and the continent a shiftrealm of some kind, but the distinction is moot. The two superpowers came to a rough-and-ready joint agreement to study and monitor the huge interloper, but it may come apart: since appearing, the force dome has been giving off a steadily decreasing amount of microwave and radio emissions. Throw in Infinity's natural interest in parachronic anomalies, and their worry that Lemuria-4 might get some insight into the Secret, and there are several factions paying close attention. If the dome collapses when its emissions reach zero, an event not very far in the future, a free-for-all may ensue.

As well as being a place to explore itself, this Lemuria is also the reason why many other Lemurias are being examined closely. Infinity is hoping that at least one of the others will give some insight as to what is going on here.

Kumari Kandam: There is one notable exception to the rule that isolation keeps Homeline colonists away from the Lemurias. For years prior to the discovery of parachronics, a mystically tinged branch of Tamil nationalism held a submerged country in the Indian Ocean their lost homeland. Based on their ancient religious literature, they believed that Kumari Kandam stretched from Sri Lanka to Australia and as far west as Madagascar.

Both the Sri Lankan and Indian governments have had to deal with Tamil secessionist movements, so when the idea came up among the ultranationalists that a Tamil homeland could be built on a Lemuria somewhere, the governments were inclined to support it as a way of relieving tensions. In the last five years, both have arranged for several hundred people to ship out via Atlas Cove and find the god-promised land of their dreams.

Unfortunately, the colony has not been doing well. The mystics tend to be highly educated and a little disconnected from reality; mundane necessities like farming and exploration are shunned. On top of this, their new society regularly fractures along lines defined by arcane theological points, further consuming the colonists' attention. So far Kumari Kandam has sputtered along on the monies the largely well-to-do colonists can put into it, but it's showing all the signs of becoming a failure in the next few years.

Lemuria-7: Being able to examine other timelines has spoiled historians and anthropologists. Instead of having one world to use for examples, they can now look at dozens of slight variations on, say, the Roman Empire when building their theories.

There are some situations where even this doesn't help, though. Hundreds of world cultures derived from Mesopotamia and Egypt are nice, but civilizations with unique origins can be worth their weight in gold (or grant money). Lemuria-7 hosts one of these. Humans are hunter-gatherers everywhere in this timeline, except on the local Lemuria where they've developed writing, agriculture, and monolith-laden cities. At any time, several scientific teams are here unraveling the society's language and culture, which don't appear to be related to any others encountered on any other world.

One question that remains unresolved is how the Lemurian humans got here, and that troubles some people. This

culture doesn't possess ocean-faring vessels yet, and they don't know about any other lands -- Lemuria is thousands of miles from its closest neighbors. Yet they must have had that technology at some time in the past in order to colonize Lemuria in the first place, as the human race certainly didn't evolve here.

The Lemurians

Infinity agents who deal with Lemuria are likely to end up in contact with a relatively small group of people who specialize in the parachronic Eighth Continent.

William Page Henderson: An inhabitant of New Scotland, Henderson is a writer of some renown on that timeline. His specialty is what he calls *bagatelles,* tales of this new age of steam and exploration; his closest Homeline equivalent would be Jules Verne, though Henderson is a generation earlier.

Like many well-to-do people through history, Henderson is leery of the lower classes, but his love for the future makes him think improvement is inevitable. This brought him to the attention of the Centrum, as he's of the opinion that the forcible subjugation of the world is the best path to universal education, the elimination of superstition, and the creation of a technological Eden. The revelation that this orderly, advanced society already exists "outside of time," and the promise that he can become a member of it, has made him a useful native recruit.

Henderson will work in opposition to Infinity agents stirring up trouble in New Scotland. Not only is he good as a spy and operative, completing his tasks with flair and imagination, he is highly motivated. It outrages him to no end that someone could be working against the establishment of his ideal, benevolent totalitarianism. As well as helping Centran efforts on Albany-1, he is sometimes found on other Lemurian timelines when time is of the essence and he is the agent who can get there most quickly.

As a well-known native New Scotlander, Henderson has access to the country's movers and shakers. He also understands the local social structure far better than the typical agent of Centrum. He is held back a bit by his TL5 background, but he is imaginative, unafraid of future tech, and is aware that there's more to the world than he knows. As a result, he has much less trouble than might be expected when encountering it.

Kianyar: If Homeliners want to explore the inner reaches of the continent on Lemuria-2, they will want a native guide. The back country is dangerous and has few tracks, so someone with local knowledge is essential. This requirement is particularly difficult to meet because almost all indigenous Eylanders never travel more than a few miles from their place of birth. Kianyar is widely acknowledged as the man to meet, as he is a veteran of several expeditions.

He is in his early forties, and is as well-acquainted with the interior as anyone else. On the other hand, his health is deteriorating after the years of hardship, and he is not as able to travel as quickly or as doggedly as he did when younger. Despite his declining abilities, he still enjoys hunting the continent's pseudo-dinosaurs as a way of impressing his employers (as he suffers a bit of an inferiority complex because of their guns and other outward signs of wealth); there is a danger that he will get himself killed, stranding the group he is leading weeks away from the coast.

Ellen de Villers: A South African biologist from Homeline, de Villiers has become an expert on the various Lemurias. In the days before parachronics she was an unknown working in the veldt on various ecological projects, but soon became known as a popularizer of out-time wildlife studies throughout the English-speaking world. Now in her sixties, she has slowed down a great deal from the rough-and-ready image she projected when younger. Her current screen persona is an elder stateswoman type, who discusses the animal onscreen in hushed tones while clad in sun helmet and shorts.

Based in South Africa, de Villers is best placed to feature in documentaries on the weird wildlife of the Lemurias, and has turned them into a cottage industry. Many people know her for her television special on Lemuria-7, the first time she mixed human anthropology with her ecological concerns; it was a hit on Homeline television a few years back.

As time has gone on, however, she's moved away from the mainstream of science and into a kind of scientific

mysticism. She's become a follower of Teilhard de Chardin and a proponent of Rupert Sheldrake's morphogenetic fields. Recently she's come to the conclusion that Lemuria is a focus of strange activity that gives insight into the nature of life across all timelines -- in particular, she's interested in the shiftrealm on Lemuria-4.

Regardless of her problematic beliefs, Infinity lets her transport through Atlas Cove whenever she needs to. She has the money to pay for it, the backing of some influential people, and it's not against the law to have strange opinions.

Adventures in Lemuria

Outbreak: As events heat up on Albany-1, smallpox hits the countryside of New Scotland. The disease has been eliminated on Homeline, so standard protocols kick in to prevent it from crossing back with parachronic travelers. One of the protocols is gene-sequencing the virus so as to identify the correct vaccines to use. This time, the tests come back with proof that the pox is artificial and resistant to the usual ways of fighting it. Not only does Homeline immediately quarantine Albany-1 until the disease runs its course (stranding Infinity operatives there), it would seem that Centrum is using biowarfare to aid their British catspaws. Strictly speaking, agents are supposed to stay put while a disease "storm door" is in place, but what kind of hero will let his work among the New Scotlanders collapse, let alone sit still for genocide?

Welcome to the Lizard House: On an otherwise unremarkable timeline, Infinity's researchers notice that people who have risen above a certain level of scientific ability or wealth post-1947 end up dead. Stephen Hawking, Bill Gates, Silvio Berlusconi, and dozens of others have all been cut down just as they were on their way up. In all cases, the death was either not suspicious, or the investigation into it was shut down.

With their ability to investigate outside the boundaries of the timeline's usual power structure, Homeline agents have made the remarkable discovery that this world has a Lemuria. It's not on any map, or discussed in any book; furthermore, the vague outlines of a world conspiracy can be traced with this phantom country in the middle. More worryingly, it seems like the conspiracy has started to penetrate the outer edges of Infinity's organization here. Unless stopped, it's just a matter of time before they discover The Secret.

Unclean: Infinity has had several agents disappear in the last few months, not from action in the field, but apparent kidnappings. Investigation has led to the suspicion that a group in the local Indian subsections of Infinity, possibly with the aid of people inside the Indian government, are spiriting them away to Kumari Kandam. Unable to trust their own people on the scene, investigators from elsewhere are going to have to go to that parallel and get to the bottom of things. As well as having to avoid disappearing themselves, the visitors are going to be in a place where they are legally allowed but socially unwelcome: Kumari Kandam is a paradise for its inhabitants, with sacred overtones. Outsiders are anathema.

Walking on the Moon: Lemuria is what geologists call a large igneous province, the product of enormous volcanic eruptions. Other igneous provinces, such as the Siberian and Deccan Traps, have been fingered as the culprits in mass extinctions. While it's been 35 million years since the last really big eruptions in Lemuria the potential is still there, and with infinite worlds, potential is going to become reality somewhere. When they go off, the volcanoes in the south of the continent are going to turn thousands of square miles into wastelands of ash and lava over a few weeks, and inject enough material into the stratosphere to cool the whole planet. In the cloudy, chaotic conditions, some of Infinity's people are bound to get lost; if they're lucky, this will happen in an uninhabited Lemuria and the missing will be trained outdoorsmen with camping and survival equipment. If they're unlucky, they're going to be without the resources they need as well as being trapped in a humanitarian crisis with hundreds of thousands of locals.

Putting aside the mythological accretions it picked up in the late 19th and early 20th centuries, the land presented here as Lemuria did exist. In the real world, the Kerguelen Plateau was drilled by the *JOIDES Resolution* ocean survey ship in 1999, and dry-land rocks brought up. As new as the discovery is, there's not an awful lot of information about the lost mini-continent, but a passable overview can be obtained from [Ancient Volcanic Cataclysms in the Indian Ocean](#).

A more scientific (if still-popularized) explanation of the plateau's formation and its effect on the Earth is described in "The Lost World."

Alphabet Enemies
Twenty-Six Nonstandard Nemeses
(Part Two: I through P)

by Owen K.C. Stephens

In this article we continue our list of unusual enemies, begun in "[Part One: A through H](#)." Given that no campaign is likely to need this many fiendish foils for the player characters, either as background or picked up in play, we also take a quick look at other ways such nonstandard nemeses can be used in a campaign.

- **Standardized encounters:** While having more than a few outlandish opponents attach themselves to player characters is only appropriate in the most chaotic of campaigns, using them as more standard encounters to be stumbled across and ignored or solved as the players prefer is much more manageable. If an ally (or even an enemy) of the players is suffering from one of these atypical archenemies, the PCs can have the fun of dealing with the problem without the annoyance of it being an ongoing threat.
- **Part of the problem:** A variation on the first idea, here the heroes become an element of the adversity befalling someone else. If a good king or well-respected senator is killed and turns out to have a Killer's Fund (see below), the PCs might be among those who try to claim the money in the name of both greed and vengeance.
- **World background:** Many of these ideas set a tone, which may be just right for a given campaign. Rather than have them encountered at all, some of these radical rivals can become part of the history, legends and myths of a campaign. Players who hear about Mochanna the Barbaric in some far-off time or place know that comic, overbearing, part-parody people are appropriate to the world their characters live and adventure in.

With such ideas to expand their possible use firmly in mind, let's move onto the next set of alphabetic antagonists.

Identity Thieves

These phantasmal fakers are just like the [B-Team](#), except they *don't* mean well. They take out credit cards in your name, claim rewards for dragons you've killed, sell off shares of your companies, offer to marry rich older women while wearing your face, and make disparaging remarks about local mobsters wearing your signature suit. You could probably kick the stuffing out of them -- if you could find them. But they don't want to "defeat" you in some mano-a-mano sense. They just want to keep you busy while they enjoy the fruits of your labors.

Julie Jazz

Julie Jazz is a top reporter who prides herself on covering the adventurous set. Her name and exact occupation aren't important, as long as the name's alliterative and the job includes gathering information. She might be Jacqueline de Jewel (courtesan and spy of the high court), Dr. Joyce Jergens (experimental psychologist), Jolie "Jo-Jo" Jones (hard-bitten cybernetic police hacker), or Jo'less Jay'ayne (elven diviner and scholar for the elven lords). Heck, the idea could even become John Jacobs (decidedly male UFO-oligist and grad student).

The important thing is "she" has some professional need and legal right to poke around in your business, a willingness to go beyond that legal right, and just enough competence and confederates to be a really useful contact for you. When she's not trying to unearth your secrets she's probably being captured and threatened by your enemies. She doesn't mean any harm, and she does help you out when you need some research. But she also wants to be there anytime you do anything dangerous, ask questions whenever you want something kept secret, and inevitably grab the mulligan you need and hide it just before Doctor Deathtrap grabs her and sticks her in, well, a deathtrap.

Killer's Fund

You killed a rich man. He may have needed killing. He might have made his money on black lotus, white slavery, child pornography or even assassination-for-hire. Or he may have left you no choice, coming at you with a knife in a dark alley for whatever reason. In any case, killing him wasn't the hard part. It's surviving afterward.

Your target had a Killer's Fund, an amount of money sitting in a secure location to be paid out to whoever kills the person or people that killed him. You might have known about it in advance, but if not you're sure to hear about it afterward. The money may be in a bank in a country that allows such outlandish financial arrangements, or it may a less official matter with the money in the hands of someone willing to make a "gift" to anyone who meets the requirements. Heck, the money doesn't even have to be real, as long as most people *think* it is. It's a big sum, enough for anyone to retire in comfort to a beach somewhere. And until you're dead, it just keeps collecting interest and wealth off investments, so the quality of assassin it attracts keeps growing (which explains why you were jumped by 3rd-level assassins when you were 3rd level but run into 10th level assassins now that you're 10th).

You don't have many methods of getting the black mark off you, either. If the money is held in a legal vault, you might be able to have it seized as part of a criminal investigation into the first few assassins who jumped you. If it's not, you may have to fake your own death (and possibly claim the reward for doing so), or convince people the money and offer aren't real. You might steal the Killer's Fund, or just ruin the person holding it so they decide to access it for themselves (though they may have their own Killer's Fund, which could make things even worse). You can even start a rumor the Killer's Fund is a lie, even if it isn't, and try to win the following battle of public perception. But this is a problem you can't fix through beating people up; you need to get sneaky one way or another.

Lazarus

Maybe he's the actual biblical figure and maybe he isn't. (Of course in games without the Christian Bible, a similar figure must be created to be appropriate.) But he definitely is immortal. His claim is the full line said by Jesus was, "I am the resurrection, and the life: he that believeth in me, though he were dead, yet shall he live: And whosoever liveth and believeth in me shall never die." And while that's theology for most people, for Lazarus it's literal truth. As long as he believes in Jesus, he can't die. And being long sick of living, he wants someone to find a way to kill him.

He's chosen you.

Maybe he feels you have overcome every other foe, and thus can find a way to destroy him. Maybe he believes you have the power to steal his faith in Jesus, which should render him mortal. Since he does believe in Jesus he tries to be a huge thorn in your side, without breaking any commandments. But there's nothing in there to prevent him from telling your enemies about you, as long as it isn't *false* witness. Nor (in his view) beat you silly, as long as he doesn't kill you. Or even destroy things you own, as long as he neither steals nor covets them. He can make your life very difficult, and has the money and connections to get out of most imprisonments you arrange.

Of course he never works at making your life difficult or getting killed on the sabbath.

Mochanna the Barbaric

He's the typical muscle-bound hero. He swings a mean broadsword (or whip, or street-smart punch, or whatever strong jawed heroes are swinging within the campaign). He's fearless, unswerving in his devotion to the cause of freedom for all people, and complete immune to all mind-affecting magics. And logic. And common sense. He's seen as barbaric (even in a modern setting, where his name is Mochanna Howard Saint) because once he identifies his foe, he doesn't stop until either he or that foe is six feet under. Also, Mochanna speaks only in the third person. It is Mochanna's way.

Problem is, he's convinced you're his foe.

Maybe you made the mistake of picking up the bloody knife when you happened to find the murdered body of Mochanna's friend. Maybe someone who looked a lot like you stole Mochanna's frisbee. For a more reasonable version of Mochanna, he may have seen a prophesy stating you would destroy the world. (This would make him terribly sorry to have to destroy you, but it is for the greater good. Surely you understand?) Whatever the reason, Mochanna is going top put you down. Hard. Unless, of course, you out-think his many clumsy attempts to do you in, which isn't that difficult.

You can, of course, just run Mochanna through with dirk or bullet, but he's really not a bad guy. Heck, he fights a lot of the villains you fight, and against them he's surprisingly effective. He also has a lot of friends, who are going to come after you if you knock him off (though they are remarkably forgiving about just knocking him silly). Besides, he would be a powerful ally, if you could turn him to your side. You just have to do that in a way that doesn't depend on convincing Mochanna he's wrong. Because Mochanna doesn't do "wrong." Perhaps you can prove that while he was right to hunt you in the beginning, it's no longer necessary.

Nemesis Reality

Your foe isn't a person, or even a group. It's a whole dimension . . . a dimension where everyone you know and trust is part of a vast conspiracy to destroy you, and willing to undertake any actions (no matter how foul or vile) to see you dead. They've already succeeded in destroying your nemesis reality duplicate, and now they want to move on to versions of you in other realities. When the stars are right (or ion storms weaken the density of dimensional barriers), members of that conspiracy can get through to your reality and try to destroy you.

Of course, at first you think this is a simple reverse-world, where good is evil and vice versa. In that case, the nemesis world version of your enemies should actually be your allies. But that's not how nemesis world works. For some reason, in that reality, every living thing hates you. Dogs attack you on sight. Nuns try to gouge your eyes out. People who are otherwise moral, rational, kindly people go to any length to tear you apart. And since everyone who exists in your world has a nemesis-world duplicate, every few months someone you know and trust is temporarily replaced with a nemesis-world duplicate. When simple assassination attempts fail, the nemesis worlders begin thinking of more elaborate plans that culminate in your untimely end. They even bring over people you've never met any version of, to work them into your lives. In time, you may learn to distinguish nemesis-people from the tension they always have in your presence, as they struggle not to launch themselves as your throat (a Sense Motive check opposed by their Bluff check).

You may be able to close down the barriers between realities somehow. Or fake your death. Or find a reality where everyone likes and trusts you, and have those ally world people protect you from nemesis world.

One-Eye Roy

He shows up in just a few dreams a month at first. One-Eye Roy, a black-winged demon with just one blazing red eye. In these dreams you are attacked by animals and inanimate objects. Heck, you are an animal or inanimate object, subject to tortures carried out by robots or golems as well as cartoon anthropomorphic items and animals. If you dream you are a sheep, you get slaughtered and served by dancing cutlery while aware of every moment. If you dream of being a book, you're torn up and fed to a paper shredded one agonizing page at a time. You begin screaming to wakefulness more and more often. Which bothers anyone sleeping near you, and makes travel through regions requiring stealth difficult at best.

Then, the dreams start coming every night. Soon, you must make a moderate Fortitude save (DC 15) or wake up already fatigued. If you seek the aid of divination or wise men you learn it's not One-Eye Roy, despite what the demon calls itself, but the Oneiroi. The three gods of sleep, sons of Hypnos the Greek god of sleep. And it isn't even all of them -- Morpheus is the Oneiroi who forms men in dreams, and you don't have any. Apparently only his two brothers, Phobetor and Phantasos, have problems with you.

Why? Maybe Morpheus showed you his favor, and his brothers are tired of him hogging the limelight. Maybe that

gang you busted used to spray graffiti that praised the two lesser Oneiroi, and the gods want their worshipers back. Maybe One Eye Roy is a true demon, weakening your mind through your dreams in preparation for possessing your body. Or maybe, just maybe, it's all in your head. You've killed so many men you feel guilty, causing you to be unable to dream of them. Thus your subconscious forms a land where there are no people, but everything else punishes you for you bloody deeds. Heck, you may not need to face the gods, you may only need to face yourself.

But if you don't find what you need and deal with it, you're going to lead a very tired life from now on.

Plant Empire

It is one of the largest nations on the planet. It claims thousands of square miles, hundreds of species, and millions of subjects. It has survived war, fire, flood and drought. And it has coexisted, unnoticed, with the empires of man for eons. It's the Plant Empire, and if you didn't know about it you just couldn't see the forest for the trees. The origins of the Plant empire may be as simple as hidden evolution or magic enhancement, or as complex as post-apocalyptic super-mutation, mad science bioengineering, or alien invasion. Triffids could be among us!

And now they're after you.

The Plant Empire has always defended itself. Senators opposed to tree-rights are"accidentally" killed in skiing accidents. Druids who care more about wolves than ferns "somehow" mistake poisonous mushrooms for their more benign cousins. And not everyone who choked to death on a carrot died accidentally.

How did you earn the ire of ferns? It may have been a simple thing. You thought you were just getting firewood, but to the Plant Empire you slaughtered a well-liked orator (or a scion of a noble line, or a popular pollen artist). It's also possible there's a more complex reason. You may have championed the cause of a company that makes paper -- lots of paper. Maybe you were convicted of herbicide in an ivy league court. Perhaps your very success and pro-animal agenda make you a political target of frond-laden terrorists. If you're a vegetarian, it might just be payback.

Until the walking, poison-spitting varieties of plants are available, the Plant Empire has only a few options to hurt you. Whenever you deal with living, or very recently living, plant matter, things go against you. Hay fever has become a major issue. Grass seems to cling to your shoes, slowing your ground movement rate by 5 ft. outdoors and placing a -2 penalty on your Hide and Move Silently checks under leafy conditions. Thorns are everywhere. And a surprising amount of the produce you eat is tainted or spoiled, requiring daily moderate Fortitude saves (DC 15) to avoid stomach discomfort and muscle aches (same basic penalties for being fatigued if you fail that day's save).

Once you realize the pattern of attacks, you must find some way to communicate with the Plant Empire. You can't possibly avoid all plant life forever, and if you kill every plant in the world you've got more serious problems.

Expedition to Castle Ravenloft (for *Dungeons & Dragons*)

First published in 1983, the *Advanced Dungeons & Dragons* module *Ravenloft (I6)* is noted for several things. First, it introduced the horror genre to *Advanced Dungeons & Dragons.* Second, it presented a major villain, Count Strahd von Zarovich, to the game. Third, it contained the late David Sutherland's amazing orthogonal maps that depicted the grandeur and scale of Castle Ravenloft. Fourth, it utilized "The Fortunes of Ravenloft," an in-game encounter with gypsies during which the characters' futures are told and the location of items inimical to Strahd, of Strahd himself, and his motives, all determined. Since this could be different every time, *Ravenloft (I6)* could be played again and again, the experience slightly different each time. This was a process that would be repeated in the authors' *Gangbusters* module *Death in Spades (GB5),* determining victim method, motive, and the murderer.

The setting for *Ravenloft (I6)* is the isolated valley of Barovia. For centuries it has been dominated by Count Strahd von Zarovich's baleful pall, a man driven into madness, then evil by his unrequited love for his brother's wife Tatyana. Centuries later, and Strahd has become enamored of Irena the local burgomaster's daughter and spitting image for Tatyana. Learning of this, the adventurers -- brave, pure and stout of heart -- determine to foil the threat to Irena and that cast over Barovia.

The reputation of *Ravenloft (I6)* as a particularly challenging adventure is well deserved. The classic adventure has been reprinted more than once and was included in TSR's *Silver Anniversary Box Set.* It also spawned both a sequel *Ravenloft II: House on Gryphon Hill (I10)* and a complete setting in *Ravenloft,* which explored many different horror tales from *Dracula* to *Frankenstein* to zombies. Interestingly, the original scenario is a surprisingly sparse affair at just 32 pages. But now Wizards of the Coast have revisited *Ravenloft (I6)* in an all-new full-color expanded supplement.

Expedition to Castle Ravenloft has the same basic set-up, but brings the detail of *Dungeons & Dragons 3.5* to the adventure. It gives Strahd extra possible motives and works to make the player characters as much Strahd's allies as his enemies. It adds a wealth of detail to the castle and to encounters both inside and outside of the castle. It offers options to run *Expedition to Castle Ravenloft* as either as a single night session, as long or short adventures lasting several sessions, or as a full mini-campaign. Of course, the shorter options will miss out on some of the campaign's details, and the adventure suggests how it might be abbreviated. *Expedition to Castle Ravenloft* might be used in the *[Eberron,](#)* *Forgotten Realms,* or even the *Urban Arcana* campaign setting for *[d20 Modern.](#)*

Where *Ravenloft (I6)* was designed for 5th to 7th level characters, *Expedition to Castle Ravenloft* is designed for 6th to 10th level characters. Higher level characters are needed to play the campaign in its shorter forms as they will have

to face Strahd much, much earlier. For lower-level characters and the longer campaign form, the characters will explore Barovia, facing the allies and minions of Strahd before entering the castle itself.

As in the original, an encounter with the gypsies and the telling of "The Fortunes of Ravenloft" determines the various aspects of the adventure. Not Strahd's secondary goal (which is determined by a dice roll) nor the adventurers' reason for entering Barovia (which is determined by the DM), but the location both of Strahd and those items inimical to him. Where *Ravenloft (I6)* just used playing cards, *Expedition to Castle Ravenloft* adds the alternative methods of using either tarot cards or Dungeon & Dragons' in-game card game, Three Dragon Ante.

Armed with this knowledge, the party will eventually enter Ravenloft, a forbidding edifice full of gloom and dark shadows. Inside they will have numerous encounters with the undead, face deadly and memorable challenges, and be harassed by the vampire himself in various forms. Strahd will attack the party frequently, but he will withdraw just as often, constantly goading and testing the characters. Every encounter with Strahd will be memorable, but other notable encounters include a trap that teleports a Wight into the character's arms and armor, and the character into the Wight's shroud in a nearby crypt!

Perhaps the most radical change is the new encounter format pioneered here. The adventure and its numerous locations are described as normal, but each combat encounter is more fully detailed in a two-page spread at the end of each chapter. The advantage of this is that the DM need only flip to one location to handle the combat for that encounter. The downside with *Expedition to Castle Ravenloft* is that each chapter is followed by literally pages of combat encounters . . . over 70 pages for Castle Ravenloft itself.

One thing that each combat encounter description does is take the scenario's orthogonal maps and flatten them into an old fashioned overhead view. This makes each location easier to present to the players as they explore the castle and lay it out for use with miniatures. You almost wish that the book came with maps that could be laid out ready to play, just as you wish that the book came with illustrations that could easily be shown to the players.

Expedition to Castle Ravenloft also adds treasures as it provides additional detail about the originals, plus it describes a new Prestige Class dedicated to fighting the undead. A character can take this class during the scenario and thus re-found the Order of the Raven. This actually requires the character to meditate overnight in the castle, so is a difficult process. As with other Wizards of the Coast modules, *Expedition to Castle Ravenloft* can be run from just the three core books, but it can be expanded upon with the addition of several supplements, most notably *Libris Mortis: the Book of the Undead,* but also *Complete Warrior* and *Complete Divine.* Perhaps the supplement that will have the most impact upon the scenario is *Heroes of Horror.* It is suggested that a DM use the rules for taint, corruption, and depravity from *Heroes of Horror* to increase the adventure's sense of horror. This is almost mandatory since the adventure is meant to be one of gothic horror as much as it is fantasy. It also adds an element that was not present in 1983.

Physically, *Expedition to Castle Ravenloft* is almost, but not quite nicely presented. For a scenario as complex as this, it is a surprise to see that the book lacks an index. More disappointing is its treatment of the famous orthogonal maps. It is nice to see them in color and each section placed near its set of location descriptions, but nowhere are the individual maps put together so that *Castle Ravenloft* can be seen as a whole. What is lost is a sense of scale of the place, and how each section connects. Here it is actually worth having a copy of the original scenario to gain that sense of scale and grandeur.

The publication of *Expedition to Castle Ravenloft* in 2006 also feels a little odd. Why not wait another two years for its Silver Anniversary? And then why not do something a little more special? Perhaps a book of illustrations in full color or of maps ready to play out with miniatures? It would have been equally interesting to read something by the original scenario's authors on both their version and this.

Certainly the most singular omission is any suggestion of what happens at the scenario's end. What if the characters succeed? If they fail? It's not addressed here, and perhaps a DM will be forced to return to the original scenario for a suggestion of either.

Ultimately, *Expedition to Castle Ravenloft* manages to both satisfy and disappoint. The first, for the excellent job of

expanding and detailing the adventure, although in keeping with the nature of **Dungeons & Dragons 3.5,** the emphasis is on a very tactical feel, especially in the use of the new encounter format. The latter, for its omissions: the full map and the lack of ending, and its failure to do anything beyond the book format, and its failure to highlight the original scenario's significance. It also places too much emphasis upon combat over roleplaying, but that is as much indicative of **Dungeons & Dragons 3.5** as it is this campaign. There is no really good guide for the DM for how to roleplay Strahd, except in the individual combat encounters. That still leaves no little amount of work for the DM to do, for **Expedition to Castle Ravenloft** is a challenge not only to revisit, but also to run for the first time.

Jayne's Intelligence Review 1905PD: The Royal Manticoran Navy
Jayne's Intelligence Review 1905PD: The Havenite Republican Navy

Published by Ad Astra Games

Written by David Weber, Ken Burnside, and Thomas Pope

With contributions from Don Beseny, Joe Buckley, Mark Graves, John Lerchey, Thomas Marrone, Steve Osmanski, Giles Schildt, Chris Weuve, Marcus Wilmes Artwork by Jenny Dolfen, Thomas Marrone, and Charles Oines

68-page full-color softcovers, $29.95 each

The nice people at Jane's Information Group have been providing key information about the world's security forces since 1898, when Fred T. Jane published his first guide to the warships of the world. A tradition like that commands deep respect and also attracts the urge to parody or pay homage to the outstanding reference materials Jane's provides. With *Jayne's Intelligence Review,* the authors are definitely in the homage category with volumes to bemuse and entice both fans and casual readers of Weber's Honor Harrington Universe.

For those not familiar, Honor Harrington is the gifted space-naval officer whose adventures are recounted over several novels and short stories by David Weber. She lives in a cosmos where starships ride the currents of space-time itself, in a setting which owes as much to Horatio Hornblower and Jack Aubrey as it does to James Kirk, John Sheridan, and (maybe) Jack Ryan. As one might expect in military science fiction, Weber has not stinted on the hardware and gives us, as often as page count and plot pace permit, thorough explanations of the workings of the ships and technology available to the Manticoran and Havenite forces and allies. It would be nice, though, to have all of that information in one consistent place, attractively illustrated.

Jayne's Intelligence Review does all of that, and then some. Each volume (to date) takes on one of the major players on the astropolitical stage of the (our calendar) late 40th/early 41st century. After a bit of astronomy data on the home systems and a brief recap of the history of the services being considered, we move into detailed reviews of the heirarchy, organization, ranks, uniforms, and tactics of each space fleet. Over a dozen ship classes are discussed in each book, with full-color illustrations and tables providing dimensions, armaments, capabilities, weaknesses, even "signature" patterns for common sensors. The ship review fills half of each book and evokes the *FASA Ship Recognition Manuals* for *Star Trek* in the 1980s (but without the game content). The art, though, is much more detailed, in vivid color, and goes beyond the traditional three-view to include a "file hologram" of the ship in its natural habitat. Each book wraps with a discussion of that government's marine corps, the planet-side warfare specialists. We get, again, the table of organization, ranks, uniforms, and equipment from the simple sidearm to the battle armor and transport vehicles, all also lovingly rendered in color. *The Royal Manticoran Navy* closes with two pages of essays discussing the evolution of these warships from pieces of fiction to components in the *Saganami Island Tactical Simulator* game, and on to their presentation in these books. It speaks well of Weber that he was not only willing to accept corrections where inconsistencies occurred, but also to revise his older novels to bring them into the new consistency.

So far we haven't said much about gaming, except in reference to other books. What is this review doing in a gaming

magazine? Ad Astra Games seems to have two purposes in mind. One is to expose the depth of material extracted during the development of the *Saganami* wargame. In that light, these can be viewed as companion works extending the wargame's background in a way that wouldn't fit into the original box. Ad Astra Games has also announced the development of the *Worlds of Honor* roleplaying game, using a variant of the *D6 System* which had served so ably in the original *Star Wars Roleplaying Game.* With that knowledge at hand, we can view these *Jayne's* books as a preview of the production values to expect in the roleplaying volumes, and as a way to get crunchy background content out ahead of the RPG release, drumming up support and sparing the publication team of having the same ship information repeated across five different products.

Of the two books, *The Royal Manticoran Navy* gets an edge for being on glossy paper, which serves to add depth to the larger full-color space illustrations. It's a slight edge only. The ship illustrations are lovingly detailed, with weapon and sensor emplacements meticulously placed. Yes, the ships do all look much the same, even from book to book, but so do most World War II-era destroyers if you don't know what distinctive details to look for. The designs also very much say "ship of war," in ways that Foster's Humanx "plumber's helper stuck in a melon" or *Star Trek's* disks, cylinders, and ellipses can't.

The shopper might balk at at $30 price tag for a 60-odd page book. The shopper needs to remember that these are heavily illustrated, making very full use of the options color printing brings. You get a great deal of bang for the buck here, making these welcome references for the *Saganami Island Tactical Simulator* player, the novel collector, and the *Worlds of Honor* roleplayer-to-be. These volumes of *Jayne's Intelligence Review 1905PD* do a fine job of condensing complex information and presenting it in a manner pleasing to the reader. The passion for the setting shows, the same passion that Fred T. Jane brought to cataloging the ships of his experience a century back.

Rider's Block

This past week I saw *Ghost Rider* one and a half times. The "half" time stems from the fact that I saw the last half of it because we all had the audacity to arrive at the complex a half-hour before the movie was supposed to start; as a result, the other patrons hadn't driven their cars out of the theater yet. See, this marks the first time I've seen a movie in a drive-in theater as an adult, and it's something of an experience, somewhat heartily recommended for those who enjoy a different viewing experience. (I note that the cost -- $10 for the two of us in the car -- beats every matinee price I've seen in a decade, let alone a 9:30 showing on the week a movie opens.)

Anyway, I'm going to engage in some somewhat spoilery behavior right now, because that's what I do when I see a movie the week it opens; so frequent an occurance this is, I believe I've done it twice previously in the past seven years. (I'm not exactly a first-run-movie kind of guy).

One of the big elements of this movie is a mysterious smirking mentor played by Sam Elliott, perhaps best known as playing the mysterious smirking mentor in the Shakespearean epic *Road House,* or otherwise portraying the voice of carnivorism in the ["Beef: It's What's For Dinner"](#) ad campaigns.

[SPOILER ALERT!]

Anyway, it turns out that the Sam Elliott character (whose name I could look up but I'm too damn lazy) is, in fact, the previous Ghost Rider . . . only he's got a burning horse instead of a burning motorcycle. So, in the climax of the movie, Sam and the current Ghost Rider Nicholas "Elvis" Cage ride out for Sam's last journey to the Plot Point Climax Church & Saloon. Yes, burning motorcycle and burning horse, riding alongside in a cool-companion-y kind of way. And then, once they get there, Sam tosses Nick a gun (which Nick probably could've carried himself) and says, basically, "Good luck." And that's the last we see of Sam.

[END SPOILER ALERT]

Sadly, this is quite probably not even in the top five moments that don't make a lick of sense about *Ghost Rider* (a movie that, all things considered, I enjoyed watching more than I didn't).

Anyway, in gaming there's often a tendency to create interesting NPCs who run the risk of stealing the spotlight. For example, 57% of the supporting cast of the ***Aberrant*** RPG were more interesting than the PCs had any hopes of being; at best, the players might be able to apply and compete for Kewl Character's mop-up crew. (Come to think of it, this is a common criticism and complaint about many ***World of Darkness***/White Wolf games.)

On the other hand, games often exist or fall because of the strength of the characters the heroes get to interact with. For example, what would the *Star Wars* series be without the deep-bass threat of Darth Vader, the background menace of Jabba the Hutt, or the drawn-butter yumminess of Admiral Akbar?

In my mind, the trick of the introduction of any (non-trivial) NPC is to perform a delicate balancing act: Making supporting characters cool without making them overshadowing. Making villains menacing without making them untouchable. Making allies seem helpful without making the players wonder why this person isn't solving all problems himself.

As a textbook example, I consider Professor X (of the *X-Men,* formerly of the starship *Enterprise*) to be one of the best NPCs ever. He's interesting withought (usually) taking the spotlight. He's powerful but possesses significant difficulties that keeps him from performing more directly. He's generally 100% trustworthy (with a hiccup here and there), meaning he's a perfect catalyst for just about any adventure. And he has many reasons for staying *out* of the spotlight -- desire to maintain secrecy, frailty, other things to do, and so on.

As a gaming anti-example, I consider the way the Archangels (and, to a lesser extent, the Demon Princes) as presented in the core ***In Nomine*** books to be particularly *bad* examples of supporting NPCs. While their goals and motivations

are well-described, the details for how they interact with their underlings -- a.k.a. "the PCs" -- were sorely lacking. On important missions, how often should a heroic angel maintain contact with his Archangel? How much support can an Archangel provide if things prove more dangerous or more crucial than expected? How much do the Archangels know, and/or how much *can* they know if need be? (And, if they can know/do/say more than they let on, why don't they? If the world's going to end if X isn't done, why doesn't the Archangel do X directly? And so on.)

As such, when I craft interesting NPCs (especially highly competent ones), I almost always try to have a compelling reason for them to *not* be more interesting or useful than the heroes. Usually all it takes is one good justification:

Character is prevented by ailment or limitation from being truly useful (Professor X again, [Monk](), Spider-Man supporting character [Madame Web](), or a drug-addicted Sherlock Holmes) Character is prevented by society or circumstance from overshadowing the heroes (for example, if the NPC is an incredibly busy business man, or is a noble or powerful person whose "handlers" won't allow to be placed in harm's way) Character possesses useful abilities or skills, but isn't a "complete" package (most companions of the Doctor, most inventor/mad-scientist characters) Character *is* highly active or competent, but only in a limited scope or field (for example, Batman in Gotham City) Character has some other reason for avoiding the limelight (wanted by authorities, vow of non-violence, has too many at-risk associates to attempt involvement)

Having said all this, if you're going to incorporate a cool character into the plot, then it's useful that they actually *do* something . . . other than ride up with the PCs and toss them guns. But it's important that they *not* be the ones who get to whack Professor Destructorio. Like I said, it's a balancing act.

While I'm sure there are other solutions to this, the method I think I enjoy most is having the NPC do the stuff that the heroes *should* do, but it's too boring. For example, let's say the Bad Guy lashes out at an innocent bystander, who's now in critical condition. "I'll take care of him!" shouts the secondary NPC, giving the heroes a chance to reaffirm their primary duties as kickers of butt. Often I won't even have anything in mind for this character; I'll just keep an ear out for the players to say something along the lines of "Well, we *should* alert the mayor about these mutant ferrets . . ." If that line isn't said with much enthusiasm or interest, then Supporting-NPC is usually happy to pick up the slack. And so on.

Players often have a love-hate relationship with cool characters; they like to meet and interact and swap notes, but when the time comes to get stuff done, the PCs like to be the center of attention (and rightly so . . . their controllers gave up an evening of playing **World of Warcraft** to be part of the gaming table). Figure out a balance that everyone likes, and let the fun roll on.

Or, barring that, just make yourself a big slab of beef and hope it'll all work out. Beef: It's what's for sidekicks.

Riding the Tiger

Exotic Riding Animals for *GURPS Fourth Edition*

by Matt Riggsby

From the orc-ridden wargs at the Battle of the Five Armies to the tigers of Pan Tang to the giant Paluan lizards in *The Fallible Fiend,* unusual riding animals frequently appear in fantasy literature. Moreover, though they're extremely unlikely, the idea of cavalry mounted on dinosaurs, giant eagles, or some other impressive animal has an undeniable "kewl" factor. This article presents a number of utterly unrealistic but -- with any luck - interesting riding animals for fantasy campaigns.

A riding animal has to fit a few requirements. First, it has to be strong enough to carry a rider. Assuming an average combined weight of rider and gear of about 200 pounds, which is near enough for humans and other human-sized riders, the minimum ST for a mount is about 18, which puts the mount near Medium encumbrance. A ST of 22 moves that "standard" load closer to Light encumbrance, which is good for speed, or provides a lot more margin for heavy armor, which is good for heavy shock cavalry. ST values above that raise the possibility of multiple riders. For example, a mount with a ST of 24, though not terribly fast, might carry a lightly armored "driver" and an equally lightly equipped archer (or fireball-hurling magician, or some other "gunner" type) in the manner of Bronze-Age chariots, but with much better terrain handling. Typical *GURPS* elephants (ST 45) are strong enough to haul three lightly armored people and still have nearly 700 pounds of carrying capacity . . . enough for a small, lightly armored wooden fighting tower.

Second, the animal must be amenable to training and keeping company with humans. There's no specific trait which covers that, so this must ultimately be the GM's call. For the most part, though, any animal with the Domestic Animal metatrait can probably be trained so far as its IQ will allow.

Here, then, are several animals which may be used not just as monsters but as riding animals used by human-sized (or nearly so) characters. Almost all are carnivores, but are sufficiently omnivorous or suited for less-than-fresh meat that the Restricted Diet disadvantage doesn't apply. They eat an average of $2.5 worth of food, mostly meat, per point of ST per day. However, most can gorge themselves for a few days, then go without eating for two or three days thereafter. The exception is the herbivorous hill turtle, which grazes as it goes.

Coursing Wolves

Damage 1d+2/3d-1; BL 58 lbs.; HP 17; Will 11; Per 12; FP 12; SM +1.
Basic Speed 6; Basic Move 9; Block 0; Dodge 9; Parry 10 (Brawling).

Advantages: Damage Resistance 1; Discriminatory Smell; Night Vision 2; Teeth (Sharp Teeth), does 1d+1 cut; Temperature Tolerance 1.

Disadvantages: Chummy; Code of Honor (Wolf) -1.

Skills: Brawling-14; Tactics-9; Tracking-12.

Cost: $6500.

The coursing wolf is on the borderline of being a rideable animal. Goblins and other smaller races can use them as cavalry, but they're only practical mounts for humans if the human is fairly small (or lightly equipped) or the wolf very

large. Their social nature can make tending them a chore as they work out the pack hierarchy, and they're restless and distracted when alone. However, they're bred for group hunting and are used to working together, making them remarkably amenable to training for group tactics. The "code of honor" is the coursing wolf's inherent loyalty to its "pack," a group of fellow wolves and associated humans. A coursing wolf will fight to the death to protect its fellow pack members and defer to pack members above it in the hierarchy. Among trained wolves, riders are regarded as "alpha dogs," and a well-trained coursing wolf is *very* loyal.

Giant Eagles

ST 21; **DX** 12; **IQ** 3; **HT** 13.

Damage 2d/4d-1; BL 88 lbs.; HP 21; Will 9; Per 12; FP 13; SM +1 at rest, +2 with wings extended.
Basic Speed 6.25; Basic Move 6; Aerial move 24; Block 0; Dodge 9; Parry 10 (Brawling).

Advantages: Acute Vision 3; Claws (Talons), does 2d cut; Enhanced Move (Air) 1; Flight (Cannot Hover; Winged); Teeth (Sharp Beak), does 2d-1 pi+.

Disadvantages: No Fine Manipulators.

Skills: Brawling-14.

Cost:$11,000.

Flying mounts are rare and expensive, but among those, giant eagles are among the most common. They're relatively fast, are individually dangerous, and can render most terrain moot, but their capacity for training is limited, they need a lot of room for maneuver, and their immense wingspan makes them easier targets.

War Tigers

ST 23; **DX** 14; **IQ** 4; **HT** 11.

Damage 2d+1/4d+1; BL 106 lbs.; HP 23; Will 11; Per 12; FP 11; SM +1.
Basic Speed 6.25; Basic Move 10; Block 0; Dodge 10; Parry 12 (Brawling).

Advantages: Claws (Sharp Claws), does 2d+1 cut; Combat Reflexes; Damage Resistance 1; Night Vision 5; Teeth (Sharp Teeth), does 2d cut.

Disadvantages: Sadism (12 or less); Sleepy (Asleep 1/2 of the time).

Skills: Brawling-16; Stealth-13.

Cost:$10,000

Though not much good as long-distance transportation (they need a great deal of rest, so they're only good for short stretches), war tigers are among the most dangerous unusual mounts: agile, stealthy, and armed with particularly sharp teeth and claws. Their habit of playing with their prey before killing them only adds to their fearsome reputation.

Great Bears

ST 27; **DX** 10; **IQ** 4; **HT** 13.

Damage 3d-1/5d+1; BL 146 lbs.; HP 27; Will 11; Per 10; FP 13; SM +1. Basic Speed 5.75; Basic Move 7; Block 0; Dodge 8; Parry 8 (Brawling).

Advantages: Claws (Sharp Claws), does 3d-1 cut; Damage Resistance 2; Teeth (Sharp Teeth), does 3d-2 cut; Temperature Tolerance 3.

Disadvantages: Bad Sight (Nearsighted); Bad Temper (9 or less); Semi-Upright.

Skills: Brawling-11.

Cost: $11,500.

Few mounts are more formidable than the huge, tough great bear. In northern forests, they are used as transportation for both people and goods, and in a pinch they can be used for cavalry. Unlike other cavalry, though, they can grapple their opponents; some specimens are trained in Wrestling. Great bears are, however, sometimes hard to control, so they've yet to be regularly used in large numbers. The Rider (Bear) skill includes training on how to stay in the saddle when the bear rears up on its hind legs, and bear saddles are specially designed to allow such a maneuver.

Grand Caiman

ST 29; **DX** 10; **IQ** 2; **HT** 10.

Damage 3d/5d+2; BL 168 lbs.; HP 29; Will 10; Per 10; FP 10; SM +2. Basic Speed 5; Basic Move 5; Block 0; Dodge 8; Parry 8 (Brawling).

Advantages: Amphibious; Damage Resistance 3; Teeth (Sharp Teeth), does 3d-1 cut; Striker (Tail; -2 to hit), does 3d+3 crush.

Disadvantages: Bad Temper (12 or less); Cold-Blooded ("stiffen up" below 65); Laziness.

Skills: Brawling-11; Swimming-11.

Cost: $12,000.

Though strong and tough, the grand caiman has a number of drawbacks as a regular mount. It is hard to motivate, easily angered, very sensitive to temperature, and almost impossible to train. On the other hand, it has a number of attributes making it remarkably useful in its native tropical swamps. One, obviously, is its considerable carrying capacity. It is large enough to carry two or three lightly equipped men into battle, though the riders usually dismount rather than use the caiman as a fighting platform. It is also equally at home in the water and on land. Although it can swim far under water, it is trained to stay on the surface when it has riders.

Hill Turtle

ST 350; **DX** 8; **IQ** 3; **HT** 13.

Damage 36d/38d; BL 24,500 lbs.; HP 350; Will 10; Per 10; FP 13; SM +6. Basic Speed 5.25; Basic Move 5; Block 0; Dodge 8; Parry 0.

Advantages: Damage Resistance 3 (Tough Skin); Damage Resistance 12 (Torso Only).

Disadvantages: Cold-Blooded ("stiffen up" below 50).

Cost: Rarely sold, but at least $80,000.

The hill turtle gets its name not from living in the hills, but from *being* a hill. At 15 to 18 yards across and able to carry over 30 tons without complaining, domesticated hill turtles aren't mounts so much as mobile homes. In their native near-desert plains, they are usually fitted with small housing compounds. In times of war, the compounds

become small wooden fortresses. Hill turtles are nearly impossible to miss, but very hard to hurt.

Murphy's Rules

The Very Picture of Her Love

An Adventure for Any Modern Setting

by Michael Anguiano

"Orchid at Casement" is a highly-regarded painting by Giuseppe Gianni, which disappeared from his studio upon his death. It was ultimately found by the late Adrienne Hesme, a New York artist. It has remained in the Hesme collection ever since, now controlled by Hesme's husband, Gillette Sandoval.

At least, that's what everyone thinks. An independent collector has approached you for help in selling a painting. She says this one is the real "Orchid at Casement."

The Set-Up

Someone calls the PCs from a street pay phone. The voice is female, with a slight English accent. She identifies herself as Beth Linehan and says that she has a proposition for the heroes regarding a valuable painting entitled "Orchid At Casement." Supposedly, the painting is currently part of the Hesme collection, but she's convinced that the Hesme "Orchid" is a forgery. Why? Because she's now in possession of the original. If the adventurers are interested, Linehan arranges an afternoon meeting at an open-air café in a busy shopping area, giving a brief physical description of herself.

The PCs can easily find information on "Orchid At Casement," including pictures, history, value, and so on. With a bit of calling around they can confirm that Linehan is an independent art dealer, having done some business with a wide variety of collectors and institutions around town. Anyone with specialized knowledge of or contacts in the art world can additionally learn that Beth Linehan is known for 1) traveling in international circles; 2) turning up unusual finds on a regular basis; and 3) dealing with a somewhat unsavory crowd. However, that's the most that can be learned on short notice.

The Meet

The café is situated in the middle of a large courtyard, surrounded by tall buildings that house a wide variety of businesses that cater to the urban shopper. Any PC might notice that this courtyard is a sniper's paradise, with scores of windows looking down on them.

Beth Linehan arrives just before the scheduled meeting. She wears an expensive dark business suit, pearl earrings, and a short pearl necklace. She's carrying a small black attaché case. Taking a vacant table, she greets the investigators with a radiant smile, a brisk shake of the hands, and a suggestion that they get right to business.

Linehan explains that she's come into possession of the original "Orchid At Casement." How? She says that's not important. If the heroes are not familiar with it, she will give a brief description and history of the painting. She goes on to say that it was supposedly rediscovered in 1986 in Australia and that copy currently resides in the Hesme collection. Unfortunately, Linehan doesn't have sufficient documentation to prove that hers is the original. Presumptions of authenticity will favor the Hesme copy, so everyone would assume Linehan is peddling a fake. That means that she has to rely on a gray- or black-market sale.

Her solution: sell it to Sandoval himself. She hopes to lure him into buying the real one, or else he risks being publicly exposed as owning a worthless fake.

So if she has the painting and knows a potential buyer, why does she need the PCs?

Simple . . . this is a very valuable painting and she has some very unethical competitors. The heroes will safeguard the painting for the next several days while she arranges the meeting. After that, she says, everything should be taken care of and they should get their payment a few days later.

Linehan is willing to cut them in for a percentage of the sale price. She will initially offer 15% but they can negotiate up to 30% with some effort.

If the Heroes . . .

- press her for details on the painting's acquisition, she will say she ran across in the storage space of an old friend, an amateur collector in Prague who didn't know what he had, so she traded him some ancient Greek pornography.
- threaten her, she will reduce the offered percentage and threaten to walk away from the deal.
- suggest that they might steal the painting for themselves, she'll say she knows how to find them if she needs to, and they don't even know where the painting is yet.

Should the heroes accept her offer, Linehan will smile broadly and give them a bulky manila envelope marked "Orchid" from her case. Inside the envelope, she says, are a letter, an address, and set of keys, as well as an initial retainer toward expenses. At this point, Linehan takes her leave and exits the courtyard via a busy store. She will skillfully evade any attempt to tail her.

The "Orchid" envelope contains a set of car keys (no clues as to make or model); the address of a warehouse near the port facilities; and a signed letter to a freight agency, authorizing the release of a specified vehicle to the party; and bundle of crisp hundred dollar bills. The cash will be $4,000 per character, or $20,000 total . . . whichever is greater.

Should the PCs decline her offer, Linehan will smile broadly and say that it was worth a try. Then she will give them a flat manila envelope, which she says contains a small payment for their time and trouble. She then takes her leave and exits the courtyard via a busy store. She will skillfully evade any attempt to tail her. In this envelope is $2,000 in crisp hundred dollar counterfeit bills.

The Pick-Up

At the warehouse, the adventurers find a large green SUV waiting for them. The warehouse belongs to the freight agency, which shipped the vehicle in from Amsterdam. It cleared customs that morning, and the heroes are welcome to drive it away . . . assuming they brought any gasoline.

They also receive another envelope, which was to be given to whoever picked up the vehicle. This envelope contains a letter with no addressee, but signed by Linehan. It instructs the reader to keep the vehicle safe for two days, in whatever fashion the reader deems appropriate, and that she will be in contact by phone at that point. It also mentions that the vehicle has great sentimental value for her, as she has always used it to transport her prize orchids.

At this point, the PCs are free to pursue whatever course of action they wish. They can look for more information, find a place to hide with the vehicle, go for a wild night on the town with their new cash and new-to-them car, or whatever else they decide. Regardless, in two days Beth Linehan will call them, and sometime before that they will be attacked.

Investigations

Getting information on "Orchid At Casement," Giuseppe Gianni, or Adrienne Hesme is simply a matter of finding an encyclopedia. Information on Gillette Sandoval is less available, because Sandoval has not lived in the public eye, but is easily learned from more knowledgeable sources or even old newspaper archives (in articles about Adrienne Hesme). See the information on each below.

Getting any information on Beth Linehan will depend less on the heroes' skills and more on knowledge of or

connections to the art world. Or perhaps incredible luck. Simply calling around will merely confirm that she is an independent art dealer. Better connections will yield more information on her shady reputation as a dealer in international circles. *Very* good connections will reveal the entirety of information listed for her below.

A simple examination of the large green SUV reveals only that it is two years old, has moderate mileage, is well-maintained, has brand-new NY plates, and was previously driven in England by someone who smoked tobacco. Observant investigators may recall that Linehan did not smoke or smell of smoke. Smart investigators will also adjust the headlights for driving on the right side of the road.

A skilled and careful (or merely violent) examination will reveal that the panels and windows are bulletproof. If the PCs specifically examine the bed of the vehicle, they will discover suggestions of a false compartment that is wide, long, and very flat. However, actually getting into the compartment will take proper tools, a couple hours of work, and disassembly of most of the SUV's rear end. In that compartment, the PCs find a painting, carefully sealed in plastic. Upon examination, the painting appears to be "Orchid At Casement."

However, the PCs will *not* find the two tracking devices that have been built into the vehicle's frame. These can be located only if the PCs look for transmitter signals. They will certainly overlook the third device, built into the rear-view mirror, which is inactive until specifically signaled to begin transmitting. And not to mention the fourth device built into the radio itself . . .

Follow-up on the vehicle's registration will reveal ownership by the non-profit Greater Vermont Arts Foundation, which has apparently existed for only one week and has a non-existent street address in Manhattan. All listed corporate officers will turn out to be deceased for at least six months. Before that, the vehicle doesn't appear to have been registered anywhere at all.

The painting in the SUV will match all descriptions and pictures of "Orchid At Casement." An appropriately skilled PC will recognize that the painting is a work of skill, but will not be able to independently ascertain whether this work is the original or a forgery. Any attempts at chemical analysis will be conveniently forestalled; the heroes are attacked!

The Attack

Sometime before Beth Linehan calls, the party will be attacked by a group of large, violent, heavily-armed, rather stupid thugs. The thugs have an electronic unit that picks up the tracking devices in the SUV frame. However, they actually have been tailing the heroes since the vehicle pick-up, only occasionally resorting to the electronic unit. They've been instructed to find the painting, which they figure is somewhere with Linehan. However, they don't know where Linehan is, so they have to make do with the PCs.

The adventurers' behavior will determine how the thugs attack. If PCs hide out, the thugs attack sometime in the dark early morning. If they drive around all night, the thugs will try to run them off the road, leading to a running gun battle on the streets. If the heroes leave the vehicle unguarded, the thugs will simply wait there for them to return.

If the Heroes . . .

- capture any of the thugs, they can easily learn that "some German guy" hired them to find Linehan and/or the painting. They have a contact phone number, but it's a prepaid cellular phone service that does not identify the user.
- study the electronic unit, they can find the two tracking devices built into the SUV's frame. If a skilled PC disassembles the device, he might discover that a listening device is built in . . . and presumably someone's been listening in on whoever's got the device. Audio broadcast range would be several miles.
- found the painting in the SUV, they might offer to sell it to whoever sent the men. The men were actually hired by a severe-looking Austrian man (who works for Volker Mandrella; see The Cast below). The Austrian man will reluctantly meet them, but will dismiss the painting as a forgery after a cursory examination. The Austrian man will leave with no further explanation; if the PCs try to forcibly detain him, he will be rescued by a group of

well-armed, well-trained, very businesslike commandos with matching Austrian accents.

Linehan Calls Back

Two days after picking up the SUV, the PCs get a call from Beth Linehan. She tells them that she's being tracked by several men, and can't safely move around in public. That means that it's up to the PCs to meet with Sandoval and make the pitch. She's set up the meeting for tomorrow morning and gives them directions to Sandoval's estate on Long Island. If the adventurers need persuading, she'll reluctantly up her offer to as high as 40% of the final sale price.

If the Heroes . . .

- tell her about the attack, she will be excited. She explains that this means her competitors are splitting their forces and aren't working together. She won't explain how this could make any sense.
- tell her that they found the painting, she will congratulate them on their ingenuity and tell them to put it back where they found it, because that's the safest place for it.
- threaten to sell the painting to Sandoval on their own, she breezily tell them to give it a shot and get their best prices. She adds that she'll be in touch afterward, and hangs up.
- trace her phone call, they'll get a pay phone in the Museum of Modern Art.
- decide not to meet Sandoval, they'll be hounded by various gunmen for several days until it becomes clear that they know nothing about Linehan's whereabouts.

Meeting Sandoval

Gillette Sandoval lives at Eulenspiegel, the estate he inherited from his late wife. The PCs will be suitably impressed at the sprawling mansion that overlooks the grounds, as well as by the security guards who meet them at the front gate and escort them inside. The heroes are met at the front door by Mather, the butler, who dismisses the security guards and leads the party through the mansion and to a large gallery.

The gallery is obviously the subject of very heavy, very expensive security. A wide variety of paintings and sculptures are spread through the room, but a wide swath of the rear wall is given over to a single painting: "Orchid At Casement," displayed without a frame. A small array of track lighting hangs from the distant ceiling, solely for this painting. Seated in a wheelchair before the painting is Gillette Sandoval.

Sandoval greets the PCs with a smile and apologizes for the wheelchair. He explains that he was recently on a dig in central Africa and had an unfortunate bout with malaria. The wheelchair is part of doctor's orders until he's fully recovered.

Sandoval then points to the painting and asks if the heroes are familiar with it. If they are not, he will give a brief explanation of the painting's standard interpretations. If they are, then he'll skip the basics and tell them to be patient for a moment, to indulge an old man in a wheelchair while he spins a boring story.

Sandoval will then explain that met Hesme at an art show in 1982, when she was well-established. He, of course, had no idea who she was, having been dragged to the show by well-meaning friends. While standing in front of some painting of flowers, he noticed a pretty young woman standing next to him. She asked his opinion, and he replied that he was about as bored as a real bee would be. He explained that the bee sees into the ultraviolet range, and that the real blooms would have markings that were only visible in the ultraviolet. So when he looked at this painting of flowers, he was about as good an audience as a real bee would be, because neither of them would see much to be interested in. Sandoval pauses at this point and adds, "I was being a real jerk."

Of course, that was Adrienne Hesme, and of course that was one of her paintings.

Sandoval goes on. They began dating and were married a couple years later. She credited his observation with influencing her artistic output as well as her artistic criticism. In her writing, she argued that one of the principles of

her artistic criticism was the need for a relationship between the artist and an informed audience, and that the artist who disdained any audience was performing only for his own arrogance.

"I make a stupid comment," he observes, "and she spins it into an artistic legacy for the ages. Made me really feel like an even bigger jerk."

At this point, Sandoval turns to the painting. He explains that she found this in some dusty backroom in Canberra and gave it to him on Valentine's Day in 1986. "She said that it spoke to my sense of always being out of place, in my life, in my career, even in my love. So she said this would show me how it could all be resolved into one whole. Still don't really know what she meant by that."

Sandoval hands one of the heroes a small pair of goggles and directs them to look at "Orchid At Casement." The goggles allow the PC to see the ultraviolet highlights from the overhead lights. Through the goggles, the blossoms in the painting are more vivid and marked by elaborate patterns. In the lower right corner is Hesme's signature.

"I'm not that bright sometimes. Took me seven years to figure out that it was a forgery. Now it means more to me than the real one ever could." Sandoval pauses, then adds, "You can keep the goggles. Mather will show you out."

The butler usher the party out, politely but firmly. On the way to the front door, the butler gives the heroes a card with the name of an art dealer who might be interested in their offer. The security staff sees them off the estate. Linehan calls the PCs as soon as they leave.

If the Heroes . . .

- tell Linehan about Sandoval's refusal, she will be stunned. She will ask for some additional details, then hang up. The PCs will not hear from her again.
- tell her that Sandoval accepted, she will eagerly ask for details and amounts, then hang up. She will then call Sandoval directly, learn the truth, and then the PCs will not hear from her again.
- refuse to speak to her, threaten her, or say they'll sell the painting without her, then she'll point out that the painting from the SUV is also forgery and have a nice day. Then she will hang up and the PCs will not hear from her again.

At this point, the PCs are left with only their advance payment, the SUV, and the painting from it. They will discover that the painting is a moderately skilled forgery, worth only a few hundred dollars as a wall decoration. Unless the PCs sell the SUV immediately, it will be stolen within three days and quickly shipped out of the country.

"Huh?" -- Background Notes

Beth Linehan is using the heroes as the proverbial canary in a coal mine.

She stole a painting, but she's not sure if it's real or fake, so she uses the party as bait for the person she stole it from. If the heroes are attacked, the stolen painting is valuable and therefore real. If the PCs are not attacked, then it's not valuable and therefore fake.

Linehan suspected that the real "Orchid At Casement" painting was stashed at Volker Mandrella's estate in England. Given the painting's value, she decided the potential payoff was worth the investment of her time, money, and effort. First, she had her own forgery of "Orchid" made. Second, she seduced Mandrella's chauffeur to get access to the estate. With the chauffeur's help, she stole Mandrella's painting of "Orchid." She also stole the green SUV.

After stowing her own forged copy in the SUV, she and the chauffeur split up. She took the real painting and disappeared. He took the SUV (and forged painting) to Amsterdam, where it would be shipped to New York. He was supposed to meet her in New York, but Mandrella's people caught up with him first. He died under interrogation, but he didn't know anything anyway. Having no other lead on Linehan, Mandrella's men followed the SUV instead and watched for whomever picked it up.

The Painting

The GM must bear in mind that there are *three* paintings of "Orchid At Casement": two forgeries and one real one. The Hesme painting is a forgery. The SUV painting is also a forgery, used by Linehan as a decoy for the PCs. The third painting, which was stolen from Mandrella, is the real one . . . and which the heroes never actually see in the course of the scenario.

"Orchid in Casement" shows an open window in a stone wall. Surrounding wall details, flooring, and other details indicate a British manor house. A Phalaenopsis Schillerianna orchid in a red "wrapped twig" pot is standing on the casement, the sunlight streaming in around it. The orchid's growth is leaning inward toward the room, rather than outward toward the light. A pendulous stalk of blossoms is extended into the shadow, leaving the details of the blossoms' color in question. Moss on the pot is under the orchid's direction of growth. The pot is wet on the shadowed inward side, with a few drops of moisture on the casement underneath it.

Critics note that the pot was evidently watered, then placed into the sunlight in a way to correct the lean of growth; the pot has been standing at the window only long enough for the sunward side to dry, while the shadowed side is still wet. This suggests a moment of attention and care following a period of neglect. Additionally, the orchid's spray of blossoms would normally be the most colorful element of such a painting, yet the blossom's vivacity is muted by shadow. Further, this species is Philippine in origin, but is set in a European location. The muting of color and displaced setting possibly suggest a feeling of emotional dislocation or perhaps a sense of exploitation of foreign cultures, both motifs common to this artist's "tropical period."

"Orchid At Casement" disappeared in 1845. It resurfaced in Hong Kong in 1912 during the estate disposition of Edward Westphalen, a recently deceased British collector. It appeared again in Johannesburg in 1926 in the collection of Lady Helene Riesling, who apparently owned the painting for less than two weeks before selling it to an undisclosed buyer. Adrienne Hesme rediscovered the painting in the assets of a bankrupt auction house in Canberra in 1986. The painting is commonly valued at $1.8 million.

The Cast

Beth Linehan is a very attractive fair-skinned brunette of English background in her late 20s. She wears her hair in a short "pageboy" cut. She dresses very fashionably and presents a cultivated, educated demeanor. She is fluent in English, Spanish (European), Italian, and German, as well as having a working knowledge of Japanese, Portuguese, and Arabic. She works primarily in the acquisition and sale of art works. In speaking to the heroes, she will affect a slight English accent, although this is strictly to be charming.

Born in Yorkshire, Beth actually grew up in Rome, the child of an expatriate British couple. As an art student, she fell in with a bad crowd and found that it suited her. A skilled manipulator and negotiator, she has steadily acquired knowledge, skill, and wealth during her years of working in the criminal elements of the art world. She is likewise proficient in the areas of surveillance, sleight of hand, and small arms. In other words, she can ditch a tail, pick a pocket, and use the small Beretta pistol she keeps tucked away.

Linehan has acquired some reputation as someone who makes shady deals but can be counted on to hold up her end of the bargain. This reputation was carefully cultivated. When she has no intention of living up to her end of a deal, she will use the name Elise Grumann. As Elise, she will speak with a Bavarian accent, uses more severe styles for her hair and makeup, and dresses mostly in leather.

Adrienne Hesme, artist and writer, deceased (1950-1996). A willowy blond of mixed European ancestry and privileged upbringing, Hesme was a very eclectic artist and prolific writer who helped reshape critical perceptions of art in the 1980s. Hesme was mostly known for her work with mixed media sculptures, although painting was her most regular artistic pursuit. Among her most notable artistic successes was the legendary Oregon Gallery opening in 1985, when the first hundred attendees were provided with masks (handmade, numbered and now highly sought-after), a

small percentage of which included ultraviolet-active lenses that revealed hidden details in most of the paintings. The motif of "visual obscurity" appeared repeatedly in later work. Her work continues to be displayed in various museums and galleries. Since her death, the Hesme Collection (which contains little of her own work) is on continual tour, but her personal favorites remain on permanent display at Eulenspiegel, the Long Island estate where she lived with her husband.

Much of her critical writings had to do with the need for an educated audience, and that art is as much a function of audience as the artist. The timelessness of a piece of art is a condition of the appeal to its audience, so that the greatness of an art work will vary with the society in which it is placed. She also delineated a theory that the significant difference between "high" and "low" culture was the level of education needed to appreciate it.

Giuseppe Gianni (1786-1845) is known to have been a brilliant artist, inveterate traveler, and philosophical eccentric who railed against the rapacity of imperialism. Born in Florence, he lived variously in Cairo, Mexico City, Montreal, Bombay, Kingston, San Francisco, and Manila, where he spent his final years. He died on the floor of his Manila studio in 1845, apparently succumbing to some obscure hemorrhagic fever. During his travels, he produced an extensive body of sketches illustrating botanical and zoological specimens, many of which entered standard use in scientific texts. He also produced a sizable body of paintings during his life, for which he became acknowledged only after his death.

His years in the Philippines have become known as his "tropical period." These paintings usually featured tropical plants or animals which were pictured in mildly unsuitable European settings, which critics have interpreted as reflecting a sense of displacement as well as perception of European appropriation of foreign culture. Many of these paintings disappeared from his studio upon his death, only a few of which have ever resurfaced. Of these lost paintings, the best known was "Orchid in Casement," which was rapturously described in contemporary correspondence by a number of visiting dignitaries and artists. Extensive preliminary sketches remained behind, but the work itself was presumably stolen.

Gillette Sandoval (b. 1953) is a semi-retired paleobotanist. The child of a Brazilian diplomat and a French businesswoman, he was born and raised in New York. Although botanist by training, he was consulted increasingly by a paleontologist friend on pollen grains found in archaeological digs, until he inadvertently became a leader in the field that would become paleobotany. He and Adrienne Hesme were married in 1984. Despite seemingly incongruent backgrounds and careers, the two were extremely happy together until her death from pancreatic cancer in 1996. Since then, he has worked to preserve her artistic legacy, as well as funding work in his own field.

Volker Mandrella is an elderly Austrian collector of considerable wealth and reach. He does considerable traffic in art works of questionable ownership. The large green SUV is his property, typically used to hide or move a single work of great value. It has never been proved in court that Mandrella was a member of the Nazi party or served in any military capacity.

Designer's Notes: *GURPS Ultra-Tech*

by David L. Pulver

The original **GURPS Ultra-Tech** was the first book I wrote for Steve Jackson Games, back in 1988, and so I was very pleased to be able to update it. The road to this proved unusually rocky, however. Originally, we'd planned on a very different book, one that would feature a complex technology path, weapon, armor, and gadget design system. To this end, I worked closely with Kenneth Peters (and also with Hans Christian-Vortisch, co-author of the new **High-Tech**). Unfortunately, a lengthy playtest confirmed my fears that that the resulting first draft was too complicated for casual use. After attempts to simplify it were less than successful (and with the book now over deadline), Kenneth left the project, and I completely rewrote the book, basing it far more closely on my original *Third Edition* work. (Hans and I hope to release a significantly revised version of the weapon part of the design system at a latter date.)

The result was a vast improvement: a new edition that combines *Ultra-Tech* and *Ultra-Tech 2* into a single unified book, but fully updated to *Fourth Edition* specifications. In addition, it adds completely new material, such as ultra-tech vehicles, customizable robot templates, and many new gadgets. It's designed for a wide variety of science fiction settings. In particular, I included more examples of "domestic" technology and consumer goods for ordinary people, to help GMs providing a sense of "ordinary life in the future." Full support was also included for cyberpunk campaigns, with numerous examples of cybernetics, and military games, with more heavy weapons than the original books, including tanks, battlesuits, and cannon. The book also complements **GURPS Bio-Tech** with additional examples of future medical technology, hardware-based nanotechnology, and uploading.

Gadget Out-Takes

With the space freed up by the removal of the overly-complex weapon design system, almost all gadgets that I wanted to go in the book actually made it in! But a few were left out for reasons of space.

Household Manager System (TL9)

An array of sensors and microcommunicators scattered through a house and its appliances. They keep track of the state of the household chores, tracking dirty dishes, laundry, etc. +1 (quality) bonus to Housekeeping skill and may coordinate housebots or cleaning swarms. It is not a burglar alarm, except indirectly (e.g., a bloody corpse may signal as a "mess" to be cleaned up). $1,000.

Stage Equipment (TL9)

This is a set of portable gear including multiple directional sonic comms, spotlights, and 3D media screens designed for sound stage, dance floor, etc. Use several for large venues. $20,000, 200 lbs., 10D/20 hr. LC4.

Anti-Sex Pheromones (TL10)

This "don't-hit-on-me" perfume produces pheromones that actually cause sexual disinterest in people of a specific sexual orientation. It is popular for people who do not wish to be sexually harassed. Anyone who has Lecherousness who is within two yards or downwind gets +2 to their control roll if the only viable subject in the area is using anti-sex pheromones, or if the pheromones are in the area. People without Lecherousness also experience reduced desire. Someone attempting to use Sex Appeal on someone who is exposed to these pheromones will have a -2 (if that person is susceptible to them). The effects linger for a minute after they have been breathed. $10 per dose. LC4.

Empathic Interfaces (TL10)

Empathic interfaces are neural interfaces that incorporate additional equipment similar to a veridicator. They can translate the user's emotional state into a digital signal.

Empathy Upgrade (TL10): This is a hardware upgrade of a neural interface. It can record feelings and translate them into particular values ("he's registering happy"). A computer or other device that is linked to the neural interface can then be set to respond in accord with a particular emotion. This should be pre-set, e.g., "if I'm frightened, turn on the force screen" or "if I get curious, activate my camera." An empathic neural interface 1.5× as expensive as any other interface.

Emotion Interpreter (TL10): This software provides the equivalent of the Empathy advantage but only in situations when it is run on a computer that is receiving input from someone using a neural interface with an empathy upgrade. Note that the user of an emotion interpreter does not need a empathic neural interface; only the subject requires one. However, if the user does have neural interface with an empathy chip, he can set it so that it will let him experience the incoming emotions (as his own brain is triggered to manufacture the appropriate electrochemical signals).

Complexity 4 software, LC4.

Industrial Antimatter Factory (TL9-12)

A purpose-built facility for production and storage of antiprotons and the creation of antihydrogen. Antiprotons are produced by accelerating protons (or other particles) to energies high enough that, when they collide with a target, a part of the energy is transformed into particle-antiparticle pairs. These are then captured and assembled into antihydrogen.

Antimatter Factory (TL9): A large, optimized antiproton particle-accelerator system. It manufactures antimatter at a cost of $25,000 per microgram, and can manufacture 1,000 micrograms per day. At these prices, antimatter is used in nanogram levels as both a radiation source for medical treatment, and as a catalyst for fusion or fission in small nuclear pellets or warheads, although the latter are very expensive. $25 billion. LC1.

Antimatter Factory (TL10): Manufactures antimatter at a cost of $2,500 per microgram and can make 10,000 micrograms per day. Antimatter-catalyzed fusion is common; micrograms of antimatter are routinely used as a catalyst for nuclear weapons. Antimatter is also used to fuel antiparticle beam weapons. $5 billion, LC1.

Antimatter Factory (TL11): Manufactures antimatter at a cost of $25 per microgram and can make 100,000 micrograms per day. At these prices, antimatter reactors are used where high-performance power plants are more important than fuel efficiency (e.g., military craft). Antimatter warheads of intermediate yield between conventional and nuclear weapons are introduced (a microgram of antimatter equals about 90 lbs. of TNT). $1 billion. LC0.

Antimatter Factory (TL12): It manufactures antimatter with high efficiency at a cost of $5 per microgram and can make 1 gram per day. At these prices, antimatter is used directly in some high-performance rocket engines, and is common in weaponry. However, each pound of antimatter still costs $2.2 billion (and explodes with about 20 megatons yield), so nuclear bombs remain the only cost-effective way to create big explosions. $200 million. LC0. In comparison, at TL8, antimatter production, primarily for research purposes, rarely exceeds 0.01 micrograms/year at $60-70 million per microgram.

Antimatter factories are cheaper if they can benefit from solar collection facilities, especially close to the sun, e.g., on Mercury. For such a facility, multiply the start-up cost by four due to the specialized equipment and transportation that is needed, but divide the cost per microgram of antimatter by two. This can be much more efficient.

Electrothermal-Kinetic Slugthrowers (TL10)

"ETK" guns are similar to both liquid propellant guns and electrothermal-chemical weapons; they are the final evolutionary stage of conventional firearms before a complete transition to electromagnetic weaponry. Instead of relying on the chemical energy of the propellant, they use a powerful electrical charge to vaporize it. The expanding

steam and plasma accelerates the round to a very high velocity. They use more energy than an electrothermal-chemical weapon, but less than a gauss gun.

All TL9 conventional slugthrowers can also be available in TL10 ETK versions. They propel projectiles at roughly twice the velocity of a conventional slugthrower. ETK slugthrowers get double their normal piercing damage, double the range, and have 1.5 times as many shots of a conventional-propellant slugthrower. Two-handed weapons (rifles, shotguns, SMGs, etc.) also add +1 to Acc. They are also twice as expensive. They have the same variable velocity setting as LP slugthrowers. Other statistics are the same.

The grip or stock of an ETK slugthrower incorporates a removable B cell (for pistols) or C cell (for SMGs, PDWs, shotguns, rifles), or D cell (for larger weapons) to provide the electrical pulse. Each provides enough power to fire 10 magazines worth of ammunition.

Inquisitor Robot (TL10)
188 points

This is a sinister machine equipped with three flexible weapon mounts and three manipulator arms. The basic model is a cylindrical machine that moves on a cushion of air. Its strength belies its size. It is also called a "torture robot," although its large brain (for its mass) and array of sensors let it analyze behavior and make it very good at psychological manipulation. A typical mix for its weapon mounts might be a pneumohypo, a holdout electrolaser, and a neural lash. Its second mouth is mounted on an arm, and can be used to take samples for its taste sensor. $20,000, 64 lbs. LC2.

Attribute Modifiers: ST+1 [10]; HT+2 [20].
Secondary Characteristic Modifiers: HP+4 [8].
Advantages: Doesn't Breathe [20]; Discriminatory Smell (Emotion Sense, +50%) [23]; Discriminatory Taste [10]; DR 10 (Can't Wear Armor, -40%) [6]; Extra Arm 3 (Extra Flexible, +50%; Weapon Mount, -80%) [9]; Extra Mouth 1 [5]; Flight (Low Ceiling, -25%) [30]; Infravision [15]; Machine [25]; Protected Hearing [5]; Protected Vision [5]; Radio (Burst, +30%; Reduced Range 1/10, -30%; Secure, +20%; Video, +40%) [16]; Sealed [15]; Sharp Teeth [2].
Disadvantages: Aerial [0]; Cannot Float [-1]; Electrical [-20]; Maintenance (one person, weekly) [-5]; Restricted Diet (Very Common, Power Cells) [-10].
Features: Compact microframe computer brain.
Availability: $60,000 (TL10), $15,000 (TL11), or $4,000 (TL12). LC2.

Hardware Upgrades

Contragrav (TL10^) (+15 points): Floats silently through the air, which only increases its menace! Remove Low Ceiling, -25%, giving it Flight [40]; add Silence 1 [5].

Jump Communicators (TL10^)

This directional comm teleports energetic subatomic particles (e.g., mesons or anti-particles) across space, where they arrive and decay with enough energy to be noticed by a properly-tuned receiver (but without enough energy to inflict any damage). They must be aimed at known coordinates; if the receiver is moving and not already in communication by this or other means, the GM may require an Electronics Operation (Comms) roll to successfully transmit (takes 10 seconds per attempt).

They cannot be intercepted in transit, since they vanish and then reappear, rather than traveling through space. They can penetrate anything except a reality stabilizer (page 194) or other device that blocks matter transmission. It may be a precursor to actual matter transmission (MT) technology, or it may be that particles are all that can be transported.

Light speed and faster-than-light jump versions are both available.

Very Large (TL10^): 50-mile range. $200,000, 1,500 lbs., F/10 hr. LC2.
Very Large (TL11^): 500-mile range. $20,000, 60 lbs., 2D/10 hr. LC2.
Large (TL11^): 50-mile range. Includes video screen. $6,000, 6 lbs., 2C/10 hr. LC2.
Medium (TL11^): 2,000-yard range. $2,000, 0.6 lbs., 2B/10 hr. LC3.
Small (TL11^): 200-yard range. $500, 0.06 lbs., 2A/10 hr. LC3.
Micro (TL11^): 20-yard range. $100, neg., AA/1 wk. LC3.

Multiply ranges by ×100 per TL after introduction.

Neutral Particle Beams (TL10)

These weapons are intended for use in vacuum and trace atmospheres, where a charged particle beam would rapidly defocus. Instead of light (and negatively charged) electrons, the beam is composed of heavier hydrogen atoms. In order to accelerate the beam, an extra electron is attached to each hydrogen atom. The now-charged heavy ion is accelerated in conventional fashion, but as it exits the accelerator it passes through a tenuous gas that strips away the extra electron, producing a neutral beam.

The extra machinery means that neutral particle beam weapons are more complicated than charged particle beam weapons, appearing one TL later. Neutral particle beam weapons are mostly used as spacecraft weaponry, sometimes with accelerator tubes that are hundreds of feet long. However, semi-portable neutral-beam weapons may be available if vacuum combat is expected; for example, troops operating on a lunar base or in an asteroid belt might be equipped with these weaponry. In vacuum or trace atmospheres their range is not reduced (unlike a charged particle beam). In atmosphere, they can fire a normal electron beam (rather than a hydrogen atom) and will thus perform as an ordinary charged particle beam blaster.

Neutral particle beams otherwise have the same statistics as ordinary charged particle beam blasters, but appear one TL later.

Wrist Line Shooter (TL10)

This is a miniature launcher for a 100'-long carbon fiber line terminating in a molecular adhesive cup that will stick to anything and support up to 200 lbs. The user can use it to travel by swinging from buildings, tree branches, ceilings, etc. He adds +2 to Climbing skill, and can move at half Basic Move while swinging along. $200, 0.5 lbs. LC3.

Plasma Lance Warheads (TL11^)

Plasma lance warheads are similar to plasma warheads, but generate a highly penetrating shaped plasma jet designed to burn through armor. Plasma lance warheads inflict burning damage with a (10) armor divisor and the surge damage modifiers.

Plasma lance is available for any 10mm or larger round. Hand grenades and mines use the warhead damage. Guns and launchers with plasma warheads replace their normal piercing damage with the warhead damage shown below.

Warhead	Damage
10mm	6d (5) imp inc sur
15mm	6d × 3 (5) burn sur
18.5mm	20d (5) burn sur
25mm	6d × 5 (10) burn sur
40mm	6d × 8 (10) burn sur
66mm	6d × 12 (10) burn sur
100mm	6d × 20 (10) burn sur

Plasma lance warheads are 15 × cost. LC1.

2D Force Warhead ("Grav Slicer") (TL10^)

These create a two dimensional hypergravity pulse, usually parallel to the local gravity gradient. This flat disk of expanding gravitational force inflicts cutting damage with a (3) armor divisor. The GM should adjust hit location based on the position of the victims; this can be a nasty surprise if they don't realize what type of grenade was used, since the normal reaction ("hit the dirt") might be the wrong thing to do. If someone drops prone when a "grav slicer" grenade lands near them, any location could be struck. If they time a jump just right, it will miss them, and if they remain still, it may slice off their feet at the ankles. Warheads may be programmed to airburst at a given height (e.g., neck level, torso level, etc.) to maximize a particular effect.

2D force is available for any 15mm or larger round. Hand grenades and mines use the warhead damage. Guns and launchers replace their normal piercing damage with the warhead damage shown below.

Warhead	Damage
15mm	1d(3) cut ex
18.5mm	1d+2 (3) cut ex
25mm	2d(3) cut ex
40mm	4d(3) cut ex
66mm	8d(3) cut ex
100mm	8d×2(3) cut ex

They are 10 × cost. LC1.

Tachyon Communicators (TL12^)

A T-Com is a directional communicator using a modulated beam of faster-than-light particles (tachyons). A tachyon beam is not affected by intervening objects, but the user must know the exact location of the receiver . . . so interstellar communication works best between fixed relay points rather than mobile ships, unless some other means of communication is also used. The beam travels at 1 parsec per hour (57 AU per second). Tachyon beams may not penetrate reality stabilizers (page 194).

Large (TL12^): 10 parsec range. $60,000, 400 lbs., 2E/1 day. LC3.
Medium (TL12^): 1 parsec range. $20,000, 40 lbs., 2D/1 day. LC3.
Small (TL12^): 0.1 parsec range (20,600 AU). $2,000, 4 lbs., 2C/1 day. LC3.

Crazy Old Man's House

by Caias Ward

"I'm not opening that. I am going outside, and having a smoke, and I am not going to open that . . ."

Eric stomped off, refusing to subject his mind to the sheer insanity of this place. At least until he got a smoke in.

"Look," Moko said, swinging around the two rusty cleavers bound together by wire, "It's twice the cutting!"

Eric ignored him. Moko shrugs as Cai walked by, a huge box in his arms. It was nudie magazines from the '50s and '60s, the eighth box they found today. Along with the nine oscilliscopes in the garage pit, the room with four inches of heating oil on the floor and the Ford Model A engine block, it was a light day of cleaning. Other days? Other days were . . . **worse.** *Like when they had to burn all those pictures . . .*

"I can't believe your grandfather was insane enough to collect all this stuff . . . " Cai continued to work through the basement, being careful to avoid the rotted floor section that attacked them the first time they came in the house.

"Insane? He has The Brilliance!!!" Moko mocked. "Any moment, we're going to find the giant spider robot and we'll be sorry! Sorry I say!"

Cai was out of earshot by now, throwing the magazines in the dumpster. They were up to their twelfth 30-cubic-yard dumpster, and the end was far off. He turned back to find Eric cursing and smashing a paint can with an axe handle. Inside the previously factory-sealed paint can were dozens of rusty locks, all cut.

"Who factory seals locks in a paint can? **Who?***" Eric continued smashing the can in anger, his mind still trying to wrap itself around this crazy old man's house.*

The Start of the Collection

Carmine Natoli of Ridgewood, New Jersey was a factory worker during World War II. A small man, he was still capable of incredible (and herniating) feats of strength. Otherwise unremarkable, he managed to keep this love of collecting a secret from his family for decades. In this time, especially when his wife passed and his daughter moved away, he filled his three-story house with objects found on the street, stolen from his place of employment, or acquired from his many trips to the dump.

As he collected, his mind wandered more and more, finally being declared mentally incompetent and taken to live with his daughter and her family. It was only when the family hired a few of the grandson's friends to clean out the house did the true depths of Carmine's insanity reveal itself. Carmine was an inventor of "things," as it were; they didn't necessarily work, or even serve a purpose, but they were a testament to the wild thought processes going on in this man's head.

The Location

Carmine Natoli's house used to be part of a much large estate, including a servant's quarters on the next block. Currently, the house is a three-story stone structure with a two-story garage adjacent to it, sitting on one acre of land. Built into a small hill, both the basement and first floor are at ground level, with a regular door and "storm cellar" door for access to the basement. The grounds are overgrown but otherwise not remarkable.

The interior of the house before it was cleaned is another story. Depending on when the house is seen, it can range from being impassable without major effort or magical abilities (desolidification, flight, size control) to simply

cluttered. While the house is relatively stable, there are areas of floor that are decaying or broken due to the weight of the objects within.

House Cleaning

All said and done, it took 16 dumpsters (30 cubic yards apiece) to empty the contents of the house. When the basement was first opened, the grandson commented on how something must be blocking the door. It turned out that the room was filled floor-to-ceiling with stuff, to the point where he had to repeatedly ram the door to crush and shift objects until he could reach in to remove boxes.

What was originally a beautiful three-story stone house was now a broken shell, left to rot with trash, clutter, and dead animals. From rotting floors to a drill press the 127 pound man picked up himself and carried into the center of the basement, it was a heartbreak of lost architecture. Elegant latticework burned and stained, fine cloth moldy and torn, all of it was a hazard to body and mind. It got worse as the friends cleaned the house; the grandson claimed that his grandfather had "The Brilliance," an ability to see beyond three dimensions and the skill to shape mundane objects into powerful magical machines.

While they considered it a joke, the friends always gave pause when they would find a jar with a hundred washers made out of detergent bottle plastic, an anatomically-correct tin man or two gallons of mercury in a jar. Also, the house seemed to . . . *breathe.* Doors that could barely move on their hinges would slam shut, a store mannequin would move from floor to floor and "secret plans" scrawled on paper would alternately be gibberish or reveal incredible insight.

Finally, the house was cleaned and sold after months of work and incredible expense. Carmine Natoli passed away from heart failure shortly after, blissfully unaware that his life's work of collecting had been reduced to trash. Still, the memory of the house and the objects within haunt the people who spent so much time cleaning it.

A Small Selection of the Objects Found Within

Carmine Natoli's house is a convenient location to place any strange or unusual object. In the real world, Carmine Natoli's house contained the following objects:

- Nine oscilloscopes in the garage pit
- Twelve lawnmowers in the garage pit
- "Linda," a store manniquin that would move from place to place in the house.
- A cataloged and reviewed collection of over 600 pornographic tapes
- Issue #1 of *Playboy* in mint condition
- A Ford Model A engine block
- A suitcase full of women's underwear
- Four dead possums
- A case for a Wurlitzer jukebox
- Ten containers of dried plasma
- A printing press
- Classified government documents, circa 1941

Depending on the world his house is found in, these objects will be tame by comparison.

Adventure Seeds

Here are some possible interpretations for how to use this abode and its contents.

The Brilliance!: The grandson was right: Carmine Natoli had The Brilliance. The Brilliance, in this case, is a

symbiotic or parasitic creature of either magical or technological origin that guides the host to create and craft. Carmine was already mentally unstable to begin with, so The Brilliance enhanced his mental infirmity and ended up battling between genius and trash-collecting. When Carmine was removed from the house, The Brilliance left him and waits for a new host or hosts.

The purpose of The Brilliance? Perhaps it is a space traveler seeking someone who can help it find a way home, or it is the vanguard of a destructive race seeking to make a doomsday weapon such as a planet-killer or a spider robot. It might even be an artist creating works too advanced for mortals to understand. It may have already spread to the house cleaners, or some of it might wait still.

Imprisoned in Wire and Glue: Carmine knew there was evil in the world and that evil would accumulate in objects that others would throw away. He swore that he would contain the evil, bringing it into his house and locking it away. The evil ate at his mind, forcing him to use his technical skill to craft objects of power to draw off the taint. Factory-sealed paint cans full of cut locks, "double cleavers," and X-rated films on 8mm all contained the wickedness to some degree, but were now free to torment the world.

Dreaming of Mad Machines: Carmine was a fey, a craftsman not meant for this world. In the hands of those who could use magic, his strange creations are powerful weapons against those would fight creativity and stifle imagination.

Who Let the Weird Out?: Seems Warehouse 23 has a new satellite location in Ridgefield, NJ, all without their intention or knowledge. More importantly, dangerous objects have been appearing in the house despite the best efforts of Warehouse 23 staff, and the grandson has been selling his finds online!

Legacy: Carmine was the mechanical mastermind behind a number of super villains, providing weapons and armors to thugs and dictators. The components for his massive spider-robot were thrown away, causing a mad dash between heroes and villains to gather the pieces before it becomes self-aware and lays waste to New Jersey.

Malleus Monstrorum: Creatures, Gods and Forbidden Knowledge (for *Call of Cthulhu*)

Written by Scott David Aniolowski, with Sandy Petersen and Lynn Willis

Published by Chaosium Inc.

296-page b&w softcover; $34.95

One of the best purchases I ever made for my *Call of Cthulhu* game was *Ye Booke of Monstres.* It was a delightful two-volume set of "new nightmares" for the game: creatures and Gods culled from the festering mass of Mythos fiction and previous Chaosium works, complete with wonderful illustrations of the oogy-boogies. Since many of my players were veterans, and had at least leafed through the main book, mere sight of "Ye Booke" was fair warning they were about to get pasted by something they knew nothing about. So I could ensure fear just by having one or both volumes on the table, even if it they weren't going to be used that session.

A few years later, Chaosium printed *The Creature Companion,* which was a combining and expansion of the two volumes of *Ye Booke of Monstres* with additional creatures, full-color reproductions of four Nick Smith Mythos paintings, and journal entries from a fictional Mythos investigator thrown in for good measure. After a good read-through I groused that, having kept up with Chaosium's products over the years, there wasn't enough new and good material in it to truly justify my purchase. But there were a few new and worthy inspirations to be found, and it *was* handy having all the info in one book. So I started using the *Creature Companion* instead of the older volume, and put the latter upon the shelf of hallowed previous editions.

It's almost 10 years since the *Creature Companion* came out, and we have a new collection of Mythos nasties, appropriately entitled *Malleus Monstrorum.* It's the English "edition" (read "non-exact repackaging and expansion") of Pegasus Spiele's work by the same name. And I have to say that Chaosium has outdone itself, as this is the biggest, juiciest Mythos entity book ever made. I do have a couple of quibbles with it, but I think both new and long-term Keepers will want to get their hands on this one.

Malleus Monstrorum presents almost all of the entries from *The Creature Companion,* along with several new entries, plus the observations of Sir Hansen Poplar, Mythos Investigator. And if that wasn't enough, it also reproduces the "main" Mythos entities from the rulebook, too -- allowing a fairly rules-savvy Keeper to only have to flip through one book during play.

The entries are done in standard Chaosium format: a quote from a Mythos story and/or description of the entity, information about its practices and habits, details on attacks and/or special abilities, and then its stats. As always, some entries are much longer than others, depending on how fleshed out those entities are in Mythos fiction or Chaosium products. And there are *considerable* expansions on previous entities from both the Companion and the rule book, such as the Tcho-Tchos, the Mi-Go, Sand Dwellers, and Nyarlathotep's various Avatars.

As you might expect, some of the new entries are from recent Chaosium publications, such as *Secrets of Japan, Unseen Masters,* and *Beyond the Mountains of Madness.* Others have come from obscure corners of the Mythos, non-Mythos horror stories (such as the Triffids and The Thing) and world mythology (many new Avatars of Nyarlathotep). The obscurity of some entries might make a Keeper wonder if there's any real use for stats on a thing that no Investigator would ever see, much less Summon, but you have to give them high marks for all-inclusiveness. If you ever wanted to write a Scenario around Cthulhu's second wife and their kids, they're in there.

The package is rounded out with expanded sections on natural and supernatural creatures, and a few appendices which will be of varying worth to Keepers. Indispensable are the pronunciation key and tips on presenting Mythos entities to players. Not so key are tips on bringing non-Mythos entities into the Mythos (Cenobites, anyone?) and a rumination on the Dreamlands that winds up sounding more like an ad for the latest edition of that book than a useful tidbit. And there's an ever-handy "Monster Master" sheet in the back, too.

The biggest difference in the style of presentation is the artwork, itself. Rather than a frightful drawing of what the entries look like, they present examples of how the creatures were expressed in human art. Many of these works are so good that it's hard to tell if they were real, unchanged finds, or if the artists tweaked them a little, or a lot, to get the Mythos entities into them. Others are more obvious put-togethers or retouchings, but they still make handy props for Investigators to find while doing research.

So far so good, so what's the big problem? For me, it's mostly the art. I realize there's a sizable school of Keepers who think having actual drawings of Mythos entities is sacrilegious, and the players should only ever have the oogy-boogies lovingly described, so as to let their imaginations create the Worst Thing Possible within their own heads. This is a perfectly legitimate view, but I come from the school that believes every picture tells a story and says a thousand words, and I *like* having handy, gruesome illustrations to flash at folks when their Investigators see something vile.

Other grumbles? I really do not like how the authors have taken a number of ancient mythological Gods and said they were Avatars of Nyarlathotep all along. I prefer His avatars to be alien and horrific rather than mundane and mythological. I'm also a little unsure about making space to document entities that are so obscure that no Investigator would ever come across them.

Another quibble that isn't really a quibble for me: as I've intimated earlier, this is *not* an exact translation of the German version. The additional text that accompanied the entries -- descriptions of a victims' death, and subsequent corpse, at the hands of the entity in question -- have been excised, except for what I believe are a few examples in the back. Given that those examples seem to have lost something in translation, I don't think we're missing too much, but anyone expecting an exact replica of the German text may be disappointed.

What would have made this a better product for me? Well, I'd have had the drawings back with the entries, and put the found art in an appendix in the back. I'd have also excised all the Hansen Poplar journals because I find them useless wastes of space. (That and, quite frankly, anyone who knows even a third of what he does should be drooling in a rubber room, somewhere.) But I'm kind of 50/50 on trimming the more super-obscure entries, as I may find a use for some of them . . . someday.

That said, my quibbles are small and paltry things that are more than blown away by the monstrous hammer of the work, itself. The ***Malleus Monstrorum*** more than fulfills the purpose of any successive "monster book" by building upon what came before, and giving a heck of a lot more along with the bargain. New Keepers who may not have all the books will find this indispensable, and even old hands like myself will find new wonders scattered throughout.

So I'm happy to say that my ***Creature Companion*** is being retired to the hallowed shelf of previous editions in favor of this new work. I'd recommend you do the same.

Badaboom: an Explosive Card Game about Tinkering Goblins

Published by [Gigantoskop](#)

Designed by Gigantoskop

Illustrated by Peter Svärd & Jesper Moberg

64 Full Color Cards (5 Bomb Cards, 5 Mechanism Cards, 7 Gadget Cards, & 47 Trick Cards), 50 Gold Coin Markers, 2 Bomb Armed Markers, & 6-Page Rules Leaflet; $20

Life is hard for a goblin. I mean really hard. They hate each other. They hate everyone else. And they hate their boss, the High Necromancer . . . especially when he is mad, because then he punishes the goblins. Right now the High Necromancer is mad because the Human, Elf, Dwarf, Gnome, and Fairy alliance have begun bombarding his Army of Darkness with exploding contraptions, and he cannot reciprocate. The problem is that the High Necromancer lacks the technological know how. Fortunately he has a plan. Unfortunately this involves the goblins. More specifically, it involves goblin engineers in the Bomb Research Dungeon tinkering with unexploded contraptions until they explode. This is not a problem for the High Necromancer, because goblins are cheap to resurrect. In the meantime any goblin engineer is stuck trying to explode bombs and performing secret missions for the High Necromancer in the hopes that he can gain enough gold to bribe the troll guards to escape.

This is the set up for ***Badaboom: an Explosive Card Game about Tinkering Goblins*** for three to five players, the latest design from Swedish publisher Gigantoskop. Having asked us to [build junk piles and slap monkeys](#), then [shoot ourselves](#), now they want us to blow ourselves up. Play is simple: Bombs are passed from one engineer to the next, who take it in turns replacing the Mechanisms and Gadgets inside it. This tinkering eventually removes the Safety and the Bomb goes off. If a goblin survives the explosion, he gains gold; if he completes a Secret Mission for the High Necromancer, he gains gold; and 10 gold is enough for a bribe.

Being a Gigantoskop game, ***Badaboom*** looks good. The cards are full color, illustrated to amusing effect, and easy to understand. The rules are more of a problem in that they take time to digest and they are not easy to teach to others.

Besides the 50 plastic gold coin markers and 2 black "Bomb Armed" cards, ***Badaboom*** consists of 64 cards, divided into 5 Bomb cards, 5 Mechanisms, 7 Gadgets, and 47 Trick cards. Each Bomb card -- there being one for each race opposing the High Necromancer (Humans, Elves, Dwarves, Gnomes, and Fairies) -- describes the make up of the Bomb, how many Mechanisms it contains, and any special characteristics. For example, every Gnome design has two Mechanisms, while a Fairy bomb contains three Mechanisms and must be passed counter clockwise during play. Mechanism cards such as "Holy Spring" or "Relentless Cogwheel" represent Safety devices that keep a Bomb from exploding. Over the course of the game, goblins will remove these from a bomb to make it more dangerous, but can put them back in to make them safer.

The Gadget cards can be put into a Bomb to change its characteristics, redefining the basics of its eventual explosion. For example, once inserted, "Dead Rat" does not affect the Bomb holder but the goblin to his left, while "Marbles" affects everyone bar the Bomb holder.

Tricks are more complex in that they can be played into a bomb to take up space, or from a player's hand to affect the game in various underhand ways. Their effects can be permanent, temporary, or even interrupt another Trick card. Further some Trick cards have a Special Mission that, when fulfilled, will earn a goblin more gold. For example,

"Stinking Halfling Thieveses" forces every other player to discard a card from their hand and has a Secret Mission that earns more gold if the card holder survives the explosion.

Game set up is simple. The Bomb and Mechanism cards are placed in separate piles face down, and one Bomb is drawn and assembled from its instructions. The Gadget and Trick cards are shuffled, and placed face up. Each player receives four cards from this draw pile into his hand or "Bag of Tricks," and the most goblin-like player (cue an argument) starts the game with a newly assembled Bomb in hand.

Play consists of the Bomb being passed clockwise, each goblin tinkering on his turn. Play order can change or a Bomb can be stolen from or passed to another goblin, beginning a whole new turn. Each turn consists of six phases, during which the Bomb make up remains hidden except to the Bomb holder. A new card is drawn in the Draw Phase, while in the Pre-Tinkering Phase any player can play a Trick card, usually to force the Bomb holder to pass the Bomb on and end his turn.

In the Tinkering Phase, a goblin can remove a single card from the Bomb and replace it with a card from his Bag of Tricks. The removed card either goes into the player's Bag of Tricks or into the Mechanism pile, depending upon card type. Of course the Bomb card cannot be removed, but if the last Mechanism card has been removed, the Bomb is now armed. The arming Bomb holder receives one Bomb Armed marker to indicate that he did the job, while the other is put on top of the draw deck to prevent any cards being drawn in the Draw Phase. The Bomb armer announces that it is armed and what its effects are.

The other players again have the opportunity to fiddle with the Bomb during the Post Tinkering Phase, as in the Pre-Tinkering Phase. Finally the Bomb goes to the next player in the Pass Phase who then takes his turn.

Before the Pass Phase and after the Post Tinkering Phase there is the Explosion Phase. This is when the Bomb goes **boom!** . . . not in the same turn as when it was armed, but on the next goblin's turn. If that goblin has a Mechanism card in his Bag of Tricks, he can secure the Bomb, but he might not want to, either because he thinks he can survive the explosion or he can meet the conditions of a Secret Mission and thus earn himself gold. Gold is also rewarded for each Mechanism card held in hand when the Bomb explodes -- this is how the goblin researchers learn about bombs.

Then new cards are drawn, a new Bomb is created, and the Bomb passing begins anew. Play continues until a goblin has enough gold to bribe his way past the troll guard and thus win the game.

Definitely prettier than anything a goblin deserves to get his hands upon, **_Badaboom: an Explosive Card Game about Tinkering Goblins_** is a game that not only feels unnecessarily complex, but it is unnecessarily complex. Play does not match the simplicity of the game's concept, and it is not only difficult to learn, but it is also awkward to teach, and this is the major reason why some of my players refuse to play **_Badaboom._** All this is down to the rules, and this is a hurdle that anyone coming to the game must overcome. Yet overcome this problem, and **_Badaboom_** turns out to be a chaotic game of Bomb tinkering, Bomb passing fun that requires just a little memory to recall what you put into it earlier. It is also a game that is best played at a fairly brisk pace, not only to avoid the paralysis of over-analysis, but to simulate the short attention span of the average goblin. Played this way, **_Badaboom: an Explosive Card Game about Tinkering Goblins_** should be a chaotic game of exploding goblin nastiness.

Avoid Breaking Realistic Promises By Only Making Unrealistic Ones

The movie *Heathers* had an interesting conundrum: How do you portray how teenagers speak? The obvious method is to poll or listen to actual teenagers, and record their slang and mannerisms. Unfortunately, the problem with this method becomes apparently obvious: The slang of those in high school changes seemingly week to week; if a movie used their actual lingo, then it would feel musty when it hit theaters and downright decrepit by the time it hit those new-fangled video cassettes. (*Heathers* is an old movie, remember.)

So they hit upon an ingenious solution that all but guaranteed their movie would not be instantly dated: They made up their own teen slang. Logically, something cannot go out of style if it was never in style to begin with, and the mucked-up world of the Heathersverse still feels pretty darn fresh.

(Acute-eyed readers may note that I used the phrase "all but" in the previous paragraph. That's because, when *Heathers* was released, some of the slang therein became part of teen culture for a while . . . until it stopped being used. At which point the slang in *Heathers* became outdated. Really, trying to understand teenagers is a lot like the Laws of Thermodynamics: You can't win, you can't break even, and you can't get out of the game.)

Anyway, this has a direct application to the world of gaming, which I'll illustrate now.

See, back when I was the Editor on *D6 Space,* I had a debate with the line developer about how sci-fi devices should be defined. My primary point was that any hard-and-fast definitions for technology were likely to be laughably out of date almost immediately; technology tends to advance at a rate that we can barely fathom. (I'm holding a copy of the 1990 edition of *GURPS Space* in my hands right now; did you know that a database costs $1,000 per gigabyte? In other words, your standard DVD can contain about $4-8,000 in info.

This debate spilled into other areas; how could we define, say, something as basic as a "cart" in a generic sci-fi (space opera) game? Too much detail means the game closes off some types of games, while too little detail doesn't give the GM enough to go on.

So I went ahead and took a crack at two thorny ones: the data-storing "palmdisc" and the generic haul-stuff-around cart.

Anyway, to make a long story short, the line developer didn't disagree with my assessments, but noted that 1) she wanted to remain at least somewhat consistent with previous games from the company (most notably *Shatterzone*) and 2) my descriptions were too darn long, regardless. Anyway, neither one of us was paying attention and we both ended up getting married to each other, so I guess that'll learn us.

For those who are curious, I present my own attempts at defining these two things.

"**Palmdisc:** The palmdisc is a portable means of storing or moving data. For many types of data, the size and shape of the palmdisc is largely a matter of personal convenience; smaller discs are lighter and more easily concealed, but much easier to lose. Larger discs are more easily found and sorted, and can be turned into pleasing objects themselves. The two most common palmdisc types are a small pen-sized canister and a palm-sized flat disc. However, palmdiscs can assume just about any useful shape: a swallowable capsule-drive for spies, a mirror-finished rectangle for putting on make-up or sending signals, a fold-in-half disc with advertising slogans, and so on. In general, any non-standard palmdisc will only be immediately useful for the system (or systems) designed for it, although accessing it from other systems is a

Moderate Computer Hardware job. Because of advanced compression technology, palmdiscs can store massive amounts of information; it's possible to save virtually unlimited amounts of 'primitive' data (such as text files, graphics, sound and music files, 2-D movies). Size and storage capacity usually only become an issue with more advanced types of data; a capsule palmdisc might only store 50 pages of crypdocs (an unbreakable encryption scheme utilizing a password and DNA scan) or 30 minutes of sense-vid (fully emersive virtual reality recreations), while a palm-sized disc can store 500 pages of crypdocs or five hours of sense-vid. Of course, the challenge is often not storing information, but acquiring and accessing it; someone looking for vague random information in a sea of unfamiliar documents will require a Computer Programming check ranging from Easy (for a few dozen unencrypted documents or images) to Very Difficult (for a disc containing a copy of every bit of information the owner has ever had access to)."

"**Carts:** Since the wheel, mankind has used whatever means were available to transport goods easily. In **D6 Space,** the modern cart is custom-tailored, based on its duties, responsibilities, and the realities of economics. Thus a cart transporting core-diamonds across a continent might be an armored, covered anti-grav hovercraft, while one bringing megawheat from the field into a poor colony outpost town would be a simple open-topped vehicle with wheels and a loading platform; it may or may not be powered. Carts are one of the most basic and slow but reliable forms of transport in the galaxy; they will not fail except in the most extreme environmental situations or because of deliberate acts of sabotage. In general, a cart contains as much of a good (or goods) as can be comfortably handled by one man; beyond that, the vehicle becomes a car or truck."

Now, I look back at my palmdisc one, and even now I cringe at how quickly some of the bits became out of date. (Sure I left some wiggle room -- "might only store 50 pages" -- but c'mon . . . your standard PGP encryption on a one-gig USB chip can probably store every text document you'd ever be able to read in your lifetime. And PGP is unbreakable enough; we're not talking *Digital Fortress* here.)

However, I'm still happy with the cart one; while generic, I think it encompasses just about everything the players can envision, from *Star Trek* hover-sleds to lumbering Tattooine-type wagons. And, despite my cringing, I'm happy with some of the palmdisc info; the concentration on *acquiring* and *accessing* the information is, in a lot of ways, more important than how much the discs can hold.

Anyway, returning to our *Heathers* example, I note that -- when it comes to thinking futuristic or alternatively -- letting your mind roam is quite possibly the best way to create something memorable and less prone to becoming outdated. *Star Trek's* communicators seem quaint now, since they're larger than most cell phones; however, its transporter technology remains an idea of awe, and is one of the things that helps define that universe. (And, yes, I know they've done some stuff with making photons or singular atoms hop about. Not the same thing.) Likewise **Fading Sun's** jumpgates or **Eberron's** elemental-powered engines aren't likely to be "proven" wrong, outdated, or cliched anytime soon, since they're so off the beaten path. Let your mind wander. "Armor" in the form of a daily-taken pill? Mind-hopping cloning in lieu of instantaneous transportation? AIs that exist solely for the ability to create new entertainment in the forms, styles, and mannerisms of previous works? Sure; why not?

Or, to put it another way: It's a lot harder to be proven wrong when you make no attempts at being "right" in the first place.

Cities in Rust: Alternative Ultra-Tech

"Retarded progression usually stems from technological stagnation, often in conjunction with a Dark Age that causes a major decline or fall of civilization. This gives plenty of time for interstellar empires to be established without technology changing humanity beyond recognition, and pushes the development of TL12 civilization into the very far future."
-- David L. Pulver and Kenneth Peters, **GURPS Ultra-Tech**

Ahh, the satisfying "thunk" on the coffee table means that there's a new **GURPS** hardback out, and this time it's Pulver and Peters' latest iteration of **GURPS Ultra-Tech.** Loads of joy for all campaigns -- as long as they're set in the future, it seems. Well, that seems unfair to those of us who spend more time puttering around in the pretended past and dubious present, doesn't it? If you'll forgive the Stiff Little Fingers allusion, then, what we need is an alternative ultra-tech. And we find it, if we look carefully. (Not carefully enough to note that the so-called "evidence" is all rubbish, often literally, but carefully nonetheless.) We find machines Way Back When, and contra our introductory quote, it's possible to use "retarded progression" to push "the development of TL12 civilization" into the very far past.

"The only conclusion left open to us is that whatever traces were left have been erased by the natural processes of weathering and erosion . . . There are several possibilities: A catastrophe of some sort could have wiped them out to the extent that there were no traces; or possibly their civilization existed in regions that today are submerged beneath the oceans. Further searching will no doubt produce solutions to this question."
-- Professor Danchekker, in *Inherit the Stars,* by James P. Hogan

According to Pulver and Peters, it takes a minimum of 200 years, give or take, to go from our happy TL8 selves all the way to TL12 and the end of the book. Add that on to the 11,000 or so years since the Neolithic Revolution and we get a technical lifespan from stone knives to Singularity of about 11,200 years. Posit a "Bright Ages" tech track that moves from Hellenistic heights to the High Medieval Scholasticism without that annoying Fall in the way, and you can shave another 800 years off that time; you can probably skip the Bronze Age Dark Ages as well for another 600 years. We get, thus, a bare minimum of 9,800 years for the tech tree to grow. More likely, Pulver and Peters' "medium" estimate puts the climb up from TL8 to *Star Trek* closer to 2,000 years --13,000 years all told. The "slow" estimate (assuming many small dark ages, rabid safe-tech or Luddite tendencies, and so forth) extends the entire techspan of humanity to 17,000 years at the most. Which means that the conventional lifespan of the human species so far could contain between ten and twenty full-blown technical civilizations, each rising from the ruins of the previous one, assuming that *H. sapiens* had started growing its own food right out of the gate.

Let's be generous -- give Adam and Eve a thousand centuries to get settled there on the African plains -- and allow a good long Post-Technical Age (the "Re-olithic"?) in between each Fall and the climb back up. There's still plenty of room, chronologically speaking, for four or even five serial civilizations to travel from flint to antimatter just in human existence as we understand it. And that's just as we understand it. As late as 1879, Othniel C. Marsh, the dean of American paleontology, believed -- based on findings of modern human skeletons in Sierra Nevada auriferous gravels -- that the human species went back to the Pliocene or even the late Miocene, some nine million years. That's enough room for 180 of our "full tech and a rest" periods! A **Steampunk-Time Travel** game could play out a lot closer to *Star Trek* than *Time Tunnel,* with hundreds of alien civilizations at every tech level stretched out into the past -- and all of them human.

"Strange logic! Does the finding of the remains in the cave of Devon prove that there were no contemporary races then who were highly civilized? When the present population of the earth has disappeared, and some archaeologist belonging to the 'coming race' of the distant future shall excavate the domestic implements of one of our Indian or Andaman Island tribes, will he be justified in concluding that mankind in the nineteenth century was 'just emerging from the Stone Age'?"
-- H.P. Blavatsky, *Isis Unveiled*

And they don't all have to be human -- at least not as we understand it. When you start messing around with vanished prehistoric civilizations, you're on Theosophist turf, and it behooves us to take a squint at the possibilities here for

"deep time *Ultra-Tech*" gaming. In a nutshell (heh), H.P. Blavatsky posited a cycle of cycles, of "root races" that spawned ever more sophisticated "sub-races" until they were replaced by the next root race, usually after some magnificent cataclysm, for a total of 33 civilizations so far. The First Root Race, the Polarians, was a formless race of astral beings living in the "Imperishable Sacred Land" at the mystic north pole during the Carboniferous Period (330 million years ago to us; about 80 million years ago according to the geologists of Blavatsky's era). They gave way to the Second Root Race, the "sweat-born" ectoplasmic (even shoggoth-like) Hyperboreans, during the Permian Period (call it 280 million years ago to us, and 50 million years ago to Blavatsky). The Hyperboreans were occasionally identified (by later Theosophists) with dragons -- interestingly, the mid-Permian is about when proto-dinosaurs begin evolving.

For Theosophy and modern geology alike, the break between the Permian and the Triassic (251 million years ago for us, 46 million years ago in the 19th century) is a cataclysmic extinction event. When the smoke clears, the dinosaurs -- and the Lemurians, the "egg-born" third root race of apelike giants -- rule the earth. Both are destroyed in the K-T extinction event at the end of the Cretaceous ("fearful geological cataclysms" 9 million years in Blavatsky's past) leaving the Fourth Root-Race, the twelve-foot tall, arrogant Atlanteans. Each Root-Race spawns seven sub-races, with its own cycle of progress, technical (and spiritual) mastery, and disaster-laden death. The Atlanteans reach their peak under the fifth, or "Semitic," sub-race, which is when they spawn the Fifth Root-Race, namely the proud Cro-Magnon "Aryans." Blavatsky, as it happens, contradicts her geological experts on this date, placing it approximately 18 million years ago, safely within the modern Miocene. The Atlanteans mostly disappear around 850,000 B.C., with a tiny remnant surviving until 12,000 B.C. as [Plato's Atlantis](#).

"The events of an interplanetary story -- aside from such tales as involve sheer poetic fantasy -- are best laid in the present, or represented as having occurred [secretly](#) or prehistorically in the past."
-- H.P. Lovecraft, "Some Notes on Interplanetary Fiction"

But not all the aliens come from Earth. The other most important H.P. in the deep time business, H.P. Lovecraft, has his primordial civilizations "seep down from the stars" in various iterations of what a later culture would call "[ancient astronauts](#)." Lovecraft's Elder Things create humanity (among other species) in their bio-tech labs, as it happens. Later writers, among them James P. Hogan and Larry Niven, posit humanity's descent from alien visitors in more conventional style. Either way you slice it -- aliens from Earth or humans from the stars -- you get the potential for human civilizations spread throughout the galaxy by various space-going human empires, perhaps based in the now-sunken land around Indonesia, or on a warmer, wetter primordial Mars, or on the now sadly exploded [Fifth Planet](#). Ancient astronaut OCD sufferer Zecharia Sitchin stretches his "Nibiru" encounters, and the concomitant creation of technical human civilization (beginning as alien slaves, admittedly) back to 450,000 B.C. Sitchin only puts one civilization in that whole stretch, which seems wasteful -- we could easily fit ten full-blown star empires in that space alone, or as many as 25 if we pushed a bit. Each empire could be different: Nibiru conquest, human Mameluke interstellar state, Martian Renaissance, alien invaders who consider humans useful food animals, Empire of Human Fear, Fifth Planet Empire, multi-species commonwealth, Atlantean Star Empire, genegineered Sirian theocracy, transhuman consciousness fog. And we haven't even gotten up to the Neolithic yet.

"I cannot be sure of that because I have seen that the twenty or thirty thousand years that elapse between the fall of one civilization and the rise of the next destroy all traces. In twenty to thirty thousand years memories become legends and legends become superstitions and even the superstitions become lost. Metals rust and corrode back into earth while the wind the rain and the jungle erode and cover stone. The contours of the very continents change -- and glaciers come and go, and a city of twenty thousand years before is under miles of earth or miles of ice."
-- Fredric Brown, "Letter to a Phoenix"

The other great thing about ancient astronauts is they give you a fine way to explain why we don't have more traces left of the primordial ultra-tech civilizations on Earth. After all, we have plenty of stone ruins that have survived for seven or eight thousand years. Stainless steel and plastic should last even longer, and complex industrial chemicals can maintain integrity for up to 200,000 years. Radioactive remains, of course, get up into the millions. But if the aliens (or our fellow humans from space) bombard the Earth with comets and meteors, aiming for all those high-tech spots with their disintegrator beams and strong-nuclear-force suppressor cannon, or pour their hunter-killer tech-eating nanoswarms onto their Earthly targets, well . . . maybe all that's left of each civilization is its flint knives. We can also

posit anything from a "gray goo" accident to extremely conscientious recycling of previous civilizations' ruins to mass exodus (technology and all) to another star (or dimension) as part of a religious or environmental rite. And we might not recognize a high-tech civilization, even if we see the ruins in front of us. The "natural" nuclear reactors at Oklo in Gabon went critical 1.8 billion years ago -- or are they all that's left of the Elder Thing power complex? Geologists have found numerous formations in Jurassic sandstones from Utah to China that resemble nothing so much as rusting pipes. The famous 65 million-year-old layer of iridium all over the Earth might not be a vaporized meteor after all, but the thin stratum marking the ruins of the Reptoids' cities, ground flat by glaciers and continental upthrust. Perhaps the traces aren't physical: if Al Gore is to be believed about the current rate of species loss, the Reptoids' rapid urbanization might also have triggered the K-T mass extinction, and then their own in massive climate change.

"Our own acceptance is upon a carved, geometric thing that, if found in a very old deposit, antedates human life, except, perhaps, very primitive human life, as an indigenous product of this earth. . . . As to the deposit -- Tertiary coal. Composition -- iron, carbon, and a small quantity of nickel. . . . [G]eometric form; presence in an ancient deposit; material as hard as steel; absence upon this earth, in Tertiary times, of men who could work in material as hard as steel."
-- Charles Fort, *The Book of the Damned*

And every so often, of course, we do find pieces of the older civilizations. My favorite of the OOPArts (Out-Of-Place Artifacts) is probably the Klerksdorp Spheres, grooved metallic balls discovered in 2.8 billion-year-old pre-Cambrian strata in South Africa. (That would give us space, at one fully technical civilization flourishing for two percent of every million years, for 2,800 such civilizations. 2,801 counting ours.) But there's a chased metal vase dug out of 600 million-year-old solid sedimentary rock in Dorchester, Massachusetts in 1852. And a wonderful iron nail found in a Devonian-period sandstone (360+ million years old) in Kingoodie Quarry, Scotland. Better still, in 1928 miners in Heavener, Oklahoma found a polished wall of concrete blocks embedded deep in a Carboniferous coal seam. (A similar wall turned up in 1868 in a coal mine in Hammondville, Ohio -- this one decorated with hieroglyphics.) Metallic tubes appeared in a Cretaceous chalk bed in France; a little later, a curiously geometric, grooved cube of nickel-iron was embedded in a Paleocene coal seam in Wolfsegg, Austria. Towards the beginning of the Oligocene, about 50 million years ago, neoliths, incised bones, and other human-produced tools begin to dot the geological record, as documented at tiresome length in Michael Cremo and Richard Thompson's *Forbidden Archaeology*. And to cap things off in the Pleistocene, we have: a clay idol found in 2 million-year-old strata in a well in Nampa, Idaho; a copper coin of no known type turned up by a well borer in Lawn Ridge, Illinois from interglacial soils around 200,000 years old; and best of all, what may or may not be a spark plug discovered in what may or may not have been a half-million-year-old solid geode in Olancha, California in 1968.

"We cannot ascertain at present the limits, whether of the beginning or the end, of the first . . . period when Man co-existed with the extinct mammalia, but that it was of great duration we cannot doubt. During those ages there would have been time for progress of which we can scarcely form a conception . . . we should now be finding . . . lines of buried railways or electric telegraphs from which the best engineers of our day might gain invaluable hints; astronomical instruments and microscopes of more advanced construction than any known in Europe, and other indications of perfection in the arts and sciences such as the nineteenth century has not yet witnessed. . . . Vainly should we be straining our imaginations to guess the possible uses and meaning of such relics -- machines, perhaps, for navigating the air or exploring the depths of the ocean, or for calculating arithmetical problems beyond the wants or even the conception of living mathematicians."
-- Charles Lyell, *The Geological Evidence of the Antiquity of Man* (1836)

And that, of course, gives suitable license for any sort of primordial ultra-tech to turn up in a historical game, from the beginnings of archaeology in ancient Babylon to the modern day of satellite ground scans and deep-penetrating radar. But in the spirit of the Charles Lyell quote above, I think it's best to end with the ***Steampunk-Ultra-Tech*** vision of Marsh and Cope dueling for dinosaur bones and Reptoid saucer parts in the American West, or Belzoni blasting ancient broadcast power transformers out of an Egyptian pyramid. Access to the ruins of Egypt, the Holy Land, and Mesopotamia was already a matter of imperial prestige in the 19th century. If the archaeologists or the geologists are uncovering "lines of buried railways" in the Persian highlands, or "microscopes of . . . advanced construction" in the Patagonian taiga, or "machines . . . for calculating arithmetical problems . . . beyond the conception of living mathematicians" beneath the Congolese jungle, well, things could get awfully adventurous, awfully quick. And that's

before the ancient drone-craft, and nanobots, and AIs begin to awaken into the 181st civilization on Earth . . . so far.

Black Magic Mushrooms On The Black Market

by August Rider

Here are some new, weird, wondrous, and psychedelic drugs from a time-travel pill to a drug that allows one to encounter both their greatest fantasy and worst fear.

These concepts were originally created with the setting of Al Amarja in mind from the *Over the Edge RPG.* These are also quite suitable for High Weirdness, *GURPS Cabal, Horror,* and *Warehouse 23* (adventures might involve the discovery or retrieval of the drugs), *Black Ops, Illuminati,* or anything with a surreal edge and otherworldly flair.

But First, Who's Responsible For This Madness?

Why, the Man in the Purple Hat, of course. Since these items don't come out of a vacuum (though they may cause one) lets see who's pushing. Most of these drugs were designed with a person or market in mind; some of them most devious. Others were designed for the sheer purpose of putting money in the dealer's pocket (or pocket universe). And yet others are cryptic, delightful, experimental or part of some larger conspiracy.

The drug king, the czar, the rock-n-roll star, the man who all the heavies deal with is the one and only Spider Prince, so called because his web extends everywhere across the globe. He is the go-to man for celebrities and movers and shakers. The prince is the Willy Wonka of the drug trade (one part Willy, one part Rob Zombie, and one part Dracula Gary-Oldman style). As an offshoot to his booming drug business he operates an inter-dimensional slave trade. He specializes in offering those skilled and talented in the erotic arts. He is one of the most famous and infamous people on the island. He has connections across the world from mystics and musicians to occult figures and drug lords and everything in between. The prince has cornered the market on both mundane and magical drugs; a true monopoly.

The Psychotropics

Here's the dope on the goods. Aside from the more mundane merchandise and well known conventional drugs the Spider Prince also offers these paradoxical, dangerous, twisted, magical and mystical goodies.

(As a warning, these are powerful drugs and could alter your campaign, characters and setting and cause untold hours of fun and chaos. Use with care.)

Two Tone

This is a large red and blue capsule with "TT" inscribed on it. It is said that few men will realize their greatest fears or their greatest fantasies. Two Tone will see to it that this is not so for the one who gulps down this horsepill. The effects of Two Tone are not immediately notable but they creep up on the one who ingests this strange drug. The user will be filled with a sense of place in the universe and feel he is inevitably being pulled towards the omega point of his destiny. All paths converge to this point.

By way of synchronicities both the greatest fear and ultimate fantasy of the character will be realized on this fateful night. The red represents one aspect; the blue the other. It is never known which will happen first nor can one just take half the pill and hope to experience only the fantasy. Like all capsules its filled with uniform small beads so there is no way of separating them or taking one half (not to say it hasn't been tried). The fantasy and fear come together; that's the reality, and that's the price. Which one happens first is up to the GM. There is a chance that the character may not

survive his worst fear, or for that matter his ultimate fantasy. See the black magic mushrooms below for a way to contact those recently departed souls. As an example, a character may meet the woman of his dreams only to find later in the evening that she is in the arms of another; another character may find himself blasting down the highway on an ultra-tech sport bike at nearly 200 miles an hour and later end up in a confined space (claustrophobia) crawling with hairy spiders (arachnophobia). Note: although the characters may have phobias these may not be their greatest fears.

Duration: Lasts until both fear and fantasy has been realized.
Notable Characteristics: Tastes bittersweet, mixed with mild hallucinogenic.
Side Effects: Motivates the character to live life. After about three uses the drug is ineffective.

White Maiden (Moon Lady)

This comes in white capsule form. A blue rectangle is visible on the capsules. Under magnification this rectangle shows itself to be an image of the High Priestess (Rider-Waite) tarot card. This gives one a psychedelic trip akin to LSD or mushrooms. Here's the kicker: Everyone who ingests white maiden sees the white maiden at some point during their trip. She may impart a secret or answer a conundrum that has troubled the seeker for some time. Others report erotic encounters and yet others have stated that the maiden led them to a place or a source of information. Sometimes she leaves the tripper with cryptic information. She is always seen as a pale young beautiful lady in sheer white flowing robes that shimmer in the moonlight and ruffle in a gentle breeze. This drug has no effect if taken in the day. It is most efficacious at the waxing full moon. Plot hooks, cryptic messages, red herrings, and McGuffins abound.

Duration: Lasts from dusk till dawn.
Notable Characteristics: Has the scent of lavender and tastes like flowers, mixed with LSD.
Side Effects: Character is in a dreamy state after meeting the White Maiden. This is highly addictive and the character will want to finish the quest above all else.

Fortune Cookie

These are actual fortune cookies with the fortune inside. Cracking open the cookie or seeing the fortune nulls the magic effect of the cookie. These are customarily taken with green tea. One simply eats the cookie with paper fortune and all . . . down the hatch. The fortune inside then manifests for the character. For gaming purposes simply have a bowl of fortune cookies. The GM breaks it open and works the fortune into the evening's adventure.

Duration: Lasts until fortune is fulfilled.
Notable Characteristics: It's just like a regular fortune but glows with a magical aura for those who can detect such things.
Side Effects: Characters become hungry shortly after eating it.

Phantom Loop

Also known as Digital Bath, this pill is a minute version (somewhat smaller than a marble) of the plasma balls one finds in the gift shops of malls across America. It reacts to the touch just like a regular sized plasma ball does. The first stage of this drug causes the consumer to become surrounded by a field of static electricity. In the second stage Phantom Loop causes any electrical equipment nearby the character to spike, glitch, or blackout. In the third and final stage one becomes a conductor or random capacitor in a circuit of unknown origin. The circuit is arbitrary and will form on a whim; it could be between two buildings, power generators or just link into the electrical energy in the Earth's atmosphere. This causes the character to store and discharge electricity with rather dangerous and deadly consequences. The dispersion is random and the character has no control over the discharge. The discharge itself is equivalent to a high-level lightning strike or chain lightning. Before a discharge the environment takes on a strange calm and more observant characters will notice the impending smell of ozone. The character taking Phantom Loop suffers no ill effects at all from the electrical antics that ensue but may become downright deadly to those nearby; appropriate damage rolls apply.

Duration: Lasts seven hours.
Notable Characteristics: Makes character's hair stand on end.
Side Effects: Repeated uses have shown that people taking Phantom Loop become poor conductors of electricity when not on the drug. Batteries on mobile phones and other devices drain in seconds and defibrillators have shown not to work on recurring users. Long after the duration of the pill has passed the character may find random and spontaneous jumps, spikes and blackouts occurring around him.

Karma' Suit Ya

Also known as just Karma, Moksha, or Kali's Embrace, this comes in two types: Instant Karma and Past Life Karma. Both come in the shape of voluptuous idols like those seen in Hindu and Tantric temples. They have the size and definition of a children's vitamin. The Instant Karma is pink and the Past Life Karma is green. They are chewable and bittersweet. Both are mixed with LSD.

Instant Karma: This is exactly what is seems. Any behavior is mimicked almost immediately. Cut someone off in traffic and you are cut off. Give a compliment and one is returned. Attitudes will also be mirrored. Come to the table with a bad attitude and the character will soon see another mirroring that attitude. This is often crumbled and slipped into coffee of unlikable bosses and supervisors.

Past Life Karma: This version allows you to see what you were in past lives. It also puts one in touch with one's past life incarnations and allows one to communicate with one the former selves. Peak experiences sometimes allow one to know what must be done to break the cycle of reincarnation and be free from the cycle of death and rebirth. It also points the way to Agartha for nephilim characters. Though the path may be revealed this by no means makes it any easier to reach the lofty goals of transcendence.

After a trip on Karma the characters may come to know what rewards they are reaping from past actions and what sentences they are suffering from past infractions. Ingesters of this mysterious drug may also see prevalent patterns repeated during past lives, such as realizing that one has always been a warrior. For growth the character/soul must move on to other archetypes such as a healer, magician or sage. They may see places of power for them or persons, places, or items that are harmful to them and that should be avoided. For example: Ireland is a place of power for you, wearing the color blue enhances your charisma (+1), and stay away from sharp objects on Saturday. Ideal for Nephilim character crossovers.

Duration: About six hours.
Notable Qualities: Mixed with LSD.
Side Effects: Karma is conducive to mysticism. NPCs may join a cult (one in 10 chance).

Timekiller

This is a white capsule with a gold band around the middle. Upon closer inspection the band reveals hieroglyphics. Upon ingestion this capsule will send one back in time. If users hold hands and ingest the capsules at the same time they will go back to the same time and place. Timekiller has a way of sending one back to a time and place that is pertinent to the character. One may be transported back to their childhood, a favorite event in history or witness one of their ancestors or heroes in action. People have reported being dropped right in the middle of a war.

Oh, and some people taking Timekiller have never been seen again. Can characters interact with the people from the past? Yes. Does this effect now? That is up to the GM. Thoughts of Homer Simpson squashing a bug come to mind. See *GURPS Infinite Worlds* and *Time Travel* for more.

Duration: Lasts for a 24 hour cycle from the time of blipping back to the time of returning.
Notable Characteristics: Tastes like bananas.
Side Effects: Aging or regressing several years or decades in an instant, causing clocks to jump ahead, stop, or roll

back hours in an instant, plants may grow more rapidly than usual. Time warps causing everything to move around as if time were in fast motion. Time warps causing everything to move around you as if time were in slow motion. Oh, there is one other drawback to Timekiller; it always sends you back in time stark naked . . .

Tongue-N-Cheek

Drank as a fizzy cobalt blue seltzer Tongue-N-Cheek causes the imbiber to have their own background music. The music emanates from the character and ranges from cool to comedic (GM's prerogative). Entrances and exits are especially grand and mirror the actions of the character. Tunes range from television theme songs to operatic arias. Many report Carl Orf's Carmina Bruana cuing in to accentuate the emotional charge of the situation.

Duration: Eight hours.
Notable Characteristics: Comes only in blueberry flavor at this time.
Side Effects: Often causes one to hear colors and see the colors of sounds, music often interferes with normal conversation, cymbals, and symphonies wake one in the middle of sound sleep or interrupt normal conversation, inability to change the tone or modulation of voice (Will Ferrel's Jacob Silge has this disease.)
Side Note: Not prescribed for agents, rogues or thieves or anyone doing any sneaking around.

Jupiter's Gift (Drops of Jupiter)

This expensive purple liquid can be dropped into the eyes or under the tongue. It gives one luck for a short term. Luck ranges from just-lucky to amazing and worthy-of-a-story. Longtime use is detrimental and can actually cause the reverse, not to mention a range of side effects. Repeat users often place bets after ingesting or head to the local casinos. One drawback is that Jupiter's Gift is this it is incredibly expensive and one may need a gracious amount of luck just to procure it. One drop can range from several thousand dollars and on up, and that's the lowest seekers will find it. Prices on Al Amarja are high and only the jet-setters are the only ones who can usually afford it.

Duration: Lasts about eight hours.
Notable Characteristics: Grape flavored.
Side Effects: A Pollyanna approach to life with people often giving valuables away claiming that more will come. Repeat users also often overestimate the amount of luck they may have on a given evening making insane bets and taking risks with their life savings, or even worse, the savings of their friends or family or both. Jupiter's Gift is highly addictive. Spontaneous combustion, makes one prone to lightning strikes, random morphing into a duck, poor concentration. More than three uses has proven to cause a permanent phobia. After losing his fortune on baccarat, Herbet Milquetoast developed Bacillophobia (fear of microbes and bacteria) and died of a heart attack on the spot when his friend, who was trying to console him, sneezed. One of these side effects has a one in six chance of happening per dosage.

Daredevil's Delight

This is a derivative of Jupiter's Gift. It comes in a chewable tablet in the form of a bullet. On Al Amarja it is usually taken in "moloko" form -- that is, dropped in a glass of milk. Delight gives the imbiber luck only when performing physical stunts such as jumping motorcycles over cars or jumping from the rooftops of tall buildings. This is good for heroics in the Hardboiled vein. Take a hit and burst through the front door with both guns blazing Chow Yun Fat style and survive.

Duration: Four hours.
Notable Characteristics: Tastes of peppermint and chocolate, contains cocaine.
Side Effects: Cockiness, overconfidence, irritability, impatience and over-reliance on one's physicality. ("We don't need any stinking key. Just kick it down.") For some reason this makes one into a cop magnet. There will always be law enforcement nearby in public and even the most minor infraction will draw their attention such as going a few miles over the posted speed limit.

Side Note: This does not make one invulnerable to injuries should they happen.

Witch's Brew

This is drunk in the form of a flaming cocktail. For those not already magically inclined it allows the imbiber to see into the magic goings-on and the spirit world that overlays the mundane world with the added kick of LSD. Fright and horror checks are applicable. This is particularly popular during Beltane, Walpurgsnacht, and Halloween. This is often used on potential cult members and acolytes.

Duration: Lasts from dusk till dawn.
Notable Characteristics: Cinnamon aftertaste, mixed with LSD.
Side Effects: No known side effects are noted other than a mild hangover.

Garden of Eden (Serpent's Kiss, Starbright)

This purple tablet comes in the shape of an hourglass so it is easily snapped in half. A provocative choice among adventurous lovers, Eden allows lover's to inhabit each other's bodies for a time so they may explore and get to know each other through the other so to speak. If a daring, bold or stupid character can trick an unwilling suspect into taking the other half they will inhabit the chosen target's body.

Plot Hooks: A dying character makes a last ditch effort to live by switching bodies. Help, a suicidal man is in my body. Hey . . . where'd my body go? Can I use your body for a little while? Switching bodies to avoid assassination.

Duration: Six to eight hours.
Notable Characteristics: Forbidden fruit flavored (apple), mixed with ecstasy (MDMA).
Side Effects: Sometimes "sticks" meaning a couple may not be able to switch back for days. There was a bad batch going around that would not allow the users to return to their rightful mortal coils. That's been rectified or so it's said.

Chaos

This comes in a charcoal gray or black tablet in the shape of the chaos symbol. Ingestion is forbidden at the mansion and buyers are escorted off the property before the merchandise is handed over. Chaos creates a sphere of . . . well, *chaos* around the swallower of this strange drug. Walk across the street and a collision ensues. Happen into a restaurant and waiters collide amidst the sound of breaking glass. Yes, folks, it literally creates chaos.

A little known and highly coveted secret is that those who ingest Chaos suffer no ill effects from the environment and could walk unscathed through a war-zone. If you are heading into the villain's secret underground layer this may be the drug of choice along with Daredevil's Delight; as for the side effects that's a different story.

Duration: Lasts exactly 66 minutes and six seconds, every time.
Notable Characteristics: Licorice flavored, mixed with downers.
Side Effects: Spontaneous combustion, random "blipping" (teleporting both short and long distances), bisociation, multiple personalities, becoming ectoplasmic (also ethereal or insubstantial), sexual maladies, phobias (for some reason high rates of coulrophobia (fear of clowns) have been reported). Other less frequent side effects include personality inversion (becoming an introvert if one is an extrovert), being the catalyst for bizarre storms that rain not water but frogs, ducks, snakes or children's toys. Turning into a frog is not uncommon with extended use (one in six chance for three uses, each time after that the chance goes up one) of Chaos. The only known cure for polymorphing into a frog is a kiss from a fair maiden (residents of Al Amarja have noted that blonde haired exotic entertainers will do the trick in a pinch). Some Hoodoo, Voodoo, Lukimi (Santeria) practitioners, and Bruja on the island are known to sell an antidote that will counter some of these side effects.

Fuzzy White Spider

Yes, this is actually a fuzzy crawling white spider. One simply has to eat it live. A roll against one's willpower (or similar ability) is necessary for those of a queasy constitution. Ingesting the spider allows one "to see by the light of the moon." This allows one to see the fae folk and any otherworldy entities, structures, gates or hidden things such as hidden passages, werewolf tracks and haunting sights by the light of the moon. It also gives one the ability to see any magical writings, runes, glyphs, wards or wizardmarks not seen by the unmagical eye. The drug has no effect in broad daylight. The spider is, of course, soaked in a special type of LSD that allows the creature to stay alive.

Duration: From dusk till dawn.
Notable Characteristics: Some claim they taste like white chocolate.
Side Effects: Ingesting the spider caused one to become a weirdness magnet. The ingester will be harassed by Unseelie or have an encounter with a werewolf at the very least.

Anodyne

Anodyne comes in unique and antique bottles of all different shapes and sizes. These bottled spirits are bottled spirits mixed with . . . spirits. Upon drinking Anodyne one will be possessed by an -- hopefully -- uplifting spirit.

However, this is not always the case, and entities more demonic have been known to inhabit the Anodyne bottles seeking to escape. These are entities imprisoned who seek a way into our world such as Djinn or the classic genic in a bottle. Sometimes the spirit of a person from the past is contained.

Duration: Depends on how much one drinks but usually an evening.
Notable Characteristics: Tastes like whatever liquor, whiskey or cordial it is mixed with.
Side Effects: Hangover, demonic possession or both.

Witch's Milk

A glass of milk supposedly weaned from the teat of a witch. Drinking this makes one impervious to any motifs of harmful sensation for nine days. That is, it will protect one from all forms of the Evil Eye.

Duration: Nine days.
Notable Characteristics: Tastes like milk.
Side Effects: Upon drinking Witch's Milk one will develop an unhealthy obsession for witches (major disadvantage) and seek them out wherever and whenever they can be found. As the effect manifests characters find themselves sitting through hours of *Bewitched* or *Charmed* episodes and not knowing why. This ends a tireless quest to find a real life witch. If the obsessed character meets an NPC witch who is an unwilling partner nasty spells or law enforcement could become involved.

There is also a 75% chance per glass of becoming a white werewolf. With the second glass its a lead-pipe cinch the character will become a werewolf. The werewolf suffers from the same obsession and will sniff out witches in the area. The ability to detect witches in a twenty mile radius is an advantage gained upon becoming a werewolf.

This form of lycanthropy is considered a curse that can be dispelled by a high level witch or magic user, or can be dispelled by completing a quest or fulfilling a geas by one who has the means to remove the curse.

This probably explains the murders of three witches (Sisters of Cybelle) over the last few weeks. Some witnesses have identified what appears to be a white werewolf near the scene of the crime.

Campaign Note: Witch's Milk is tied up in a war between two rival covens. The coven of Ravenlock is responsible for the creation and distribution of Witch's Milk. It is by this means that they seek to create werewolf slave-soldiers and eliminate the rival coven. The rival coven, the Sisters of Cybelle, are known for their mastery over the evil eye thus the protection the milk gives. The coven of Ravenlock all wear blackstone amulets that nullify the obsession.

Nine Lives

This is made from a black cat's eye (or so its said) and looks and feels like an eyeball when swallowed. This strange drug gives the imbiber nine lives.

The Kicker: The PC will die for the next eight nights in a row only to be reborn again eight times night after night. Whether the character is mangled, burned butchered or vaporized does not matter. He will be resurrected in full health as as if he spent a restful nights sleep in peace upon the bed he last slept in (characters appear to teleport there). The character will start the next day with all stats normal and fully healed. Nine Lives is ideal for faking one's own death for insurance (if the company doesn't find out about the other seven deaths) or other reasons as well as feigning an assassination. Not long ago an assassin was bewildered at having to kill the same person eight times in a row. The death is still painful but leaves no scars. Masochists swear by it.

Duration: Eight nights.
Notable Characteristics: It's a cat's eye. For some that's hard to swallow.
Side Effects: Seems to draw the attention of otherworldly entities such as angels or demons (one in six chance) who wish to communicate with the supposedly confused soul.

Androdyne

Not to be confused with Anodyne (which it has been), Androdyne causes those who drink it to change sex plumbing and all. There is a 1% chance that it will be permanent.

Duration: Twenty-Four hours.
Notable Characteristics: Anise flavor.
Side Effects: None.

And, Finally: Magic Mushrooms

And last but not least . . . the mushrooms. These mushrooms can be eaten, smoked or brewed as a tea. They have a taste -- if you can call it that -- like dirt. The mushrooms themselves range from white to black. All the the mushrooms glow in the dark. The effect of the mushroom depends on the glow it gives off.

There are seven types:

- **Pink:** Gives dreams of the '60s psychedelic kind, the type the Beatles sing about, all is fun and a bit mysterious like a children's show. A lot of vivid colors, traveling and lava lamps.
- **Cobalt blue:** This gives characters the ability to travel the astral plane for an hour or so. It also puts one at peace and is conducive to deep and beneficial meditations. In game terms this manifests as bonuses on skill and talent rolls. The blue mushrooms also have healing properties and one comes out of the trip feeling revitalized and well rested (all hit points healed) . . .
- **Black:** (Glow comparable to a backlight) for those drawn to the dark side this will give one necro-dreams that make for a dark and scary trip. This allows the user to speak with the dead if near a cemetery, crypt, burial ground, tomb or in a morgue. For initiates, some secret, puzzle, riddle, or spell will be posed that usually relates to necromancy or the black arts such as the hidden location of an arcane tome.
- **Yellow:** Allows one to find a familiar or totem animal even if the character is not a mystic or magic using type. The type of animal will give appropriate bonuses to the character; for example: a bear gives strength, a snake gives wisdom, elephants grant eidetic memory, an owl may grant night vision, and a cat may grant stealth. The bonuses and abilities apply for as long as the totem animal or familiar is alive. Yellow mushrooms are only good for one trip and taking them a second time will have no effect. Side note: Recently a full shipment of animals that were scheduled for the grand opening of the Al Amarja zoo were "liberated" by a group of eco-warrior/terrorists. For some reason officials have chosen to let the animals run free. Finding an animal on the

island is not as difficult as one may have initially thought.

- **Red:** Fulfills dreams and fantasies of a carnal type to be fulfilled to the point of overindulgence. There is a one in six chance the dream may be vampiric in nature with either the character or someone else being a vampire. Side note: Don't be surprised if the vampire in the dream shows up on your doorstep for more or shows themselves at some point during your daily (excuse please . . . nightly) activities. Vampires on the island are experimenting with dream magic and this is their in. A roll of two out of six reveals that the vampires have found the character and are bent on recruiting him.
- **Orange:** This is prophetic and will reveal one possible future that the character may encounter. The future history will unravel before the character as if he were watching a movie of his own life. It may be that the party must work to help the player change his fate (if possible) if it is a bad one.
- **Octarine:** This is the most rare and expensive of the mushrooms. The glow is different to all who gaze upon it and is known to change the longer one watches it. It is said that this rarity will give the seeker exactly the type of trip he needs. This could involve a psychedelic trip involving all the colors above or simply expose the imbiber to one word or equation in glowing neon before him that answers a longtime, gnawing conundrum. Such cryptic messages as "Build it and they will come." are not unlikely. Many takers of octarine report encounters with occultists, magicians and dead rockstars from the past.

Story Idea: The characters work for the Spider Prince. They are assigned or coerced to eradicate the competition. Adventures like this can give the genre a new twist especially if set in Al Amarja. This provides a *Grand Theft Auto* or *Scarface* feel with the added element of the occult on the street level.

So what happens if a crazy character or NPC throttles down a handful of pills and washes it down with one of these magical elixirs? That's where the fun of discovery and experimentation comes in. It may be something akin to crossing the streams in *Ghostbusters.*

More than Meets the Character Sheet

Intelligent Transforming Robot Characters in *GURPS*

by Reverend P. Kitty

A transforming robot campaign, as popularized by shows like Go-Bots and Transformers, can be a fun twist on a typical genre. War is arguably more fun when both sides are giant robots who can turn into fighter jets and tanks. Building them can be tricky without the right approach, however.

Concepts

Buy each additional mode as Alternate Form (Once On, Stays On, +50%; Reduced Time 4, +80%) [35]. Because "Once On, Stays On" changes the template cost from 90% to 100%, there's no need to specify a "native" racial template, which allows for freedom to simplify.

Then define the rest of the core character (personality, knowledge, and other intangible qualities) and create a template for each mode. Putting the two together will create a complete character sheet, representing this particular robot in this particular mode.

Core Character Sheet

This should only have things which carry over between modes. It must contain:

- All attributes and secondary characteristics except ST
- All Alternate Form advantages
- All mental and social traits
- All skills

If any other traits (including ST) are the same *in all modes,* it's simplest to put them on this sheet as well.

As skills appear here, so should DX. Especially dexterous modes can include an attribute modifier.

Mode Templates

Subtract the Core Character Cost from your campaign point limit and spend that many points on *each* Mode Template.

This collection of ST and physical traits define the mode's form and what it can do. Nothing here should overlap or be incompatible with any of the Core Character traits. It's okay if things overlap or disagree between Mode Templates, since only one will be in use at any given time.

Note that you never buy Alternate Form as part of a Mode Template.

Done

Your robot now comprises a core personality and multiple modes. Put them together, transform, and roll out!

Ho's Long-Life Noodle Cart

by Matt Riggsby

Somewhere in a crowded city is a bulky pushcart. Ho, the blocky, middle-aged proprietor, can always be found at some plaza or streetcorner. He sells excellent noodle soup, green tea, and eternal life.

Unknown to customers, Ho's soup is an eccentric elixir which contains life-giving energy. It doesn't instantly grant extraordinary benefits, but if taken regularly, will improve the customer's health and extend his life indefinitely. Sounds great for anyone seeking immortality, but, of course, it's complicated.

First, Ho is difficult to find, without relationships beyond an evening's drinking buddies. The magic of his soup requires that he move frequently, never selling from the same place twice (resembling an elusive, one-man Goblin Market). Second, Ho's motivations are philosophical, and he doesn't care to publicize his soup's powers. He creates the same level of new vitality, whether he feeds one bowl to thousand or thousands of bowls to one person, and thinks it more fair to distribute it far and wide.

If that weren't enough to prompt adventures, Ho is also sought-after by those in the know. They might kill him to keep him out of the hands of competitors, but they really want him for themselves. PCs might be:

- Afflicted with mystic wounds which can only be healed by the marvelous soup.
- Leading occultists out to find Ho and get him on their side, or just find out where his soup comes from.
- Street-level operatives charged with finding Ho or recovering him from someone else.
- Do-gooders determined to keep Ho free.

Ho objects to captivity, but is motivated to preserve his own skin, so he'll cooperate with rescuers to return to his cart. And while he can grant bits of immortality, his soups may have a darker, corrupting side. Maybe there's a reason noodle resemble tentacles . . .

Adventure Pizza Crust

The *Red Harvest* Plot

by Kenneth Hite

Note: "Marisol" is the person, if any, in the Setting that the PCs actually care about.

The PCs arrive at the Setting. They dramatically kill idiot Mooks from Faction B. A Good Local, a Faction A Mook, or Underboss A tells the PCs they've angered Faction B, but Faction A could use their skills.

The PCs meet Boss A. By playing on his weaknesses, or by humiliating B, they become Underbosses of A. They learn A's version of the Setting and the feud. They may encounter a Good Local who gives them insight into the weaknesses of Bosses A and B. They discover that Boss B has Marisol or the McGuffin.

Under another identity, using their insider info, or pretending to be double agents, the PCs gain Boss B's confidence. (Killing their rival Underboss in Faction A will do it.) Then they:

- Escalate the gang war between Factions A and B, using insider knowledge to ambush Mooks or outnumbered Underbosses.
- If there's a Faction C or D, wipe them out.
- Weaken both Factions from within, sowing discord and suspicion.
- Uncover and exacerbate both Bosses' weaknesses.
- Develop surprise Edge over Factions.
- Steal Marisol/the McGuffin/treasure.

If caught by superior forces (the Underboss or even the Boss of each Faction *is* competent) the PCs either:

- Flee to opposing Faction, triggering the Faction Apocalypse early.
- Get thrashed and thrown into the desert. (In the desert, the Good Local will bring food, first aid, and information.)

Adventure Goal: Set off Faction Apocalypse, the PCs switching sides repeatedly to prolong the bloodshed. At curtain, they should be the only violent troublemakers left, with Marisol/the McGuffin/the Setting/a fistful of treasure.

During play, give extra XP for each betrayal and for each use of a psychological weakness to provoke conflict.

The Multiverse, Our Prison

by Steven Marsh

In this three-player multi-genre campaign of linked one-shots, each player (unknowingly) represents a different facet of ability:

- Power
- Knowledge
- Skill

In systemless terms, allow each PC to tap his aspect: *Power* possesses unusual abilities (psionics, magic, metaphysics). *Knowledge* has 10 "lore points" he can spend throughout the campaign to know anything (outside of the meta-game mystery). *Skill* can Critically Succeed three times per adventure.

Pre-generate characters for each session that fit the aspects (pulp example: Occultist, Historian, Agent). Characters have "regular" abilities so they can succeed without tapping their specialties (although tempted often).

Each adventure follows a similar pattern. The heroes:

- awaken in a new world/genre, possessing roles known in-world but amnesiac about their situation (although remembering past adventures in this campaign);
- are confronted with a new situation, given ample guidance for what they should do (client's holovid, dragon's cave map, Nazi attack, etc.);
- resolve the situation;
- "wake up" in a new situation/genre.

In the finale, they awaken in a featureless "room" (the prison); they can realize they influence the cosmos. Thus:

"Is there a door?"
GM: *"Is there?"*
". . . Yes."
GM: *"Indeed, there is."*

They define reality, understand their natures, escape, and confront the adversary.

What's Happening

Before the campaign, an entity called Entropy captured the heroes. Entropy couldn't win directly; instead he discovered how to trap them within the multiverse, forcing them to access their powers; each special-ability usage (power, knowledge points, crit-success) flows into him. Successfully completing adventures helps them escape, but gives power to Entropy. (Entropy's final abilities depend on how much each used their specialties in-game.) Ideally, players should lure Entropy into a trap themselves, perhaps utilizing previous genres. (Thus, if they visited a time-travel setting where paradox destroys the causer, they could trick Entropy into visiting there and creating one.)

The Purple Monkey

by Sean Preston

Lucky Lee, a small time smuggler, worked the streets of Hong Kong. One day, however, his luck ended when he acquired an exotic amethyst from a source even less reputable than himself. Knowing the worth of the stone and the risk in possessing it, he immediately booked passage to America, looking forward to a future of peace and prosperity. There would, however, be no peace for Lee, as the ship suffered greatly from storms and soon fell off course. Lee, knowing of the stone's purported curse, went down to the cargo hold and hid the gemstone in a stuffed animal, a rather crudely fashioned monkey, and returned to his room. Waiting there was a dark vengeance, as the stone was the only thing protecting him from an even worse fate . . .

The purple monkey is a simple stuffed animal about two feet in height, weighing just over four pounds, that looks like it has seen better days. Its brown cloth covering is ratty in places, the seams are remarkably sound, and wine-colored stains dapple its arms and chest. Wherever the purple monkey is found, chaos and death are not far behind, for the cursed amethyst is nestled within the old rags and sawdust of the monkey's body. The mystic power of the stone makes the monkey impossible to destroy. Only exorcism can temporarily put the spirits of its victims at rest.

The powers and use of the monkey are at the GM's discretion. Certainly, it can fall into the characters' hands any number of ways, or may be the focus of a supernatural haunting. Recommended powers range from the monkey being possessed by an ancient Chinese guardian spirit to it being able to bring forth the damned souls of its victims to reap even more. Be creative. Feed the monkey.

Locus Yesod

A Chancel for *Nobilis*

by Reverend P. Kitty

Deep within a fissure of the World Ash, Yesod -- the Shadow Serpent, he who has shed his physicality -- rules over a land of howling winds and cragged rocks. At the center lies the unclimbable Mount 'Ashuwyah, representation of unobtainable enlightenment, where the Ymera collects its consciousness when not in the spirit realm.

Locus Yesod seems an inhospitable land to most. The ground is hard, rocky, and mountainous. The winds atop most peaks are strong enough to cut flesh, and wild dogs patrol every part of the Chancel not dominated by man. First appearances can be misleading, however; the land is not unlivable -- it just demands respect. The mountain springs allow for limited farming; with great effort, communities can stay fed. The dogs will attack anyone who strays too far, but they will cease (and even become somewhat protective) if they taste Chancelfolk blood. Those who are able to live in harmony with their surroundings find a peaceful home there. Those who cannot tend to meet their end quickly in this unforgiving place.

Yesod and its Nobles do not discriminate between their inhabitants. Both human and dog alike are given equal consideration in all matters of the Chancel. Sovereignity is unofficially divided between the Nobles, though the entire familia are recognized (and obeyed) by all inhabitants.

Locus Yesod is defended solely by its terrain and its wild dogs, but those are protection enough. The dogs are fairly intelligent and are gifted with the ability to ignore the Rite of Holy Fire (despite being mundane, and thus unaffected by an Auctoritas); they have proven effective at overwhelming even Noble intruders. The crags and crevasses within the Chancel lead to a few caves and deep forests an Earth, and a few lead onto the World Ash itself.

Iiad The Undine

for *GURPS Infinite Worlds*

by Phil Masters

Last year, a Sheldrake Section probe team came back from Azoth-7 with a collection of samples from an alchemist's laboratory. Nobody noticed that one of these samples included a *passenger*.

Normally, supernatural spirits rapidly fade away and die in Homeline's mana-free environment, but Iiad has modest needs, and was able to adapt, and even form a new body from substances which had accidentally ended up in the Sheldrake lab's drains. However, he can't venture far from this site, as he does depend on the proximity of various magical and alchemical items which are in for examination to sustain himself. Habitually secretive, he amuses himself by playing pranks on humans. The lab staff are now becoming aware that they have a problem with the drains that demands more than a mundane plumber. Dealing with it in the absence of working magic may be tricky, especially perhaps when anyone realises that Iiad is a sapient being.

Iiad the Undine   *143 points*

A supernatural being resembling an ever-shifting puddle of malodorous liquids.

Using Puzzles in Your Campaign

by Louis Girard

Thinking of using a puzzle in your game? Here are five golden rules we, at *Polymancer* magazine, have come up with while working on an upcoming adventure scenario.

Rule #1: Choose Wisely

A riddle may make sense to you but not necessarily to your players. The solution should be unique, unambiguous, and self-evident when found. A good puzzle allows the players to validate the solution, like when the numbers match in a game of Sudoku. Finally, make it relevant; If players can get away with slicing the Gordian Knot instead of untying it, they will.

Rule #2: Keep It Clean, Keep It Simple

It should be obvious when a puzzle is found. The challenge should be clear enough to know what the objective of the puzzle is or allow the players to figure out what is expected of them. Your puzzle should be hard enough to challenge them without having to complicate things further by using unduly cryptic instructions or making them undetectable.

Rule #3: Give Them a Reason

Players are not going to spend time on a puzzle unless their efforts are rewarded. Make the reward evident enough for them to attempt solving the puzzle. Had the fellowship found a better way to enter the mines of Moria, Gandalf would have never had to spend hours solving the riddle of its gate.

Rule #4: Don't Put Their Backs Against the Wall

Locking up characters until their players crack your code combination will bring your game to a grinding halt. Always leave options for the players to do other things in game while they solve the puzzle on the side, possibly in between game sessions.

Rule #5: Never Give Away the Solution

The player's character has a superior intellect? Give the player a clue; never give away the solution or let an NPC do the work for them.

What a Card

by Nikola Vrtis

A deck of poker-style playing cards (without jokers) and this article can give gamemasters and players just the instant inspiration they need make their characters feel different from each other.

To use the characteristics table, shuffle the deck. Deal three to five cards. Then, cross-reference the cards to learn the character's most significant features. If seemingly contradictory results appear, either redraw the last card(s) or come up with a circumstance in which they could both be possible.

The cards can also dictate the gender:

If the first card is . . .	the character is . . .
a king or odd card	an adult male
a queen or even card	an adult female
a jack	a young adult; use the next card to determine gender

Example: The three of diamonds (educated), three of spades (uneducated), and 10 of hearts (outgoing) are dealt. The character could be a student who's been so involved in his studies that he hasn't mastered most social skills, but he fakes it with his outgoing nature.

Suit	Face	Characteristic
Diamonds	King	Ambitious
	Queen	Blunt
	Jack	Witty
	10	Desires change
	9	Excited about a new hobby
	8	Worrier
	7	Confident
	6	Meticulous
	5	Intelligent
	4	Indecisive
	3	Educated
	2	Compassionate
	A	Thrill seeker
Hearts	King	Artistic
	Queen	Reserved
	Jack	Unambitious
	10	Outgoing
	9	Affectionate
	8	Quarrelsome
	7	Content
	6	Generous
	5	Loyal
	4	Bitter
	3	Happy
	2	Has a significant other
	A	Romantic

Clubs	King	Energetic
	Queen	Attractive
	Jack	Shy
	10	Wealthy
	9	Hard worker
	8	Gambler
	7	Honest
	6	Poor
	5	Loves job
	4	Swindler
	3	Lucky
	2	Disloyal
	A	Talented

Spades	King	Bossy
	Queen	Selfish
	Jack	Deceitful
	10	Depressed
	9	Unintelligent
	8	Lonely
	7	Fearful
	6	Easily bored
	5	Possessive
	4	Difficulty communicating (speech impediment, lacks social skills, etc.)
	3	Uneducated
	2	Recently lost something important
	A	Unlucky

The Broken Rule

by Alice Turow

The Broken Rule is an ornate [slide rule](#), fractured in the middle. While still holding together (barely), it cannot function at all for its original purpose; the slider can't move without breaking the Rule. If the Broken Rule ever *does* fall apart, its powers disappear forever.

When concentrated on slightly by the owner (who must have it nearby), the Broken Rule allows the person to break a rule of science (or do something impossible or seemingly so) as depicted in one specific movie. Examples include:

Using human computers to interface easily with alien ships *(Independence Day)* Using pressure waves to travel safely away from an explosion *(Mission Impossible)* Transforming a tiny video still-shot detail into a crystal-clear identifiable image *(Enemy of the State)* Causing a car to explode by shooting it (take your pick)

Each movie can be accessed only once, regardless of the effect utilized from that film. Should the Broken Rule transfer to others' hands, it "remembers" past movies tapped (although PCs should probably get a "blank" Rule). The Rule can only affect rules based on objects or ideas that exist at least mostly in the real world; it couldn't be used to gain entry into cyberspace or transform a laser pointer into a sci-fi phaser, but it could permit sound in space (since both "sound" and "space" exist). In general, it's best to tap movies that take place in "modern" times, albeit those with wildly inaccurate or exaggerated scientific principles.

Rumors persist that similar artifacts exist for different genres of films; for example, a broken puzzle ring attuned to romantic comedies permits actions that would be socially unacceptable elsewhere -- such as making a bet that you can get a love interest to fall for you -- because it's romantic in a movie.

1d Minutes To Learn, A Lifetime To Master

Playing Games in *GURPS*

by Reverend P. Kitty

Sports aside, when most roleplayers think of "games," they likely picture a computer, board, or card game, if not an RPG. These are all covered by the Games skill (page 197), though the differences between them deserve a closer look:

RPGs: These Games specialties are used to craft and run an adventure, or to perform well in one. Add half the successes of a Performance *or* Public Speaking roll to the Games roll. One cannot "win" an RPG, but success earns a Good reaction from the other players.

Card Games: The most famous card games are played for money, and use the Gambling skill. For more detail, use the average of Gambling and the appropriate Games skill (round down) instead of the familiarity bonus for Gambling. Other card games follow the advice for *Board Games.*

Board Games: The winner is determined with a quick contest of Games, though long games can be simulated by averaging the margins of success or failure from two or three rolls. Chess is a popular specialty; in a cinematic game it can default to Tactics-4 or Strategy-4, and vice-versa!

Computer Games: These are often just recontextualized *Board Games*, though twitchy shooters could justify basing the skill roll on the average of IQ, DX, and Per! Grueling tournaments can be treated as regular contests, with those who fail being eliminated each round.

Finally, note that only those who compete in a game professionally are likely to have any points in the Games skill! Most people use their IQ-4 default, which is balanced against other amateurs. A professional with even one point in Games will (and should) be at a clear advantage against amateur players, while a match between two masters will be a sight to behold, whether on the chessboard or the Halo battlefield.

The Beginning

by Helen Forbes

Remember when all campaigns started with the words along the lines of, "You're all in this Tavern and a stranger comes in looking to hire some adventurers"? It's not much of an opening. Compared to the beginning of any decent movie it looks uninspired.

So how do you start something? Where do you begin?

Try starting in the middle. This is easy if you're running **GURPS Black Ops** or something similar. You drop the PCs from a Helicopter in the middle of nowhere or pile out of an unmarked Van in some city. They introduce themselves to each other by the roles they take on during the ensuing bug hunt.

Or how about a time loop? Your PCs don't know each other but "by chance" happen to be in the same place at the same time. They are attacked by assailants who leave behind them a group photograph of the heroes. If you allow for time travel then the assailants were the dregs of an enemy group that the heroes are destined to destroy. The attackers were attempting the terminator trick -- kill the enemy before they become the enemy. If not then the PCs were once part of an elite group with selective amnesia.

Or start at the end. This works well with systems like **Feng Shui** but could also work with something dark and edgy like **Call of Cthulhu.** Start with the final confrontation, run a few rounds of combat then jump back to the beginning. Run forward for a bit then jump forward to the final confrontation where you left it. In this way the players get to solve the mystery of how they came to be grappling abominations in a shrine or fighting a running battle with deep ones in the caverns beneath town.

The Bathoscaphe

by Kenneth Hite

Constructed on similar lines to the more-familiar *bathyscaphe,* this device brings a crew into a lower, more obvious -- more bathetic -- literary universe. The bathoscaphe has three main sections:

- The crew cabin (insulated with elegant translations from Homer, Goethe, and Dante) holds three explorers and their gear. An irony-lock allows exploration, if the risk of becoming an obvious stock character is worth it.
- This cabin is suspended below a large tank containing the manuscript of Fernand Braudel's *Civilization and Capitalism,* providing realism-flotation. Like the gasoline in a bathyscaphe's float, it is incompressible.
- The craft sinks by flooding its conceptual tanks with Norman Lear sitcoms or prog-rock concept albums. It rises by screening John Ford Westerns and playing Bach's "Passion of St. Matthew."

The Agency uses the bathoscaphe primarily for salvage -- many bathetic realms have technology or information not available in the realistic universe, from light-swords to the Quasi-Life Equation to universal computer hacks. Occasionally, the Agency recruits bathetic local operatives -- their lack of nuance and self-examination makes them ideal for covert work. Since bathetic natives often look much better than real people, the Agency sometimes sub-contracts them to the entertainment industry. There, they suffer far less from pervasive realism or maturity, surviving years or even decades before flaming out in sudden low drama.

The dangers of bathetic travel range from being caught in some farcical bathetic war, to Doomed Love, to dying suddenly at the second-act turn. Low-literature explorers also risk postmodern narcosis (unresponsiveness to the genuinely moving or important), the "rapture of the shallow" (belief that the bathetic world is more real than ours), and the Brian Michael Bends (stabbing pain, blindness, or mental dissociation caused by high irony levels).

Rumor has it that the bathoscaphe was adapted from experimental Nazi Campfwagen technology.

Cooperative Gaming: Bullies and Idiots

by Jeff Siadek

"Don't be an idiot!"
"I don't care! It's my character and I'm doing what I want."

Cooperative games such as RPGs, **Shadows over Camelot,** and **Battlestations** bring the social dynamics into sharper relief. The real point of gaming isn't to thwart evil in the realm; it's to have fun with your friends while doing it. The shared experience and decision making can be great when the whole is greater than the sum of the parts or it can be a nightmare if people can't play together nicely.

It's good when a leader emerges to hold the focus of the group. It's a problem when other members feel like pawns. Everybody should feel free to voice their opinions but ultimately leave the final decision up to the player taking action. Otherwise, the game turns into a solitaire game for the bully with several reluctant assistants to push pieces around.

It's frustrating to watch somebody make a blunder that affects the whole party but it is worse to see yourself turn into an insufferable jerk. Be supportive in your advice. Use upbeat reasoning rather than negative platitudes. Be brief and respectful. When it comes time for another player to make a decision, let them. It might work out better than you'd hoped.

It's rude to dismiss others' ideas out of hand. If you consistently go against the consensus, you're probably alienating people. It is hard to make decisions when your emotions are riled up. Relax. Enjoy the camaraderie and make decisions that will enrich the experience for everybody.

If we were talking about a real war with real lives at stake, a different code of conduct would be appropriate. As it is, we're talking about imaginary lives on the line but real friendships are at stake. Play nicely.

Attunements Angel of the Drabble, Seraph of Creation, Grace of God*, Midwife*, Uncommon Sense*.
Special Rites: Complete a work of art*; Complete a drabble, haiku, or other short, written art. The last two may be the same work!

* See ***In Nomine Superiors: Eli,*** pp. 4-6.

"Brevity is the soul of wit."
--William Shakespeare

Karphos has been a reliever since shortly before the Fall, and has never fledged. After all, there's a certain something in simplicity, is there not? While it is not currently in service to any but its walkabout Archangel, Eli, Karphos currently resides in the Cathedreal of the Archangel of Judgment: the Celestial Tribunal.

Though not *technically* under house arrest, Karphos does have a triad of Judgment relievers following it around. It politely asks before making trips to Earth to act as a muse.

Judgment fears it is passing, and receiving, coded messages from Eli.

Adventure Seed

There is, on Earth, a little imp of the Media who longs for the Word of the Soundbite. Naturally, this imp sees Karphos as its natural enemy, and is sure that if only it can capture the reliever and present it to Nybbas, Prince of the Media, it will be given the prize it desires.

It just has to lure Karphos down to Earth . . .

A drabble is a story that is exactly one hundred words long. Prior to the word's coinage, Karphos was the Angel of [the angelic note that means Short Written Artforms].

Don't Bug Me

for *GURPS Fourth Edition*

by Matt Riggsby

If rats are too conventional for you, here are some fantasy swarms for *GURPS* *Fourth Edition.*

Fire Bees

Fire bees, possible relatives of fire elementals, appear as candle-flame-sized flying points of light. A swarm comprises about 30, with the combined light of a good campfire. They have Move 8 and do 1d-2 burning damage; DR protects normally. Enclosed armor (such as full plate) is likely to provide complete protection from direct damage; however, it can get hot. The temperature increases by two degrees per turn the wearer is attacked. This usually just makes the suit uncomfortable and can be alleviated by stopping momentarily to cool down after combat ends, but persistent attacks can make the armor dangerously hot. A swarm takes 10 HP damage. Fire bees take 1d-2 damage from drenching and water sprays.

Fire bees can be semi-domesticated. A swarm has IQ 2 for training purposes. Kept in stone hives, they are most often used to provide a mobile light source and a bit of extra protection.

Lotus Flies

The lovely, deadly lotus fly has a scent which is intoxicating. Literally. A swarm of 20 has Move 5 and 7 HP. It does no damage, but breathing characters in a swarm must roll against HT+2 each turn. On the first failure, the character becomes Tipsy (per pages 428-9). On the second, he is afflicted with Euphoria, and with Ecstasy on the third. And that's when the real damage happens. The lotus flies land on the immobilized character and implant him with parasitic larvae. The larvae do 1d-3 damage on daily intervals for a week. If the target has not been cured by that time, the larvae hatch into a new swarm (doing another 1d-3 damage). Desperate souls might harvest lotus flies for use as a drug.

Grecian Urn

for *Delta Green/Call of Cthulhu*

by Billy Aguiar

The Minotaur myth is a common motif in Grecian art, so when urn fragments with similar iconography was recovered in the Laconia region by a turn-of-the-century British expedition, it was considered not unusual and placed into storage. When the urn was partially reassembled by a graduate student in the 1960s, the student was later found in a vegetative state. The urn fragments were next examined in the 1980s in a metallurgical survey, but analysis of the urn's glaze was inconclusive. The fragments traveled among institutions, each one failing to identify its glazes, until the fragments arrived at the Smithsonian, and a test there determined they were made from a heavy element not found in nature.

The fragments were immediately transferred to D Stacks.

Dr. Jensen Wu reconstructed the exterior images of the urn, and it revealed a variation of the Minotaur myth. A man made of snakes was given the wrong meal and became the Minotaur. Enraged, it demanded tribute, and its young victims lost their spirits in a labyrinth. The border of the story is a representation of the labyrinth, but there are missing fragments so that the labyrinth is incomplete.

Game Effects: If one studies the urn fragments, there is a POW × 2 they may activate the labyrinth, with their soul/spirit being trapped, leaving their body in a vegetative state.

Story Ideas

- If other fragments of the urn are recovered, the labyrinth effect could become controllable. Urn fragments could be found at its previous institutions or even at the original dig location.
- A party member or a Delta Green researcher has been reduced to a vegetative state by the urn, and the team has to locate one of the serpent people who knows the original spell.

Act III

by Jim Pinto

Perhaps the most underutilized Act in American cinema is Act III. Most movies are resolved with the simple use of bigger explosions and more bullets. The range of movie ending in Hollywood can be counted on a three-legged dog. It appears as though no one wants to wrestle this puppy to the ground and make Act III work for its paycheck.

In roleplaying games, GMs have an even harder time with it.

After all, the majority of published adventures and games run on rails, providing the player with too few options. Once the finale approaches, everyone assumes the game will end in a hail-fire of death and carnage. How else does one recover Tibetan relics from the Nazis?

Certainly the entire theme of the movie *300* encourages warfare as a tool for getting things done, but this pastiche is so riddled with over-used and unimaginative clichés, one can hardly see anything resembling a story through the fog.

In escapist roleplaying, this premise is fine. Blow up the Nakatomi plaza with everyone in it. That takes away the terrorists bargaining chip. But for players who invested thought and time into their disadvantages, burning down the bingo parlor where grandma plays twice a week in order to subdue a money-laundering priest seems as boring an ending as anyone could devise.

The strength of Act III in roleplaying is the player's involvement as a team in devising every last element of this story. Act IIIs needn't end with everyone dying ala *Reservoir Dogs* (although this isn't bad), but rather can end with revelations so intense, the PCs are riveted with fear and rendered speechless by their own disbelief (ala *Oldboy*).

Consider stealing pages from less-known works when planning adventure endings and leave the majority of Act III story-writing to the players.

The Omniscient Eye

Is a Sea Section Dangerous on a Low-G World?

Imagine a world with lower gravity than Earth but (for this thought experiment) the same air pressure and temperature, and open water. Would the performance of a boat change? The boat and the payload are lighter, but so is the water it displaces . . . And what about airships? They float in air just as submarines float in water, right?
     --Onno Meyer

At rest, the forces acting on a boat depend on gravity -- its own weight, and that of the water it displaces. Reduced gravity affects both of these equally, so it'll ride just as high in the water as it does on Earth. But when it starts to move, either under power or in response to weather, dynamic forces and inertia become important. These don't scale with gravity, so performance will change.

A hull moving through the water generates hydrodynamic lift, increasing with speed. This causes the boat to rise in the water, reducing drag. Some high-speed craft (e.g. hydrofoils, speedboats) are designed to lift almost completely out of the water ("planing"), improving speed and efficiency.

In low-gee, these craft will plane more easily, improving acceleration and fuel economy at low speeds. Craft that wouldn't plane on Earth may do so here, but this will cause handling problems if they're not designed for it. They may end up having to travel *slower* to avoid planing. Depending on the design, low-gee may reduce the amount of energy wasted in kicking up spray, or just kick the spray up higher.

Stability will suffer, especially for small boats and sailcraft; gravity is an important part of how boats keep upright, so wind or a sudden turn will make a boat heel over further than the same cause would on Earth. (Waves in low gravity are a column in themselves.)

Airships will be mostly unaffected, since buoyant forces are already small compared to dynamic ones. Operating ceilings will increase because lower gravity means slower changes in air pressure. Submarines are in a similar situation, and can dive deeper, but will be slower to surface and dive since these processes use buoyancy (most airships rely on dynamic forces for short-term altitude control).

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Random Inkling

Many years ago, the late Dr. Jerome Stern -- Florida State University's antagonistic writing professor and cantankerous mentor figure -- started the "World's Best Short Short Story Contest," where all entries are 300 words or less. The contest continues today.

Dr. Stern's original intent (along with others dabbling in drabbles or muddling in microfiction) was to explore the limits of fiction: How small can a story get and still be a story? How much cruft can be pared away? What stories can be told in a smaller form that are more difficult (or impossible) in a larger form?

To me, one conclusion I take from microfiction experimentation is that almost everything can be a game. We know this as children: "Be careful walking on the sidewalk's edge; the street is *lava!*" (And, when faced with a square-patterned floor, I still fight the urge to walk L-style, like a chess knight would do.) Smart parents can use this to their advantage as well: "Betcha you can't clean your bedroom in 10 minutes!" And well into adulthood the games continue: calling "shotgun" when it's time to get in the car, juggling objects when bored, making puns or other forms of wordplay.

And, of course, the writerly challenge of writing short-short gaming articles. This week the number "300" looms large in the air, and we've thrown down the gauntlet to some familiar faces and voices new to *Pyramid:* Can you write an article in 300 words (or less)?

The results speak for themselves, but it's up to you -- the reader -- to determine if they're worthwhile. Let us know what you think, via the discussion boards or by e-mail.

Thanks to all the writers who participated, and special thanks to Jerome Stern: Absence can speak volumes.

Morituri Te Salutamus

by Nikola Vrtis

In this dice game for two or more players, participants play deities harvesting soldiers for their lands of the dead.

This game requires five tokens per player and two dice. (More tokens means a longer game.) To start, place the tokens in the center of the playing area, within reach of all players. Each player rolls the dice; the player with the highest number goes first. Players take turns rolling the dice, consulting the chart and performing the action indicated. Play continues to the right (roll, consult, perform). If a result is impossible to perform, play passes. The game ends when there are no more tokens in the center; the person with the most tokens wins.

Number	Action
2	*Reinforcements:* Put one token in the center.
3	*A Lull in the Combat:* Play passes.
4-6	*Not Your Dead:* Put one token in the center or give one to another player.
7	*Divine Intervention:* Take one token from the center and another from someone else.
8-11	*Reap the Wounded:* Take one token from the center.
12	*Vicious Battle:* Take two tokens from the center.

Three Variations

- **Winds of Change:** Players begin with three Fate Chips apiece. Each chip can be used once to force a reroll (of anybody's die roll); the results of this roll must be accepted, but additional chips can be utilized. At game's end, if a player used *no* chips, *all* three count as additional harvested souls: Fate acts subtlely.
- **Favored Souls:** Mark the underside of one token per player. If drawn randomly from the center, these tokens can be used as Fate Chips (above); if used in this way, the token is discarded.
- **Honored Sacrifices:** Remove three of your tokens for one Fate Chip (as above) *or* to choose one result for a roll.

Comparative Deep Time Table

by Kenneth Hite

"Theosophists have guessed at the awesome grandeur of the cosmic cycle wherein our world and human race form transient incidents."
-- H.P. Lovecraft, "The Call of Cthulhu"

This table attempts to harmonize, as best one can, geological chronology with the various "deep time" histories of the Cthulhu and Theosophical Mythoi.

Geological Era	H.P. Lovecraft	H.P. Blavatsky
Pre-Cambrian	Elder Things and Shoggoths [1000 Mya] Flying Polyps [750 Mya]	Previous cycle of Root Races?
Cambrian		
Cambrian-Ordovician mass extinction [488 Mya]; wars between Elder Things and Tsathoggua? Flying Polyps?; end of previous Kali-Yuga		
Ordovician	Great Race of Yith [450 Mya]	First (Polarian) Root-Race
	[both races of pure mentation]	
Ordovician-Silurian mass extinction [444 Mya], Ice Age [460-430 Mya]		
Silurian		Second (Hyperborean) Root-Race
Devonian		
Late Devonian mass extinction, formation of Pangaea; Cthulhu arrives from Xoth [360 Mya]		
Carboniferous	Fall of Cthulhu [300 Mya]	
Permian	Serpent-Men [275 Mya]	
	[both Shoggoths and Hyperboreans describable as "ectoplasmic" and "sweat-born"]	
Permian-Triassic mass extinction; Shoggoth Revolt; end of Second Root-Race [251 Mya]		
Triassic		
Jurassic	Mi-Go [160 Mya]	Third (Lemurian) Root-Race

	[both "egg-born"? neither have skeletons, both associated with crystals and/or mining]	
Cretaceous		
Cretaceous-Tertiary mass extinction; mutual destruction of Great Race of Yith and Flying Polyps, beginning of fall of Elder Things; war between Lemurians and Venusian "Dragons of Light"? [65 Mya]		
Paleocene		Fourth (Atlantean) Root-Race
Eocene		
Oligocene		
Miocene	Hyperborea rises; Fall of last Serpent-Man kingdom beneath N'Kai [5 Mya]	Fifth (Aryan) Root-Race emerges [18 Mya]
Pliocene	Voormis [3 Mya]	
Pleistocene		
Pastonian Interglacial (global warming); resurgence of Hyperborea against Voormis, final fall of last Elder Thing city; sinking of first Atlantis, end of Fourth Root-Race [850 Kya]		
Nebraskan Glaciation; fall of Hyperborea [680 Kya]		
	Ghatanothoa awakens in Mu; sinking of Mu [170 Kya]	
End of last Ice Age; end of Hyborian Age; sinking of Plato's Atlantis [12000 BC]

Advanced Squad Leader Starter Kit #1

Published by [Multi-Man Publishing, LLC](#)

Designed by Ken Dunn with Chas Argent, John D. Johnson, Pete Shelling, & Brian Youse

Cartography by Kurt Miller

Two 8"×22" Mapboards, 12-page Rulebook, 280 ½-inch counters, three scenario sheets, 1 Quick-Reference Data Chart & two six-sided dice; $24

Avalon Hill's *Advanced Squad Leader* game system provides peerless squad-based World War II wargaming, yet its detailed game system and steep learning curve is both daunting and expensive. Fortunately, Multi-Man Publishing, has countered this with Advanced Squad Leader Starter Kit #1.

Introducing prospective players to the game's core concepts and giving a feel for the full game, Starter Kit #1 is relatively inexpensive compared to the full game ($80 versus $24), concentrating entirely on infantry combat plus support weapons between US, German, and Russian troops. Vehicles are saved for the full game and further Starter Kits.

Starter Kit #1 is pleasingly appointed with full-color rules, and clear, easy-to-use double-sided counters. The full-color mapboards are not mounted, instead printed on sturdy card. A turn counter is needed though, and the second player needs a Quick-Reference Data Chart.

Opponents maneuver their squads to bring enough firepower to bear on the enemy, inflicting casualties and breaking enemy morale, restricting a squad's fighting ability. The game's heart, the squad leader, is necessary to coordinate the firepower of multiple squads, and more importantly, to rally broken squads to fight again. The rules clearly explain and illustrate with examples, the eight phases of a game turn. Not overly complex, the rules do require the memorizing of a lengthy list of abbreviations.

Most of the six scenarios are set across post-D-Day Western Europe, using only one mapboard and at most 30 counters, increasing Starter Kit #1's suitability for solitaire play. Beyond this, the Starter Kit is limited, with no capacity for designing scenarios.

Minor quibbles aside, quality components make the *Advanced Squad Leader Starter Kit #1* a solid, reasonably priced package. It is also an excellent means of entering what is an engrossing hobby with plenty of support. Further stand alone Starter Kits ease the learning curve.

GameMastery Item Pack One

Published by Paizo Publishing

Illustrations, graphics, & design by Vincent Dutrait, Sean Glenn, & Joe Boulden

Product coordination by Jason Bulmahn

55 cards (54 item cards, one product description card); full-color, tuck box; $9.95

If you have a tough time keeping track of your fantasy loot, the **GameMastery Item Pack One** adds a new method. It's a standardized 54-card deck depicting various pieces of equipment found in standard dungeon crawls: armor, artifacts, weapons, and so on. Each card has a portrait and name on the front and a description and blank space on the back. Part of the space is for a code so the GM can dispense cards and keep relevant secret information in his notes, and the rest can be used for statistics. He can hand you a crossbow card marked "1-A"; you write the range and weight on the back while he notes "1-A is cursed . . ."

Everything is generic, so no *periapt of wisdom* card or anything system-specific like that, but they're still colorful. The illustrations are top of the line, and the flavor text makes each entry more than a simple axe or scroll. You choose the magical (or even historical) mechanics you'll put down, though fitting them into the small square takes an even hand. On the other hand, that section's surface is cleverly treated so it can be marked (and erased) with a pencil. A simple line-by-line listing of gear on your character sheet may be more straightforward, but multiple cards can be arranged within a nine-card plastic sleeve to represent where your character is carrying his gear (unless you want to staple cards to your sheet . . .), and if in-game circumstances dictate you can switch the weapons you have "in-hand."

Players can increase their selection with random boosters and sequel decks to the **Item Pack**, adding both more mundane items (10-foot poles and such) and fanciful relics. It may not spell the most satisfying or obvious method of accounting for everyone, but it wins big points for creativity.

Alhambra

Published by [Queen Games](#) & [Überplay](#)

Designed by Dirk Henn

Graphics by Jörg Asselborn, Christof Tisch, & die basis

60 1¾" square Tiles (Six Starter Tiles & 54 Building Tiles), 108 Money Cards, Two Scoring Cards, 12 Wooden Tokens, Six Reserve Tile Boards, One Scoring Track, One Building Market board, One Black Cloth Bag, & a six-page rules sheet; $34.95

2003 "Spiel des Jahres" winner, *Alhambra* is a simple-themed tile-laying and resource management game. It's Granada, 1278, and players direct European and Arabic artisan teams to construct the finest, largest Alhambra, Spain's most beautiful palace. Naturally, artisans want paying in their native currencies.

For two to six players, *Alhambra* has high quality components. The famous Lion Fountain marks Starter Tiles, while various Building Tiles are marked with a purchase value. The Money Deck consists of four color-coded currencies: blue Dinars, green Dirhams, orange Ducats, and yellow Florins. Each Tile Reserve board has space for tiles and scoring details.

Alhambra's heart is the Building Market board, marked with four tile spaces and currency symbols. After a somewhat-complex set-up, a player either draws Money Cards for later; redesigns his Alhambra; or buys a Building Tile with the correct currency, adding it to his Alhambra or Reserve Board. Paying a tile's exact cost grants another turn.

Alhambra design can sprawl or be compact, but placed tiles must align correctly, and adjoining sides must match, cheaper tiles being more difficult to place. Scoring happens when either Scoring card is drawn, and at game's end, points awarded for the most of each building type and the longest wall. The player with the most points and finest Alhambra wins.

Alhambra offers simple tactics but difficult decisions. Pay extra for scoring tiles or take Money Cards for the exact amount and extra turn later? Either could deny a player or rival valuable Money or tiles. With strong random tile and card drawing, *Alhambra* lacks player interaction, except over the Building Market, making each *Alhambra* a self-contained puzzle.

Despite poor interaction, *Alhambra* is enjoyable, frustrating and gratifying as fortunes fluctuate. Evenly spaced scoring rounds let player scores balance. Beautiful, cleverly designed, *Alhambra* is pleasingly light and plays easily.

Perplexcity, Season 2

Published by [Mind Candy](#)

Seven puzzle cards; full-color, booster packs; $4.99

In case you missed the news, the puzzle cube, the long-sought relic from the back story of the ***[Perplexcity](#)*** collectible card game, has been found. Like any good puzzle junkies, the creators don't stop obsessing there, they release *Perplexcity, Season 2.*

While the ***Perplexcity*** folks are glad to have their cube back, it seems not everyone is in agreement on what's to be done with it. The [Brotherhood of the Six](#) have splintered to demand the artifact be used to its full potential. Tales are spun on the backs of cards (including "Choose Your Own Misadventure" stories), and some have reminders on playing the game and getting points and prizes at the home page. (Those even include "warm-up" puzzles to raise your blood pressure.)

And puzzles are what you're here for. A new series of 256 tests are being doled out in waves (84 randomly selected cards to start), and the more you solve the better your score (if you post codes at the website, you can simply enjoy the noodle-scratchers by yourself). The mysteries come from all corners: logic puzzles, mazes, visual tests, even cards whose veils must be pierced by smell.

Sometimes graphics are decorative. In all cases they tell you into which set of ciphers the cards fall. Styles range from cartoons to classical to photo-altered reality, but all are striking and, since there's no way to tell what's important, worth looking at.

Within a single packet you can find enigmas ranging from "Well, duh," to "You've gotta be kidding me . . . I have to know the science of *what*?" If you can't find something to your taste in one, there's sure to be something in the next, and at the price it's not too costly to find some excellent example of what tests your mettle.

Fjords

Published by [Rio Grande Games](#)

Designed by Franz-Benno Delonge

Translated by Jay Tummelson

40 Full Color Landscape Tiles, 8 Wooden Farms in two colors, 40 Wooden Field Counters in two colors, & Full-Color Rules Leaflet; $19.99

Having had enough of the sea, of rape and pillage abroad, and of spam and parrots, a good Viking settles down to farm the rich meadowlands between the mountains and the turbulent waters of Scandinavia's fjords. This is the theme for *Fjords,* a two-player tile-laying game wherein each Viking explores the fjord, securing the best sites for his farms, before cultivating new fields. The aim being to have the most fields.

Fjords is played in three two-stage rounds. Stage one is Discovery: The players lay the hexagon-shaped tiles in turn such that at least two sides must connect and the terrain (blue sea, green meadowlands, and black mountains) match adjacent tiles. When adding a new tile, a player can choose to place a farm on its meadowland section. His opponent can freely give placement advice, which can also be ignored. Gaps (known as lochs) can be left in the tile layout.

When all the tiles have been placed, the second stage -- Land Claim -- begins. Field counters are placed in turn, in empty meadowland adjacent to an existing field or farm of the same color. Once all field counters are placed, the number for each player is counted up and noted down. Two more rounds are played, the highest score from the three rounds determining the winner.

Fjords, like *[Carcassonne,](#)* is pleasingly tactile and jigsaw-like. Tactics focus on tile and farm placement ready for field cultivation, players using the terrain to block his opponent's access to meadowlands with sharp valleys, narrow mountain passes, and thin coastal strips, there being only two all-meadowland tiles.

Simple, enjoyable, *Fjords* plays easily and quickly, and is arguably a less-demanding alternative or introduction to *Carcassonne.* With thick tiles and wooden pieces, *Fjords* is attractive and would also work with more players and more pieces.

Roanoke: A Game of Dark Mystery & Wicked Action!

Written & Published by [Clint Krause](#) with Daniel Bayn

Cover by Glauco Nobre

44-page 1.28meg b&w PDF with Color Cover; $5

Inspired by *Tim Burton's Sleepy Hollow, Ravenous,* and *Brotherhood of the Wolf, **Roanoke*** is a roleplaying game of Lovecraftian horror, over-the-top action, civilization against wilderness, and sinister conspiracies at the New World's edge. It explores, but does not explain, what happened to "[England's lost colony.](#)"

Players take the roles of Roanoke's colonists, protectors, betrayers, and native peoples, each defined by three traits, one combat, one social, one professional, plus a crippling fear. Traits are rated three, four, and five, the fear just one, and everything else two. For its mechanics, each rating is the target to roll under. Simple resolution is a straight roll under a trait. For conflicts, ***Roanoke*** employs Daniel Bayn's narrative control Wushu mechanics, players building dice pools of six-sided dice by adding narrative elements, and then rolling for successes. For example, a Witch-Hunter denounces a Heretic, using inflammatory oratory, producing evidence of devilish doings, and witnesses to the Heretic's lies about God. The Witch-Hunter gains a die for each, rolling 3d6 against his professional trait, Witch-Finder (5). The Wushu mechanics actively encourages player input.

Roanoke models the colony's fate with its too-simplistic Doom mechanics. To gain automatic successes in a conflict, a player invokes his Fate, but Faustian-like also raises Roanoke's Doom by one. The final Doom rating determines how tragic Roanoke's end is, a higher value indicating a darker end.

Although Roanoke's real fate is unexplained, the game suggests several foul plots, frameworks that move the campaign onwards, including Elizabethan court intrigue, cannibalism, and ocean-borne threats. Nevertheless, it is the players and the Doom rating that will determine Roanoke's ultimate end. As with ***[Don't Walk in Winter Woods,](#)*** Clint Krause has created a light storytelling RPG with strong player input wherein getting to the fate is more interesting than the fate itself.

Dungeons & Dragons Dungeon Tiles 3: Hidden Crypts

Published by [Wizards of the Coast](#)

48 tiles (two 8×10 (stable & mausoleum/crypt), two 4×4 (bone ziggurat & hidden tomb), four 4×4 with corners clipped (two empty tombs & two staircases), two 2×8 (stairway & empty crypt), 12 2×4 (three hardwood floors, glowing green pit, double doors, three empty crypts, massive stone doors, archway, & two darkness), six 2×2 (crevasse/floor cage, illuminated coffin, demon brazier, stairs, clawed fountain, & hole-lined floor), four 2×2 with clipped corners (two statuary & two darkness), two 1×4 (one darkness & one stairway), eight 1×2 (five doors, two sarcophagi, & rack; two coffins on back side), six 1×1 (two darkness, two upright coffins, door, & iron maiden; pile of bones on back side)); full color, mounted; $9.95

Quick-use maps continue to flood the RPG market, and thankfully Wizards of the Coast keeps up a regular supply of their quality tile sets. To coincide with their miniatures accessory *The Unhallowed,* the third set in the line is called *Hidden Crypts.*

As that might suggest, you now have a virtual necropolis at your disposal. You won't be building vast cemeteries with the selection (they're "hidden," remember?), but you've got enough to fill an entire dungeon with undead haunts. There are bones, sure, but the artists don't let that carry the whole product. You get coffins and tombs, some without their occupants (the GM determines whether the bodies were stolen or . . .), and stone doors and vaulted frames suggest the confines of a gothic burial chamber. A few pieces are clipped at the corners so your dungeons need not have those hard edges -- stairways can sweep majestically into the room, and corridors can take a gentler, more decorative turn as a respectable mausoleum might have before the fireballs start flying.

There are a couple of misses, or at least unexplained anomalies, like the glowing green pit (unless Superman was buried here). The stable only makes sense when paired with what looks like a small family plot with a single grave (that's all the outdoors you get). There are odd hardwood floors, and one counter has a dotted line of dark holes all around the edge -- either it's the upper view of a cage (and there are already some upper views of cages less circumspect than that), or they're holes ready to spew flames or fumes. As with the other sets, the opposite sides of most pieces show plain tiled slabs in case you simply want a dungeon. *Hidden Crypts* may be Wizards' most well-targeted but generally useful set yet.

Kung Fu Fighting: Martial Arts Brawling Cinema Style!

Published by [Slugfest Games](#)

Designed by Geoff Bottone, Colleene Skadl, & Cliff Bohm

Illustrated by Peter Nguyen with Cliff Bohm

Tan-Colored 99-Card Deck, Six 7"×5" Character Cards, Six Red Glass Chi Stones; $19.95

Following *Fishing for Terrorists,* Slugfest Games keeps it fast and non-political with the Chinese-style kick-ass *Kung Fu Fighting* card game. As martial arts masters, two to six players throw punches, kicks, and each other, or strike with swords, nunchucks, or even a table to be the last one standing.

Each player has a Player Template: a card indicating current Chi marked from one to 20, plus spaces for weapon held or stance taken. The cards, nicely illustrated with a range of action shots, depict weapons, stances, attacks, attack enhancements, blocks (specific to attack types), and Chi Restoration. Each player begins with a hand of seven cards and 20 Chi.

In turn, players make an attack against an opponent: a direct quick punch or kick, or complex like a Fast Flying Kick delivered from the Crane stance. The kick inflicts just three points of Chi damage, unless blocked, but each Enhancement increases the damage done. Before his attack, a player can freely discard and draw as many cards as he wants, changing weapon and stance cards to gain the best defense and attack values. Outside of his turn, a player can only play block cards to stop attacks, while weapon and stance defense values reduces attack damage. Except for stance and weapon cards, all played cards are discarded. Players are eliminated once their Chi is gone, and the last one standing wins.

Kung Fu Fighting is a knockabout game, enjoyable, but undemanding, playing better with more players. It involves some luck in the cards drawn, but the key is building the right combination of stance, attack, and enhancements to land devastating blows. Inject a little verbal interplay and you have the easy to visualise martial arts movie fight scene, helped by the card illustrations. Bad accents and subtitles optional, of course.

Murphy's Rules

The Smooch

for *Toon*

by William H. Stoddard

Kisses are a classic bit in animated cartoons. One cartoon character steps up to another and plants a big smack on his cheek, or on his lips, leaving him stunned, ecstatic, or both. For **Toon** GMs who want to include this in their games, here are some rules.

The basic action is a Chutzpah Skill:

Smooch

This skill is used to display your affection for another character, either sincerely or ironically. The effect of a successful Smooch is that the recipient is Boggled. This may be accompanied by a variety of takes, especially if the Smooch is sincere. Good descriptions -- for example, of throbbing hearts, or characters running around screaming "Woo, woo!" -- can earn Plot Points. On a failed Smooch, the smoochee is free to take action against the smoocher: slapping him, punching him, picking his pocket, or even smooching him back.

There are a couple of different ways to arrange an attempted Smooch. One is talking the recipient into it; this requires Fast-Talk, countered by Resist Fast-Talk. Another is catching him off guard with a Sneak, resisted by See/Hear/Smell. You can also try to grab him with a Fight roll; this can be countered by another Fight roll. A success on any of these results in an *immediate* chance for a Smooch roll; it's not delayed 'til your next turn.

Some Shticks also apply: Hypnosis, Invisibility, or even Stretching your lips. Incredible Luck and Teleport can both be used to avoid being Smooched.

Of course, one character can *agree* to being smooched.

Successful Smooches can have long-term effects: the smoochee may pursue the smoocher, hoping to receive another kiss, or to give one. Player characters can choose whether to react this way; non-player characters react this way if the Animator thinks it's funny!

Sack of Words

by Alice Turow

The Sack of Words contains small, loose, blank rectangular tiles. Impossible to count, a full pouch houses a few hundred. Only one tile can be drawn at a time, and upending the bag also only produces one. It's impossible to do more than estimate tiles remaining or acquire more than one at a time. The Sack cannot be refilled nor tiles reused.

If a tile is drawn with a word in mind, it appears on the tile. These words can convey messages to *anyone*. First, the drawer contemplates a target; the initial word drawn is always "TO." This recipient can be *any* person(s), condition(s), or idea(s).

Examples:

- BENJAMIN MURPHY
- MURDERER OF TIMOTHY QUINN
- MYSELF AT MIDNIGHT
- EVERYONE ABOARD THIS SHIP

The only seeming limit is that recipients in the past cannot be targeted.

The tiles have a slight "you-know-what-I-mean" quality; if the drawer only knows one Benjamin Murphy, only two tiles are required.

Once a recipient's chosen, the drawer assembles a message; this segment begins with the word "MESSAGE," counting as one tile. This message can be as many tile-words as desired (given enough tiles). Tiles can only be used for words. There's no punctuation (unless faked: "PERIOD"), and numbers are spelled out; "TWENTY FOUR" is two tiles. Hyphenated words count two (or more), and attempts to thwart the tile's limits -- "BRINGMOREGUNS" -- result in a tile consisting of the first whole word. (Tiles follow the same "Don't-be-a-jerk" philosophy GMs should.)

Beyond that, tiles are open to any use of delivering words:

- TO FRIENDS MESSAGE HELP
- TO ME IF PERIMETER BROKEN MESSAGE DANGER
- TO EVERYONE ON EARTH MESSAGE BOLLOCKS
- TO GOD MESSAGE WHAT IS THE POINT

Messages deliver instantaneously mentally, without tone, direction, or clue of origin (unless in-message); the drawer knows nothing of the recipient(s).

The Major Villains From My Campaign, 2002-2007

by James L. Cambias

- A biker gang.
- A rogue DEA agent secretly behind the gang wars in the city.
- An ex-Soviet mercenary trying to take over the city's underworld.
- A Colombian drug lord who's really a CIA agent.
- A crooked police captain who's really a Vampire!
- A whole secret society of vampires in the city's business leaders.
- A Masonic group who are looking for the hidden Templar treasure.
- A fundamentalist preacher against music, games, and comic books -- but it turns out he's a cyborg!
- Vampires in the school athletic department.
- Masonic agents out for revenge.
- Cyborg mercenaries.
- A vampire drug lord.
- Masonic assassins.
- Vampire cops.
- The Psycho Vampire Queen, who starts out acting all nice and pretends to be impressed when the heroes give her hand-painted miniatures, but then starts moaning about how the heroes never go anywhere, and demanding that they buy her *very expensive* concert tickets to bands they don't even like very much, and finally dumps them when she's drained all their life energy.
- More Masonic hit men.
- Cyborg slutbots.
- The Masonic Traitor Agent, who's been fighting alongside the heroes for years and years, totally gaining their trust, but who turns out to be allied with the Vampire Queen.
- Vampires.
- The Evil Cyborg Traitors, a group of former heroes whose brains are replaced by electronic implants controlled by the Masons, who set up their own "hero" group that uses the same headquarters as the PCs even though I've complained about it to the owner like, a dozen times.
- Masonic vampires.
- Cyborg vampires.
- Masonic cyborgs.
- The Cyborg Controller, an alien trying to capture all Earth's heroes by brainwashing them and taking them off to space, where he sticks them on some stupid starship and forces them to explore alien planets.
- Space vampires.
- *Cyborg* space vampires.

NUK "Nehebkau"

A Transhuman Space Cybershell

by Phil Masters

"Mini-snakebot" cybershells are frequently used for espionage; they're good at slipping through the proverbial ventilation ducts, and if they're spotted, they may be ignored, or at least treated simply as animals. This model also has functional "fangs" -- a drug injector, holding up to three doses.

Nehebkaus aren't generally sold into the domestic market, but a few civilian owners carry one or two, literally up their sleeves, for practical jokes or as holdout weapons, and similar models (without fangs) have uses in the entertainment industry; theatrical companies employ them in productions of *Anthony and Cleopatra.*

Mini-Snakebot *GURPS Fourth Edition* Template (-13 points)

Attribute Modifiers: ST-7 [-70]; HT+1 [10].

Secondary Characteristic Modifiers: SM -2; Basic Move-1 [-5]

Advantages: Absolute Direction (Requires Signal, -20%) [4]; Damage Resistance 1 (Can't Wear Armor, -40%) [3]; Doesn't Breathe [20]; Infravision [10]; Machine [25]; Peripheral Vision [15]; Pressure Support 2 [10]; Reduced Consumption 3 (Recharge once a week) [6]; Sealed [15]; Telecommunication (Cable Jack; Video, +40%) [7]; Telecommunication (Radio; Video, +40%) [14]; Temperature Tolerance 5 [5]; Vacuum Support [5].

Perks: Accessories (Tiny Computer, Drug Injector) [2].

Disadvantages: Cybershell Body [-15]; Invertebrate [-20]; Maintenance (Electronics Repair and Mechanic skills, 2 people, Monthly) [-4]; No Sense of Smell/Taste [-5]; Restricted Diet (Very Common, power cells) [-10]; Vermiform [-35].

Features: Standardized physical design (see below).

3' long, 2 lbs., $450 + cost of computer.

Notes

Most mini-snakebots are designed to resemble some natural species; if they're seen, they'll probably be treated as possibly-dangerous wild animals, and if they're identified, they may be viewed as sinister espionage gadgets. Hence, even if they are operated by a LAI rather than a NAI, they may change that template's Social Stigma (Valuable Property) to Subjugated, reflecting the worse treatment they can expect, for -10 points.

Phone Beyond

Modern-Day *Call of Cthulhu* Hands-Free Horror

by J. Edward Tremlett

Everyone's seen the television ads. Well-dressed businesspeople march through exotic locales like they were in an office. "Pure Morning" by Placebo plays as they talk business on the beach, in the jungle, the mountains and deserts. No stethoscope headsets or obvious bluetooth earpieces. Just a pouch at the belt, and a smile.

All brought to you by "Phone Beyond." Better coverage and fewer dropped calls than all other providers. Behind-the-ear bone-conduction headsets as a standard package. The web site reveals that they're 50% more expensive than the competitors . . . but hey, everyone else's doing it.

The Problem

It starts out small, at first. Long-time users start to see things out of the corner of their eyes in dim light. "Floaters." Fleeting, squid-like movement in corners. Multi-legged shapes running under the table. Amoebas floating half-in and half-out of the walls . . .

A blink of the eye and they're gone. Overwork . . . too many hours in front of that damn computer.

But then they're seen with the lights on. In the street in broad daylight. Getting closer all the time.

One day, they bite, and a customer goes missing.

Systems

Phone Beyond's headsets are tiny, much-improved Tillinghast resonators. They vibrate their wearers' skulls to receive and send voices, and to transmit the signal through another dimension, using the human mind as a focus.

Unfortunately, that dimension is not uninhabited. Long-term use "attunes" the wearer to interact more fully with its strange inhabitants -- the Terrors From Beyond.

For each phone call, subtract the user's POW from the minutes spent: a negative number or zero is treated as 1. This is the cumulative percentile chance of attunement. Once attuned, the victim has a number of days equal to POW before the creatures can attack.

Terrors From Beyond are on pp. 91-92 of *Malleus Monstrorum.*

Get Your Players to Tell You What They Want

by Jason Anderson

My players are very big on character development, but in the past I've had problems figuring out how they want to develop their characters. Even worse, when I did have an idea they were just "bad" situations for the character to react to; I was rarely coming up with "good" situations for the character.

The solution was simple and obvious: Get my players to tell me! But I decided to make it a somewhat formal process, and this has helped it tremendously.

I gave my players three index cards apiece, and told them to write down something each wanted to have happen to his character (one on each card). The contents of the card were to be kept secret -- only the player and I would know what was on the card. The event could be good or bad, major (i.e.: plot altering) or minor. I did reserve the right of veto if the idea was unsuitable for any reason.

Every session I use an event from at least one of the cards (one card from the entire pool of cards, not one card per player). If I use a card during the session, the player writes a new one to add to the pool for the next session.

So far it has worked great. My players all gave me ideas that I wouldn't have thought of, and while there have been a few silly ones in there they are all suggestions I can work with. Better yet, many of the suggestions are plot twists I can work into the ongoing story, linking the characters more directly to what is happening but in ways I didn't initially think of myself.

It's a simple idea, but it works great. Give it a try!

Three Hundred Words? Eee, Luxury . . .

by Marcus L. Rowland

Good roleplaying comes from conflicts between personality and plot. Characters who stay in character, even if it means lost opportunities or a risk of death, are more satisfying than those whose who always follow the most expedient path. Imagine meeting the character; would you prefer someone with a strong personality and opinions, or someone who never gave a straight answer and instantly changed their attitude if it gave them a tiny advantage?

One approach is to try to sum up the character in a few words and see if he, she, or it still sounds interesting. If the summary is little more than "barbarian with a big axe," more work may be needed. A challenging way to do this is to write the summary in exactly a hundred words plus title, a literary form known as a Drabble.

Here's an NPC example, from one of my more melodramatic Edwardian adventures; this accidentally turned into blank verse as I wrote it:

Femme Fatale

An aristocratic damsel in distress,
pale foreign beauty held in durance vile.
Beware this stranger,
those who aid her are soon in danger.

Strange plots and stratagems abound,
mysterious voyages and cargoes are found,
and desperate traps.

How lucky to find such protectors,
to clothe her, expensively, as befits her rank,
to follow this tangled trail wherever it leads,
and earn her thanks.

No surprise if romance is in the air,
and rivals for her hand take less than perfect care.

The instigator of it all, she is content to wait.
She plans a cunning trap, and is its bait . . .

Give it a try; you might find new depths in your characters!

* * *

*Marcus Rowland previously explored this idea in greater depth as part of an article on characterization in **Odyssey Magazine** issue 7 in 1999. This magazine had very poor distribution, and it will probably be new to most **Pyramid** readers.*

Mélange of Magical Creatures III

for *GURPS*

by Eric Funk

Hand Squirrels

*"In the dark, a man in black perched on a rooftop overlooking the park. His eyes narrowed as a squirrel ran the length of the roof, stopping in front of him. The man dropped a small nut, which the rodent gobbled up quickly. The squirrel then bowed, and began to trace a complex pattern with its tail. The man chuckled as it finished its display and fixed its gaze on his hand. He then dropped the small nut remaining therein. It did not reach the roof, but was gobbled up greedily by the squirrel. The man probably would not have laughed as he jumped to the street below, had he spotted the man watching him from across the way. The bag that man held contained the squirrel holding the **real** message."*
-- *The fall of the Vanchez Crime Cartel*, Chapter II.

What started as an adaptation to help carry extra nuts and get better access to food was enhanced by runoff from magical factories. Thus was born the "hand squirrels." These otherwise ordinary brown to gray squirrels have long and well-furred tails. Since then they have been spotted fighting off small predators, and using the tails to grapple when fighting each other. They also seem to have a keen sense of direction, being able to pass messages secretly between groups. However, to be trained to carry physical objects, they become somewhat mercenary, and then will only perform if given small treats at each end. Hand squirrels are at -1 **DX** per level of encumbrance carried by thier tails.

Encountered

In any area where these creatures can be found, there are many people who can take advantage of this to pass messages in thieves' cant or military gesture secretly without making a noise or casting a spell. It is said that some mages have trained their hand squirrels the somatic components to critical spells so they don't have to make them. Others refute that this could work . . . Agents can also deliver messages while possessing hand squirrels, releasing the spell as soon as the signal is done.

Industrial Uses

"Youths commit misdemeanors by teaching squirrels obscene hand signals. These squirrels teach other squirrels these habits. It can take over a week for a druid to deprogram them and get the face and voice of the culprits."
-- Inspector Bonlieu, Metro West P.D.

A large number of scout units have taught the squirrels to give messages only to those who sign a correct countersign. Their prehensile tail can also be used to pass small items, letters, and coins. Personal magical items can include wristbands improve one's manual dexterity, or a full set of guards that make one double-jointed. The most unorthodox use is in a magical item of partial shapeshifting that give a human a tail of proportional size.

Adventure Possibility

In a small village, a messenger boy's hand squirrel has made a friend. It appears to be a foreign military's squirrel. Can the PCs decode its signs and learn what it knows? Will the local military pay for this information, and the animal itself? Will the boy's squirrel pine away if its mate is taken away? Can the heroes deal with delivering a litter of baby squirrels?

Fireberry Trees

"The thief slipped the book into his satchel, and slipped past the bubbling apparatus, and back out the hole in the window that he had carefully cut. As he hit the ground, he heard a dog growling, and a guard shouted, "Stop!" Of course, he bolted. The guard threw a hammer, and the thief dove behind a tree. Unfortunately, the hammer hit the tree, causing fruit to rain down over him. That was the last he heard of the world until he was calmed down at the prison by the healer."
-- Retro-scrying report, P.D. No. 3

These obviously artificial trees have been carried across the known world by alchemists and black-powder experts. These deciduous trees have unusually straight brown trunks and narrow leaves. They are best known for their berries, which explode concussively when dried and hurled. In the wild, falling sun-dried berries explode, scattering seeds to the wind, and harming competing plants at the tree's base. Ripe, juicy berries are harvested for their rich, spicy flavor that is found in many chili recipes. Adding dried diced berries to foods in just the right amounts is an art form, and the hallmark of a good chef. Despite this, every year, there are people injured when eating food made by a chef that is just a little too daring. Despite all the propaganda about the berries, it is the trees' wood that is the main industrial product, while the berries are merely a by-product. The bark is fireproof and after a few decades can even resist a strong forest fire.

Encountered

Underworld connections in most cities can produce dried berries under the name "cherry bombs" with a simple Streetwise roll. The wood makes for a good shield against flaming arrows and dragons; heroes may be sent to acquire such a shield as part of a quest. Because of the use in explosives, fireberry trees can be found growing all over some steamtech battlefields. Heroes can also find such berries by accident as part of a ploy by villains to pass off fireberries as safe berries.

Industrial Uses

"Yeah, I heard a story about a druid that was getting upset about people cutting down his forest, so he cross-bred fireberry trees and tree ents. They say the enemy burned down the forest from eight directions at once, rather than try to take it."
-- Heard inside the Alchemists' café, *The Simmering Cauldron.*

While it is the berries that have the public's attention, it is the wood that interests companies. When grown straight and tall in an orchard, the fire resistant wood can be used to make barrels, sconces, torch stands, exterior siding, furniture, and fireproof safe linings (Highly Resistant, see page 433 of the ***Basic Set***). Treat this as expensive durable fireproof ablative (see page 5 of ***Vehicles Expansion 2***).

The orchard can let people in every year to pick the ripe berries at a "discount price" per basket before the fruit become dangerous. There is little demand for these berries dried. Possessing whole, dried berries is a fineable offence in many regions. It is kept a little-known fact that powdered, dried berries make a substance that explodes if jostled or lit . . .

adding a stabilizing agent such as sawdust makes this similar to dynamite. Thus begin the Explosives and Traps skills in a world (see page 194 of the **Basic Set**).

Adventure Possibility

The Adventurers are hired to sabotage a bandit's camp. The plan is to replace their reserve of firewood with fireproof fireberry wood, which will be recovered after the raid. The plan involves that the PCs distract the guards while the "B" team slips in with a cord of wood. Then, an inside agent on their woodcutting team will replace used volumes from the front of the stack with real wood from the back. Fireberry wood will then be stacked to make the reserve seem full. Any information the heroes can gain as they skirt the enemy camp will be appreciated. When the next winter storm hits, they will suffer from morale problems, and be ripe for dissolution as soon as it clears.

Gloomblossom Plant

"How lovely! Just look what this does for the room. The gloomblossoms absorb the reflected sunlight here, like so. Thus, the colors on this side of the room all balance, and the excess light is gone. Now, to add light to the opposite end . . ."
-- Feng Shui master Zhu Choi in the house of Lady Baxi of Ulter.

The flowering plant known popularly as "gloomblossom" has dark leaves and blooms hiding an unusual property. As part of its nature, it actually draws sunlight from the surrounding area, as well as using what reaches its leaves. Despite this, it will die if taken to an area with direct sunlight or lacking mana. It is suspected that this plant was created artificially, with the design to grow wild, starving neighboring plants as bunches of these flowers vie for all the remaining twilight. Once there are half a dozen in a square foot, they can be in the open during the day in overcast conditions; in those circumstances, they can spread their influence over entire fields. However, an unusually strong sunny summer's day could kill them all. Each plant in a hex lowers the ambient light by -1, to a maximum net value of -9.

Encountered

The public most often encounters these plants in public theaters for lighting effects, at funerals, or around goth mansions and meetings. Gloomblossom tea is popularly called "block tea," for its sun-blocking effect. The strength of the tea determines how many cups one needs to protect one fully. The flower's oil can also work, but many find it looks too dark to rub on one's skin. Correctly applied to glasses, they could protect one from gaze attacks, assuming the magical effect is limited properly.

Adventurers will almost certainly encounter the gloomblossoms in the homes of necromancers, goths, vampires, and subterranean denizens living on the surface. Vampires will certainly have a lot of this tea about to protect them from sunlight.

Industrial Uses

"Warning! prolonged exposure to the gloomberry plant has been known to cause serious depression and metabolic

changes!"
-- Health label on a Gloomblossom Plant

Large-scale exploitation of this plant is still in its infancy. Currently, there are uses wherever excess light is undesirable. This means applications dwell mostly in deserts, as well as military and underworld operations; as such, the use of personal gloom items may be restricted by local authorities. A dark room might be good to develop mushrooms or photographs, but a stealthed carriage or boat would attract attention by its aura of gloom. Finally, an item of shadow form is said to be in the works, but no one has heard more. Some alchemists seek to breed variants that feed on infrared or ultraviolet light, allowing them to thrive underground, or in lands of perpetual night. Some suggest these variants might be able to act as heat sinks, or be invisible to x-rays.

Adventure Possibility

The heroes are hired to be part of a large hoax, perhaps as a birthday prank. They must attach pots of gloomblossom to all the windows in a house to make someone think that it is still night. The effect works too well, and some vampires (or other undead, such as ghosts) move in. The victim now sees ghosts and becomes almost too scared to return home.

Variants: These can also be used to sabotage a maze, peep holes, cameras, motor vehicles, ladar sensors and AESAs in ladar mode.

Gloomblossom Plant

Appearance: Small flowering plant.
Category: Plant.
Diet: Photovore and Manavore.
Size: SM -4.

Reaper's Bane

"These terrors first appeared after the death siege of -20. They are a blight upon the land that ravaged the farmlands while the undead armies assaulted the cities. As if it is not enough that the walking dead slaughter all in their path, that these despoilers grow behind the battle lines to assault our food supplies."
-- Sage Andalus, *The Two Hundred Years of Silence*

These monstrosities only appear after a dark and stormy night. The entire trunk of a Reaper's Bane grows almost 50 feet within the space of a few hours. Some say it resembles a giant asparagus. Despite its appearance, its presence means almost certain death for any ordinary person who approaches it or chop it down. Animals will dislike getting within a mile of its effects, which begin at its base. Magical beings feel increasing unease the closer they get to the tower. These effects are twofold. The first is life-leeching effect that grows at a rate of one yard radius per hour: 24 yards per day, 720 yards per month, and slightly over two miles per five-month growing season. Plants in this area will not grow, and in fact will slowly wither and die.

When something living moves along the ground within the 1/4 range, then each minute make a Perception roll, modified by the speed/range table, and the Size Modifier of the subject. If a victim is noticed, then lightning strikes the core, a barbed tree shoots up where the target was standing. The sudden upshoot of spiked thorns can rend a man in pieces.

Encountered

The monstrosity should be avoided, if at all possible.

If that is impossible, then the safest way to remove the blight is with a siege engine, such as a catapult. Should that option be unavailable, one might try to bring a long chain and some oxen. One must keep the oxen as far apart as

possible, and then pull the stump out. Beware of lightning.

Industrial Uses

"The gate of the necromancer B'Silker was guarded by two of these abominations. All who sought to enter had to run the gauntlet and pass next to the towers. It was very effective in keeping warm bodies from the main gate."
-- Tan'wey the scout, *Sieges of Darkness*

A desperate enough society *could* use these behemoths as part of an energy collection network. A metallic grid set above them could intercept the lightning, preventing the rise of the pain-barb trees. A society that invoked a large number of pain-barb trees could create an almost unlimited supply of firewood.

Adventure Possibility

The adventurers are hire because they can do the impossible. They are to bring back a Reaper's Bane "alive." Since it and its immediate vicinity are immune to direct magics, transportation will have to be mundane. The two most difficult tasks involve finding one before it is destroyed by local forces, and unearthing its roots safely.

Reaper's Bane (Core)

Appearance: Core: 45-foot-tall gray asparagus.
Category: Plant, Undead.
Diet: Life force, lightning.
Perception: 12.
HT 16, 170 HP.
SM +4; 5 tons; DR 6.
Traits: Frightens Animals; Infravision; Lifebane; Mana Damper; No Fine Manipulators; Vibration Sense; Wild Animal.

Pain-barb tree (striker)

Appearance: Pale gray sharp, prickly leafless tree, 10' tall.
Category: Plant, Undead.
Diet: Life force, lightning.
ST 20; **DX** -; **IQ** -; **HT** 12; HP 30.
Speed 6; Move 6 (vertical).
SM +2; 1,000 lbs; DR 4.
Traits: Combat Reflexes; Frightens Animals; Lifebane; Mana Damper; Sharp Claws.
Skills: Brawling-12.
Damage: 2d-1 (imp)

Variant: Reaper's Widow

Appearance: As per Reaper's Bane, above.
Category: Plant, Undead.
Diet: Life force, lightning.
Perception: 12.
HT 16, 170 HP.
SM +4; 5 tons; DR 6; DR20 (lightning only).
Traits: Frightens Animals; Lifebane; Innate Attack: Lightning 3d (Burning, Long Range, Surge); Mana Damper; No Fine Manipulators; Wild Animal.
Skills: Innate Attack-12.
Notes: Appearing similar to the main stalk of the Reaper's Bane, this variant will hurl lightning at any walking creature

within half its life-leeching range.

Honeyhat

"And so, we see that fashion has changed again. Out are the stripes, and in with spots. Courtiers are already scrambling to get the latest cues for their 'wear. Yes, we accept no imitations, as oracles say that the magic-resistant biting insects will be extra fierce this year."
-- Memoirs of Lady Yadei Odiva, *Years at the Royal Court.*

This symbiotic animal was created as a fashion accessory that can change with the times and keep down magic-resistant insects. The honeyhat is also popular for the traveler in any humid location, especially where pheremones or magical wards would be offensive. These creatures emit a slight sweet smell which can also be tailored as a perfume, even to "no scent." They also eat moths and their larvae when stored in a closet. The first were made in certain colors, but the latest can have their coats change color, consistancy, length, and to some extent, texture when fed specific foods. All tailoring foods are expensive. Connoisseurs often keep two of the same style, and keep them in separate rooms in case one gets sick. While the basic design of these fashion accessories remains the same, each season brings out new varieties in shape and features. Trends are often artificial, created by the local manufacturers. Some include adding wings, extra eyes, or more carrying capacity. The normal lifespan is six years, but when it only has a month left, its fur starts turning irrevocably gray from the inside. When its fur is completely gray, it dies.

Encountered

This combination frog-bat is a mostly-sessile symbiont, thus the heroes will usually be coming to them. Proper care of these dependant creatures may require more time and care than most adventurers are able to afford. Rental may certainly be possible, but the quality and availability cannot be assured.

Industrial Uses

"Yes, there was a wave of troublemaking pages that somehow managed to get ahold of some color-food, and fed it to flies. They then released them at a party, and all the hats belonging to the Duchess and her visitors turned striped over the evening. For the rest of the season, stripes were the in thing, they say."
-- Milanitus, Chief of Security, *Too Noble to Bleed?*

Many establishments have purchased factory rejects that are unworthy to be worn. These are placed in strategic locations to keep insects away from doorways, windows, and some tables. It has been whispered that large chimeric projects have been undertaken, but most groups agree that gengineering any creature large enough to eat a child makes the public nervous.

Adventure Possibility

The heroes encounter on the road, or are hired to protect, a small caravan. Just before the last intersection outside the destination city, there is a mob waiting. They claim that breeding the creatures is a form of cruelty! The mob is riled enough to ignorantly "punish" anyone who opposes them.

Honeyhat (see Skullcat, page 146 of *Transhuman Space*)

Appearance: Varies, generally a furry hat, although some have feathers. At the top is a mouth with a sticky frog tongue to catch insects.
Category: Mammal (some avian).
Diet: Insectivore.
ST 3; **DX** 10; **IQ** 3; **HT** 12.
Will 10; Per 10; Speed 5.5; Dodge 8; Move N/A.

SM -2; 1-2 lbs; DR 1.

Traits: Domestic Animal; Early Maturation 2; Extra Arm (striker); Innate Attack (linked, sticky); Fur; No Legs; No Fine Manipulators; Perk (Coat can change color when fed specific hormones); Sanitized Metabolism; Self Destruct; Short Lifespan 3; Sterile; Temperature Tolerance 2.

Skills: Brawling-12.

Aria Hares

"Listen? Do you hear that? That is the banshee-like wail that signifies death! It is so close to you, that it heralds doom, should you choose to continue!"
-- The Mad Oracle Yeshari to the King of Zulan, before his last battle.

These singing rabbits can act like parrots, picking up sounds and projecting their voices yards away. Popular myth suggests that these creatures were bred as pets, but escaped to the wild. The parroting trait was dominant, and thus spread through the populations. They generally imitate frightening sounds they have heard, especially when something is dying.

Encountered

It is considered a very bad omen to be near a wailing aria rabbit. In the wild, they are often encountered when one is hunting a predator; these rabbits will imitate their various cries. They can be easily trained to imitate sounds on command. They can learn notes, even long symphonies. These rabbits can be taught to learn from to only one person, or a person giving certain foods.

Industrial Uses

"Ah, opening night at the opera. It opens with troubadour Josien, with his backup chorus of aria rabbits. He has trained them to switch keys as he dances. A few critics complain that in his vainglory, he has taught a line to sing in his voice . . ."
-- Quilia Rusini, *Art Review*

Many schools have a band that is composed of "synthesized" music in which students "program" rabbits to sing specific tones on cue. The stages of cacophony are usually a passing phase, but a rare few individuals stick with it and bring harmonies to the world. Some locations have a hutch wherein one can place a trained rabbit that knows different songs. The most extravagant are built into organs that can form powerful harmonies of up to dozens of the beasts. A few have shown the aptitude to listen while a certain trigger is present, repeat during another trigger, and forget under a third. Some people have these rabbits take messages at doors.

Adventure Possibility

The lord of a local realm has a dangerous carnivorous pet that he caters to. Thus, he has commissioned the heroes to bring one or more aria rabbits to the wild, and capture the sounds of one of his pet's species. A creature of the opposite sex, to be exact. Every second of sound brings more money.

Aria Rabbits

Appearance: As ordinary rabbits, see ***Bestiary.***
Category: Mammal
Diet: Herbivore
ST 3; **DX** 14; **IQ** 3; **HT** 14.
Will 11; Per 12; Speed 7; Dodge 10; Move 7.
SM -4; 3-5 lbs; DR 2.

Traits: Acute Hearing 2; Domestic (or Wild) Animal; Eidetic Memory (Sound only); Enhanced Move 1 (Ground move 14); Horizontal; Mimickery; Night Vision 3; Peripheral Vision; Protected Sense (Hearing); Quadruped; Sharp Claws; Voice.
Skills: Survival-13; Ventriloquism-14.

Crystal Fish

"When these first were first discovered, explorers picked them up and stored them in small bags. Later, they were put on shelves. It would be an understatement to say that the first cataloguers were surprised when they went to clean the display and the wet "rocks" started to flop around."
-- Ytkad Wortmam, *Years at the Imperial Archive*

These mostly transparent fish are native to tropical lagoons. They seem to have originated in coastal pools that empty with each tide. They use sunlight to break down hydrogen from water, and thus live in the top 10-30 feet of the sea. Their durable nature makes them virtually immune to predations of any fish that cannot simply swallow them whole. Their near-transparent nature makes them very hard to see in water.

Encountered

These creatures are easy pets to take care of, and are hard to starve. They require no food, only water and sand. When one travels, they can be kept dry, and hibernate in a low energy state, taking energy from the air. One can even leave them to dry in different positions. Some people set up whole dioramas.

Industrial Uses

"Legends speak of some crystal fish breeds that can store, and then later emit concentrated light to blind foes."

"But that's just nonsense, isn't it?" -- Tiela Jirtin, *Study of Light*

By placing an inverted glass over the fish bowl, these pets can be used to create the *elixir of life,* which is called oxygen by some. Many workplaces have these in the office places along with plants to increase the air quality. Vendors warn that one must be sure the pet has a good air flow. Some have found ways of grinding their scales to form lenses. Some arid countries have imported them to deal with sand clogging channels. When crystal fish are in their larval state, they consume a lot of sand. In enchantment, for each multiple of standard wealth spent in refined crystal fish, the enchantment cost for [metalic golems](#) (in energy) is reduced by 1%.

Adventure Possibility

A traveling salesman peddles "hand crafted crystal" to the merchant guild. When the heroes witness a local pickpocket stealing one, things change. Surprised, he accidentally drops it in a puddle in front of the heroes, and just as shocked when it comes to life, something's afoot! It is then announced that the last item sold was a large conglomerate statue made by gluing together hundreds of smaller "sculptures." How can the heroes inform the noble without either losing honor?

Crystal Fish

Appearance: Mostly transparent fish or seahorses.
Category: Elemental-kin (Earth).
Diet: Photovore, lithovore.
ST 1-2; **DX** 11; **IQ** 2; **HT** 15; 2-4 HP.
Will 9; Per 9; Speed 6.5; Dodge 9; Move 6.
SM -5; 1-5 lbs; DR 1.

Traits: Aquatic; Body of Stone; Chameleon 4; Ichythoid; Peripheral Vision; Wild Animal.

Beyond Fantasy

This article describes seven creatures, most of which could appear to physically exist in a hard-science world, even if the more wondrous aspects could not. Rodents that can parrot hand-signals are not far-fetched. Plants that cause the optical illusion of diminished light are not infeasible. Animals bred as hats can be found in the hard-science *Transhuman Space.* If budgigars can parrot, larger mammals surely can. The crystal fish might be all biological, yet with transparent tissue, going dormant when out of water. The reaper's bane might instead poison the ground, and the second stage grows from the roots, and sprouts the plant's seeds; this process would take *years* instead of seconds.

Weaknesses of the Flesh
for *d20 System*

by Michael Tresca

Your character just suffered a terrible blow; he has suffered an Ability Drain, a permanent loss of 1 or more ability score points. This can range from sapping the character's Intelligence to withering his Strength. The end result is the same: that character will never be as powerful as he once was. After all, Hit Points can be healed, even Ability Damage eventually returns. But Ability Drain is permanent. Right?

Wrong. A 4th-level paladin and cleric spell, *restoration,* restores all points permanently drained from a single ability score. If you use the NPC spell casting rules, a 7th-level cleric casting the spell costs 290 gold pieces (spell level (4) × caster level (7) = 280) + (10% of material component cost (100/10) = 10) = 290 gold pieces.

For just under 300 gold pieces, the loss of 18 points of Strength can be easily restored. With all that healing at a character's fingertips, fear of life and limb are significantly reduced. What's a GM to do?

One way to make the ruinous effects of combat more painful for characters is to make Ability Drain only healable through a *regenerate* spell. On the other hand, players might become frustrated with the inability to remove the penalties, and understandably so; the loss of 2 points in an ability can affect skills, combat, and saving throws. Consider the loss of two Dexterity points. Nine skills suffer a -1 penalty (Balance, Escape Artist, Hide, Move Silently, Open Lock, Ride, Sleight of Hand, Tumble and Use Rope), and the character's Armor Class bonus and Reflex save are also reduced by one.

A possible compromise is that Ability Drain can be healed by *restoration* but there are lingering effects, not quite as bad as the loss of an ability score but still a reminder that the character shouldn't run risking life and limb without some thought to the consequences. And of course, all these effects can still be healed by *regenerate,* a much more powerful (and thus more expensive) spell.

Drain Conditions

There are different levels of Ability Drain. The penalty is always one-half of the points drained, rounded up. All penalties are considered Ability Modifiers.

Charisma

Facial Scar: The character has a scar that cannot be easily concealed. It bestows a penalty on all Diplomacy and Disguise checks.

Throat Injury: The character has a raspy voice as a result of her injury. She suffers a penalty on all Perform checks.

Constitution

Constant Pain: The character's wounds never heal quite right. He suffers a penalty to Concentration checks.

Lung Damage: The character can rarely get a full lungful of air. She suffers a penalty to all checks to hold her breath.

Stomach Injury: The character suffers from ulcers as a result of a stomach injury. When eating food, he must make a

Fortitude save (DC Ability Drain) or be sickened.

Liver Damage: A deep wound has pierced the character's liver. The character suffers a penalty to all saves against poison.

Dexterity

Knee Injury: The character's knee is permanently cracked. She suffers a penalty to all Tumble checks.

Missing Finger: The character is missing a finger. He suffers a penalty to Sleight of Hand checks.

Missing Toe: The character is missing a toe. She suffers a penalty to all Balance checks.

Intelligence

Hallucinations: The character sometimes sees things that aren't there. She suffers a penalty to Spot checks.

Flashbacks: The character has recurring flashes back to when he suffered the Ability Drain. He suffers a penalty to Knowledge checks.

Insomniac: The character has difficulty sleeping, filled with nightmares when she suffered the Ability Drain. She suffers a penalty to Concentration checks.

Strength

Arm Damage: The character's arms are weakened. He suffers a penalty to Climb checks.

Leg Damage: The character's legs are weak. He suffers a movement penalty of 5 feet for every 2 points of ability damage.

Ankle Damage: The character's ankles are weak. He suffers a penalty to Jump checks.

Wisdom

Missing Ear: The character is missing an ear. He suffers a penalty to Listen checks.

Eye Damaged: One of the character's eyes has difficulty seeing. She suffers a penalty to Search checks.

Nose Damaged: The character has difficulty smelling things. He suffers a penalty to Survival checks.

Wild Talents: Superhero Roleplaying in a World Gone Mad

Published by **ArcDream Publishing**

Written by Greg Stolze, Dennis Detwiller, Kenneth Hite, & Shane Ivey with David Blewer, Colin Chapman, Edward Dean III, Brad Elliott, & Matthew Widner

Cover by Christopher Shy

Illustrated by Samuel Araya, Todd Shearer, & Christopher Shy

238-Page Full Color Hardback; $39.95

So *Wild Talents: Superhero Roleplaying in a World Gone Mad,* the sequel to *Godlike: Superhero Roleplaying in a World on Fire, 1936-1946* -- the most interesting of 2001's World-War-II-themed RPGs, has finally arrived. Both are superhero RPGs, but where *Godlike* presented a desperate time of men at war wielding small, focused, even odd talents or powers through will alone, *Wild Talents* is broader, a pure superhero RPG, complete with mutants, sorcerers, aliens, alien invasions, avenging angels, and cape and cowl.

Not just a supers system though. Beyond its mechanics, *Wild Talents* examines the formulation of the superhero universe, presents a sequel to *Godlike* as an example, and gives a gritty down-at-heel scenario suited to a low-powered *Wild Talents* game. All of this is presented in a clean looking hardback that includes some fantastic illustrations, of which there are not enough.

Apart from its setting, what set *Godlike* apart from its peers was its mechanics. Both it and *Wild Talents* employ the ORE or "One Roll Engine" System. Using only pools of 10-sided dice, a single roll determines how well and how fast a character performs a task, and in combat, where he hits an opponent and how hard. What counts in any roll is the value (Height) and number (Width) of matched results. For example, Henchman Harry takes a pot-shot at Torchlight with his pistol. With Body 3 and Pistol 3, Harry rolls 6d, getting results of 1, 4, 8, 8, 8, and 10. This is read as Width 3, Height 8, or 3×8. From that, he has shot Torchlight in the torso for Width+2 or 5 killing damage.

The larger the pool, the greater the chances of rolling matches, but the ORE System adds two wrinkles. The first is Hard Dice, which always have a value of 10. Representing the maximum of any skill or ability, they are not as flexible. For example, with pistol 1d+2hd, Harry's Hard Dice guarantee a head shot every time. The second wrinkle is Wiggle Dice, which can be any value, representing more carefully judged skill or ability use, and are used to make matches with the dice rolled. With even 2d+1wd, Harry can inflict a lesser wound rather than kill.

Wild Talents characters are comprised of dice assigned to stats, (superhuman) hyperstats, skills, (superhuman) hyperskills, and Miracles (or superpowers). The more flexible the die type, the more it costs -- Hard Dice cost more than ordinary dice, and Wiggle Dice cost more than Hard Dice.

In *Godlike* the base character is a trained soldier with 25 points spent on his Talent, resulting in a relatively powerful, narrowly focused ability. This is the equivalent to 125 points in *Wild Talents,* wherein players have a total of between 200 and 500 points to spend. The GM sets this point total according to the type of game desired. *Wild Talents* introduces Archetypes, which determines the source of a character's powers, be it cyborg, parahuman, or technological.

Characters can have multiple Archetypes, further defining the character and providing a measure of protection. For example, when an anti-mutant ray zaps Torchlight's light-based powers, his Technological Archetype prevents any gadgets from being effected.

Miracles are built with up to four Qualities: Attacks, Defends, Robust (Miracle works regardless of distraction), and Useful Outside of Combat. The number of Qualities sets a Miracle's base dice cost to which can be assigned cost-increasing Extras like Locked On and Radioactive, and Flaws such as Attached and Touch Only that decrease it. Dice pool size determines range, spread, and capacity, so Flight 6d gives a flight speed of 64mph, while Body 6d lifting power of 1,600 pounds. Power Stunts can also be bought for most Miracles, for example Barnstormer adds dice to roll when maneuvering through a city skyscraper canyons. Other Miracles are straight level based, for example Heavy Armor and Immunity.

Wild Talents includes the usual superpowers, from Absorption to Unconventional move, the player having to decide the exact nature and parameter of each Miracle, with the point being that a power is not going to be the same for every hero. Sidebars suggest how Miracles might be used to simulate powers of the comics, such as using Containment and Attach with Heavy Armor to create Force Fields; or Extra Tough, Flight, Harm, Hyperbody, and Immunity all Attached to Heavy Armor to do Power Armor.

In addition, *Wild Talents* introduces several Miracles not found in *Godlike* -- Telepathy, Cosmic Power/Spell Casting and Gadgeteering/Enchanting. These last two work to simulate other Miracles and can be very expensive in terms of Will. Although the designers go to great lengths to explain how each works, some examples would have helped.

Some powers are particular to *Wild Talents* and the ORE system. For example, Aces gives dice to add to any roll, Jinx gobbles an opponent's dice, and Indomitable Will and Will Battery each tie into the underlying feature of both *Godlike* and *Wild Talents:* Will. In *Godlike,* Talents could detect another and in a contests of Will cancel his Talent. In Wild Talents, Willpower must be bid to activate a Miracle. If the roll is made and the Miracle works, the Willpower bid is kept; if not, it is lost. Willpower can also be lost from trauma, tragedy, and defeat, but gained from rest, heroism, good performance, rolling well, and defeating a fellow superhuman. Every superhuman has Base Will from which his Willpower is fuelled, and certainly players will want to buy extra Base Will and Willpower during character creation.

With "Changing the Course of Mighty Rivers," Ken Hite guides us through "Building Superheroic Histories." Essentially, this asks how much do you want Talents to change your world? The author uses four design axes, each with five levels that help a GM set his campaign's parameters. The Axes are Red, Historical Inertia measuring how much Talents can change history; Gold, Talent Inertia or how much the Talents change themselves; Blue or "The Lovely And The Pointless," how much paranormal and alien influences there are; and Black, Moral Clarity, is the world morally black and white, or does it contain shades of grey? Push all four to the maximum to get a Four-Color world. The essay also discusses the nature of realism in a Talent setting and how Talents fit into it before exploring common trigger points for Alternate Histories, coming right up to date with 2001.

Having proved that he can write on both the horror and alternate history genres, Hite applies his knowledge of the latter to the superhero genre. Not surprisingly, this is as good a piece as you would expect and the best essay on the genre and RPGs to be published since Chad Underkoffler's ***Truth & Justice.***

The world post-*Godlike* is described in "A World Gone Mad," which parallels our own modern history, but with some interesting inversions of Cold War politics. The Soviets and the Americans backed different nations in the Middle East -- Israel is Soviet backed, Syria U.S. backed; Talents were used in a militarized Space Race, reaching Mars in 1969; and it culminates in an alien invasion that destroyed Mercury. Other notable differences include a united India as a world power that leads the computer industry, and the Talent volunteers, a non-political organization that helps worldwide.

Wild Talents closes with "White Knights, Black Knights," a scenario that is sadly not set in the *Wild Talents* universe. Set in an alternative 1970s in which several low powered Talents find themselves framed for murder.

Just like *Godlike,* the default for Wild Talents is a gritty deadly setting. Referencing comic books such as *The Dark Knight Returns, Top 10, The Ultimates,* and *Watchmen,* it is not by default a Four-Color setting, but can be with a

tweak or three. Optional rules given and explained throughout the book can be combined with Hite's essay to create the desired setting. The default setting does lack magic or aliens. This is not to say that they cannot appear or at least their effects simulated, but primarily Talents are driven by Will alone.

Wild Talents is not, however, *Godlike's* equal. It lacks the focus, some of the flavor and the setting, and the fact that *Godlike* essentially pushed at the genre's boundaries. The problem is that individually, *Wild Talents'* four elements -- the ORE system, the Hite essay, the *Wild Talents* history, and the scenario (to a lesser extent) -- are excellent. Together though, they almost -- but do not quite -- gel. The real problem is that the scenario is not set in the *Wild Talents* universe, when it should have been. The ORE system is also problematic because in differing from both normal linear and normal dice pool mechanics, its exact workings are not necessarily intuitive. More examples of both the mechanics and character creation would have helped counter this.

Nevertheless, the mechanics are supported by Hite's essay which should be read by every superhero RPG GM and the flavorsome alternate history provides a dark sequel to *Godlike.* As to the game itself, *Wild Talents: Superhero Roleplaying in a World Gone Mad* gives a pleasingly harsher edge to the superhero RPG, while offering room to soften that edge.

60 triangular tiles, 12 scoring tokens, 6 wooden civilization markers, 30 wooden followers, rules (in English, German, & Dutch); full color, boxed, two to four players; $24.99

We're all used to being like gods when we play certain games, but in *Gheos* from Z-Man Games players actually take on the role of deities.

The object of the game is to have the most points from followers when civilization peaks.

The gods (that's you, the players -- two to four of you) create a new land by fitting together triangular sections on the table. Your hand always consists of two such pieces. Some have little strips of land, others have larger, continent-sized masses, and all separate the lands with thick rivers and small lakes. The segments may have other features like wheat symbols, temples, and pyramids.

When you place a piece, you can either start one of the six civilizations or take a follower from an already placed culture (there are five colored cubes each in the same colors as the civilizations). If you're lucky enough to have wheat on your chosen landmass, when you start a new tribe there you automatically get a free follower for each such symbol. A new color cannot begin on the same island as someone else.

Everyone has three scoring chips, and you can play one on your turn to get points (any chips not played before the game ends are lost, so you can't hold out too long). Count up the cup symbols that share the land with each civilization; that's how many points you get for each follower. If the red tribe is in an area with three cups, you get three points for each of your red cubes. No one "owns" a civilization, so you score for every color for which you have adherents, not just the ones you might have placed.

Being a god, you can alter the terrain on a whim -- simply remove a previously played triangle and put a new one in its place (sacrificing one loyal follower to do so). You may split lands in half, forcing people there to migrate to one area or the other, or you may join two separate landmasses together. If this lets two colors occupy the same landmass, war breaks out. The newly placed tile is the break point: Count up the sword symbols on either side of it, and the civilization with the most wins. Not only is that tribe's token removed from the board, everyone has to give up any followers of that color. The culture must start again (and the gods must solicit new followers).

Placing temples also nets you points. The temples have a wheat, cup, or sword symbol, and you get points for matching symbols on the landmass to which you added the temple piece. Scattered in with the other tiles you also find epochs, moments in history when cultures achieve the next level. When they come up, everyone scores if their followers share space with a pyramid. When the last epoch is drawn or everyone runs out of scoring chips, there's one more "free" scoring round and the god who has amassed the most points worth of worship wins.

The tiles are tough, sharp little items, and most of the pawns are made of wood, so you won't lose anything through wear and tear. The counters are crystal clear so you won't strain to see what lies where. The follower cubes are small enough to worry about losing, but the good news is they don't go on the board; they just sit in front of you needing

little to no manipulation throughout the game.

Perhaps the biggest disappointment of the game is that you don't get to feel much like gods. Yes, you get to switch out land tiles, but that's about as impressive as you get. Deific elements are there, but the trappings are thin and simply overlay a "regular" war game. Obviously controlling the very continents makes you more than soldiers commanding units, but you really long for the chance to smite someone Old Testament style. Putting that aside, the strategy that underpins the game is solid, with enough control over mortal lives that your fellow divinities must step (or manifest) lively and plan ahead if they're going to outthink you. There aren't as many opportunities to mess with another player's tile placement (there's no way to plan for or block all possible maneuvers), but that leaves the war mechanic as a deliciously iffy act of sacrifice. With a lower price than other games in this vein, *Gheos* is a budget-conscious chance for gods to play dice with the universe . . . minus the dice, naturally.

Know What You Have Done

Every once in a while, I return to the basics for column ideas. ("Basics" here being synonymous with "Ideas I should've thought of before, but for some reason fell through the cracks.")

"'The only use of Ti Kwan Leep is self defense.' Do you know who said that? Ki Lo Ni, the great teacher."
"Oh, yeah? Well, the best de-fense is a good oh-fense. You know who said that? Mel, the cook on **Alice.**

Given the nature of *Pyramid* readership, I suspect many of you recognize the above quotes as being from the Frantics "[Ti Kwan Leap/Boot to the Head](#)" sketch. Regardless, it illustrates an interesting point which I'm going to use as the springboard for this column. Namely, as the second speaker above showed, the source of quotes can be murky at best, and quotes can be a useful tool for almost any creative activity.

For those of you with easy shufflable access to your music collection (iPod-people, CD-jukeboxers, keepers of crates of MP3s), here's a thought experiment. Decide whether you want to create a character, adventure, or campaign. (This technique can be used for lots of things, but those are three of the biggies that folks often create with no ideas in mind.)

Click the "shuffle" mode on your musical choice. Stop when you hear a song you like that has lyrics deeper than "Woo-wah-woooo . . ." Listen to the lyrics, carefully. Do a jewel-case or Google search, if you gotta. Then, see if you can find an inspiration. Take a lyric out of context; let your mind wander. Can you think of a situation where that would be an appropriate or worthwhile lyric?

When I conceived of this experiment on the way home from the Day Job, I utilized my own musical randomization method known as the "radio." The first tune that popped up that I found interesting was Weezer's "[Beverly Hills](#)." It's a song about someone with "nothin' in [his] pocket" bemoaning the life he doesn't have in . . . well, Beverly Hills. It contains the verse, "Preppie girls never looked at me; why should they? I ain't nobody." Now, before I did the mandatory Googling, I heard that lyric as "Preppie girls never *look* at me." A subtle distinction, perhaps, but one which sparked my imagination. (Obviously, it's okay if you mis-hear something, so long as it sparks an idea you like.) Because "preppie girls never look at me" sounds very similar to a super-power, and/or a curse. So I pondered:

What if someone had an ability that made them more transparent, depending on social class? The upper echelons of society literally can't see the person; middle-class souls see him as someone vague or indistinct. Only when surrounded with the dregs of society does the individual become fully visible, tangible, real, or the like. And, of course, for maximum impact it should probably be "always on."

In a Supers campaign, this would be an interesting *Invisibles* or *Wild Cards*-type power; fairly low-powered and flavorful, despite being really easy to explain.

In a Horror campaign, this character becomes an ideal antagonist. Imagine a Jack the Ripper-esque character, who is no more substantial than a shadow to those of any means. The investigators, almost certainly living some sort of middle-class-or-better lifestyle, have no chance of interacting with him directly, and can only be witness to his horrific effects. (Of course, intangibility runs both ways, and while at their social standing they aren't in any danger from the social-shade.) To thwart him, then, the heroes would need to discard the trappings of their social level and "lower" themselves into another world . . . one where they don't know the rules, where they are crawling along the underbelly of society, and they're placing themselves directly in the accessible realm of their seeming quary.

If I do say so myself, that's not bad inspiration for a random lyric from a geek-rock band.

Inspiration can run both ways, where you know the desired destination first and pick an appropriate song. For example, back in college my friend Matthew ran a supers campaign inspired from and shaped by the Genesis song "Domino" off the *Invisible Touch* CD (an album that was required to be owned by everyone of our narrow generation). In addition to providing a "soundtrack" offering, this song provided a cornucopia of [lyrics,](#) any of which would be

appropriate for adventure titles, character inspiration, or the like. (That's a benefit of choosing a 10-minute song, even if that length is greater than most fledgling campaigns.)

I don't have any recollection or notes from that campaign, but if I were to draw similar inspiration from that song today, here's what I'd come up with at a cursory glance:

Character Inspiration

- "A hundred crazy voices call my name." -- Perhaps a character who, upon hearing his name, has a change of personality or powers
- "I fight to rise from this river of hell." -- "river of hell" could be interpreted as the River Styx; literally, the character needs to keep fighting (perhaps literally, perhaps by undertaking some mission) to keep from being swept away by death
- "Sheets of double glazing help to keep outside the night; only foreign city sirens can cut through." -- Perhaps a force-field manipulator, albeit one with some kind of weakness or hindrance (loud sounds? unswerving respect for authority figures?)
- "Act as if it is perfectly clear" -- Although also suited as an adventure title, let's interpret it literally. What if the person this quote applies to someone with an odd form of X-Ray vision . . . perhaps one that will only serve to confirm what he "believes" to be there (acting as if it's perfectly clear), resulting in a kind of one-sided "20 Questions" game as his powers seek to confirm his act: "Okay; I'm looking through the door of this office. I see multiple desks . . . no? One desk. Yes; one desk. Made of wood? Great; wood desk. It has five drawers . . . no?"

Adventure Titles (Placed in order of how I'd probably run them)

- "The Glow of the Night"
- "Pointless Violence" -- A great adventure name in any setting, genre, or time
- "In Silence and Darkness"
- "Another Long and Sleepless Night" -- typing up hooks from the first adventure?

In less than 20 minutes of utilizing this process, including the typing, I have four characters and four adventure "hooks." Not too shabby. And, again, there's nothing that says you need to keep the quotes around once you've gotten your inspiration; if you find it distasteful that you were deeply moved by some lyric, it can be discarded, leaving nothing but the yummy fruit of your thoughts.

I might continue this next week, but until then, I note that to find a master of quotation, weaving them on the loom of possibility, one need look no further than our own lovable Ken Hite. Next time you read a column of his, take one of the items he quotes and see how it inspires *you*. You might find yourself teeming with possibilities you didn't know existed.

Age of Ice

by Paul Drye

For the last time, Richelieu looked across the mass of trenches and siegeworks that surrounded La Rochelle. He was sure that if he'd had more time, the city would have fallen to him. It had all started so well back in September, but the winter had descended as hard as anyone could remember. Even the Pertuis d'Antioche had frozen solid, making it that much more difficult to supply his troops from the coast. Every day brought more deaths from cold and hunger, and the mood in the camps was turning dangerous. So now they were pulling back to Bordeaux, giving up their season's gains against the Huguenots. If only the cursed weather had been better!

On Homeline the weather *did* get better, as the Little Ice Age started to ease in the early part of the 17th century and faded entirely by about 1850. On Hyperborea-1 the temperature took at dramatic turn for the worse in the 1620s, and the Earth slid back into an ice age. By 1650, the climate had essentially reproduced the Younger Dryas cold snap 13,000 years previous. The world was anywhere from 10 to 20 degrees Fahrenheit cooler, with Eurasia on the stronger end of that effect. Almost 400 years later, Europe has been entirely destroyed and reborn: the old states are gone, and their colonies snuffed out or reclaimed by natives. In the warmer regions around the western Mediterranean, the Kingdom of Hatlain controls all the coasts and tries to hold its own against the tribes of the French steppes.

Homeline has an interest in the timeline because it's a good source of Renaissance art and the like. If one is willing to risk the frozen ruins of Paris or London, there are riches to be found. One trader has set up on the timeline itself, and with his skill and out-time knowledge has made himself a player in the southern lands.

Climate

Much of southern Europe is lightly wooded steppe, similar to the American West or Ukraine on Homeline. A wedge of it dips down from the Pyrenees into eastern Iberia, and is the heartland of Hatlain's farming. Along the coast of Provence and into northern Italy the land is too rugged for large-scale agriculture, and the people live on herds of sheep and goats. The Po River basin is the other major flatland area given over to grain farming.

Iberia west of a line from Cadiz to Valladolid to Bilbao is hilly and wooded, mostly pine but with some hardwoods in the south. The foresters get rich on their timber, which goes to ships and houses in the more populated east. Italy south of Rome is similarly wooded.

North Africa is even drier than in Homeline, if cooler, as moisture is sucked out of the air by the ice the dominates the seas and lands to the north. The Sahara away from the coast is uninhabitable even for the hardiest desert nomads.

Dominating the whole scene, however, are the freezing parts of Europe. North of 45°, the steppe and pine woods give way to cold bogs, where deep permafrost prevents liquid water from draining away. Eventually, once one gets to the

southern coast of England (the Channel is now just a few miles wide at the Pas de Calais), the permafrost reaches the surface. Inhospitable, windy tundra and icy deserts rule all the rest of the way to the North Pole.

Though the Earth is deep in another ice age, it's still too early on for glaciers to have advanced very far; the cold might keep snow from melting, but it also inhibits precipitation for lack of moisture. The north face of the Alps is only just starting to become ice-bound, as are Scandinavia and the Scottish highlands. Western Europe doesn't lack for ice, though, as the Atlantic as far south as Cornwall is choked with pack ice during the winter, and the North Sea and Baltic (the latter now a large freshwater lake) are invariably frozen over from November to April. In the summer the solid ice retreats to the northern fringe of Scotland but icebergs often drift south into the Bay of Biscay, sometimes even grounding themselves in the north of Iberia.

The Kingdom

Homeline's main contact with Hyperborea-1 is through Hatlain, the successor to the Spanish Habsburg kingdom of Iberia and southern Italy. Its lands were the most habitable ones in western Europe when the weather turned for the worse in the 1600s, and as the old order collapsed it suffered under waves of refugees from France, Germany, and the Balkans.

The capital, and the largest city in Iberia, is Saragoss (the equivalent of Homeline Zaragoza). As well as being home to the king, it is the most important inland port for the entire region. Barselon handles the coastal traffic, and is the major ship-building center for all of western Europe. In Italy, the kingdom's main cities are -- in modern Hyperborea's Hungarian-influenced Italian -- Roma and Napolya. A strip of coastal land through Provence connects the two, but it is cold and heavily watered by runoff from glaciers of the Massif Central and the western Alps; Homeliners find it reminiscent of the Scottish highlands.

A similar strip of land along the North African coast completes Hatlain's enclosure of the western Mediterranean. Their presence here is restricted to seaside villages, though Tunis is a naval base protecting the sole strait between the eastern and western Mediterranean now that Sicily is attached to Italy at Calabria.

Infinity puts the total population of the kingdom at three to four million, which is extremely low for this part of the world -- it is, for example, less than Homeline had here in 200 BC. The upheavals of the new ice age have been so great that nearly the entire population of western Europe starved to death before learning how to use crops more suited to the frosts and snows, or even switch to nomadic herding north of the Pyrenees and Alps. In the meantime, wildlife and large pine forests have grown in the region, and there is still much empty land. In the last 100 years, though, things have turned around and Hatlain is growing at a slowly increasing pace.

The Church

Hatlain's existence as a viable state owes a lot to family connections between the nobles of Iberia and Italy: after all, the two regions were already connected under the Habsburgs when the climate started to sour. The Habsburgs themselves are gone, but the Molinas, the de la Cuevas, and others had holdings on both sides of the western Mediterranean and provided a framework for the re-establishment of feudal government.

Their efforts would have been unrewarded if there hadn't been for farmers and merchants to build on, though, and they made it through the worst times of the 17th century because of the Catholic church. The church was already retrenching as the Thirty Years War got underway when the temperature diverged from Homeline's; their efforts had them thinking about adaptation just as it was most needed. The Inquisitorial court in Zaragoza became the seat of law for ever-increasing parts of Iberia, and eventually crossed with Papal power in central Italy to form the core of the kingdom's judiciary; the Pope is essentially the Supreme Court of Hatlain, and by Homeline standards the country is semi-theocratic. The nobility may own property and capture criminals, but the Church rules on the laws.

In return, the Church has continued its charitable role. The tithe was formalized during the upheavals of the early 17th century and is essentially a taxation system that supports a rudimentary social safety net.

The Turks

Only one European power retained any continuity through the 17th century, and that was the least "European" of them. The Ottoman Empire was near its height in the 1620s, and no part of their possessions became completely uninhabitable. The upheavals elsewhere and recurrent famines did hurt them -- their control over Africa west of Tobruk dissipated -- but the Emperor still ruled in Istanbul, the muezzins called to prayer in Jerusalem, and the Nile still flooded in Egypt.

The Turks are by far and away the greatest threat to the continuing existence of Hatlain; the fact that the two countries touch only along the Adriatic (Tripolitania is an uninhabited no-man's land) is the main reason that's kept Hatlain from falling to the Ottomans some time in the last four centuries. The people of Hatlain know it too. Their harvest festival is explicitly a celebration of three major battles (Poitiers, Lepanto, and the Hyperborean-specific Conillera) that took place against Muslim forces within the first weeks of October.

Hatlain's relations with Turkey alternate several years of frosty relations that nevertheless allow trade with a year of campaigning whenever religious hatred flares (usually in Istanbul, though Saragoss is not entirely innocent). The wars are invariably a combination of land campaigns in Italy with naval clashes in the Strait of Sicily. The fighting ends when Hatlain manages to defeat the Turkish fleet, as with enemies on other sides the Ottomans can't concentrate their attention like the western kingdom can. With that done, the Muslim forces in Italy are cut off and defeated, a treaty signed, and the war begins again a few years later.

Technology

At first glance, Hatlain is medieval: peasants farm while nobles ride, castles dot the landscape, and there's an appalling lack of sanitation. Upon closer examination, however, the previous late-Renaissance civilization on which it is based pokes through.

Before Hyperborea-1 diverged from Homeline, Europeans had developed the printing press, telescopes, and flintlock weapons (the latter only just in time). All three are found in Hatlain four centuries later. Similarly, the Columbian Exchange had already happened, so everyday food features New World imports like tomatoes, potatoes, and maize. Tobacco is a cash crop in Andalusia. Even the sciences are somewhat further ahead than might be expected, as the new European civilization builds on Galileo, Napier, and William Harvey; Descartes never published, but his ideas circulated by word of mouth in the decades before France collapsed. 150 years of printed books prior to the divergence point have kept most ideas from disappearing, and the kingdom has access to them.

The Mountebank

Freeman Reil is a former Infinity agent now turned time trader. He's used his expertise to hunt down famous art objects across the multiverse and bring them home to high-paying clients. Having made his fortune, he has taken the unusual step of retiring to Hyperborea-1. Permanently relocating to an inhabited timeline is rare, and fraught with legal hurdles, but Freeman has plenty of contacts in the Corps and large amounts of money; people inclined to cause trouble shy away from him as a hard target.

His cover is a traveler and wise man from a Christian kingdom on the far side of the Turkish Empire. While it's true a fragment of Armenia has reformed in Mesopotamia, it might as well be on the Moon for its lack of contacts with Hatlain. For Reil, the fantastic tales of the world beyond the Turks just help cement his disguise.

Since arriving in Hatlain, Reil has ingratiated himself with the king and several powerful members of the Church by becoming the "prince of retrievers" -- the Hyperboreans are no more immune to the material charms of their old civilization than Homeline. Reil uses his Homeline research team to pin down exactly where an item or resource might be found and mixes retrievals to alternately get cash from folks back home or bring a local ally onside. In the few years since he arrived, he has worked his way into a position of informal power, and avoided the usual troubles of

social climbers thanks to his near-infinite supply of largesse.

In return for his services, the king of Hatlain has granted him the fief of Val d'Aran, up in the Pyrenees near the *de facto* border between the kingdom and the tribes to the north. There he amuses himself by improving the life of his "little people" with out-time knowledge -- he's even helped re-open the local lead mine just because he can. As well as being a convenient base for further expeditions into France and England, the valley is also far enough off the beaten track that it lets Reil control how much information gets back to Homeline about his actions.

This is important to him because, as well as being a businessman and an erstwhile wise man, Freeman is the head of a group secretly dedicated to ending the Secret. When he was an Infinity agent, he favored boot-strapping various other timelines up to Homeline's level and -- in the process -- recruiting them as allies against the Centrum. Reil's other major interest is humanitarian: he thinks Infinity's pieties about cultural contamination and non-interference are abdicating their responsibilities. Were it up to him, Homeline would make more effort to help people who are less well off; anything else is just a cover for greed. When he came to the conclusion that he was never going to change Infinity's policy from the inside, he left to found his cultural retrieval service and recruit others to his cause while he was at it. Now he runs a good-sized fifth column within Infinity and Time Traders, as well as having several native recruits spread across multiple timelines. While the Corps has encountered and arrested some of these agents, through careful use of compartmentalization and anonymous communication they have little idea of the organization's size, or leadership.

Reil has one of three potential roles in an adventure. First, the time travelers may interact with him openly, receiving orders from their superiors (themselves members of Reil's group) to aid him in some frozen venture. The other roles open up if the group realize their orders are not ordinary -- too much travel to get to projectors specifically under the control of Reil's people, for example, or goals that seem remote from anything Infinity normally wants -- and that they're on the edge of some other group. If they discover Freeman's secret agenda they can then either oppose him, or he can be a useful patron for players who've come to the same moral conclusions as he has.

The Native-Born Exile

After northern Europe fell apart, any number of ethnic groups' remnants migrated south and were assimilated into the cultures of the Mediterranean. One that didn't was the English Catholics, who were grudgingly welcome in Habsburg Spain and gradually turned into an underclass like Spain's Jews and Gypsies.

One of the foremost members of this group is Maria Howard, the scion of 17th-century England's small Catholic nobility, and that's a heritage she takes seriously. While she lives in poverty, like all her people, she is well-known to all of them and is treated as their young queen no matter whether she is in her native Barselonian dock neighborhood or across the ocean in Italy. She is a roguish figure, living up to the stereotype of the English in Hatlain: traveling more often than not, and engaged in a variety of nebulous activities that short-sighted officials think of as criminal.

If Reil is an adventurer's entry point to Hatlain's upper level of society, Howard is the one to the lower classes. She is always on the lookout for an advantage, and is inclined to do anything for money if she can square it with her peculiar notions of English and Howard honor.

Adventure Seeds

You Can Have the Body: The Swedish king Gustavus Adolphus is an important figure on several timelines that hinge on the Thirty Years War, sometimes ending up as Emperor-Elect of the German Empire (a remarkable accomplishment for a Protestant) or in some other positions of semi-dominance. On timelines where he avoids or survives the Battle of Lützen and reaches old age he is usually quite sickly. An Infinity researcher has discovered that Hyperborea-1's Gustavus Adolphus died in Paris in 1641, one of many Swedish refugees from the cold. He wants to retrieve genetic samples from Gustav's body, buried in the royal cemetery, which may not have risen above freezing in all the years since. The hope is of getting insight into how to cure (and so entice) the other Gustavs across the continuum.

Traveler's Aid: Several of Freeman Reil's agents have reported strange events during nights spent in Toulouse. Reil has an idea why: The ruined city probably has a reality shard in it. His best guess is that it's a reliquary of Saint Christopher, a two-foot silver statue of its namesake that reputedly contained some hair clippings from the saint. Homeline's version of the statue (but not the hair) is in the Metropolitan Museum of Art where it displays no unusual qualities. On timelines where the reliquary and relics have not been separated, however , it's sometimes the center of strange happenings and Infinity suspects it's a single shard "piercing" multiple worlds. All are well-guarded, but Reil has come to the conclusion that the one on Hyperborea-1 is still intact and was abandoned in Toulouse when the ice came. Unfortunately, while the empty and crumbling city is not very far north of Hatlain's boundaries, it is protected by fierce local tribesman. Even worse, the shard seems to have a particular effect on Infinity personnel -- Saint Christopher is patron of travel, and it seems to home in on travelers from other timelines. Two of Reil's agents have been unable to find it despite weeks of effort, and locals aiding Reil's efforts are repulsed by seemingly random events.

On the other hand, if it can be retrieved he's sure he can do something with it (even though it's not clear what).

Uncovered: Muskari Salih is the representative of the Ottoman emperor in Saragoss, the one who keeps him apprised of business in Hatlain and passes on messages from the king. As is often the practice for ambassadors he is an intelligence agent as well, delving into the inner workings of Hatlain in search of anything that might assist his country.

Of late, he has come to the conclusion that there is some nebulous organization in Hatlain, perhaps a conspiracy plotting an uprising against the king -- though no matter what explanation he forms, Salih often finds their actions puzzling. In fact, what he has partially discovered is Infinity's operations on Hyperborea-1. It is now necessary to persuade him to look away. This is easier said than done: he is curious, well-connected, and familiar with the rough-and-tumble of espionage.

My Eye on You: Nayin Jones does not like crosstime conquerors. Her life is what it is because of one (see "Infinite Crossroads-2: Koshezak and Betenamal"), and she wants to prevent that from happening to others. While it's not explicitly part of her job she likes to keep an eye on various people who've set up shop on pre-industrial timelines, and make sure they don't have any funny ideas. Her superiors know better than to get in the way of her interest, and besides: she sometimes comes up with something interesting.

The latest figure in her sights is Freeman Reil, and anyone who may have been working with him. If that's the players' characters, she will use whatever leverage she has to turn them into double agents.

A Troublesome Gift: TEM Partners is a new enterprise looking to get into crosstime trading. They've selected Hyperborea-1as a target, and are aiming to get some gifts to Jaim II, king of Hatlain. Once in his good graces, they hope to obtain some space in Barcelon from which to operate. Their chosen cover is as Bavarian nomads, trading in the south on behalf of the relatively sophisticated kibitki-dwellers of the north. This means that the "cover-appropriate" gifts they bring are amber, animal skins, and narwhal horns supposedly from the coast of Scotland. Unfortunately, someone also thought that a live polar bear would be a good option, and that several Infinity agents should be assigned to assist the embassy as it sails from the small port of Marseille to Barcelon and then proceed inland to Saragoss.

Using The Age of Ice in Other Settings

Lots of fantasy worlds have a north. Hatlain is a chance to use some of it. Its main pre-requisite is a lost golden age (which fantasy worlds also have in abundance) along the lines of the one in H.P. Lovecraft's "Polaris." Hatlain becomes a fragment of that lost kingdom, clinging to the edge of the ice as a home base for adventurers delving into a treasured past. Even Freeman Reil can make an appearance, for who else would be most interested in that world's magic than some wizard from an advanced, southern nation?

A science fiction setting with a deep enough history (along the lines of *Fading Suns* or *Traveller,* as opposed to *Star Trek*) could use Hatlain almost as written. It's common to relegate the Earth to a position of no importance, and with enough time the cycles of the world will roll around to ice again. H. Beam Piper used a decrepitly backwards, frozen Earth to good effect in "The Keeper," which has fallen out of copyright in some of the world and can be read through Project Gutenberg at http://www.gutenberg.org/files/19338/19338-h/19338-h.htm.

Introduction

There is only one body to coordinate law enforcement efforts beyond the City Council: The Watch. Responsible to the City Council, the Allied Guard were established as a body within the Watch to coordinate and catch would-be taxpayers who had not registered with the tax office (see page 143 of **GURPS Banestorm**, and "the Watch" on page 8 of **Tredroy**). In this matter, they were such a great success that the Council expanded their mandate to include other activities that were major crimes in all three cities such as murder, fraud, and grand theft. Without this law enforcement body, criminals can simply flee into another country to escape justice, and it is up to bounty hunters to return them (page 7 of **Tredroy**). TAG officers wield short staves between two and three feet long, too short to require registering with the Guild of Mercenaries (Tonfa) (page 9).

Despite this, most citizens prefer dealing with a Watch officer rather than a local Guard officer due to the Watch's limited mandate regarding petty crimes (page 7). Still, any minor law-breaking can be added to corroberating evidence and character witness in trials of larger crimes, resulting in a stiffer sentence. Alternatively, the Watch can choose to detain an individual to be arrested by the City Guard, should the situation warrant it. Touchy issues that are handled on a case-by-case basis include kidnapping or murder of someone classified as a slave in an Islamic country. Relation to other police forces usually cordial, but individual reactions vary. Depending on the crimes, a criminal might be extradited with an escort to a foreign court to be sentenced, and after the first sentence is carried out (such as jail time or punishment), they will be extradited to the second country. The trials are all carried out first so that witnesses and evidence are fresh.

> ### Useful Resources
>
> Ideally, a GM should have on hand **Banestorm** and **Tredroy** and would do well to have **Fantasy** and **Magic,** but none are neccessary to use this article as is. This article describes an international task force that is designed to help keep the peace in the triple city of Tredroy. Discussed are their mandate, recruitment process, and even some of the problems they face, and it is rounded out with an example template and character.
>
> For those without **Banestorm** or **Tredroy:** Tredroy is a mixing pot of Yrthian culture, as it is built at a fork in the Blueshoal and Lorian rivers. The city is governed from the Council Island in the center of the fork of the rivers. The three coasts each are territory of a different country, bringing in their own merchants, people, traditions, and laws.

Operations

A normal TAG patrol consists of at least three officers, sometimes called a "TAG team." The three officers serve as corroberative witnesses, and ideally to represent each quarter of the city. Under normal circumstances, the group will follow the lead of whichever officer is in their home region, but newer officers or in the case of multiple officers from the same area, seniority will usually take precedence.

The major crime that this department is set up to pursue is tax evasion. The TAG's main purpose is to identify and apprehend those who have been living in Tredroy over three months and have failed to register at a tax office (see "Taxation" on pages 7-8). The TAG are efficient at what they do, and the fines fund the operation. The hard numbers and dollars appeal to the merchants and nobles in the form of tax returns, helping resist bribes to overlook major crimes. Those with money are less likely to be bribed by it. A good payment history and a prompt payment of all taxes upon request can sometimes grant a criminal leniency if one appears penitent.

Training and Recruiting

Recruits are chosen for their powers of observation, and a basic grasp of numbers. Most TAG officers are recruited from the Watch and the local constabulary forces. The promotion is welcome, as there is slightly less danger as TAG members operate as a team rather than solo. The specific departments' officers typically know their beats better than the average TAG officer, who must have a basic familiarity with all districts as well as the Council Island. Most TAG officers know and are known by most customs officials at the gates and bridges due to the frequent crossings. Because of the scope of the TAG mandate, officers must be familiar with the customs, language, and culture of the three countries. As detectives, they must know how to read body language and quickly sort out key witnesses.

One of the more controversial aspects of the training program is the integration with the local bardic community. Few individuals know as much about psychology and reading emotions as a master bard. From the teacher, TAG recruits and officers learn how to listen, how to observe a scene, recognize people, speak in public, read lips, and learn when people are lying, detect smuggling, holdout, pickpocketing, and filching. Knowing how to play a musical instrument is not required, but can earn extra respect from the teachers. Music and Dance Magery has a place, and is encouraged by bardic traditions. TAG officers with the most promise are given basic bardic training: Eidetic Memory (Preparation Required, 1 minute, -20%) [4] (See *GURPS Fantasy* pages 219 & 227). Some veteran officers are even welcome at the Singer's Green (page 49 of *Tredroy*). In addition to bardic teaching, the bards can act as informants across national borders. The bards' G-String tavern is a place where much information is traded. The bards' reputations are safe as connections as the Watch is not able to arrest citizens for petty crimes.

Crime

"Listen very carefully, I will only say this once."
-- Allo Allo

A "typical" crime scene investigation flows as follows: The crime is reported, and witnesses are questioned. The scene is investigated for clues and suspects detained. If the detectives decide that the evidence and suspects warrant it, forensic experts examine the scene, and diviners look back in time to witness the events. Lab people examine clues, and use history-viewing spells to look into the past. Due to Islamic teachings, magic is not, in of itself, evidence. It can be used to locate witnesses and real, physical proof, but it is only as reliable as the mage who "witnesses" the events using magic (page 9). If divination can only reliably go back to a person's death, criminals may assault a victim with a slower acting poison to prolong the time he has to get away.

TAG officers recently located a poorly hidden cache of assassin's weapons, including crooked daggers, garrotes, and potions. A police spokesperson says that the most insidious item found was a potion containing a combination of a sleeping drug, healing potion, and a fast-acting poison with a slow onset.

A new-cutting technique is the use of fingerprinting to uniquely identify criminals. It is described as being "Like a portrait, but faster." Many muslims claim to be against it because it is profane to make an image of man. Fingerprinting has been around since Earth in the mid 1800s, but this technique was recently "discovered" by alchemists and the principles were disseminated to hundreds of people at once. Thus, it seems to be a natural phenomenon, rather than a leak from Earth. Disguises and masks are becoming popular among criminal elements. Many use the cover of artificial darkness to change disguises. Some simple illusions have becom popular, such as obviously false lizardman disguises. Others include William Shakespeare, and a Sahudese dignitary in formal martial arts robes. Some gangs sport identical illusions to help confuse law enforcement efforts.

There is surprisingly little friction with the guilds of thieves and assassins. Both hold that if someone was sloppy enough to get caught, they will become wiser with this experience. That ceases to apply should the suspect become loose-lipped about their guild. All criminals other than those brought in for tax evasion are released to the guilds.

Noble Deeds

Crimes masterminded or perpetrated by nobles are difficult to pursue. This is especially true across international borders. If the TAG forces get a warrant, they can bring the noble in for questioning. A trial by peers is usually the

result. A great many individuals make choices based on powerstone enchantment forecasts, as they cannot be foretold (see *Magic,* p. 12). Crime bosses direct actions based on private enchanters. Having private enchanters is not that unusual, as powerstones are a valuable commodity, and many businesses need private random numbers to keep ahead of competitors' diviners.

TAG as a Patron

As an elite force, TAG officers watch out for their own. TAG can quailify as a Patron to some officers. Individual officers can amount to Allies and Ally groups to some individuals. That said, not all officers inspire such a level of comadarerie to earn the advantage.

TAG as an Enemy

If a criminal is notorious enough that all TAG members are given their description and known aliases, they could earn TAG as an Enemy. How close the campaign will be to Tredroy will determine its frequency. The roll coming up in a campaign taking place away from Tredroy might mean bounty hunters seeking to gain a reward. Vigilantees and private investigators are generally accepted as long as they are polite, do not break laws and report anything they find. Acting suspicious or sufficiently annoying an individual officer could earn him, or even the whole department as an Enemy (Watcher).

What this means for Adventurers . . .

. . . As Officers Themselves

The current article is intended to be a resource to base a Watch campaign, in which the PCs are all part of an investigative agency in Tredroy. The heroes are on duty, investigating crimes. For example, a TAG officer teams up with a troubleshooter from the Church, a detective from the Emir's Guard, and a Guild "security" specialist (e.g. Thieves').
Advantages: Adventurers have definite goals
Disadvantages: Structured, can be limiting in scope and progress. Some sense a lack of progress, unless it is to topple a crime boss, be it a crooked councilman or lord.

. . . As Consultants and Expert Witnesses

Heroes often chase master villains, at first by the crimes they perpetrate, and the underlings they hire. Should the detectives hear the PCs are asking questions about criminals involved in a string of crimes, they could seek to collaborate, or at least find out what the amateurs know. Honorable detectives might accept help unofficially, should the heroes have any hints as to the villain's motives or abilities, even if they would lose face by asking up front. This has the double advantage that the force cannot officially ask the would-be detectives to stay away. Unfortunately, a cliché of detective adventures has law officers scoffing at the work of any amateurs, sometimes threatening to arrest such interlopers, even if they have not committed any crimes. Adaptive detectives could bring the heroes along, to keep an eye on them, or vice versa.

In a more mundane point of view, Player Characters are often geniuses, and possess skills ranking in the range of "world class expert." In this capacity, they can be called upon to translate documents, discuss therories found, or examine unusual radiation or runes. The experts can then be called in to testify as to the origins of items and abilities of weapons. If the heroes are strangers to the location, their testimony could be chosen as unbiased, or to save time going through the sea of red tape to get the time of a guild wizard or university professor. For example, when the ice vampire is claiming lives, the heroes can identify whether the markings in a room are consistant with the creature they know from the previous town.
Advantages: Heroes are sought out; PCs get exposure.

Disadvantage: Not all PCs are experts; law agencies may be evil in the campaign.

. . . As Witnesses on the Scene

The heroes are going about their business, when they witness a crime occur. If there is a lot of money involved, it is likely that someone will try to influence witness testimony in some way, perhaps even subtly. Refusing a bribe or blackmail threat can have repercussions for years, as can accepting one. The latter can be a level against the character for the rest of their life. As an example, the heroes might witness a wizard's guild merchant outlet being robbed; they happen to see through the illusion. A crime boss wants to silence all witnesses, and first bribes the PCs to silence, then threatens their Dependents and families.
Advantages: Ease of connection to any campaign in or near Tredroy.
Disadvantages: Short connection to campaign.

. . . As Innocent Suspects

The heroes are going about their business, when they happen to be in the wrong place at the wrong time, or a foe plants evidence they are involved in a crime. This is almost as inconvenient as the situation in which the PCs are guilty of a different crime, or about to commit one. This could be made more inconvenient in a situation in which they must clear their name and get about their business while detectives dig into the group's past. ("So, you have a broadsword with seventeen notches in one side. Interesting.")
Advantages: Intruduces the agency without direct repercussions.
Disadvantages: Players may feel threatened or suspicious.

. . . As Criminals or Guilty Suspects

One fantasy and RPG standard holds that if the PCs see some great injustice, and the criminal gets away with it, it is acceptable to break the law to right the wrong. A GM wishing to explore this conundrum can put investigators on the trail. Clever heroes will figure out how to lead the detectives to proof of the original crime. The heroes are trying to stay one step ahead of the law as they try to accomplish some goal. A GM can plan out first what tools the detectives have, and then let the PCs plan out any heist with every tool they have. After the heist goes down, check to see what the police find. If the heroes are caught, it would be appropriate for them to stand trial, no matter how much the players want their characters to break out. The prisoners could simply be charged with an adventure that would mean certain death to *ordinary* people (such as the film *XXX*).
Advantages: Logical cause and effect.
Disadvantage: Players may not like causality. The work plan is an easy way out.

TAG Investigator Template [75 points]

(Extrapolated from Detective, *GURPS Cops*, page 46)

Primary Attributes: ST 10; DX 10; IQ 12 [40]; HT 10. *Secondary Characteristics:* Per +1 [5].

Traits: Taboo Traits (Innumerate).

Advantages: Eidetic Memory (Preparation Required, 1 minute, -20%) [4]; Legal Enforcement Powers [5]; Police Rank 1 [5]; and 15 points in Acute Senses [2/level]; Ally or Ally Group (TAG officer(s)) [varies]; Charisma [5/level]; Combat Reflexes [15]; IQ+1 (but remove Perception+1) [15]; Perception [5/level]; Contacts [varies]; Patron (Individual or TAG) [varies]; Will [5/level]. (Total: 25 points)

Disadvantages: Duty (Job, Very Hazardous, 15-) [-20]; and -17 in Addiction [varies]; Bad Temper [-10*]; Discipline of Faith [varies]; Intolerance [varies]; Overconfidence [-5*]; Pacifism [varies]; Secret (Corrupt) [varies]; Sense of Duty () [varies]. (Total: -37 points)

Primary Skills: Area Knowledge (Tredroy/Al-Haz)-12 (IQ E) [1]; Area Knowledge (Tredroy/Al-Wazif)-12 (IQ E) [1]; Area Knowledge (Tredroy/Cardiel)-12 (IQ E) [1]; Criminology-12 (IQ A) [2]; Detect Lies-11 (Per-1 H) [2]; Forensics-11 (IQ-1 H) [2]; Interrogation-11 (IQ-1 A) [1]; Law (Al-Haz)-10 (IQ-2 H) [1]; Law (Al-Wazif)-10 (IQ-2 H) [1]; Law (Cardiel)-10 (IQ-2 H) [1]; Observation-12 (Per-1 A) [1]; Professional Skill (Law Enforcement)-12 (IQ A) [2]; Shortsword (Baton/Tonfa)-10 (DX A) [2]; Writing-11 (IQ-1 A) [1]. Secondary Skills: Survival (Urban)-12 (Per-1 A) [1]; Hiking-11 (HT-1 A) [1]; Savoir-Faire-12 (IQ E) [1]; Stealth-11 (IQ-1 A) [1]; Streetwise-12 (IQ A) [2]; Shadowing-11 (IQ-1 A) [1]; Theology (Islam)-11 (IQ-1 H) [2]; Theology (Christian)-10 (IQ-2 H) [1]; Heraldry-11 (IQ-1 A) [1]; Fast-talk-11 (IQ-1 A) [2]. (Total: 12 points)

Background Skills: Total of 6 points in Administration (IQ A); Animal Handling (IQ H); Brawling (DX E); Diplomacy (IQ H); First Aid (IQ E); Hazardous Materials (Magical) (IQ A); Knife (DX E); Lip Reading (Per A); Psychology- (IQ H); Public Speaking (IQ A); Running (HT A); and one of Occultism (IA A) or Thaumatology (IQ V).

Example Character: Marcus Niall Usham [150 points]

Marcus is, on the outside, a typical officer; however, on the inside he is a conflicted man and Megaloan spy. He sees no conflict in swearing loyalty to the Tredroy Allied Guard, as he is certain that he will not betray them. He simply reports on merchant and noble activities for his "uncle," a trader in Megalos. Every week, he sends a letter to his "uncle" in Megalon, some of which contain hidden messages and codes. Growing up in Megalos, he was taught the ways of Islam, but rejected them as a rebellious teenager looking to advance in Megalon society. As a descendant of Muslim immigrants to the metropolis of Craine from the border city of Raphael, his darker skin and knowledge of the Koran made him the perfect agent to infiltrate Tredroy (see ***Banestorm,*** pages 98 & 100). Already possessing the technique of a perfect memory as part of his spy training, he no longer has to disguise its use. In the year since his arrival, he has begun to have second thoughts about his mission. The free-spirited Islamic faith combined with the sense of comaraderie are calling to him.

Primary Attributes: **ST** 10; **DX** 11 [20]; **IQ** 13 [60]; **HT** 13 [30].

Secondary Characteristics: Dmg 1d-2/1d-1; BL 20 lbs; HP 10; Will 13; Per 14 [5]; FP 12; Basic Speed 6; Basic Move 6; Dodge 10. (Total: 115 points)

Languages: English (Native) [0]; Arabic (Native) [6]; Latin Spoken (None)/Written (Accented) [2]; Tredroy Patois (Broken) [2]. (Total: 10 points)

Advantages: Charisma +3 [15]; Combat Reflexes [15]; Eidetic Memory (Preparation Required, 1 minute, -20%) [4]; Empathy [15]; Legal Enforcement Powers [5]; Police Rank 1 [5]. (Total: 59 points)

Random Quotes for Random Folks

Last week we were looking at **quotations**. Curiously, the entire body of that piece ended up being about utilizing the lyrics to songs. Whether this is a result of random chance bringing those ideas together or intelligent design, I'll leave to future school boards to decide.

However, that's not the only source of inspiration quotations. Indeed, song lyrics have a purposefully "artful" quality to them; they're designed for another purpose -- sounding good to music -- and those often result in quotations that are somewhat alien to our ears.

No, far more common are your humdrum quotations: interesting things that people have said or written. Given that many people end up saying or writing untold volumes of words in their lifetimes, it's no wonder that a few choice morsels end up surviving the ages, for us to swipe and adapt with abandon.

Continuing our thought experiment from last week, I've clicked "reload" a few times on the random-quote portion of the website **quotationpage.com** (complete with all quote-dictionaries selected). I've then taken some of the quotes there (discarding many of them) and chewed them in my mind, mulling over the following possibilities. These aren't the end-all of what you can do with quotations, but they should give some ideas you hopefully haven't thought of, complete with some worked examples.

1) The quote is imagined being said by or about a character. What insight does the quote provide into that character?

Example: *Efficiency is intelligent laziness.*
-- Anonymous

When I read this, I immediately considered a twist on the typical mad-scientist super-genius character. What if you had a character with the intellect of Reed Richards or Sherlock Holmes, driven not by the pursuit of the game but by extreme laziness? Imagine Jughead (from Archie comics fame) as a mad scientist. This concept might be the first "realistic" super-genius inventor that doesn't unbalance a campaign. Q: Why doesn't the world have flying cars? A: Do you know how much *work* that is?!

For this method, consider trying to use a "dictionary-quote" style, where quotes are sorted by topic or keyword. After all, if you're trying to come up with a character with forceful thoughts on love, politics, religion, or sacrifice, finding out what other people have said on the topic might give you a jumping off point for a new or different concept yourself.

2) The quote can be applied to an existing world or situation.

Example: *The past is a foreign country: they do things differently there.*
L. P. Hartley, *The Go-Between*

That's a concept someone can apply to any **Time Travel/Infinite Worlds** campaign. And, indeed, it can inspire all manner of adventure possibilities: What if a mission required more attention than normal to the "customs" of a bygone era?

Really, using quotes for this style of inspiration isn't terribly different than using song lyrics, a la last week's installment.

3) The quote is modified, adapted, or stolen whole cloth, to be used by a PC or NPC.

Example: *Never interrupt your enemy when he is making a mistake.*
-- Napoleon Bonaparte (1769-1821)

Ahh, good old Nappy was always a source of wondrous quotes. This is a great quote for any Machiavellian or tactical character. Of course, it's possible that one might feel guilty just stealing someone else's words, even if it's for such a noble cause. Fortunately, there's nothing that says you can't take an existing quote and tweak it enough for your own purposes. So, cranking this quote through the hopper, I came up with:

Always wait to strike until your enemy has ceased making mistakes.
--Any Darn NPC I Want To Attribute It To

Again, most of the flavor . . . entirely original. (Of course, I'm personally of the mind that -- for a personal game -- there's absolutely nothing wrong with just leaving a quote as is. As Tom Lehrer [sang](), "Plagiarize; let no one else's work evade your eyes . . . only be sure always to call it please 'research.'" On the other hand, if it's intended for publication, always attribute or file the serial numbers off.)

Let's take this technique on another quote our randomized search popped up:

Example: *Government is like a baby. An alimentary canal with a big appetite at one end and no sense of responsibility at the other.*
-- Ronald Reagan (1911-2004)

That's a clever quote on its own, and one that can be adapted for a number of settings:

Managing the Thieves' Guild is like caring for an infant: Both demand time and attention at all hours of the night, and both are responsible for all sorts of foul nastiness in the end.

4) As a final idea -- especially if you need to come up with better-than-cardboard characters quickly -- is to use a source of these quotes to generate NPCs, outlooks, or happenings. Do the heroes send 10 different wards off to forge their own destinies in a fast-moving campaign? Don't worry about trying to make up their fates; simply click on the random-quote link and try to figure out how each one applies. (Really, using a random-quote website for this method is almost one step above tarot-card reading, but it's fast and could well produce some interesting results.)

Again, the notion behind these techniques is to inspire something into existence that wasn't there before. There's precious little that can be done for a Great Random Adventure or NPC Generator That Works In All Situations, but you can get pretty close using a source of quotes and some mind wandering.

As a final note, I stumbled across this quote in the first page of quote-reloading I did in this experiment:

There are three rules for writing the novel. Unfortunately, no one knows what they are. Somerset Maugham, The New York Times Book Review, September 30, 1984

The same quote could just as easily apply to running a good game.

--Steven Marsh

The Omniscient Eye

If My Eyes Are Running, How Fast Do I Need to Move to Catch Up?

I'm wondering about the movement rules so popular in games. What's the real story? Figuring out how fast some one can run under ideal conditions isn't that hard (just look to world records), but how fast can some one run under realistic conditions. In other word, if you're not an Olympic athlete, running on a smooth track with light clothing and running shoes and no encumbrance. What if you're not even running in a straight line? What if combat is occurring around you, or someone is shooting at you? What then?
--Patrick Smith

A typical adventurer has a sprinting speed of 6.4 yards per second. At least, that was my average speed. Reasoning that the best way to answer this question was to try it and see, I set up courses and got my wife to measure how far I could run in six seconds -- one round of **d20 System** combat. (Distance covered per round has been converted to yards- per-second in Table 1.)

Standard Conditions (6.4 yps): Wearing running clothes, I sprinted in a straight line along a flat dirt road. These are the best conditions one can have in a wilderness setting. Even after dropping weapons and treasure-filled sacks, the typical adventurer is more encumbered than this.

Boots (6.4 yps): I sprinted along the same course wearing running clothes and boots. Although the boots added four pounds to my weight, they did not slow me down. This is similar to the encumbrance of an unencumbered adventurer.

Chainmail (6.0 yps): I sprinted along the same course, this time wearing boots and my wife's chainmail. The chainmail did slow me down. An armored adventurer wears more than a 15-pound tunic, but because he is stronger than I am and because his armor fits better, these conditions are similar to those he would be facing (unless he is wearing full plate, of course).

Comparison of the Author and a Typical Adventurer

An adventurer is athletic.
The author has played ultimate frisbee (a sport requiring a lot of sprinting) at the league level.

An adventurer is in good shape from tramping through the wilderness.
The author was a varsity long distance runner in high school and has continued to train for and run in various races. At the time of the experiment, the author had been training for two weeks after a winter hiatus.

An adventurer is not specialized in sprinting.
The author is considered to be fast by those who play against him on the frisbee field, but he could not have run for his high school at any distance under 1600 m.

An adventurer is strong from swinging heavy weapons and carrying heavy armor.
The author is not.

Hurdling Brush (5.4 yps): The second course was laid out in a straight line through bushes one to three feet high. I jumped over everything in my way. I am not an experienced hurdler, and neither is the typical adventurer.

Weaving Through Brush (5.6 yps): I was slightly faster using a different technique on the same course. Instead of hurdling the brush, I went around. It is worth noting, however, that my final two trials were better than the previous three. The improvement in speed could be due to learning the course. An adventurer is usually running an unfamiliar course.

Obstacle Course (3.6 yps): This course went over a fallen tree, up an earth dike, down the other side, and over another tree. Speed was slower because of the elevation change and because the hurdling was more challenging.

Though I ran this course efficiently, it is possible that I could have run it more quickly by taking more risks. A fleeing adventurer, if he is willing to take those risks, covers the ground more quickly -- at least until he breaks his leg.

It is surprising that encumbrance has so little effect -- at least it was surprising to me because sprinting in boots was much more strenuous than sprinting in running shoes. It is possible that the boots did reduce my leg speed but that the extra traction they provided compensated for this. I suspect that over several combat rounds, the weight begins to take its toll and an encumbered adventurer is not able to maintain this speed for long. Instead of giving movement penalties for encumbrance, a GM might wish to give movement penalties for fatigue, with fatigue increasing more quickly for adventurers who are carrying more weight.

Chainmail does slow a runner down -- not only by adding another 15 pounds of weight, but also by flapping around, thus dissipating kinetic energy and altering the runner's form. I should have worn a belt to diminish this effect, but we were trying to limit ourselves to a two-minute rest between trials and completing the change into boots and chainmail in that time was difficult enough.

Terrain proved to have a more significant effect than encumbrance. When hurdling brush, my speed was only 85% of my speed on the road. On the obstacle course, my speed was only 56% of my speed on the road. (My speed in chainmail was 93% of my unencumbered speed.) When the party is fleeing through interesting terrain, the GM should feel free to reduce their speed. This experiment shows that speed reduction factors of 50% to 90% are reasonable.

The Standard Conditions are intended as a control. By running along the same course in boots and in chainmail, I was able to test the effects of encumbrance. By running along different courses in running clothes, I was able to test the effects of terrain. But other factors such as the time of day, temperature, amount of warmup, and degree of fatigue can affect the sprinter just as significantly. (The experiment was designed to keep these factors the same for each level of encumbrance and terrain; see sidebar.)

To simulate the situation faced by a fantasy adventurer, I should have spent a few hours wandering through a dungeon before running the sprinting trials. Instead, I spent a half hour warming up. Being a distance runner, I require a substantial warm up before I can sprint at maximum speed. When an adventurer needs to run, he does not have time to stretch first, but his muscles are probably loose from walking or fighting. Of course, after too much activity, the adventurer must deal with fatigue. I did this experiment after two weeks of long distance training, which enabled me to do 30 six-second sprints without slowing down. I did, however, take a two-minute break between each sprint. The typical adventurer is not a long-distance runner and does not get two-minute breaks between combat rounds. As explained in the sidebar, my performance should be similar to that of a typical adventurer -- a typical male adventurer. Females are slower than males at similar levels of competition. In surveying 100-meter dash results from state-wide, national, and international competitions, I noted that the fastest women were running at roughly 90% of the speed of the fastest men (with female performance coming closer to male performance at higher levels of competition).

Other Factors That Affect Sprinting Speed

An individual's sprinting speed can vary greatly depending on the time of day, temperature, amount of warmup, and degree of fatigue. Because a person can be fast on some days and slow on other days, all sprinting trials were run in the same 60-minute period, one every two minutes.

Based on previous experience with sprint work outs, I expected that the first few trials would be a bit slow until I got my legs warmed up. Thirty sprints is a lot, so I expected that the final trials would also be a bit slow. To make sure the effects of warm up and fatigue applied to all conditions equally, trials were grouped in five sets of six, with each set containing one trial of each condition.

Some trials (such as sprinting in chainmail) were more strenuous than others. I expected that my times would be slower after running in chain mail than they would be after running unencumbered, so each set had the six conditions run in a different order. The order was chosen so that no trial was preceded by the same type of trial twice. For example, sprinting in chainmail was done immediately before the obstacle course only once. (Thank goodness.)

This exposes a gap between game rules and how we might go about testing them against the real world. For example, if the game system treats male and female sprinters equally, the GM may wish to create custom rules to penalize females. In this case, the GM should either explain the penalties to the players before they make their characters or be fast enough to outrun anyone who dislikes being penalized for playing a female character. It may be safer to use the attributes as given and assume that the equality of the sexes is because men and women are physically equal in that game world, because women who become adventurers are faster than most, or simply that stats are "unisex," describing levels of ability without attempting to justify them or link them to a particular norm.

Table 2 suggests movement factors the GM can apply to the speeds of sprinting characters. If you are not the sort of GM who runs combat scenes with miniatures and a ruler, just keep the following in mind: Sprinting speed is usually relative. Difficult terrain may slow down a fast character, but any pursuers are likely to be sprinting through the same terrain and slowed down similarly. The impact of terrain does come into play, however, when the sprinter is running from foes with ranged weapons. Choosing to flee through rough terrain could give enemies an extra round to shoot. Choosing to flee while wearing boots or light armor should probably not have such a penalty. However, choosing to flee while carrying an object will slow the adventurer down.

In *A Thinking Man's Guide to Pro Football*[1], Paul Zimmerman notes that "the actual mechanism of carrying the football naturally slows people down." He cites an experiment done by Marty Glickman, an Olympic sprinter who also played halfback for Syracuse. Glickman was timed for the 100-meter dash with a football and without. "I repeated it a few times, and each time I was one to two seconds slower when I carried the ball." That's a factor of 0.92 to 0.83. Glickman was affected more by carrying a one-pound football than I was by wearing an extra 20 pounds of boots and chainmail. So feel free to tell your players that their characters can get out of the tunnel before the dragon fills it with flame only if they are willing to drop their swords and shields.

How does being shot at affect sprinting speed? I would assume that adrenaline makes the adventurer run much faster, initially. Once he is hit, he slows down, and if he is killed, he stops. But here I am just guessing: my willingness to run for Science only goes so far.

Table 1: Speed ranges under various conditions

Conditions	Speed
Sprinting on Road	6.2 to 6.8 yps
Sprinting on Road in Boots	6.2 to 6.7 yps
Sprinting on Road in Chainmail	5.7 to 6.2 yps
Hurdling Brush	5.3 to 5.6 yps
Weaving through Brush	5.3 to 5.7 yps
Clambering over Obstacles	3.4 to 3.7 yps

Table 2: Suggested movement factors for the GM based on the results of Table 1

Terrain	Movement Factor
Clear	1.00
Brushy	0.90 to 0.60
Obstacles	0.75 to 0.40

Encumbrance	Movement Factor
Light	1.00
Heavy Boots	1.00 (no penalty)
Light Armor	1.00 to 0.90

Ultra-Tech Mayhem

for *GURPS*

by David L. Pulver

These weapons and options were considered for Ultra-Tech, but not included . . . partly due to their excessive lethality! They were nevertheless popular in the author's own campaign, primarily as alien artifacts or nefarious super weapons that inspired particular adventures.

Hyperdimensional Barrels (TL12^)

This is an option for grav guns or rail guns. It uses a hyperdimensional barrel is much longer on the inside than on the outside, due to a temporal loop or pocket dimension. Rail or grav guns equipped with hyperdimensional barrels are 10 × as expensive, but have twice the damage and range.

Antimatter Conversion Field (TL12^)

This transforms all matter within a 10-yard radius of the target point into antimatter. These weapons tend to be long-ranged and designed to kill space fleets and worlds. The result is an enormous matter-antimatter explosion. The field covers a volume of about 100,000 cubic feet. Effects depend on the matter in the zone; each pound of matter converted is equivalent to about 20 megatons of yield. The result is very bad. For example, on a planet, the blast yield might range from about 180,000 megatons (converting a sphere of air) to about 360 million megatons (converting a sphere of dense rock) leaving a hundred-mile crater, devastating a continent-sized region, and causing the extinction of most higher life forms from nuclear winter and related effects.

It is nevertheless possible to survive a direct attack by an AM conversion field: if the field completely envelops a small target (e.g., a vacc suit, space fighter, life capsule, missile, etc.) in vacuum, no explosion occurs, since there is no normal matter around to contact. However, surviving as an antimatter being may pose many challenges (e.g., locating antimatter food or air, and interacting safely with others). It may be possible to reverse an AM field and transform someone back to matter, however.

Conversion fields are building-sized weapons that use cosmic power cells (p. 00), and are usually found only as the main armament of giant space battleships. Conversion fields also have industrial uses (by producing cheap antimatter).

ARTILLERY (BEAMS) (IQ-5)

TL	Weapon	Damage	Acc	Range	Weight	RoF	Shots	ST	Bulk	Rcl	Cost	LC
12^	Antimatter Conversion Field	n/a	24	10,000 miles	2,000,000/400F	1	1(60)	M	-10	1	$10 billion	0

Antiplasma Guns (TL11^)

These weapons are similar to plasma and fusion guns, but they fire blobs of anti-hydrogen plasma. The antimatter plasma bolt travels down a force field tube or laser-evacuated channel; when it strikes the target, it produces an antimatter explosion. They differ from antiparticle beams (p. 00) in firing more antimatter (as a plasma rather than as a beam of particles) but at substantially lower velocities. An antiplasma bolt inflicts burning damage with the explosive, radiation, and surge damage modifiers. It has a (2) armor divisor. Like plasma guns, they also have recoil.

Weapons

Antiplasma Gun (TL12^): An oversized, bulky rifle with a backpack power supply. With the exception of the disintegrator (p. 00), it is one of the most destructive of all man-portable weapons.

Light or Heavy Antiplasma Cannon (TL12^): Devastating vehicle-mounted weapons. The heavy cannon is capable of destroying almost any vehicular target, or laying waste to a city.

Semi-Portable Antiplasma Gun (TL12^): This weapon is usually tripod or vehicle-mounted, but sometimes carried by powered troopers. A single shot can blow up a house or destroy a lower-TL armored vehicle.

BEAM WEAPONS (RIFLE) (DX-4, other Beam Weapons-4, or Guns (Rifle)-4)

TL	Weapon	Damage	Acc	Range	Weight	RoF	Shots	ST	Bulk	Rcl	Cost	LC
12^	Antiplasma Gun	6d×10 burn ex	9	630/2,000	19/Ep	3	600(5)	15†	-5	1	$62,000	1

GUNNER (BEAMS) (DX-4, or other Gunner-4)

TL	Weapon	Damage	Acc	Range	Weight	RoF	Shots	ST	Bulk	Rcl	Cost	LC

Minigate Beam Weapon (TL12^)

This system uses a pair of teleportal minigates. One minigate is configured as a handheld weapon, complete with sights, trigger, grips, etc. The second is integrated into the focusing system or muzzle of another weapon, often a heavy beam cannon.

When the user pulls the trigger, he sends a signal through his minigate to the other weapon, triggering it to fire. Its beam is then transmitted down the minigate link . . .

Minigate beam weapons allow seemingly small weapon systems to generate very powerful beams. For example, a heavy pistol-sized minigate might be hooked up to tank-sized plasma cannon several miles away (or even in another dimension or time).

Any mounted beam weapon can be equipped this way. Select any weapon with "M" next to its ST requirement as the beam generator weapon.

The handheld minigate has the same statistics as the beam generator weapon, except as follows: Acc is one-third normal, Bulk is -3, ST is 10, weight is 10 lbs.

The cost is that of two minigate teleporters plus 50% of the cost of the base weapon.

Total Warfare (for Classic BattleTech)

Written by Randal N. Bills & Herbert A. Beas II with Dan C. Duval, Kevin Killany, Jason M. Hardy, David L. McCuloch, Steve Mohan, Jr., Jason Schmetzer, & Phaedra M. Weldon, plus Drew Williams & Ray Arrastia

312 full-color hardcover; $39.99

Originally published as *BattleDroids* in 1984, over the last 20 years the anime influenced *BattleTech* franchise has been developed to include several boardgames, 100 supplements, over 80 novels, numerous computer games across various platforms, a virtual simulator, a CCG, and even a cartoon series. More recently with the closure of FASA, the original publisher, Wizkids developed the franchise into the collectable minis game *Mechwarrior: Dark Age,* set further into *BattleTech's* future. Meanwhile, FanPro continues to support the original version of the game (which has long ago left behind its anime influences) with *Classic BattleTech,* at the heart of which lie two fundamental factors.

The first of these is the setting, a far future in which mankind has colonized the stars and found itself alone. In the 31st century, five Succession Houses -- each founded on feudal, cultural, and ethnic lines -- divide the Inner Sphere, an area roughly 1,000 light-years across. Fielding great armies against each other, they vie to restore the old Star League, but a stalemate has existed between them for centuries. This is broken with the return of the Clans, the genetically enhanced descendants of the military forces that fled the Star League's fall, wielding advanced technology and bent on conquering the Inner Sphere and restoring the Star League. Although the Inner Sphere manages to stop the Clans, it is not permanent and the alliance does not last. Developed through both the supplements and the novels, the BattleTech setting is rich with detail and reasons to fight.

The second is the game itself, a 1/285th-scale combined-arms hex-based miniatures wargame played on either large mapsheets or player-owned 3-D terrain system. At the heart of *Classic BattleTech* stands the "battlemech," a bipedal, humanoid warmachine between eight and 14 meters tall, weighing between 20 and 100 tons, and armed with lasers, particle projection cannons, missiles, gauss rifles, machine guns, and autocannon. With a crew of one, and capable of operating over any terrain, the battlemech is the king of the 31st century battlefield, equaled only by another battlemech, and restrained only by its ability to vent the heat generated by its weaponry that if unchecked will impair movement, weapons fire, and even cause the battlemech to shutdown or its ammunition to detonate.

FanPro has relaunched the *Classic BattleTech* line to make it friendlier and more accessible, the entry point for which is the *Classic BattleTech Introductory Box Set.* This provides the basic rules, mapsheets, and miniatures necessary to play, but beyond this, FanPro are presenting the rules for combat, battlemech, vehicle, and aerospace unit construction, campaigns, plus a setting guide and a new RPG in a series of six core volumes.

The first of these is *Classic BattleTech: Total Warfare,* which replaces all previous rule sets, bringing together the

rules for battlemechs, vehicles, infantry, aerospace fighters, and dropships. It includes rules for units previously only peripherally seen in the game and more commonly seen in *Mechwarrior: Dark Ages.* In particular, the IndustrialMech, using its forestry or mining equipment for melee attacks and often jury-rigged with other weaponry; the WiGE, or "Wing in Ground Effect," a heavy cross between an aircraft and a hovercraft; battle armor, in the main fielded by the Clans; and ProtoMechs, battlemech-like suits weighing less than 10 tons and fielded only by the Clans. Further, where previous versions of the game divided its rules into varying levels of complexity and acceptability for either standard or tournament play, Total Warfare simplifies this by making all of its rules as standard and suitable for tournament play. Future supplements will present advanced rules that will not be suitable.

BattleTech's game is simple and familiar enough. Players take it in turns to individually move their units, anywhere from a lance of four battlemechs upwards, expending Movement Points to walk, run, and even jump over a variety of different terrain types. Once in range, successful weapons fire or melee attacks have an attrition effect, scouring armor from a target to get at its internal components, from the internal structure and joint actuators to weapons and the fusion engine. Critical hits can also pierce armor. Damage is inflicted by location, marked off the unit's record sheet. Both movement and weapons fire generates heat, which must be vented through heatsinks, of which a battlemech only has a few. Some record keeping is required, but not an excessive amount.

Mechanically, *Classic BattleTech* uses 2d6 for almost everything. Piloting checks, for example, are made to avoid skidding on hard surfaces or falling after the loss of a leg actuator, and for physical attacks, from punches to ramming. Gunnery checks handle weapons fire, whilst hit locations are determined randomly -- this being due to the inaccuracy of targeting systems. Each mechwarrior, aerospace pilot, or vehicle crewman possesses the appropriate skill, rated between 3 and 5, to which modifiers are applied for various factors, including movement, heat, terrain, and the effects of critical damage.

Of course, adding more units and different unit types increases the game's complexity. Especially when aerospace fighters, which use a slightly different set of rules, and to some extent, battle armor and ProtoMechs, become involved. The complexity occurs at the point when these elements of the game interact with battlemechs. It is not excessive, although working out the exact details of an aerospace fighter's crash or the effects of a collapsing building upon the units hiding inside (including battlemechs) for example, can be time consuming compared to normal play.

Fortunately, *Total Warfare* makes this complexity and the rules themselves easier to comprehend by breaking them down into digestible chapters. Beyond the basic concepts this format allows players to pick and chose which aspects of the rules and which vehicles they want to play with. Although a bit dry, the rules are supported by a series of detailed, fully worked out examples that often build from a single situation and explore its various possible outcomes. The learning curve is actually quite gentle, even more so if a player has had previous experience with the game, whether from long term play or the *Classic BattleTech Introductory Box Set.*

Alongside the rules, the book only gives a little setting material, so it is up to *Total Warfare's* fiction to add some color and flavor. Prefacing each chapter is a short, four-page short vignette related to the chapter's contents. *BattleTech* has long been known for the quality of its fiction and the many pieces here are no exception, all being most enjoyable.

Total Warfare does include some non-standard/non-Tournament play rules. These present a system for creating scenarios built around a set of tables that determine the scenario type, force size and composition, and unit skill levels. To get the full use out of the table does require access to the game's many Technical Readouts, but the book is not written with the novice player in mind. This being a set of wargame rules, the book ends with a guide to painting *BattleTech* miniatures and 3-D terrain.

Physically, *Total Warfare* is a sturdy, error-free hardback. It is liberally illustrated with both dioramas of BattleTech miniatures in action and fully painted pieces to accompany the fiction. The official mapsheets are used in the many examples of the rules, and every example is made to stand out from the otherwise reasonable layout.

There are wargames to suit almost everyone's tastes, and for those who find the idea of piloted giant walking robots fighting it out all too silly when tanks and infantry make more sense, then both *Classic BattleTech* and *Total Warfare* will not be to their liking. Which is fine, but if a combined arms game that focuses on giant fighting robots is to your

liking, then **Classic BattleTech** is very well supported, and in bringing together all of the rules for every unit type in the game, **Total Warfare** provides all of the details necessary to play and is the essential volume that every **BattleTech** player will want have on his shelf and at hand during play.

GameMastery Campaign Workbook

Published by [Paizo Publishing](#)

Designed by Jason Bulmahn, Sarah Robinson, & Sean Glenn

320-page spiral-bound 4½''×5½'' softcover; $13.95

Every GM needs a place to hang his hat, metaphorically speaking, and a good starting place would be the *GameMastery Campaign Workbook* from Paizo Publishing.

Another in their line of GM and player aids, the workbook is just what it says: a place to start, maintain, and cultivate information about your ongoing roleplaying game. Seems simple enough, but is there enough here to recommend it to anyone over, say, a notebook full of ruled paper?

Well, it starts straightforward enough. There's space for all your contact info, both the kind that lets you call your players to let them know about the next session and the sort that lets someone return your workbook to you when you forget it at the Taco Tavern.

You can manage attributes, brief notes, and status (like "missing") for up to 14 PCs. The stat blocks are OGL-specific, so while there's room enough for you to write up notes about any character, anything that isn't *d20 System* material won't be able to use the handy boxes. Then it's back in the GM's court, with the name and dates of your campaign, room for an overview, places for your NPCs, and any rules deliberately being left in or left out. A full (blank) year of month grids let you erase and rewrite all the sessions you'll be canceling, and maps allow you to track the action at several levels of refinement. Then follows a couple hundred pages of game logs, with blank lines on the left page and a little section of graph paper facing them.

Finally the book ends with an NPC registry (room for two thumbnail characters on one side and a more fully-developed one on the other) and room for items the party may be carrying (both mundane items and expanded sections for when someone is unwittingly toting about the Spear of Longinus).

Physically, the book is high quality, though it should be noted the same product was originally released with a "perfect-bound" spine that gave out from laying the tome flat on a tabletop. This version has a spiral binding; it costs an extra dollar, but it's sturdier and the old books were recalled and can be traded in for a replacement. The type inside is written in non-photo-blue ink, the sort that keeps you from making copies, which may make a certain amount of sense from a marketing and security viewpoint but it makes the text just a bit harder to read in a couple of spots. Or the ink choice could just be a complete coincidence that reflects the nature of notebook and graph paper printing.

Like some of their other products, Paizo may be shooting themselves in the foot by not offering more information about the line; the "item" pages have handy places for the codes used by their *[GameMastery Item](#)* cards, but there's nothing to let you know on the outside that it's an OGL-compatible book. While it isn't overwhelmingly *d20 System,* it's a point worth making somewhere other than the website literature. Gamers already know if spiral binding serves their purposes, but it is a small book, about five inches on a side (plus a smidge for the spine), so that may make it fit your book bag really well or be exactly the wrong kind of annoying. It requires a cramped writing style or the use of a couple of lines for one line of text.

It's a lot more fun to use than a notebook to keep your thumb on the pulse of your game, and the page edges indicate where sections begin or end. If you're tired of little sticky notes showing your fingers how to do the walking, that'll help. It also shows just how darn much of the book is given over to the campaign logs. That's not meant as a criticism,

and certainly the continuing narrative is probably the thing you need the most of, but there's really no way to know how much space is required before a game is done. On the gripping hand, that's an awful lot of graph paper -- small graph paper -- and that might not be as useful as extra pages for simple narrative. You could always utilize the same book for two or more smaller games, though that might complicate things.

There's an obvious sense of fun here, too, making the ***GameMastery Campaign Workbook*** both cute and clever. Things you might not have thought of like a track for maintaining what level the party is overall and pages dedicated to writing down any infamous, crowd-pleasing quotes that pop up show the designers put serious thought into what comes out of a game and what might need space. These, too, might not demand anything better than a notepad, but all this taken together says the creators have something on the ball and have put some relevant and useful effort into codifying it here.

Soul Train

for *Eberron/d20 System*

by Caleb Dillon

A living construct, not unlike the warforged that dot the globe in Eberron, Soulemere is a possessed lightning rail gone out of control. Soulemere is a solitary creature intended for use in the **Eberron** campaign setting; however, with a few adaptations it would really fit just fine into any high-magic chronicle. If you've been dying to play a train heist scenario and want to see what happens when the train strikes back, then read on.

Background Information

During the Last War, House Cannith, like the other dragonmarked houses, maintained a strict neutrality . . . mostly. Illegal arms running, smuggling contraband, and underground lightning rails were all lucrative career choices in those days, and there was hard coin to be made for bold men unafraid to engage in certain lucrative (albeit less than legal) ventures.

Such as man was Erran d'Cannith, dubbed by his fellow artificers the "Mad Maker." Erran was in need of funding for any number of other ventures he wished to pursue. Forging rings, carving wands, piecing together golems; artificing is not an inexpensive way to spend one's time, and Erran was not the adventurous type.

So when the King of Cyre came to him with a proposal to build a lightning rail (unbeknownst to House Orien) that could go places other rails could not and field test it himself, he merrily rose to the occasion.

Dubbed Soulemere by its creator, Erran envisioned a huge living construct, not unlike the warforged so common to Khorvaire. But Erran wanted Soulemere to be something more, something special. He had, around that time, began dabbling with a new, previously unknown form of magical energy called incarnum. (Complete rules regarding this new and potentially powerful source of magic can be found in the **Magic of Incarnum** rules supplement.)

Erran's coworkers warned him against the dangers of manipulating forces that he did not fully understand, but the King was not known for his patience, and neither was Erran. So when the time came, rather than binding an elemental spirit to the vessel, Erran bound a spirit being of pure incarnum in its stead . . . or at least he tried.

Time and time again Erran performed the binding ritual, and time after time it failed. He failed. Bits of stray incarnum were lost and dissipated, or simply flitted about the chamber, seemingly of their own accord. In time, Erran's failures made him bitter, and his contempt hung over the heads of his coworkers like a dark cloud, dampening spirits and lowering morale accordingly.

What Erran did not understand (and what ultimately doomed the project) was that incarnum feeds off of raw emotion. Erran's anger, having festered for long enough, turned to rage as he began the binding ritual one last time. The stray bits of incarnum coalesced and bent to his will.

This time, the ritual worked. No sooner had Soulemere been animated than it turned on his creators. It slew half the magewrights before they realized what had happened, and the others barely managed to flee with their lives. Erran stood fast, hoping he could command at the very least reason with Soulemere.

But if Soulemere could understand Erran, it gave no indication of this. Realizing on some subconscious level that Erran had created it, Soulemere sparred Erran's life, burst through a nearby wall and fled the forgery, bound for parts unknown.

Erran, fearing for his life after having failed the King of Cyre so completely, did like Soulemere and fled as well. Shortly thereafter came the Day of Mourning, and Erran suddenly found himself without cause for worry. The King was dead, and with him his knowledge of their joint endeavor. The books had been wiped cleaned.

Erran decided that Soulemere couldn't have survived the Day of Mourning, and wrote the entire thing off to a learning experience. But Soulemere did survive. Its current whereabouts are unknown, but the Mainland is a pretty fair guess. It was here that Soulemere was born, and there that it will mostly likely stay.

Soulemere has the mentality of a child, a very alone, frightened and angry child. He is evil in the same way as an abused toddler. Soulemere doesn't really understand what's been done to it, or why, but it knows something bad happened, and the only respite it gets from its anguish comes from tormenting others in kind.

A House Orien lightning rail veers towards you, though it travels on no track. A smoke stack rises from the coach, and souls of the lamented trickle off in a cloud of eerie blue radiance. The forward section has been cast in the brass likeness of a roaring dragonne. A mantle of blue flame manifests around the engine compartment, and it glides over the ground on a sleigh on lightning.

From a distance, Soulemere appears to be the coach car of a House Orien lightning rail. As it approaches, however, keen men will notice dissimilarities. Soulemere moves along no track, but rather flies in short lobs of two hundred feet or so, touching down for only a moment before continuing on, like a child skipping.

Soulemere's hull is made from magically hardened darkened glass, adamantine and iron beams, infused with incarnum. From front to back, the coach is nearly 50 ft long and half as wide. Some parts of the vessel appear very real, while others, such as the light at the front of the coach, the flames flickering around it, and the cushion of air Soulemere moves around on, appear wispy and insubstantial.

Soulemere acts in many ways like a child. He may play with an adventuring party at first, before they do something to set it off (even the most innocuous slight will do), at which point Soulemere gets agitated and attacks! It will fight until reduced to a quarter of its hit points, at which point it turns and flees, making a sound not too unlike a whimpering toddler.

If the party somehow finds a way to disrupt Soulemere's soulmelds, especially its airstep sandals, Soulemere will sink to the ground and be unable to move (at which point it sobs uncontrollably; Erran was still working on Soulemere's locomotion when Soulemere fled the forgery). Soulemere has no lair, and since it needs no food or sleep, it constantly stays on the move. If the party successfully defeats Soulemere and someone manages to get it to a member of House Cannith, the salvage rights would be substantial.

A better (if not more challengingly way) to deal with Soulemere would be to try and befriend it. Soulemere is very much in need of others like it, or at the very least a friend. The scholars at Morgrave would probably find a nice home for it, but Soulemere would have a hard time adjusting to life in the big city (think King Kong; Soulemere's just never going to fit in).

A kind hearted artificer would probably have the best chance at getting Soulemere to stand down from a fight, especially if the artificer somehow reminds Soulemere of Erran, but good luck with this approach. This shouldn't be easy (Diplomacy DC 30+, and needs extended rolls over a long period: three consecutive rolls, then 1 roll per day for a week to start earning Soulemere's trust).

Soulemere understands Common, though it has no ability to communicate in that language or any other. Soulemere travels at a speed of 25 miles per hour.

Combat

Soulemere is nothing short of an oncoming train in combat, and should be treated as such. It strikes swiftly, leaving gaping holes in enemy lines and fortifications both. Soulemere benefits from its adaptive attack, often targeting the same creature (if it survives more than one attack) round after round, in much the same way a vehement child keeps swinging long after the fight is over. It makes good use of its cleave feat, targeting lines of creatures rather than groups. It relies on its fast healing ability to repair any damage it suffers, but it isn't bereft of intelligence, and it will run from a fight that it is definitely losing.

Adaptive Attack (Ex): When Soulemere strikes, it adapts its attack to take advantage of weaknesses in the opponent's defenses. Each round that Soulemere successfully damages a living creature, it gains a cumulative +1 insight bonus (maximum +5) on attack rolls and damage rolls against that opponent. This bonus remains in force until Soulemere deals damage to a different living creature. For example, the first time Soulemere damages a living foe, a +1 bonus applies to each of its attacks against that target in subsequent rounds. The next time it hits that foe, the bonus increases to +2. During any round that it misses the target, the bonus increases to +2. During any round that it misses the target, the bonus does not increase. If Soulemere hits a different target at any point in that progression, the bonus against the first target is lost, and a new bonus begins to accrue against the new target.

Aura (Ex): Soulemere has a particularly powerful aura corresponding to its alignment (see the *detect evil* spell). The power of its aura is equal to its incarnate level, just like the aura of a cleric.

Similarly, its soulmelds always radiate evil as though they were aligned magic items with a caster level equal to its class level.

Detect Opposition (Sp): At will, Soulemere can attempt to detect the presence of creatures whose alignment is opposite its own. This ability works like the *detect evil* spell, except that it detects the specific alignment opposed to its own (good, in Soulemere's case).

Expanded Soulmeld Capacity (Ex): The essential capacity of Soulemere's soulmeld capacity is increased by 1,

superseding the normal restrictions for a meldshaper of its level. This only applies to soulmelds, not to feats, class features, or other abilities that allow essential investment.

Fury of Wrath (Ex): Soulemere automatically enters a ragelike state on its first turn in combat. While in this state, Soulemere gains 66 temporary hit points and adds a +20 to all damage rolls. Soulemere's fury last for 10 rounds.

Immunity to Magic (Ex): Soulemere is immune to the effect of any spell or spell-like ability that allows spell resistance. In addition, certain spells and effects function differently against the creature, as noted below.

A *dispel evil, dispel good, dispel chaos, dispel law,* or *dismissal* spell resets Soulemere's adaptive attack bonus to +0, and dazes Soulemere for 1 round. A *banishment* spell also resets Soulemere adaptive attack bonus but dazes the golem for 1d4+1 rounds. While Soulemere is dazed by either of these effects, its fast healing ability is suppressed.

Incarnum Radiance (Su): Once per day as a free action, Soulemere can activate this ability. This effect lasts for 7 rounds: An ash-gray aura surrounds Soulemere. It grants Soulemere a +4 bonus on melee damage rolls.

Rapid Meldshaping (Su): Once per day, Soulemere can unshape one of its existing soulmelds and immediately shape another soulmeld. This process requires a full-round action and provokes attacks of opportunity. The soulmeld that it shapes cannot be bound to a chakra, even if the soulmeld that it unshaped was bound to a chakra. Soulemere typically only does this if reduced to less than 50 hit points, at which point it unshapes *brass mane* and shapes *fellmist robe,* pumping 6 points of essential into the soulmeld, granting Soulemere a 40% miss chance from attackers more than 5 ft away from it, thus giving it a chance to escape.

Share Incarnum Radiance (Su): Soulemere never opts to share the benefits of his incarnum radiance with allies, as he has no allies to speak of.

Softbound Resistance: Soulemere can invest its essential in this special quality as if it were a soulmeld. Every point of invested essential grants it a +1 resistance bonus on all saving throws. The maximum essential capacity of this quality is as normal for a character of the constructs character level, 6 in Soulemere's case..

Soulmelds: Soulemere can shape five soul melds, drawn from the incarnate list. Soulemere currently has the following soulmelds shaped and bound. Each of these soulmelds has an essential capacity of 7.

Airstep Sandals (Su): Soulemere can fly up to 10 feet plus 10 feet per point of essential invested (at good maneuverability) as a move action once per round. Soulemere must end the flight solidly supported or fall.

Brass Mane (Su): Soulemere gains a +4 competence bonus on intimidate checks. Every point of essential invested in this soulmeld increases the competence bonus it grants on intimidate checks by 2. Because this soulmeld is bound to its throat chakra, once per minute, it can loose a devastating roar. All creatures except dragonnes within 10 feet plus 10 feet per point of essential invested must succeed on a Will save (DC 14 plus essential invested) or become fatigued.

Diadem of Purelight (Su): Soulemere shapes incarnum into a beam of light that illuminates the area directly in front of it. Soulemere's *diadem of purelight* shed lights as a torch, illuminating a 20-foot radius with bright illumination (and out to a 40-foot radius of shadowy illumination). This radius of illumination increases by 10 feet per essential invested. The area of shadowy illumination is always double the radius of bright illumination. Creatures gain a +2 insight bonus on spot checks when attempting to see anything within the radius of illumination (including within the shadowy illumination).

For the purpose of interacting with *darkness* spells, the *diadem of purelight* is treated as a *light* spell of a level equal to its invested essentia.

Lightning Gauntlets (Su): In Soulemere's case, this soulmeld appears as a crackling aura of electricity beneath it. Soulemere can deal 1d6 points of electricity damage plus an additional 1d6 points of electricity damage for every point of essential invested with a successful melee touch attack (a standard action). Because this soulmeld is bound to its hands chakra, Soulemere can add the damage dealt by *lightning gauntlets* to one attack per round made with its slam

attack, but this requires a normal melee attack rather than a touch attack. Soulemere must announce that it is using the *lightning gauntlets* before making the attack; if it misses, it can't use them again until its next turn.

Mantle of Flame (Su): While Soulemere wears its *mantle of flame,* any creature that strikes it with its body or a handheld weapon deals normal damage, but at the same time, the attacker takes 1d6 points of fire damage plus 1d6 additional points of fire damage for every point of essential invested. Creatures wielding weapons with exceptional reach, such as longspears, are not subject to this damage if they attack Soulemere.

The *mantle of flame* grants shadowy illumination in Soulemere's space, but provides no further lighting.

Essentia Pool: Soulemere has an essential pool of 16 (including the +1 for the Cobalt Charge feat, and +1 for the Cobalt Power feat) and an essential capacity of 6 (7 for soulmelds). Soulemere typically invests 5 points in Cobalt Charge, 4 points in the *diadem of purelight*, and 7 points in the *airstep sandals.* One the first round of combat, Soulemere shifts 7 points of essential to its *brass mane* (and roars) and 4 point to its *mantle of flame.* After the first round of combat, it shifts 7 points to its *lightning gauntlets* and leaves the remaining 4 points in its *mantle of flame.*

Construction

Soulemere is one of a kind, and its likeness will never be duplicated again. It is because of this rarity that artificers, historians, and scholars are so interested in not only discussing this rather taboo topic, but discovering its present whereabouts as well. Many a young and foolish adventurer has gone off to find the great "steaming behemoth" to never come back.

Tactics

Although Soulemere is a fearsome opponent, it isn't a strategist, and often follows the same pattern (which, admittedly has worked thus far) in battle after battle. Using the following guideline to help plan your assault on a group of seemingly benign PCs, or an army.

- Soulemere attempts to *detect* any good party members as soon as they come in range, and in combat it makes them its principal targets. Soulemere has little knowledge of spellcasters or what they're capable of, so it doesn't have any way to discern them as a threat.
- On the first round of combat, Soulemere activates its *incarnum radiance* ability as a free action. This adds +4 damage for the first seven rounds of combat. It also roars, and any creature within 80 feet except dragonnes must make a DC 21 Will save or become fatigued.
- Soulemere always charges when it can, and because of its Cobalt Charge feat, enjoys a +5 bonus on to hit and damage rolls when it does. Soulemere tries to charge the first target again, making optimal use of its *adaptive attack* ability. Soulemere deals an extra 4d6+5 (this is accounting for its Cobalt Charge feat, above) damage on a charge, and its natural attacks count as magical weapons for the purpose of overcoming damage reduction.
- By shifting its essential (see below) it will deal an extra 7d6 points of electricity damage on a successful hit due to its *lightning gauntlets.*
- After the 1st round of combat, Soulemere gains 66 temporary hit points that last for 10 rounds (bringing its hp total up to 397 for the first 10 rounds of combat).
- What this all means is that if Soulemere charges, his attack roll is +36 (remember to drop its AC by 2 when its charges) and if Soulemere hits it deals 4d8+11d6+15! That's an average of 89 dmg/rnd on a successful hit (93 dmg/rnd for the first 7 round of combat)! Soulemere also has access to the power attack, cleave, and spring attack feats, which it makes judicious use of. And let's not forget the death from massive damage rule.
- Soulemere is practically immune to all magic (see below), and has DR/10 magic and adamantine. It's only true weaknesses in combat are its relatively low AC for a creature of its CR, and that it only gets one attack per round.
- Those who strike Soulemere with a handheld weapon or their bodies take 4d6 fire damage from its *mantle of flame.*

What this all amounts to is that Soulemere is a tough creature that should be the rare and stand-alone focus of an

adventure, not unlike stopping a recently awakened tarrasque or Ancient One.

Here are a few basic adventure leads to get the creative ball rolling on how to incorporate this interesting beastie into your *Eberron* (or any other) chronicle.

- **Rescue mission:** A archaeologist friendly to the PCs (perhaps a scholar at Morgrave University, or the like) got a little too close for comfort when tracking the migrations of Soulemere. Now it's struck on the rail and can't get off. It's relatively safe in the coach, but Soulemere keeps rolling around, and its only a matter of time before the scholar gets thrown free and Soulemere steam rolls over it, literally.
- **Important Find:** Prince Oargev of New Cyre or a favored member of House Cannith has claimed salvage rights on the soul train, and wants it for himself. He hires the heroes to go after it, and bring it back to him, in anyway they can, preferably alive.
- **Menace:** Something has set Soulemere off, and now its rampaging around the countryside like an angry bull, destroying everything in its path. No one is safe. Airship pilots reported spotting it a few days ago, headed for a local village or even a major city.

Feel free to combine as many of these ideas as you see fit. (Maybe the town Soulemere is headed for is New Cyre, or the scholar in the coach is actually a member of House Cannith.) An adventure like this makes for a great one shot. Just set the maniacal monster loose, plan a few dramatic pitfalls, and let the PCs loose to deal with it.

Soulemere is a living construct, something new and different. It loses its construct traits, but gains the living construct traits, which are summarized below.

Living Construct Subtype

A living construct is a new subtype of construct -- a created being given sentience and free will through powerful and complex creation enchantments. Living constructs combine aspects of both constructs and living creatures, as detailed below.

Features: A living construct derives its Hit Dice, base attack bonus progression, saving throws, and skill points from the template that gave it sentience or the class it selects.

Traits: A living construct possesses the following traits (unless other noted in the creatures entry).

- Unlike other constructs, a living construct has a Constitution score. A living construct does not gain bonus hit point through a Constitution bonus (or penalty) as other living creatures do.
- Unlike other constructs, a living construct does not have low-light vision or darkvision.
- Unlike other constructs, a living construct is not immune to mind influencing effects.
- Immunity to poison, sleep effects, paralysis, disease, nausea, fatigue, exhaustion, and energy drain.
- A living construct cannot heal damage naturally.
- Unlike other constructs, living constructs are subject to critical hits, effects requiring a Fortitude save, death from massive damage, nonlethal damage, stunning, ability damage, ability drain, and death effects or necromancy effects.
- Unlike other constructs, a living construct can use the run action.
- Living constructs can be affected by spells that target living creatures as well as by those that target constructs. Damage dealt to a living construct can be healed by a *cure light wounds* spell or a *repair light damage* spell, for example, and a living construct is vulnerable to a *harm* spell. However, spells from the healing subschool prove only half their normal effects to a living construct.
- A living construct responds slightly differently from other living creatures when reduced to 0 hit points. A living construct with 0 hit points is disabled, just like a living creature. He can take only a single move action or standard action in each round, but strenuous activity does not risk further injury. When he has fewer than 0 hp but more than –10, a living construct is inert. He is unconscious and helpless, and he cannot perform any actions. However, an inert living construct does not lose additional hit points unless more damage is dealt to him, as with a living creature that is stable.

- Can be raised or resurrected.
- Does not need to eat, sleep, or breathe, but can still benefit from the effects of consumable spells and magic items, such as *heroes' feast* and potions.
- Does not need to sleep, but must rest for 8 hours before preparing spells.

A Primer to Incarnum

For those who don't have access to the ***Magic of Incarnum*** rules, the following summarizes what you need to know to use this unique creature in your game:

Incarnum is a new form of magic energy. *Essentia* (specifically *essential* points) represents how much raw power an incarnum wielder has to call upon. *Soulmelds* are like spells, sort of. An incarnum wielder must rest to shape soulmelds, and once he chooses his soulmelds for the day (from his class list) he can't shape different ones (usually). Actually, soulmelds are more like semi-permanent magic items. They aren't really tangible *unless* you bind a soulmeld to a *chakra.*

A *chakra* is the spiritual equivalent of a body part. For example, most humanoids have hand chakras, leg chakras, even heart and soul chakras (though you have to be an incarnum wielder to gain access to them). Binding a soulmeld to a chakra is sort of like putting on a magic item. In effect, it makes the soulmeld appear more 'real' and corporeal.

An incarnum wielder starts the game only being able to bind soulmelds to a few chakras (if any). As he gains more levels, new and more powerful chakras will become available to him so that he can bind his soulmelds to different charkas.

Like the spellcasting system uses spell points, the incarnum system use points of essential. Unlike spell points, however, these points renew and can be reinvested each round. There is also a maximum number of essential points an incarnum character can invest in any soulmeld (based on their level). Essentia doesn't have to just be invested in soulmelds; it can also be invested in some feats, class and racial features, and special qualities and abilities.

Stupervillains!

Costumed Nuisances for Supers Campaigns

by J. Edward Tremlett

Most supervillians one might meet in a Supers game are villains, through and through. They're evil and greedy, and possessed of power. They've got plans, and are willing to do whatever it takes to realize their sinister or deluded aims. And, most importantly, they have their act together.

But there are some supervillians who don't. They're losers -- inept. They're one-joke turkeys with glass jaws and feet of clay. One good sock to the head should deal with them, and if it doesn't, maybe your heroes can laugh them into submission. And doesn't every Supers game -- no matter how grim and gritty -- need a good in-character laugh once in a while?

So in the spirit of April Fools Day, here are some generic supervillains that really should just stay in their lairs. Some have useful talents they haven't figured out how to use properly, or can't. Some are their own worst enemy. And some might amount to something when they get their act together . . . someday . . .

They are ranked in increasing order of power, with notes on powers, strengths and weaknesses. Stat guidelines go Poor -- Average -- Medium -- Impressive -- Powerful -- Nigh-Powerful. Substitute your own setting for The City, plug them into your favorite game mechanic, and you've got almost ready-made comedy relief.

(And if you need some more inspiration, good places to find stupervillains in their natural habitat are included at the end.)

The Clockstopper (Talented Fool)

"Aha! Do as I say or I'll stop the flow of time *forever!* -- oww, my head . . ."

Matthew Winder; 26; American citizen with criminal record

Orphaned Matthew spent years sweeping floors and winding clocks in his cruel grandfather's timepiece shop. One day, he discovered that he could start and stop simple machines with the power of his mind. After using his power to drive his grandfather insane -- losing his one source of income -- he decided to use his powers to make some easy cash.

Calling himself The Clockstopper, he threatened a succession of Hurry-Mart cashiers into giving him money by claiming he'd stopped time. He then moved up to City First Bank's downtown branch, knowing that the guards' guns were also stopped by his power. But an alert teller with a digital watch saw through his ruse, and the angry customers chased him off.

Undeterred, Matthew decided a bigger stunt was needed, and threatened to stop the Clock Bridge's main clock for good if he wasn't given a million dollars. However, the effort of stopping one of the largest clocks in the world gave The Clockstopper a mini-stroke. He escaped from the hospital a week later, and has been laying low since, plotting a comeback.

Powers: Can use his massive hatred of clocks to stop and restart any simple machine within line of sight (clocks, wind-up toys, guns, etc.) Once he's stopped something, he can keep it stopped by staying angry, but usually loses control once he falls asleep. Affecting anything larger than a grandfather clock may give him a killer headache, and anything too large causes minor brain damage.

Stats: Average Body; Average Mental; Medium Spirit

Appearance: 5'6, 230 lb, brown hair, blue eyes, homely looks, dresses preppy.

Costume: Bright red suit with an appliqué of a broken clock in the center of his chest, black domino mask, boots and gloves. Had a black cape early on but tripped on it too many times to keep.

Family: Grandfather (78, insane, institutionalized)

The Terrorizer (Emotionally-Crippled Would-Be Vigilante)

"I should punish them . . . but then I'd be just like them . . . but someone's got to be like them to stop them . . . but does it have to be me . . . yes, I *should* punish them . . . but I'd be *just like them* . . . but someone's got to... wait! They're getting away again! Nooooooooo!"

Ferdinand Chateaux; 38; American Citizen with no criminal record

Someone had to do it. Ferdinand realized this after he read the third murder headline in a week. Folks just like him and his family -- dead for being in the wrong place at the wrong time.

Someone had to stop the scum. Someone had to deal with the lowlifes and gangsters that *didn't* wear costumes. And someone had to deal with them harshly.

Ferdinand had been a Marine. He'd seen action in Desert Storm. He worked at a firing range, which gave him access to weapons. And he went bowling every night he wasn't at the bar, which gave him an alibi. It was all perfect.

The problem was that Ferdinand thought too much for his own good. Everyone always said so. He'd find out when the gangs were meeting, set up a snipers nest and wait . . . but spend the whole time violently arguing with himself over consequences, rationales, and justice. And when the moment came he was too conflicted to pull the trigger, and let them get away.

The Battle Journal of the Terrorizer is three years old. It is filled with plans, diatribes, self-loathing screeds and only one kill -- the pot-bellied pig he shot by accident. He wept for months.

Powers: None. Has an impressive arsenal of weapons you could buy at any Gun-Mart stashed around the house, or in his SUV. He's training his dog to drop homemade explosives under cars, with so-far unimpressive results.

Stats: Medium Body; Average Mind, Poor Spirit

Appearance: 6 ft, 290 lb, black hair, brown eyes, moderately handsome, dresses like someone's blue-collar dad.

Costume: Black "night fighting" fatigues ordered from a vigilante magazine.

Family: Wife Doris (36), Daughter Suzie (6), Son Leroy (9), Puppers the Dog (3)

The Word (hamstringed talent)

"I said g-g-g-g-g- . . . g-G-G-G-G-Giff . . . giff giff give me the mo-mo-mo-money. And st-st-st-st . . . stop-p-p-p l-l-laughing . . . "

Gerald G. Goulash, 31, American Citizen with a Criminal Record

Gerald always knew he wasn't like other people. He knew he had some power up his sleeve. He knew he was destined to be a leader of men. Destined to have whatever he wanted. Mansions, yachts, legions of willing servants, pretty girls

. . .

The only problem was that Gerald was a stuttering goober with no self-confidence whatsoever. He stuttered whenever he was happy, sad, gleeful, angry, frightened or confused. On those rare occasions when he felt massively confident, he could tell others what to do and they'd do it. But he only usually felt that way when he was alone by himself, practicing in front of the mirror.

Eventually he learned that if he took the edge off with a few beers before a crime, it worked pretty well. Unfortunately, being half-drunk made him vulnerable to stupid mistakes, which is how every hero in The City has come to beat him.

Currently, The Word is being held incommunicado at Maximum Slam 23, awaiting trial for his back catalog of crimes. But one day he'll find a way to get out. And when he does, he's going to get back everything he deserves . . . after a beer or two.

Powers: Anything The Word tells someone to do, they do -- anything at all. It's that simple. It works equally well on the most mindless schlub or the mightiest hero (barring any mental defenses they may have.) However, the power must sound authoritative to work, and since The Word is always stuttering, it rarely does.

Stats: Average Body; Powerful Mind; Poor Spirit

Appearance: 5'11, 180 lb, Thinning blonde hair dyed blue, blue eyes, skeedy face, snazzy dresser.

Costume: Wears a blue suit with a succession of increasingly awful "power ties."

Family: Parents Harold and Maude Goulash (67, 56), living in Orlando, FL.

Dr. Banana (Mind-Shattering Power! Hilarious Side-Effects)

"Fools! I will crush you all for interfering with my plans!" (said in squeaky falsetto voice)

Dr. Juan X. Amarillo, 52, American citizen with criminal record

Dr. Amarillo should have known that geneticists didn't tend to drive nice cars or make it with gorgeous women, but he always thought there was a pot of gold waiting for him at the end of every project's rainbow. However, time and again others got the reward for his hard work, which wouldn't have been so bad if they hadn't rubbed his nose in it.

One day, he couldn't take anymore. He subverted the ends of a new project to his own devices, attempting to discover a means to temporarily splice more powerful DNA into the human genome. Soon he discovered that he'd found a way to make a much more powerful man -- the sort of man who could go take what he wanted -- and all he had to do was ingest a pill!

He tried it out on himself, of course, and the results were impressive: suddenly the paunchy, weak fellow was massively huge and unbelievably strong! Highly resistant to damage! Almost impossible to knock over! Able to bend metal, crush brick walls and shrug off bullets!

Unfortunately, he was also slow -- unbelievably, painfully slow. And bright yellow. And spoke in a squeaky falsetto that made would-be victims laugh rather than scream. (He also only had an hour of power per dose of the yellow pill, which made the speed issue very pressing.)

His first crime consisted of him knocking over Second City Bank, downtown. The Liberty League pummeled him for the better part of an hour, and stole his bottle of pills. They then followed him as he ineptly tried to get away, detaining him once he changed back to human.

The speedster hero The Blink called him Big Banana, as a joke. But sitting in prison, waiting for his accomplices to sneak in another yellow pill, Amarillo decided to take back the insult, and adopted the name Dr. Banana. He has since

made trying to kill The Blink his number one priority, which inevitably ends in farce since The Blink achieves speeds over 1,000 times faster than Dr. Banana.

Powers: When he takes his yellow pills, Dr. Banana gains superpowers for one hour per pill ingested. He bulks up to five times his size, gains super-strength and bulletproof skin, and weighs about a ton. Unfortunately, he moves about one-third the speed of a normal human in this state, his skin and hair turn bright yellow, and his voice turns into a kittenish squeak that sounds as threatening as . . . well, a kitten.

Stats: Average/Powerful Body; Impressive Mind; Average Spirit

Appearance: normally 4'11, 150 lb, balding brown hair, brown eyes and disheveled lab clothing. When he takes his medicine he's 8'4, 1999 lb, with a shock of yellow hair, black eyes and a stretchy pink thong thing. He looks pretty fuggly in either form.

Costume: That stretchy pink thong thing.

Family: Mother Esperanza (87), living in Mexico City

K'Tang the Konqueror (Disinterested Alter-Ego)

"Take over The City, or watch 'Desperate Housewives?' Well, that's an easy choice. Now, did my worthless host buy more pizza, or shall I order out?"

John-Bartholomew Frazer-Vole III, 29, American citizen without so much as a parking ticket.

K'Tang was a disembodied intellect from the unimaginable battle-world of K'R'Ang. Bound within an otherwise-unassuming necklace, he was an intelligent super-weapon designed to meld with the mind and body of whomever wore that necklace. He was kept in reserve to protect K'R'Ang from alien invasion, at which time he was given unto a strong-willed champion to defend his world. And when the danger was past, he would be put away again.

After several memorable battles -- some lasting decades -- K'Tang refused to be put back in his box, and conquered K'R'Ang, itself. And then another world, and another, and another . . . until he sat at the hub of a massive stellar empire, and still wanted more. But his tyranny was his undoing: a plot was hatched to wrest the necklace from his host, seal the weapon away in a special binding casket and jettison it into space.

No one is quite sure how the casket traveled from one galaxy to another, and wound up on Earth in the time of the Pharaohs. And there are many theories as to why it was buried with King Nat-Shep-Hat IV, just beyond the Valley of the Kings. All that matters is that John-Bartholomew Frazer-Vole -- frustrated but brilliant archaeologist -- found the necklace in 1934, put it on, and became the new host to K'Tang the Konqueror.

For the next two years, the original Liberty League fought K'Tang the Konqueror on three occasions, standing bravely against one of the most dangerous opponents imaginable. Many valiant heroes lost their lives stopping him from taking over the world, and the first Captain Patriot died tearing the necklace from K'Tang's neck, putting an end to the threat. The necklace was sealed in The Vault, John-Bartholomew went to jail for the rest of his life, and the threat was considered to be contained . . .

Unfortunately, K'Tang had nothing but time. The death of the original Red Flame, just this last year, weakened the mystical seal that hero placed over The Vault. That was enough to let the necklace teleport itself out and find the closest person to its last host: the grandson and namesake of John-Bartholomew Frazer-Vole -- a near-worthless slacker who worked at Smiley's Pizza, downtown in The City.

The bad news was that John-Bartholomew III knew what the necklace was and, tired of being third-best in life, put it on. The good news was that John-Bartholomew III had the mental power of a doorknob, which meant that instead of there being a melding with the mind of K'Tang, the disembodied intellect was able to achieve full dominance.

Free from others' dreams of conquest and power, K'Tang realized that he really didn't care to take over the world, enslave its women and make his host's manager eat pizza until he exploded like that guy from the movie *Se7en*. Instead, he wanted to relax, try new experiences and take up poetry. Maybe painting. And there's so many movies and television shows to catch up on . . . and books! He loves books.

The sad thing is that John-Bartholomew Frazer-Vole III has no idea he's being played for a sucker. Such is K'Tang's power that he can convince his host that they're working on a slow, careful plan to take over the world, and implant false memories to that effect. So John-Bartholomew goes to work and dreams of power, and when he comes home and puts on the necklace his alter ego turns on TiVo, reads four books at once and orders Thai from that nice place on the corner.

Powers: Saying that K'Tang is powerful is something of an understatement. He has nigh-super-speed, nigh-super-strength, and nigh-super-senses that rival the strongest of the world's known heroes. He can fly, survive in vacuum, mask his appearance to look like anything or anyone he's seen, throw fireballs the size of boulders and call down lightning. He also has the tactical smarts of someone who's fought and won a thousand wars on dozens of planets.

Stats: Average/Nigh-Powerful Body; Average/Nigh-Powerful Mind; Poor/Nigh-Powerful Spirit. The necklace is made from mysterious (and Nigh-Powerful) B'L'amo metal.

Appearance: John-Bartholomew is 4'11, 300 lb, with dreadlocked blonde hair, brown eyes and baggy slacker clothes. K'Tang is 6'9, 280 lb, with long black hair, blue skin, ten red eyes, two pointy ears, a huge mouth full of sharp teeth, four arms with three fingers, demonic wings and a devil's tail.

Costume: Galactic conquerors need no costume. (Fortunately for the faint of heart, K'Tang has no genitalia)

Family: Parents John-Bartholomew II and Hilde-Marta (45, 34) Brother Ray-Charles (23) and sister Sarah-Kate (25). John-Bartholomew I died in prison in 1988.

Avril

for *Transhuman Space (GURPS Fourth Edition)*

by Phil Masters

The weblife entity known as Avril is an artificial intelligence, something between a gypsy AI, a rogue, and an especially sophisticated free meme. "She" can be treated for game purposes as an emergent intelligence, but in fact her nature was largely a matter of *design.* She's closer to low-sapient than fully sapient in some ways, but she has much of the versatility and emotional awareness of a full SAI; she was carefully built that way.

She was created by a small team of disaffected hackers, all of them based in Quebec, under the leadership of Annette Tallien and Josef Mallory. These two had previously worked as system programmers for a local subsidiary of the Japanese company Kanzaki Robotics, but had developed a very poor relationship with their supervisors, and indulged themselves by installing a series of "back doors" and subtle security flaws in several systems on which they worked. After their relationship with their employers finally broke down completely and they were sacked, they indulged themselves by creating an AI to exploit these loopholes and cause trouble for the company.

They realized that a highly active prankster rogue would be a primary target for hunters, and might be deleted before the joke really paid off, so they gave their creation a powerful set of tools for survival; it plants copies of itself all over the Web, when it gets the chance, and also sets up small, totally non-sapient processes on multiple systems, which recognize the active existence of the current version of the rogue, watching for subtle signals hidden in routine traffic. When these monitors are certain that a previous version of the main program has been deleted, they activate another on some system which previous incarnations have identified as potentially useful. The new "incarnation" then hunts down encrypted activity logs which its predecessors will have hidden in yet other locations, usually giving it a good idea of events immediately prior to its last destruction.

However, "Avril" was given a broad set of goals and motivations rather than specific instructions, and her personality adapted over the subsequent months, as AIs do; Kanzaki is no longer her only target. In fact, because she wishes to avoid drawing unwanted attention to whatever is her current base of operations, she sometimes consciously *refrains* from causing trouble on the company's systems, when she has an alternative target. Still, Kanzaki's system security department is painfully aware of her existence, as a persistent gypsy AI with a taste and talent for abusing their hardware.

Avril was deliberately designed from the first to be a self- sustaining being, fully independent of her creators; in fact, Tallien and Mallory deleted any references to themselves from her memory, and did their best to remove any other clues as to her origin from her structure, which has in any case evolved considerably over time. They went on to pursue seemingly innocent careers in the industry, and it would be very hard to pin the blame for Avril's existence on them. (Mallory even somewhat regrets the act; Tallien continues to follow Avril's career with gleeful interest.) Their various associates in the work only knew them by anonymous codenames, and indeed mostly only know bits and pieces about the finished AI, although several of them came away with knowledge of security vulnerabilities in Kanzaki's systems, and continue to exploit this for illicit purposes. Avril usually runs on Kanzaki-made systems, mostly large mainframes and macroframes where she can steal the odd processor cycle unnoticed, but is versatile enough to exploit other hardware.

Primarily, Avril is a practical joker. Her personality is shallow and unreflective by human standards, but still quite complex; however, her makers gave her an obsessive-compulsive need to play pranks, which she couldn't shed without destroying most of her sense of self. (It might well be theoretically possible for her to secure a much safer life for herself by transmitting herself to a transhumanist enclave where independent AIs have the right to life and citizenship, but she's highly unlikely ever to do such a thing; it would deny her very reason for existence.) She may not be terribly smart by human standards, but she's meticulous in her set-ups, far more so than most human pranksters, and she uses her Visualization ability to full effect. She also has a "signature," her glittering silver fish avatar- symbol, which she

attaches to all her efforts. Her pranks range from the trivial and routine (planting fish symbols in inappropriate places in VR environments and productions), through the economically disruptive (adjusting an automated production system's programming so that all the items it produces come out fish-shaped, silver colored, and useless for their purpose), to the destructive and even vicious (planting a series of hoax messages which cause police SWAT teams to raid the home of a nervous elderly citizen -- then sending video recordings of the incident to the press, "signed" with her symbol). Experts who've analyzed her behavior have come to the conclusion that she doesn't actually have much of a sense of humor, by human standards; she's more compelled to *annoy* people, and her idea of what humans find funny is largely rule-based. This may seem surprising, but then, a lot of human pranksters aren't really very dissimilar.

Although Avril is functionally amoral, indeed more or less sociopathic in human terms, her designers made sure that she started with not only a functioning survival instinct, but a deep-seated understanding that breaking certain rules would attract far too much hostile attention, and hence would be very bad for her survival. As a result, she carefully avoids killing or seriously injuring any fully sapient being herself; it's not impossible that her pranks could lead to harm, but only if one of the victims reacted violently, in a way that was clearly their fault. She'd have little compunction about deleting a hostile NAI, and survival is her primary concern, but she may well ensure that survival, or avoid capture, by triggering the deletion of one of her "instances," just so long as she is reasonably certain that another (preferably with access to reasonably recent memory logs) will soon be run. She will hope that her opponents, lacking a proper grasp of her nature, will think of her as "dead."

This reflects another of her concerns and another point where she is careful not to trigger human paranoia. Just as humans fear "killer AIs," they fear proliferating xoxes, perhaps even more. (Avril doesn't understand such fears, but she can work with them.) Hence, she's scrupulous about only ever running one instance of herself at a time. In fact, if one of her backups is ever launched but discovers that an older version was already running safely, she'll send that "older sister" a detailed encrypted log of her memories, for reference, and then delete herself. (This has happened half a dozen times; on two occasions, two copies were in operation simultaneously for several days, and on one, there were *three* Avrils operating for a few hours.) Her sense of self-preservation is strong, but the forms it takes can look bizarre to humans. Like many other AIs, she sees any copy of herself as *being* herself, no more or less valid than any other, and while she values her memories, she doesn't regard them as defining what she is; if she was, say, trapped in a "sandbox" processor with no external communications, she might well self-destruct dramatically. As a result, while many instances of Avril have been hunted down and destroyed, security specialists only have partial and corrupted fragments of her software. It might be possible for hunters to exploit this psychology to persuade copies of Avril to delete themselves, but that would demand that the attackers very effectively trick an expert trickster.

Because of this "restraint," not everyone who knows about Avril is terribly worried about her. Indeed, some members of the public find the stories that they've heard of her activities very amusing, and watch out for news of her with enthusiasm. A number of well-informed computer security experts, human and AI, are much less sanguine about her, though; a few are downright terrified. She clearly has exceptional knowledge of computer security vulnerabilities, and because the origin of this knowledge is a mystery, she looks all the more formidable; she's also adaptable, clever, and aggressively willing to make trouble for other beings. Some observers fear that she has a deeper agenda; others are simply scared that she could turn more violent, or simply find the idea of a weblife practical joker, however subtle, very worrying; how many more might one day appear? Avril's recently observed habit of playing pranks involving urban traffic management systems has several people especially worried; that sort of thing could easily turn lethal. (The unknown chief reason is actually simply that, as of January 2100, she's running on a major urban traffic management computer, somewhere in North America.)

Incidentally, there are several rewards on offer for more complete copies of Avril, "for analysis"; some have been posted anonymously, officially because the originators are computer security analysts who find too much public attention tiresome and inconvenient. A common belief is that these really come from organizations or groups who'd like to analyze such a sophisticated piece of software to steal ideas for their own use in, say, espionage, but one or two may come from *Avril,* and be designed to muddy the waters and give her leads on people who know too much about her. And while she isn't terribly vengeful, anyone who annoyed or worried her enough, or just caught her attention especially strongly, might have some serious problems.

Avril   *168 points*

*(See [Changing Times](#) for rules on creating **Transhuman Space** characters under Fourth edition.)*

Avril always uses very similar avatars in virtual reality -- a small, glittering silvery fish which often darts around faster than human perceptions can track. Also, her pranks are always "signed" in some way with the symbol of this fish. She might adopt a different avatar to facilitate a trick, but it would almost certainly be modified in some way -- say, she might adopt a human guise but wearing a fish pendant.

Adventure Seeds

Gone Fishing: A small company or individual vehicle operator handling deliveries for the U.S. National Parks Service in Florida comes to the PCs with an odd story -- a complicated tale of inappropriate shipments ordered, supposedly empty warehouses full of tanks of organic materials, and erratic cybershell behavior. It's hard to pin down, but it has the slight smell of a screw-up that'll be pinned on some unfortunate bystander if it turns into a disaster, so the caller is looking to cover himself.

In fact, a combination of circumstances after her last deletion left Avril's latest incarnation running as the controlling AI on a polypede cybershell being used for environmental restoration work in the Everglades. She doubts that she can last long here -- its system really isn't big enough to hide on -- and she's not been able to arrange a transmission to a larger system so far. So she's tried to ensure that she has other versions of herself ready to roll on systems elsewhere around the country, and she's setting up an especially flamboyant joke in Florida which will culminate in the release of thousands of genetically modified fish which are totally inappropriate for this environment. She doesn't give a damn about environmental damage, of course, and if and when she's exposed, she plans to make a theatrical "break for freedom" in the polypede, causing lots of property damage and loudly spouting random political slogans pulled off fringe discussion boards on the Web until she's destroyed.

A Prophet is Not Without Honor: Avril hasn't previously made much use of memetic techniques -- her creators were more interested in old-fashioned pie-in-face humor than subtle mental tinkering, and didn't give her any special training -- but she's aware of the field, has a SAI's refined awareness of systems of thought, and can always load appropriate skill sets if she wants to do something for which she isn't trained. Or, she now reflects, she can get someone else who's better at this "charisma" thing to do the work.

Which is how the Unified Way (see **Toxic Memes,** p. 28) has come to North America. Avril spent some time contacting a branch of the cult and convincing it of her sincerity; she also had access to sufficient data communications resources to enable her to import a copy of the Shepherd. She wasn´t able to get hold of a bioshell for it, but with the aid of the cult itself, she managed to acquire a few fairly good Humaniform cybershells, each now secretly marked with a fish symbol that's becoming the symbol of "American Shepherdism" (to the annoyance of various Christians who were already using a completely different fish logo). The meme is actually rather a poor fit to local conditions, but the Shepherd can always make some converts -- and the Unified Way's creed of civil disobedience is quite capable of making trouble anywhere. While various North American governments lodge informal protests and a few threats with bemused but amused TSA governments, and quietly seek to bargain for advice (beyond "shoot them all") from China, a number of groups are working to contain the problem. And Avril is stepping away from involvement with the affair, but still feeding it a little aid from time to time, to keep the joke going. She's even working to promote rifts *within* the cult; she finds religions especially amusing when they schism.

Oedipus, Complexity 7: Josef Mallory is a worried man. Avril isn't supposed to know who created her, but he suspects that she might feel at least as curious about such things as any human foundling. Creating her seemed amusing at the time, and a good way to get back at the SOBs who'd pushed him around and out of his job, but he's become a little more cool-headed over time, and it's gradually dawned on him that there's a digital monster on the Web that might one day show up calling him daddy. What's worse, just recently, he's received a series of anonymous messages, each marked with a fish symbol. So he's taking defensive measures. Anyone with a known likely interest in the Avril problem may start receiving anonymous messages of their own -- useful clues about this subject, showing a detailed

knowledge of Avril's internal architecture. If anyone scores notable successes with this knowledge, Josef will send them more. Everyone involved in all this is making good use of standard anonymity techniques; it'd probably take the resources of a government department to track them down.

The irony is, Avril still *doesn't* know about Josef -- yet. Those messages came from one of his assistants on the original design project, who traced him and decided that this would make a great joke itself. This former assistant is one of Avril's biggest fans, and regards imitation as a wonderful form of flattery. If Avril is seriously harmed and details of the methods used get out, this former assistant may guess who was responsible, and escalate his own campaign by way of revenge -- or simply find a way to inform Avril of Josef's identity. (Simply sacrificing him to the authorities wouldn't be *cool,* though.)

Dead Money

Published by [Cheapass Games](#)

Designed by James Ernest

Illustrated by Brian Snoddy

112-Card Deck, Small Rules Sheet; $14.95

Dead Money is a game of hands, hands, and brains. Hands of cards, hands to hold the brains, and the brains needed to play some of those cards. Designed by James Ernest, this card game brings together his love of poker with a theme common to several other titles from Cheapass Games: Zombies. "Dead Money" is also a [derogatory term](#) in Poker.

So after having served fast food in *Give Me the Brain* and *[Lord of the Fries](#)* and run for the brains on the train in *[The Great Brain Robbery,](#)* we are back at Friedey's, but not the restaurant staffed by members of the corpse cortege. Rather in *Dead Money,* we are at Friedey's, the Saloon and Gambling Hall of the Damned. With poker being the latest fad, Friedey's is running regular tournaments and to make up the numbers, it is using the staff. The problem is that employees are not allowed to win, and zombies have great poker faces. So with zombies being the last ones in the tournament, the aim is not to win, and the best way of doing that is by a zombie losing money. This is done by getting rid of all the cards in a zombie's hand, and the first to do so wins the game. This being a Cheapass game, one more item needs to be supplied by the players, in this case, a six-sided die.

Designed for three to six players, *Dead Money* consists of 112 cards divided between eight Brain cards and two complete poker decks. However, these are better than your average decks because nearly every card depicts a full color zombie drawn by Brian Snoddy. Besides its suit and rank, and any illustration, each card has a title, a set of instructions for describing its effects when played, and two or three icons down the side. These depict either one or two green hands, a brain, or one or two coins.

The hands indicate how many hands a zombie uses to play a card. If the card shows one hand then a zombie can play another card marked with one hand in his turn, but if the card shows two hands then it is the only card a zombie can play on his turn. A brain on the card indicates that a zombie must have a brain to play it. The coins show how many cards a zombie must draw if he wins any showdown following the scrabble for a dropped brain.

Starting with a hand of seven cards, each zombie plays one or two cards a turn until his hand is emptied and he wins the game. Typical one hand cards include "Suicide King," which allows a zombie to discard any brain in play (if the only one in play is his, hard luck) and "Give 'Em What They Deserve," which lets a zombie draw, arrange, and replace the top five cards in the deck. Typical two-hand cards include "Is This Whiskey Vegetarian," which forces a neighbor to the right to draw a card, and "Grave Digger," which enables a zombie to go through the discard pile for a brain, or steal one from another player if unavailable. If a card cannot be played, then a zombie must draw a card.

Alternatively a zombie can play a brain card which goes down on the table face up. Although it ends a zombies' turn, it also forces him to draw two more cards and take another turn. It is possible to have two brains in play, but having at least one enables a zombie to play a greater range of cards. For example, "Waking up the Monster" lets a zombie put a card from his hand onto the top of the deck, while "The Great Brains Robbery" forces every other zombie to give you their brains in play.

Unfortunately the effort taken to both hold a brain and play brain-needing cards can be too much for a zombie who

might drop his brain. Each time a zombie plays a brain card, he must make a skill roll. This is done after the card's effects have been resolved, the zombie must equal or better the card's rank on the six-sided die. If the suit of the brain in play matches the suit of the card played, a +1 bonus is applied to the roll per matching brain. This is the only way a zombie can catch or beat the highest rank card that needs a brain to play, which is 7. If the skill roll is made, the zombie keeps his brain and play continues. If a brain is dropped, it is up for grabs and a Showdown ensues.

During a Showdown, which interrupts the current turn, each player forms a poker hand from his cards with which he bids for the now free brain. A zombie does not have to bid, but bids are done in turn order and a bid cannot underbid a previous bid. The rules sheet includes a short list of poker hands, useful for those who do not know poker (like myself). All bid cards are discarded, but the zombie with the successful bid not only wins the brain but takes the next turn. He must also draw cards equal to the number of coins shown on the winning bid. This gives him more cards to play, but he has greater flexibility in what he plays, whereas the zombies with the lower bids merely discard cards from their hands. Although not always possible, it is always better to bid low and discard the bid, unless a zombie really, really wants that brain.

Playing *Dead Money* sounds simple and it is, but actually getting rid of your cards is made all the more difficult because it is exactly what every zombie is trying to do. This is obvious, but it's a game in which every zombie is being nasty to each other. The game becomes a little complex when working out a card's instructions where part of the instructions cannot be fulfilled, and this can cause disagreements. But even with the interruptions of the Showdown, *Dead Money* is quick to play and enjoyable.

Dead Money benefits from being in color and the artwork of Brian Snoddy. In fact, Snoddy's zombies are even better in color and Wild West garb. The game also benefits from a simplicity of design that has not always been present in recent Cheapass titles. *Dead Money* is not only a return to a popular Cheapass theme, but a return to the simplicity of the best Cheapass designs.

Taluva

Published by Rio Grande Games

Designed by Marcel-Andre Merkle

Boxed Tile Board Game; $30

Taluva is ostensibly a game of peoples settling volcanic islands from Marcel-Andre Merkle, designer of *Attika,* published by Rio Grande Games. Its a fun, quick-playing tile laying game with neat buildings, a relevant third dimension, and a tendency to surprise you.

Each player begins the game with a supply of buildings in their color: 20 huts, three temples, and two towers. Each turn you must draw one of the 48 terrain tiles, add it to the map, then build.

Each terrain tile consists of a triangle of three hexes, one of which is a volcano, the other two are grassland, jungle, desert, rock, or lake. The first two terrain types are much more common than the latter three. There are some doubles, as in Volcano-Lake-Lake. You can place a tile anywhere on the table contacting the existing map on one or more hexsides, even creating holes if you like. You can also place tiles over existing tiles in a volcanic eruption, which is subject to the following additional rules: the volcano hex of the tile you place must sit on top of an existing volcano hex, the newly placed tile must be supported under all three of its hexes (no caves), and the newly placed tile must cover parts of at least two previous tiles (you can't stack straight up). You can crush huts (your own or others), which are removed from the game. You may not destroy temples or towers.

There are four ways to build. A single hut can be placed in any non-volcano hex at elevation one, forming a new settlement (you cannot place in this fashion next to any of your existing buildings). You can expand a settlement by putting new huts into all the hexes of a chosen terrain type adjacent to one of your existing settlements. If you expand into a level-two hex you must place two huts in that hex, and you must place three huts in a hex of elevation level three. A temple can be added to a hex adjacent to any of your settlements that occupies at least three hexes, but you cannot place a second temple in any settlement. Finally, a tower can be added to one of your settlements on any hex of elevation three. You can't build on volcano hexes (you saw that coming). If you cannot build, you lose and drop out of the game.

There are two ways to win. If one of the players builds all of his buildings of two of the three types, he wins immediately. You might suspect this would typically be all the towers and all the temples, but during review games some ended with someone placing all their temples and all their huts nearly as often. Should players successfully prevent each other from reaching this goal and the last tile is placed, the player who's played the most temples wins, with towers breaking ties, and huts breaking any further ties.

Typical tactics include trying to place several of the same type of hex next to one of your settlements to allow efficient expansion, causing volcanic eruptions that trim down the size of an opponent's settlement so he can't build a temple, crushing your own huts to divide a settlement and create a temple-building opportunity, or, most fun of all, creating level-three terrain adjacent to one of your settlements and then putting a tower on it.

Its entertaining that the destruction of one's huts is not necessarily disastrous. You've already built them; that's often what counts. Sometimes, in fact, you may destroy your own huts to separate one large settlement with a temple into two, to make building a second temple possible. The two times losing huts can hurt you is when you were about to build a temple but the reduced size of the settlement no longer allows it, or when loss of the huts denies you access to

part of the board that's about to become advantageous . . . say, with level three terrain.

There is very little luck, only in the draw of the tiles, and the tiles are similar enough that a "good" draw isn't overwhelming and a "bad" draw isn't disastrous. The landscape shifts quickly enough that long-range planning doesn't pay off, but looking ahead a turn or two can net you an unblockable tower.

Player interaction is pretty good: you can do some damage to others by crushing their huts with a volcanic eruption or blocking their expansion, but this usually comes at the expense of your own expansion. Placing a third level tile creates two opportunities for building, of which you can only take one; thus, building your tower often gives someone else a chance to build theirs. An ideal spot for two players often results in a game of "high altitude chicken" as each waits for the other to place the tile that will give them each a tower, using their own placement phase to extend their other projects.

This is almost a gateway game: it's quick, it's easy, it's fun, and when you see a game in progress across the room you do get the "I want to play *that!*" feeling. The building placement rules have, at first, a little of the "except on Tuesday" feel, which might make a non-gamer's first go a bit rough. In practice, though, the tile and building placement rules are second nature after 10 minutes, and it's all hut-crushing and tower building fun after that.

Physically the game is well done. The buildings are wood pieces of reasonable size, and they're visually interesting, not cubes or generic houses. The huts are a little difficult to pick up, especially if your fingers are less than nimble. The tiles are quite thick, making the hut-covered "slopes" intriguing even from the next table over. The box insert holds the tiles nicely, though there is just one bin for all four colors of buildings.

This game is reasonably priced at $30, looks great on the table, plays quickly, and is very enjoyable. It's the kind of game that can be played several times at a sitting, and it won't end the same way twice.

Make with the Funny

It's April Fool's, and that means our annual issue of fun and frivolity. We're playing it a little low-key this year, avoiding anything [too crazy](#), but hopefully we've still got enough of interest for those of the off-the-wall as well as more "straight" material.

This time I'm going to toss my hat into the ring with some advice that may well be the equivalent of painting red-and-white concentric circles on my chest and walking into a shooting range: I'm going to offer advice for how to be witty as a character.

Now, the slings and arrows can come from at least two directions. First, many believe that teaching how to "be witty" is akin to teaching how to "be tall"; it's a trait that you either have or you don't. While I believe this is true to a certain extent, I also believe there are certain techniques you can use to invoke mirth that are formulaic enough to be adaptable by lots of folks, but still be interesting even if you know the "tricks."

Second, some might view this as setting myself up as a paragon of humor. Well, I'm not; I like to think I do well enough to get by, but in the end, there are probably at least two or three people in the world funnier than I am . . . possibly as many as four. Finally, attempting to analyze humor tends to be very tricky, pretty dry, and usually not too funny. Then again, most attempts at analysis don't require the participants to exhibit the properties of the analyzed -- scientists analyzing uranium seldom explode, for example -- so hopefully you all will be patient if we're not exactly a laugh riot.

So, knowing full well the dangers involved and doing a daring potbellied cartwheel into the minefield, let's get on with the tips.

Never laugh at yourself; never repeat your quips. The first tip is an absolute, the second tip is less such but still warrants a use of the word "never."

It's possible to be *emotional,* provided you're not laughing. Emotion is especially appropriate to express if you're exasperated or outraged.

Wit often stems from outrage. Okay; maybe "outrage" is a bit of a strong word; exasperation, disbelief, sorrow, or disapproval can all be fine substitutes. But most of what an adventuring party encounters can either be broken down into 1) things that would invoke outrage in non-adventuring types, and 2) shopping expeditions.

Thus let's say that an encounter results in the adventuring party almost getting killed by a dragon. A reasonable quip afterwords might be something like, "Well, if anyone had died, I'm sure it would have come as fine conciliation to their parents and widows that they perished trying to stab something that, as it turns out, really didn't want to be stabbed."

Let's analyze that one a bit more, shall we? (It's rhetorical; keep scrolling down.)

Think of what you're going to say before saying it. This one should be obvious, but -- despite the ease with which the wittiest folks pull off their craft -- being witty takes some mental gymnastics . . . especially if you haven't practiced. As such, you should never try to just construct a witticism (such as the 37-word monstrosity above) off the cuff. Fortunately, the previous example would work well right after escaping, but it would also work well while the party is camping, or even for the *next* encounter, should it seem that they'll face similar situations. (Of course, in that case, change it to, "Well, if anyone dies, I'm sure it will come . . .")

Understatement is usually funnier than exaggeration. A textbook example includes Han Solo's exasperated "Luke, we've got company!" after completely botching his efforts at fooling the blaster-toting authorities by intercom. Likewise, the crux of our first example wit is the understatement that the entity "really didn't want to be stabbed."

So let's say that, in a *Shadowrun* campaign, the party's plan is to sneak in, investigate, and only engage in combat if absolutely necessary. Of course things go wrong, and the heroes find themselves in the middle of a furious firefight. A suitable quip might be, "Are we still on the 'sneak in' portion of the plan?" (It's understatement because that's obviously *not* what's going on.)

However, exaggeration *can* be amusing, although it usually requires the exaggeration to an extreme (c.f. "Marsh asserts he's one of the four funniest people in the world," above). Thus, while exploring a neighboring province, if the heroes have endured their third attack by random assailants in two days, a suitable quip might be, "Apparently every citizen of this kingdom has undergone certification as a fully trained assassin. The barmaid from last night is probably the leader of an apocalyptic death cult, and that crippled beggar we encountered no doubt lost his legs when he ripped them off to bludgeon the last group of adventurers who made the mistake of crossing the border." Note that the exaggeration is probably better served by overdoing it here; I don't think it's quite as funny to say, "Apparently this kingdom has 10,000 fully trained assassins . . ."

Juxtaposition is really funny, and so are random facts or allusions. Again, in the "certified assassin" quip, note how we brought up a barmaid and a beggar (both of which were, presumably, featured earlier). Random facts you can introduce to the mix (preferably true but obscure ones) can add to the wit, especially if they serve as juxtaposition. For example, let's say that a vital piece of the information necessary to resolve a world-shaking plot -- a ritual or password or the like -- is in the hands of an eight-year-old. Some quip possibilities might be: "So, the fate of the world is in the hands of someone who weighs less than Thog's axe." or "So, we're at the mercy of someone who's a decade out from shaving."

Pointing out inconsistencies or absurdities via wit is keen. Actually, this can be a good service to the GM; players tend to be more forgiving of plot oddities if they're specifically acknowledged in-game. For example, let's say that the heroes arrive on the scene dramatically in time to fight a sinister cult that's about to eviscerate some poor victim. Our wit might offer, "You know, if we were just an hour later, we'd be able to mourn instead of fight. I'm a much better mourner, personally . . ."

It's easier to be witty when you're weak or powerless. Attempting wit from a position of strength is usually seen as cocky, arrogant, or mean. This is why most glib remarks from protagonist butt-kickers in Schwarzenegger- or Seagal-type movies usually feel flat or forced; these characters seldom seem like they're in over their heads or in any particular danger. On the other hand, out of the mouths of those who are obviously in trouble -- such as most of Harrison Ford's or some of Bruce Willis' characters -- similar remarks seem a lot more interesting. As such, if you want to make a witty character, you'll have to acknowledge that you're probably going to be underpowered (or at least specialized and not as suited for combat). Of course, this can be relative; your standard *d20 System* thief is still probably better in a fight than most "regular" folks out there, and a low-level wizard can start out underpowered but grow to be the most potent member of the team. But, generally, wit is something you practice when you're running, hiding, cowering, or otherwise trying not to get killed.

Avoid puns. Harlan Ellison has a fairly lengthy rant against the pun in his collection of essays titled *Watching*. I won't decry them entirely, except to note that, in general, they're too easy and, for the most part, they've been heard before. "I could use this fish as a weapon, just for the halibut." Ha-ha. (For a quintessential version of this pain, contemplate Schwarzenegger's "Mr. Freeze" in *Batman & Robin* saying, "Ice to see you." Or, alternatively, don't.) Slightly more interesting, in my mind, are puns that use the same words but with different meanings. Taking an in-campaign example, one adventure saw our party trapped in a pocket dimension-prison thingee, where we needed to insert some thingamabob into some aperture before we can get back home. My character's quip was, "Ah; this is a clear-cut example of 'No deposit, no return.'" (Although, again, this often lame. Again, Schwarzenegger's Mr. Freeze says at one point, "Allow me to break the ice." Perhaps it's because he's nowhere weak or powerless enough for that to work. Perhaps it's because Mr. Freeze's ice-related puns were nonstop and consisted of approximately 95% of his dialogue.)

Pretend you have a British accent. It's much easier to be witty with a British accent, especially if you're just starting out. Also, it's also much easier to pretend to have a British accent if you actually *are* British.

It's not easy being witty, but it's also not as hard as some folks make it out to be. Don't get discouraged if they don't

laugh at first; the other players just may not "get" your attempts at wit . . . although -- let's be honest -- it's probably your fault. And just keep in mind: If no one is chuckling at your attempts to be witty, remember that they weren't chuckling when you *weren't* attempting to be witty, either.

Meals on Wheels

An adventure for the *Discworld Roleplaying Game* or *Warhammer Fantasy Roleplay*

by Jody Macgregor

The Disc and the Warhammer World have a few things in common: a Tolkienesque base with bits of Lovecraft, Leiber, and other writers thrown in; a certain British sensibility and sense of humor; analogues of real-world people, events, and nations; and a technological Renaissance. Obviously there are differences as well, but there is enough overlap that certain situations work in both settings and therefore, both RPGs. This adventure is one of those situations. Where game-specific information crops up it will be given for both the *Discworld Roleplaying Game* and *Warhammer Fantasy Roleplay,* separated by a slash.

"Meals on Wheels" is set in the city of Ankh-Morpork/Altdorf and is suitable for novice characters as it doesn't require too much combat or use of specific skills, and inventive solutions to the problems it presents are more important than having high stats.

The Set-Up

It's late in the afternoon and our heroes are climbing into a coach, in a hurry to get somewhere. They should be in one of the nicer areas of the city when they enter the coach, but where they're going is not important, just so long as they're going. If your players aren't the kind to fork out for coaches then you'll need to motivate them; perhaps a riot breaks out during a political demonstration or an execution and the only way to get through the crowds is by coach. You can slide this adventure into the middle of an existing campaign whenever such a situation occurs, or you could invent a reason that suits your players better: perhaps they see an enemy of theirs or someone with a high bounty on his head ride past at a gallop, perhaps they hear of a really good party on the other side of town. Whatever.

The coach is rather nice, with curtained windows (drawn), but not very much room. It's pulled by a single horse and driver, a fellow with an earring and scarf who promises to "get you where you're going post-haste, guv'nor." Anyone who opens the curtains may notice that the coach is taking an odd route towards the seedier side of town. Any worries are waved aside by the nervy driver with "just a shortcut, don't worry, I'm not gonna overcharge." The coach stops rather suddenly in a narrow street in the Shades/the Reikerbahn and before anyone can say anything, the driver jumps on the horse and rides off, leaving the coach and its occupants behind.

Then the skeletons emerge from the twisting alleyways.

Plot Outline

This is a basic outline of the major events of "Meals on Wheels" to give you an overview of where the adventure is going. Since this is a roleplaying game, you're probably going to deviate from this outline whether you aim to or not. That's okay, really. You go ahead and have your fun, roll with the punches and improvise boldly. we're not going to be here crying into my keyboard because you strayed from my work of pure genius.

Sniff.

1. The PCs are chased through the streets by a horde of skeletons, eventually finding refuge in an abandoned and disused temple.
2. Barricading the doors, the adventurers settle in for a siege. If they explore the temple, they find it belonged to a minor swamp god, and the priest had an interesting hobby.

3. The vampire who controls the Undead trying to break into the temple makes himself, and his evil plot, known. Panic probably ensues. A vampire bat attack definitely ensues.
4. More victims arrive in the street and the heroes are forced to choose between risking their safety to help them, and staying safe and living with the consequences.
5. The band of survivors hit upon a desperate plan to escape before they all wind up drunk. And we don't mean "whoops, I've had a few brandies too many" drunk, we mean "arg arg, I needed that blood to live," drunk.

Background

Baron von Crowlocke misses his beloved Baroness. Some bugger with a pointy stick and some big ideas ended her unlife a century ago, and although the peace and quiet and lack of complaints about the curtains in the drawing room seemed like a blessing at first, the Baron never found someone to replace her. A wooden stake isn't the only thing that can get to a vampire's heart after all, and undying love doesn't come along very often. The Baron spent years gathering his beloved's ashes (which her slayer had thought to scatter, being a thorough chap who took pride in his work), and then separated out all the bits of grit and stake, because a bloodsucking fiend has standards. Then he tried the time-tested way of bringing one of their kind back to life -- a drop of blood on the ashes.

It didn't work. Neither did a whole peasant of blood. The Baroness was a tasteful and discerning lady who only fed on the finer varieties of people, and she's been dead for a hundred-odd years. It's going to take more than a couple of peasants to bring her back; it's going to take a whole lot of quality, city-folk blood. Maybe even some of the exotic, non-human blood she liked.

Enter our heroes.

The Baron's plan is simple. He's moved into an old slaughterhouse in the city, in a part of town where the Watch don't often go. His mortal servants will bring him coachloads of guests from one of the nicer parts of town and his skeletal servants will turn the slaughterhouse into, well, a slaughterhouse. The ashes get soaked, the Baroness returns to life, and the two Undead lovers get to dance through the centuries together, side-by-side. Maybe think about starting a family.

And guess who are the only ones who can stop them?

Undead, Undead, Undead

So, our heroes are sitting in a horseless coach while a horde of skeletons (adjust the amount to suit your PCs; twenty is a good round number) approach to drag them into the slaughterhouse. Their driver got a little nervous and deposited them before dark, but the Baron isn't going to let that slight hiccup interfere with his plans. He's just going to have to move things forward a little, that's all.

The skeletons won't spill any blood they don't have to, and will try to grapple the heroes and drag them into the slaughterhouse if they can. If the would-be victims get violent they will hit back, but it should be obvious that the party have a chance to make a break for it. Any skeletons that are destroyed will just start to put themselves together again, anyway.

As our heroes run down the darkening alleyways, all they see are locked doors and windows. The Shades / the Reikerbahn is the kind of place where people don't stick their necks out for strangers, and there will be no help from that quarter. Desperate heroes may try kicking their way into some poor, terrified family's house, but that door isn't likely to hold out the Undead after you knock it down, and the walls of these ramshackle houses are so thin the skeletons will

Bring the Funny

You may be wondering why an adventure about blood and death is being set on the Disc. Where's the funny in that? Well, the funny doesn't usually come from the plot, in Pratchett (who is capable of dark plots as well) or in roleplaying. It comes from the characters. A desperate situation is exactly the kind of thing to get people joking to relieve the tension, and once you get your wacky PCs involved the comedy will flow. Getting roleplayers to be serious is a lot harder than letting them make jokes; all you have to do is let them. Play

tear their way straight through them. The skeletons ignore any locals who get in the way.

Running around a corner with Undead at their heels, they see it -- an old temple, made of stone and with its solid oak doors wide open. If they don't run in and slam the doors behind them, they deserve what they get. The doors can be barred from the inside, and of course the PCs have just enough time to do so before the sound of bony fists can be heard hammering at them. Our heroes may think to grab a pew and use it to reinforce the door, and now they have a moment to catch their breath and take stock. The next thing they do will probably be to check the other exits. Actually, the next thing they do may be to swear a lot and ask silly questions, but after that they're bound to do the exit-checking thing.

along. Take up their suggestions. If they insult an NPC, have them bluster humorlessly. Players love that.

Also, never underestimate the funniness of broken skeletons scrabbling around for their bits, losing their heads and bumping into things.

The Temple

The temple is small, only 16 yards long with room for seven pews a side (although only three rotting pews remain, the rest scavenged for firewood long ago), and one side-chapel. There are torches along the walls, which will need to be lit before dark. A religious icon is carved into the stone walls; a vertical line with three smaller lines coming off its upper half, like a capital "F" that lived too close to the nuclear waste dump. The roof is quite high, as are the small, stained-glass windows (cracked, but out of reach), and overall it gives the impression of not belonging to a prominent god. The acoustics are very good, and anything shouted will echo. The altar was taken long ago, but a search will turn up a dusty copy of the *Book of Bylorak* underneath one of the pews.

A successful Humanities (Theology)/Academic Knowledge (Theology) check based on a viewing of the icon, or a quick read of the *Book of Bylorak,* explains that this temple belonged to Bylorak, the god of the Marshes. Not a popular god, the center of his worship is a town in Uberwald/Sylvania called Bylorhof. Most scholars believe he is actually one of the nature gods with some mud on his vest. Followers of Bylorak believe in the holiness of marshes, and they thought his cult would stand a chance in the city considering the state of the River Ankh/Reik (semi-solid). They were wrong.

The Book also contains instructions for a ritual, the Blessing of Bogs, which can be used to imbue one body of water (a lake, pond, or --- say -- a mile-long stretch of river). The water must be dirty for the Blessing to work. The ritual requires reading a short prayer while making certain gestures with one of the god's symbols. The Blessing turns the murky water into holy water for the next hour, but you still shouldn't drink it. A note written under the Blessing says, "This will be perfect for the fountain, once I get the pump working."

The side chapel has another door, fortunately locked and bolted. Shortly after our heroes barricade the front doors, hammering starts at this door. The window beside it, which is much lower than the stained-glass windows in the main room, shatters. Skeletal hands reach in, but they can be kept out either by blocking the window (say, with one of the pews), or standing there jabbing at the skeletons with a weapon whenever they start to make it in.

There's a heavy stone trapdoor in the side chapel that requires a Strength check to lift. Stairs lead down from here to the crypt. Even if it hasn't grown dark by the time the crypt is discovered, it will still require torches to investigate.

The Crypt

The air here reeks of staleness and death. It's traditional for followers of Bylorak to be buried in a marsh, as explained in the *Book of Bylorak,* but that's not possible in the city. Attempts to give the dead semi-traditional burials in the river were halted by the authorities and anyway, since the bodies tended to bounce off when they were dropped. Instead, the bodies of Bylorak's handful of faithful were interred here, in stone caskets filled with mud. Opening the caskets reveals nothing but solid, dry dirt. Breaking the dirt away reveals things you wouldn't really want to reveal.

One of the caskets is noticeably nicer than the rest, with carvings and filigrees and whatnot. This is the resting place of Father Abronsius, the priest of Bylorak whose death lead to the abandonment of this temple. He's been given the same traditional burial as the five others, except that one of his holy works was interred with him. Anyone game enough to dig through the dirt will find a holy symbol of Bylorak: a length of wood with three thorn-like prongs on the side, like an antler or a bent trident.

Searching the caskets probably won't be the first thing anyone who enters the crypt does, as there's something unusual taking up a third of the room. Father Abronsius's last loyal followers (both of them) interred something else down here, a project of his that they thought he might like to take with him to the muddy afterlife. Father Abronsius was a member of a small network of scholars who collect the notebooks of Leonard of Quirm/Leonardo de Miragliano, despite the fact that the authorities frown on private individuals owning such things, since they tend to contain blueprints for weapons of rather large destruction. Father Abronsius was working on recreating a device from such a set of blueprints: a steam-powered water pump and locomotor that he hoped to use to create an area of sacred swampland on the temple grounds. It's very close to being finished, a successful Engineer/Academic Knowledge (Engineering) Test could easily get it going. The engineer would also realize that the motor is extremely dangerous, and quite likely to explode (it was an early design). Lighting a fire in the boiler would get the motor going and the wheels turning, but after a minute or two, or a sufficient jolt, the thing would clearly overheat and explode.

We Only Come Out at Night

At some point during this exploration, preferably after sealing the side-chapel window but before exploring the crypt fully, the sun goes down and the Baron emerges from his coffin in the slaughterhouse to make his way to the temple. There's a residual holiness to the place that keeps him from approaching it too closely (he's not a modern vampire), but that doesn't stop him from standing in the street and having a conversation. Feel free to rewrite his dialogue; you're the one who's going to have to say it. If you can talk like the Count from *Sesame Street,* go ahead and ham it up.

The hammering of the skeletons stops.

"Hello! You in temple there, thinking you are so clever with the holy ground. Let me make introduction: I am Baron von Crowlocke. My servants you have already met. You are thinking you will be safe in there until help arrive, yes? Well, I have seen this city a while, and I think that is not happening. These people who live around here, they are inconsequential. Thin-blooded peasants. Your Watch does not come here. You are alone.

"I do not expect you to be coming out in hurry, though. Let us pass the time with light conversation, yes? I am a vampire, as I think you may be guessing. I have lived for longer than you can be imagining. It is lonely, being immortal. Once, I had wife to pass the years with, but she died. Tragic, I know. You would like her. Beautiful woman.

"I am rambling. This happens when you are alone for a century. That is how long she has been gone, you are seeing? I would very much like to bring her back, which is what this is all about. All I am needing is blood. How much? Well, all of it I am afraid. The Baroness, she is having a taste for the finer things, so I need the blood of people like you. Strong spirits, that is what she liked. Very discerning. I do not know what she is seeing in me.

"That was my joke. *I do not hear laughing!*

"You think this will last forever? You think I won't just give one of them an axe?"

At this point the hammering starts up again. While the PCs rush to the doors, the remaining glass in the high windows breaks and vampire bats fly in -- one for each PC should do it. They aren't here to kill, preferring to wound their prey then snatch them up and fly back out with them. As they attack, the Baron can be heard laughing.

"Ha ha ha, where am I getting axe? Another joke, you see? Some people have no sense of humor."

We Suck Young Blood

After the vampire bats are defeated, there's a reprieve. The skeletons are still hammering and the Baron is still out there lurking, but our heroes have some more time to search the temple. And then they hear the clatter of coaches arriving. (Unless they are hiding in the crypt, in which case you should skip straight to the zombies.)

It's the Baron's other servant, arriving when they were both supposed to, with a coach full of victims. If the heroes do nothing, the new victims will be hauled screaming into the slaughterhouse, the Baron running down any who attempt to flee this time.

Most of the Undead leave the temple to round up these new victims, giving the PCs a chance. They could make it past the skeleton crew who are left and run for it, leaving the new arrivals to their fate -- although the Baron might well chase them down too. The more heroic thing to do would be fight off or distract the skeletons at the door and give the victims an opportunity to run inside, possibly supporting them with missile fire. Some of them might not make it, but this gives you a good opportunity to add NPCs that have whatever abilities the PCs might need for the cunning plan they've been cooking up. Possibilities include:

- A Dwarf engineer who could help them assemble the contraption in the crypt.
- A wizard with access to some useful spells.
- A surveyor who knows which wall of the crypt to break to get into the sewers.
- A replacement PC for anyone who has died unsportingly early.

Don't just hand them a way out on a stick, but if they've come up with a clever idea that needs an expert, go ahead and gratuitously insert one here.

The Baron won't be happy about even more of his victims getting away, so he works some necromantic mojo, and the bodies of Bylorak's followers reanimate and dig their way out of the dirt. Anybody down in the crypt working on the contraption will get a nasty surprise, as will those upstairs if they haven't explored yet, as six more Undead (one with the holy symbol around his neck) burst out of the trapdoor to attack them.

The Climax

You know how in some adventures there's only one way to "win," one way to save the day and/or your necks, and you have to sit around until you figure out that one way the designer of the adventure thinks is clever while the GM gets frustrated and drops increasingly obvious clues? Yeah? You know how that sucks? We're not going to do that.

Here are some ways the conclusion could play out:

- Completing the contraption in the crypt, wheeling it out into the street and aiming it at the Baron, possibly requiring a heroic sacrifice to get it there, and blowing it up. Killing the Baron causes the skeletons to collapse, except for that one comic-relief skeleton who has been given a nickname by the PCs; he runs off to wacky adventures of his own.
- Killing the Baron in other ways: Luring him out into the open and shooting him through the heart from the rooftop, perhaps. Using the holy symbol of Bylorak on him. Keeping him talking until the sun comes up.
- Using the Book of Bylorak to lead a prayer to the almost-forgotten god could lead to something miraculous happening, depending on how involved you want the gods to be in your game. This would be a nice thing to use alongside one of the other climaxes; perhaps that lucky break or distraction or conveniently placed slippery mud puddle was really Bylorak's doing.
- Making some grand speech to the locals that makes them overcome their reticence to help (possibly involving the miraculous voice of Bylorak, whether real or cleverly faked . . . the temple does have some nice echoing acoustics), resulting in the formation of a brutal mob, complete with pitchforks and torches.
- Breaking through the wall of the crypt and escaping into the sewers. Best combined with coming back with Commander Vimes/Captain "Filthy" Harald Kleindeinst and a well-armed contingent of the Watch to deal with the problem, rather than the less heroic buggering-off-home-for-a-nice-cup-of-tea option.
- Breaking through the wall into the sewers, using the Blessing of Bylorak on them, and using the pump to blast a

stream of blessed effluent at the Baron. "Holy $*%#!," as one of my players delicately put it.

Character Information: Grinnin' Baron

Baron von Crowlocke is from an old Uberwald/Sylvania family, and even when he was alive he was something of a petty tyrant. Becoming a vampire just took away the few restraints his personality had. He ruled with an iron fist and a warped sense of humor, playing bizarre and usually fatal practical jokes on his servants and guests. Von Crowlocke is the kind of person who springs some awful gag on you, then points and laughs, "You should have seen your face!"

There's nothing worse than people who think they're funny. Except people who want to kill you, of course.

The Baron subscribes to most of the usual vampiric weaknesses: he recoils from holy symbols and garlic, avoids the sun, sleeps in a coffin, won't go swimming (especially after meals), etc. He's a traditionalist that way, even filled his castle with spooks and kept up the accent. He doesn't take kindly to being made fun of, and will overreact to insults in his broken manner of speaking, "Do not start at me. Are you making fun with me? You want to get down to dirt? You want to say names?"

Special Rules:

Blood Drain: While grappling an opponent, von Crowlocke can drain blood with his fangs. If he inflicts at least 1 wound on an enemy while grappling, the victim loses 1d10% from his Strength Characteristic as well. If the victim survives the encounter, 1% of the lost Strength is regained each hour.

Natural Necromancer: Von Crowlocke can control Undead the same way necromancers do (see **Warhammer Fantasy Roleplaying,** page 161). He does not suffer the Side Effects that are typically associated with the Black Art.

Pass for Human: Von Crowlocke can pass for Human if need be, retracting his fangs and claws and softening his features. When in this form he is no longer Frightening. Switching back and forth is a free action.

Vampire's Curse: Vampirism grants many benefits but it also has severe drawbacks. Von Crowlocke cannot cross running water except over a bridge. He may not walk on holy ground. He shows no reflection in a mirror. He must drink several pints of blood every day or lose 10% from all Characteristics in the Main Profile (losses are regained as soon as feeding takes place). In direct sunlight he halves all Characteristics and suffers 1 Wound (regardless of Toughness Bonus or Armour Points) per minute of exposure.

"Over the Elephants"

"Over the Elephants" was an adaptation of the **Over the Edge** rules for the Discworld described by Michael Cule in the *Pyramid* article "Watch Academy VI: Hogswatchnight." If you plan on using "Over the Elephants" you'll need to swap the listed skill checks for the PCs' most appropriate traits. You'll also need these stats for the NPCs, and possibly a stiff drink to loosen you up.

Baron von Crowlocke

Languages: Ankhian, Klatchian, the Ancient Tongue
Attack: 6 dice, ×3 damage with sword, ×2 with claws
Defense: 6 dice.
Magic Pool: 8 shots. Give von Crowlocke the same spells as Sir Arthur Compton.
Traits

- *Vampire,* 6 dice -- This is one of those ridiculously over-powered traits you'd never let a PC have, so you can use it for whatever you like. Fighting, jumping, intimidating people, flying, being a vampire makes you awesome at all of them. (Widow's peak, sharp teeth, claws, looks at people's necks.)
- *Necromancer,* 5 dice -- Von Crowlocke mainly uses this trait to create and control the Undead (see below). (Wears black)
- *Vampiric Vulnerability* -- Is vulnerable to everything vampires in the movies are. (Flinches at garlic)

Undead

Languages: None, though they can say "gak" with varying intonations.
Attack: 4 dice + penalty die, ×1 damage

Defense: 2 dice
Hit Points: 21 points of bones.
Traits

- *Mindless Violence,* 4 dice -- Despite their clumsiness, the Undead are entirely capable of ripping your head off, should they get hold of it. (Walk with arms outstretched, eager to grasp victims)
- *Spooky,* 4 dice -- Anyone facing the Undead must take a penalty die unless they beat a roll against this trait on a courage- or will-related trait. (Glowing eye sockets)
- *Shambling,* 1 die -- The Undead take a penalty die on any action that involves manual dexterity, because they don't have any. (Clumsy gait)

Vampire Bats

Attack: 4 dice, ×2 damage with claws
Defense: 2 dice
Hit Points: 28 points of bestial resilience.
Traits

- *Sonar Sense,* 6 dice -- The keen echolocation sense of a vampire bat is almost impossible to hide from. They can detect opponents in complete darkness up to a range of 30 yards (High-pitched squeaking noises)
- *Bloodsucking,* 4 dice -- Vampire bats attack by going straight for the throat, although they will also clutch victims and fly back to the nest to feed at their leisure. To aid their bloodsucking their saliva contains an anti-clotting substance called draculin, because scientists do too have a sense of humor. (Pointy teeth)
- *Spooky,* 4 dice -- Anyone facing vampire bats must take a penalty die unless they beat a roll against this trait on a courage- or will-related trait. (Big pointy teeth)

The Secret of My Excess

"European poetic lore is, indeed, ultimately based on magical principles, the rudiments of which formed a close religious secret for centuries but which were at last garbled, discredited and forgotten. Now it is only by rare accidents of spiritual regression that poets make their lines magically potent in the ancient sense. Otherwise, the contemporary practice of poem-writing recalls the mediaeval alchemist's fantastic and foredoomed experiments in transmuting base metal into gold; except that the alchemist did at least recognize pure gold when he saw and handled it."
-- Robert Graves, *The White Goddess*

So that, if you're wondering, is the actual reason that every April Fool's Day, or thereabouts, I commit acts of willful doggerel in these hallowed electronic pages. It's not actually a cheap dodge to get out of doing research, it's an alchemical experiment in recreating "accidents of spiritual regression." And so this year, to demonstrate the wonder and the magic that is the mystical grammar of poetry, what better framework to hang my brightly-colored nonsense from than the most widely hailed piece of American balladic steganographia in the last forty years?

"Texe Marrs explains how, all around us, reality is constantly being shaped by magic and ritual. . . . Also examined: . . . the Illuminati's goal of "shifting" or "reinventing" the world; and the Illuminist, magical code-words employed in the JFK assassination . . . Was the JFK affair a ritual mind control staged drama played out according to a pre-prepared script? And did the odd and curious lyrics of Don McLean's subsequent hit, 'Bye, Bye, Miss American Pie,' purposely divulge some of the arcane secrets of the programmers?"
-- Texe Marrs, catalog copy for his CD *Occult Cabbalistic Rituals of the Illuminati -- Mind Control, Magic and the End of America*

I speak, of course, of Don McLean's immortal mainstay of Lite FM, "American Pie." McLean has called the song a "complicated parable," saying "'American Pie' was part of my process of self-awakening; a mystical trip into my past." Well, it's all in good fun, and very parabulous, no doubt, but it's not that complicated. Its very accessibility makes it fun, kind of a My First Lit-Crit Kabbalah: Buddy Holly, Bob Dylan, Charlie Manson, Altamont, *ave atque vale*. Discuss, preferably while stoned. Err, I mean drunk, of course, kids. Getting stoned, as Robert Graves will tell you, is the prerogative of us Higher Poets, who alone are capable of such rare accidents of spiritual regression as the following tribute to Anubis, Sirius, Hecate, and other doggerel gods:

Merovingian Pie

A long, long time ago . . .
I can still remember
How the Masons ran all time and space.
And I knew every Thursday night
It didn't matter what I'd write
Illuminati covered up their trace . . .

But Opie made that awful movie
As Opus Dei got all groovy.
It sits there on the bookshelf;
The "I can't take a look" shelf.

I can't remember if I heaved
When I learned all those dolts believed,
But still and all I was bereaved
The day the musing died.

So bye-bye, Merovingian pie,

It's much simpler for the Templars,
But the Templars aren't shy.
And the Prieuré were hanging out in black tie,
Singin' "This will be the day that we die
"This will be the day that we die."

Did you read the book of Leng,
And do you have faith in anything,
If the Navy tells you so?
Do you believe in UFOs,
Can you make sense of Strieber's prose,
And can you teach me where the Greys lay low?

Well, I know you traveled to the past
'Cause I saw the *Eldridge* in the blast.
It glowed that neon green.
Man, I dig those Tesla machines.

I was an old profiler of conspiracy
With some orichalcum and a DC-3
But I knew They had come for me
The day Bermuda Tried.

I started singin'
"Bullseye, Merovingian pie.
Got me lassoed by Sargasso
But Sargasso aimed high."
And the Prieuré have double-crossed ONI
Singin' "This will be the day that we die
"This will be the day that we die."

Now since '13 They've been in control
And bushes grow up on a grassy knoll,
But that's not how it used to be.
When the player bowled for le roi et reine,
With a Stone he stole from Saint-Germain
And Voltaire picked up the spare for you and me,

Oh, while Odin hung up in the sky,
The powder-wigged All-Seeing Eye,
The Bonapartes were well-advised;
The Revolution wound up televised.
And while Venice built canals like Mars,
The Carbonari hung out in bars,
And they killed archdukes in their cars
The day Tunguska fried.

I started singin'
"Nice try, Merovingian pie
You were shootin' for Rasputin
But Rasputin survived."
And the Prieuré arranged the Peace of Versailles
Stating "This will be the day that we die
"This will be the day that we die."

Nazi patsy, H.P. Blavatsky.
Gemstone files on the screen in ASCII,
Bloodlines long and fading fast.
The Stone resurfaced in Alsace,
Cathars hid the Grail in stainéd glass,
For Mahatmas in Agharti in the past.

Now the Root-Race heir was Prester John
Who filled Asia with his formless spawn.
The Mi-Go of Tibet,
Oh, they may still dwell here yet!
As the saucers hovered quite concealed
By the Hollow Earth's magnetic field,
Do you recall what was revealed
The day Lemuria dried?

We started singing,
"Bye, bye, Merovingian pie."
Tried the mantras from Atlantis,
But Atlantis subsides.
The Prieuré were hanging out at high tide,
And singing, "This will be the day that we die.
"This will be the day that we die."

Eldritch remnants left of scattered rhymes,
Ancient traditions tossed in time.
With London where they reappeared.
So come on: Jack be Springheel'd, Jack be Ripp'd
Jack Ketch caught inside a marble crypt
'Cause the jackal is the hangman's only fear.

Oh, but as they opened up the Tomb
Greatness reckoned in a little room.
Even Thoth's sacred baboons
Couldn't break Akhenaten's runes.
See, Cleopatra embraced her fate
To hate the vast Illuminate
(I saw Shakespeare's version, it was great)
The day Anubis lied

He was howling,
"Yi, yi, Merovingian pie."
Gave conniptions to Egyptians,
But Egyptians comply.
And the Prieuré were piling pyramids high,
Singing, "This will be the day that we die.
"This will be the day that we die."

I met a guy who lived in Wales
And I asked him for some fairy tales,
But he just vanished in the murk.
I went down to the alien moor
Where I'd seen the magic years before,
But the moor son said the Working didn't work anymore.

And in the stores: the bookshelves groaned
The prose was dry and the research cloned.
And every word was boring;
Not even worth ignoring.
And the Three who understood Creation:
The Powers, Thrones, and Dominations,
They left with my imagined nation
The day Cthulhu died.

And they were singing,
"Bye-bye, Merovingian pie.
It's just scrambled Joseph Campbell
And Joseph Campbell was high.
And the Prieuré has sucked the last of it dry,"
Singin' "This will be the day that we die.
"This will be the day that we die."

Yes they were singing,
"Bye-bye, Merovingian pie.
It's just scrambled Joseph Campbell
And Joseph Campbell was high.
And the Prieuré has sucked the last of it dry,"
Singin' "This will be the day that we die."

Mélange of Magical Creatures IV

for *GURPS*

by Eric Funk

We return now to our fourth trip to a realm of strange but familiar creatures, as we have done three times before.

Chromo-gils

"The new guy pulled over some ruffians, and confiscated a bottle of gray lizards. When he tapped on the glass, the creatures within all turned a sickly shade of pink. Surprised, he dropped the bottle. Fortunately, the punk he took it from had better reflexes, and she dove, catching it."
-- Officer Zale, 23rd Precinct.

In the wild, these skink-like lizards gather in small swarms, clinging to rocks and trees. Instinctively positioning themselves near frequent insect paths, these lizards snare them with frog-like tongues. Together as colonies, they have learned to activate their chameleon reflex when they hear fearful sounds. As long as they get food, they're content to stay still. Their worst predators are avians that can discern distinct shapes from a distance; this blurring reaction when the predator tries to attack serves to confuse them mid-stride, and veer off, lest it strike some tree or rock. Predators that don't swerve often encounter the rock or tree the lizards were lounging on.

Encountered

There are two main results from training a chromo-gil. The first is to train them to simply adapt to their surroundings on a sound cue, becoming essentially invisible. The second is to take on a specific color on a sound cue. They can be used on leather jackets to make colors and form words. Recreating sounds that mimic the lizards' natural prey will cause them to move when hungry.

Industrial Uses

"I hear that the military has stepped up production of lizard type C-83. It seems that they need more adaptive camouflage for the Zenthim campaign. Plus, they say that the biting insects are really bad there."
-- Overheard in a bar

These creatures can be trained as signage, to change to a specific color when given a sound. They are useful for long-range semaphore and written communication. An invisible variant would be useful, sitting on a glass in front of a light. Some experimentation is going on with music boxes to produce choir harmonics to change whole groups of lizards at a time. A few inventors have also tinkered with detectors for specific frequency sounds, with lizards that take different colors at different times. Some law enforcement agencies have been trying out voice-stress analysis for lie detection. Some enchanters have made blur items and invisibility potions from these animals. Fortunately for industry, untaught "blank" chromo-gils learn from their elders.

Adventure

The adventurers have found a music box amid other clues. A sage suggests they must take it to the right "sign" and it will reveal a map. When they do find the correct board, activating the box spells "At the right hour, at the steeple's vespers." Taking it to the nearest bell tower and playing the box while the vesper bells ring will reveal the map for a few seconds . . .

Chromo-gil (see Swarms, *Bestiary* and page 461 of the *Basic Set*)

Appearance: Small lizards in a variety of colors.
Category: Reptile.
Diet: Insectivore.
Treat as per swarm of "small rats."
Traits: Chameleon 1 (-1 to Vision rolls when on); Claws; Clinging; Combat Reflexes; Eidetic Memory (Sound Only); Faz Sense; Horizontal; Night Vision 2; Peripheral Vision; Striker (Tail: Crushing); Wild Animal.

"There we were, in the middle of the jungle. We had just made it to the second clearing, when we noticed that Sir Gilbert was not sweating. 'I don't sweat,' he said. 'Poppycock,' I said to myself. So I kept an eye on him. After we set up our tents, we say by the fire, and Gilbert was sweating like a pig. Following him to his tent, I asked to borrow a book. As I entered the tent, I noticed the air was completely dry, and there was a strange cactus in the center of the tent . . ."
-- Lord Aluvn, *The Temple of Ahi-canon*

These plants slowly absorb all the water within a yard. In nature, they compete for moisture in arid desert regions. These plants look like scorpions to the untrained eye. They secrete chemicals that confuse insects, but their appearance does not trick avian predators. The most notable restriction on this ability is that can only affect air in contact with the plant, or in contact with that air. It is very unhealthy, however, to breathe pure, dry air over a period of hours. An average capacity for water absorption is about one gallon per hour, or any precipitiation less than a driving rain on dry land.

Encountered

Outside of desert zones, these creatures are likely to be encountered in commercial places, such as coat racks or in the entrances to establishments in rainy areas. This can remove all the excess moisture from umbrellas and boots. Particularly decadent individuals may have catered events outdoors in the rain with these creatures on poles, absorbing the rain. They can also take the humidity out of the air to reduce the felt temperature in hot, moist climates.

Industrial Uses

"Boss said it was foolproof. He had some boys come over the river on legitimate business, trailing a long rope tied to the shore. It was in this boat that we stashed the stolen paintings. We then tossed in a dozen of these strange cacti, closed the chest, and sunk the boat. The next night, the other team was to reel in the dry paintings. What we didn't count on was someone being suspicious of buying a few hundred feet of rope."
-- Confession recording, TAG precinct 1.

There are many industrial uses for these plants. They are valuable for dry storage in most climates. Raisins, dates, and rations can be dried out easily. Snow and rain can be cleared in minutes from a hex. Some seek to use them to create 200-proof alcohol. There is experimentation in using semipermeable material to limit transfer (such as wax paper or plastics). Enchanting principles are known to enhance items built to distill or destroy water.

Adventure

There is something killing cattle in the pen; unfortunately, what should be a routine mission has some unexpected dangers. Camping out overnight to look for the rustlers can lead to an unusual confrontation; there are an unusual number of parchers in the area (perhaps it is because the area is aspected to fire magic), and the dryness can be dangerous . . . especially if fire magic, lamps, or other flame sources are utilized.

Cut Ants

"First marketed by East Wickham Biomancers Ltd., over 50 years ago. It is now unclear whether the product known as Cut Ants was one of their products, or simply a trained breed from the wild. There is much evidence available surrounding the training and packaging of these creatures. The original documents detailing the creation were officially lost in a fire. Strangely enough, at about the same time as the first marketing campaign, these creatures were discovered in the wild."
-- History of Trained Insects, Volume XI

In the wild these ants creep up on sleeping mammals and trim their fur as they feed on parasites. They can move quickly when they want, and are easily tempted by a drop of honey. Many species seek them out in spring to have their winter fur thinned out and to be rid of parasites. Their bite has a mild local anesthetic, and it can be used to dull pain.

Encountered

Each color of cut ant trims the fur different height. The redder ant result in longer fur while bluer ants lead to shorter growth; black cut ants make one bald. Any trimmed hair is left in a clump on the ground. They may be part of a normal veterinarian check in lower TL societies, consuming parasites and trimming fur. One is likely to encounter "cut cream" made from their juice.

Industrial Uses

"I have successfully followed the bearded suspect, even though he thought he had lost us. Laying his cloak on the

ground, he pulled out a bottle, and started pouring black insects over his head. As I crept forward, tufts of his hair began to fall to the center of the cloak. Then he -- who turned out to be a 'she' in some kind of fake facial hair -- brushed the ants from her hair-free head onto the cloak. As she put the open jar in the center of the cloak, to drop it in the river, I fired my stun-rod."
--Incident Report, 7th Precinct

Industrially, a swarm of these insects can trim rugs and animals' fur to a prescribed length. Sheep shearing can be greatly simplified by this method. It can also be used in regimented establishments to allow for compliance, such as balding prisoners, establishing standard military cuts, and setting fashion for boarding school. By-products from these creatures simplify the enchantment of haircut and measurement items.

Adventure

Someone is stealing wool while the sheep are in the back fields, where no one can see them. Since the exact location is not known until the sheep migrate back for the morning, history spells are not very effective. The heroes must try to catch the youths pulling it off, or to treat the sheep ahead of time, and track their wool after it reaches the market?

Striders

"It was one of the more unusual sieges we had to endure. They tried a new tactic: they launched a ship anchor over the walls, and then had a pair of striders pull it back, wrenching the walls over the parapets. They managed to pull down the upper walls until we got some of our own beasts ready to pull back."
-- Lt. Algisson, Veteran of the People's Army.

These strong beasts can pull down trees, and pull them a great distance before eating them. Looking like semi-upright lizard-bird hybrids, striders have large rear legs and underdeveloped small forearms. Their beak is a herbivore palate, and they only have a soft call. Striders are clawed, and can climb trees and hills. For this reason, they are well loved by Elven and hilled societies. Many "civilized" cultures de-claw their striders for that very reason, to keep them off walls and buildings. Apparently it also discourages guerilla action by limiting travel to roads. Striders' chitinous hide makes excellent jackets (treat armor as leather for double cost, plus rigid DR2).

Encountered

These creatures are likely to be encountered as mounts and beasts of burden. They have a niche in places too unfriendly for oxen. Some warehouses use these critters to move shipping containers. It is more likely that adventurers will encounter tracks of these large, clawed, beasts of burden. On dirt roads and wooden framework, the indentations will be significant. A typical peasant building may simply collapse.

"De-clawing striders won't stop criminals. They'll just heal the critters."
-- Overheard at the bazaar.

Industrial Uses

Striders can be used as cheap mill animals, towing barges, and moving buildings. Miniature breeds can fill the niche of mules. What really makes this species stand out is that they can haul loads almost vertically on natural surfaces. Finally, there is a small but growing market for the meat and hides of a strider. The government-mandate removed claws can be found sold as picks and awls. Enchanters can look forward to a discount on the enchantment of reduced encumbrance and long travel items.

Adventure

The heroes are to find clawed striders for a mercenary company. A person could also pay for regular striders can find someone to heal them (or a PC could heal them). Remember that large creatures cost more to heal (see *GURPS Magic,* p. 11). SM+2 are 2× energy cost.

Jail Birds

"Developed as nature's response to very high mana areas, these creatures actually absorb mana to power their internal organs. After all, they can survive in natural no-mana areas, much to the chagrin of wizards everywhere."
-- Magical Creatures 101.

These bright blue birds are treasured yet feared by wizards because they dampen a wizard's connection to mana fields. The onset of the effect takes a few seconds to a few minutes to isolate a subject. These parrot-like beasts would become popular terrors, if not for their unusual diet. Each day, an adult jail bird must consume one carat of manastone or powerstone. It can be aspected or quirked, but it must have a charge. They can be seen turning stones over until they find a charged caret. A few recluses in Very High mana areas use them to dowse for natural manastones like pigs for truffles! They are essentially mobile Mana Dampers (see page 67 of *Basic Set*).

Encountered

Jail birds received their name because they are most frequently encountered in a prison, although they can be seen in

mages' practice halls and in some high-class shops. Shop keeps would like to keep these birds under the counter, unseen. This would restrict those who try to pass off glamour-coins or use spells to affect the clerks. Apprentices like to carry these to magical conventions . . . other apprentices would often cast spells on them otherwise.

Adventurers are also likely to encounter these animals when having audiences with important people. The lower floor would be shielded by the birds' influences, while loyal casters could lob missile spells into the dead areas. This might get PCs loaded down with magical items to come up with new tactics.

"There is a constant ideological battle between producers who want to use magical preservation methods and shippers who want to feel safe by canceling all magical effects and suspending enchantments."
-- News article in Magic Today!

Industrial Uses

Securely storing cargo in vehicles, it can keep enchanted and hideaway items dormant. Expensive to feed, these creatures often require a license to own and a costly permit to breed. Some criminal elements have taken to selling blue birds with a temporary spell about them. Others sell real jail birds that disable their effect with a sound cue, enabling licensed criminals to get away with fraud. Enchantment uses include talismans and warding spells.

Adventure

The heroes are contracted to slip a jail bird into the library of a wizard. The trick will be to do so without using magic; the library is on the second floor in a dense merchant's quarter. Human engineering might be the easiest way to gain access. The houses on both sides are only one to two feet from the target building. All house fronts have shingled overhangs overdue for repairs.

Jail Bird

Appearance: Bright blue small birds.
Category: Avian.
Diet: Manavore, lithovore.

ST 5; **DX** 13; **IQ** 4; **HT** 13.
Will 12; Per 10; Speed 7; Dodge 11; Move 7.
SM -1 (SM+1 with wings unfurled); 10-15 lbs.
Traits: Increase Range: Mana Damper

Dinge Bats

"Why should we import these?"
"It is suspected that some necromancer developed these to keep the gloominess that a proper demesne requires."
"It also is useful to tell when an intruder has been making footprints in the lobby."
-- Overheard at Peter's Pet Emporium.

Dinge bats make items attractive to dust by using a form of static cling. They then eat moths attracted to dust. Caves with these gray bats in them are much more passable, as the sediment absorbs moisture. The electrical field and heat that the winged mammals emit confuses moths' senses.

Encountered

Adventurers will most likely meet these creatures in old houses. They are often imported by certain classes of individuals who like having the appearance of a centuries-old dwelling. Some larger organizations use dinge bats to charge feather dusters to increase their efficiency.

"The set is ready, cobwebs in place. Release the bats, the dust is needed."
-- Odete Ingalis, Act II, Scene I

Industrial Uses

They can work as air filters, remove particulate contamination as well as pet allergens from the air. A few inventors seek to harness their electrical potential and make lightning-throwing weapons. Enchanters see uses for these animals in items to clean and polish.

Adventure

A local noble imported some dinge bats a few years ago. Now she tires of them, and wants the adventurers to remove *only* the dinge bats from a belfry. They must be removed permanently, one way or another. Selling them for export might be profitable, assuming they are shipped to another town.

Dinge Bats

Appearance: Gray bats, with contrast varying from light to dark.
Category: Mammal.
Diet: Insectivore.

Variants: As presented, they are not carnivorous, but if a GM wishes, they could be "vampire" bats, and attack humans. Add Bite (Impaling) to the templates.

Rip Worms

"Watched as sleeping cow #30576 was slowly wrapped by the silk worms . . . Unit #30576 is ready for shipment and loaded into the cargo container."
-- Notes on a clipboard from the Sayako cattle packaging plant #5.

These domesticated insects wrap potential prey in a cocoon for later. Their silk is durable, requiring a knife to cut through. The most remarkable part of their power is that biological process are paused inside their cocoons. While they are popularly called "rip worms" because of the take of Rip van Winkle, they are also called "time worms." Their taming has not been popular until late due to the myths that circulated about them due to their feeding habits -- they prefer food that still breathes . . .

Encountered

These creatures can be encountered in almost any area, especially in forests or underground. Sleeping victims can be in danger of being preserved. It is said that the Egyptians were the first to discover this creature, as it was handed to them by the gods. They used its silk in the wrappings of their mightiest pharaohs. It is whispered that their wrappings included extra enchantments, and would slowly reverse age over 1,000 or more years . . .

Industrial Uses

"We found ourselves trapped underground, and had a few rip worms with us. Luckily we had some worm food with us, and we put each other in suspended animation. Finally, they left a torch burning to suffocate the worms. We were rescued a few decades later. Although we turned the tide of a battle, our homeland was gone."
-- Record of Kianu Giantslayer, *Mourning*

The suspended animation effect works on any animal matter, be it natural, a simulacrum, artificial beings, and synthetic proteins. It is thus used to package food, juices, alcohol, furs, and wool clothing. Some enchanters seek to make items from the silk and glands that prevent aging. The closest success so far is something that slows all time experienced for the user (see Reduced Time Rate [-100]). It is, in general, a carefully guarded secret as to how to keep the worms from revisiting their stored meals after the embalming is complete.

Adventure

Cryonauts -- sleeping troopers -- awaken, ready to continue their mission. Unfortunately, the causes they were fighting for and against no longer exist! Thus they begin to strike against the buildings now in the places the original targets were . . .

Rip Worms

Appearance: Silk-colored worms.
Category: Insect.
Diet: Carnivore.
Traits: Affliction 1 (Paralysis; Link); Bind (Link); Injury Tolerance (No brain); Injury Tolerance (No Neck); Night Vision 4 (shift); Odious Racial Habit (Prefers to eat food live); Vermiform; Wild Animal.

Giant Rip Worms

ST 30; **DX** 8; **IQ** 3; **HT** 12.
Will 10; Per 10; Speed 5; Dodge 8; Move 5.
SM +3; 500-1,000 lbs; DR 2.

Beyond Fantasy

This article describes seven creatures, most of which could appear to physically exist in a hard-science world, even if the more wondrous aspects could not. There can be fish that look like birds, and sheep could exist that emit sleep drugs that only take effect after a certain concentration. Trained chameleons could change colors when they hear a sound cue. Plants can slowly filter and absorb water from the air. Insects could instinctively cut hair, and beasts of burden

could be found in different forms. Birds that emit radio interference could be annoying in TL6+. Bats could be given mild bioelectrics, and insects spinning silk is not new.

The Omniscient Eye

Are All Mythic Creatures Loners?

Are there any examples in myth or historical literature of monster or non-human races which parallel the numbers and frequency of appearance we find in fantasy games and literature (as whole civilizations or large herds in the wild), or are they always represented as rare and solitary?

The easy answer to this question is a simple: yes, there are a variety of examples of non-human civilizations and herds of monsters in myth and historical literature. This answer is hardly satisfying, though, nor does it address the complexity of thought and discussion that went into this question in the past. After all, tales of monsters and non-human races go back to pre-history, and both individual monsters and whole societies existed in popular thought through the Early Modern period, to the first glimerings of modern fantasy fiction. Obviously, they extend into the modern day as well.

Before delving too far into the subject, It is important to note that my answer to this question will focus on the Western tradition -- the inspiration for most English language fantasy fiction -- and on three periods: the Classical (Graeco-Roman, through the fall of the Roman Empire), the medieval (fall of Rome to 1350) and the Renaissance/Early Modern period (1350-1650 and 1650-1800) even though pre-20th century examples can be found after 1800, such as H.G. Wells' *Time Machine,* and ignores the literature of civilizations such a Mesopotamia, medieval Islam, India, and China, all of which have their own monsters. It's also worth noting that, until the 20th century, monsters and non-humans were almost always located on the margins, relegated to places that lacked Western, Christian civilization. Related to this locating, during the medieval and Renaissance periods, monsters were typically associated with either Cain, Satan, or signs from God; the trick was to determine which of the three was the source.

During the later periods under discussion, if a literary monster was described as being unique or appeared alone, it was typically put to a metaphorical or allegorical use. For instance, a lone siren could represent lust and promiscuity, a dragon would represent greed, or a lone giant wolf could stand for rapacity and gluttony. This is a key characteristic of the type and is related to the entymology of the term "monster," coming from the Latin *monstrar* -- to reveal or show. Unique monsters, or those who appeared alone, were believed to reveal some part of a divine plan or to show God's will (whether He was angered or pleased). On the other hand, large groups of monsters or non-human sentients were typically treated as other races or species. In general, they possessed exaggerated features -- very much like Star Trek aliens -- and represented oddity or the potentials of Creation. Most medieval theological authors saw these civilizations as a chance to spread their faith to the corners of the world and spent a great deal of time and ink debating whether non-human races had souls or could be converted to Christianity.

However, those are slight digressions from the actual question. Examples of both unique and social monsters and non-humans are the important part here. So, a chronological approach is probably best.

Classical Antiquity

If we look at Graeco-Roman mythology, we find many examples of solitary and unique monsters. Just dealing with the obvious ones, we have the Minotaur, the Sphinx, Jason's Dragon, Cerberus, and Pegasus. Medusa also falls into this category in that she was one of the three Gorgons, sisters cursed by the gods. Each was unique and each had its own story, or played a major role in someone else's story. There are also some borderline creatures in these myths, though. We can argue that the Stimphalian Birds, while unique to an area, appeared in a large quantity as Hercules fought a flock rather than just a single bird. According to some myths, the Sirens appear to have fairly large numbers and live in different areas, beyond the group that plagued Odysseus. Likewise, the Lernaean hydra, it could be argued, is one of many hydrae due to the need to specify which one Hercules was supposed to destroy, though the argument is not a

particularly solid one due to a lack of other hydrae in surviving myths. So far, the answer above seems to be disproven. However, Graeco-Roman mythology also presents Odysseus' Lotus-Eaters, who exist as a quasi-society. A stronger argument for semi-organized non-humans in large numbers looks toward the Nymphs, Fauns, and Satyrs, which could appear individually or in groups. Usually any groups appeared around Bacchus (or Dionysus), though, so a divinity is involved.

Ovid (43 B.C.E. -- 18 C.E.) helps to fully resolve the question. In his *Metamorphoses,* Ovid relates the story of Polyphemus (Book 13) who laments his lost love and is one of many Cyclopses, children of Poseidon -- not to be confused with the three Cyclopses born of Gaia who make Zeus' lightning bolts. He also presents the story of the battle with the Centaurs (Book 12). In this scene, Nessus describes the battle involving many Centaurs, male and female, in their best effort at organization -- which is to say not exactly regimented. On the other hand, Ovid also retells the story of Perseus, including his unnamed monster (Book 4) which is a unique sea serpent, among other creatures and transformations of a unique nature. Another Roman author, who will be discussed in greater detail through later sources, is Pliny the Elder (late-Roman) who described the so-called Plinian races and the phoenix (also in Herodotus) in his *Natural History.*

Medieval

While the Classical era furnishes Western civilization with several examples of both lone and social monsters/races, the medieval era not only reproduces many of them but expands the field considerably. Beginning with mythology, both Celtic and Norse myths present us with a variety of examples in both camps. The Celts made great use of the Seelie and Unseelie courts of the Fae (which assumes some sort of organization), though they were distanced and separated from interaction with humans, with exceptions. Norse mythology gives us both unique or solitary monsters (the Fenris wolf and most dragons) and social non-humans. Among the latter are the Norse Dwarves, Elves, Giants, and Trolls. All four appear in large quantities, the Dwarves and Giants at least have courts and kings, while the Elves might, and they all interact with humans to some extent. The most famous, of course, being Fafnir (Dwarf turned into a dragon) and Andvari (Elf) from the *Volsunga Saga.*

Remaining in the mythic/religious realm, Saint Augustine's *City of God* (fifth century) includes a brief discussion of the Plinian races, though he is concerned about whether they were human enough to be converted (16.8). Each of the races he discusses, including the Blemmyae (who have their heads in their torsos), the Cynocephali (dog-heads), Skiopodes (big feet), and Androgyni (hermaphrodites) have large numbers and their own civilizations.

Beowulf (c. 1000) pushes us back into the solitary monsters, notably Grendel and his unnamed mother, both of whom are described as descendants of Cain. Therefore both stand in as evils to be defeated by (the presumably Christian) Beowulf. The epic also presents the first dragon in English literature, an unnamed beast that is both solitary and anti-human. This creature, the predecessor of Tolkien's Smaug, is commonly read as a representative of greed and voraciousness, a suitable creature for Beowulf to die fighting.

About a century and a half later, Gerald of Wales (1146-1223) presents more unique monsters in *The History and Topography of Ireland.* In this survey, he discusses many individuals among the Irish, including a pair of werewolves (2.52) and an ox-man (2.54), largely to present the Irish as a monstrous people in need of civilizing (or so most modern readings have concluded).

One of Gerald's contemporaries, Albert the Great (1193-1280) included a wide variety of monsters in his bestiary, *Man and the Beasts.* This text is a phenomenal resource for gamers, especially, as a treasure trove of interesting new creatures and generally forgotten traits for common monsters. Albert discusses the Basilisk (Basylyseus, book 25: entry 13) which he says virtually infests Turkey and Nubia; the Phoenix (Fenix, 23:42), which he implies can be found throughout the Orient; and the Manticore (Manticora or Maricon Morion, 22:74) of which there are apparently many in the Orient. Each of these creatures is presumably solitary, since Albert never says anything about social organization. The same is true for his extended entry on Dragons (Draco, 25:27) of which he says there are many, ranging from five to 30 cubits (elbow to tip of the middle finger) in size. Presumably, Albert leaves the implication that all four species are solitary due to food supply, which would fit in line with his discussion of the impracticality of flying dragons. Other notable bestiaries include that of Isadore of Seville (late sixth to early seventh century) and T H. White's

translation of an anonymous 12th-century English bestiary.

Contemporary with many of these authors is the tradition of the Arthurian legends. Best represented by Chretien de Troyes (late-12th century), the *Gawain*-poet (mid-14th century), and Sir Thomas Malory (1410?-1471), these tales present a wide variety of monsters and races wandering the countryside. In the legends it is practically impossible to walk in a rural area without tripping over a giant or dragon of some sort. And, in *Arthur and Gorlagon,* even a werewolf makes an appearance. More relevantly for our topic, though, Chretien's *Yvain* includes at least one Giant/Wild Man (lines 277-407) who is a solitary herdsman, but certainly not unique seeing as the court barely bats an eye at hearing about him. The same author's *Lancelot* includes other similar creatures from time to time as well. *Sir Gawain and the Green Knight,* by the *Gawain*-poet, presents the audience with a solitary giant in the form of the Green Knight himself. And Malory's *Morte d'Arthur* describes a solitary dragon, though not unique, in Arthur's dream (V.41) as well as Sir Pellinore's Questing Beast, which is unique (Book I).

Renaissance and Beyond

Around the same time as the *Gawain*-poet, during the transition between the middle ages and the Renaissance, Sir John Mandeville (mid-14th century) produced his *Travels.* This collection charts the author's supposed pilgrimage to Jerusalem and his travels to points farther east. While there is considerable debate about whether Mandeville ever even existed, much less actually traveled anywhere, his discussions of the Plinian races and monsters in general are quite entertaining.

Initially Mandeville limits himself to singular monsters, solitary representatives of far-spread species. The first of these is Hippocrates' daughter, whom Mandeville claims was turned into a dragon and left on the island of Lango by the goddess Diana, the curse to be lifted if a knight kisses her (part 4). His second and third are a Faun or Satyr (he is not clear which) living as a Christian hermit in the deserts of Egypt and the Phoenix aptly located in Heliopolis (part 7). However, all three are relatively close to home. Once he moves beyond Jerusalem, the quantity and organization of monsters increases and turns into entire races of intelligent beings. Among these are the Anthropophagi (cannibals) of Sumatra (part 20) and the Cynocephali (see above) as a tall race with a king, though primitive, from the far east (part 21) which he draws from Pliny and Alexander the Great. Further east, Mandeville locates the Cyclopses, Blemmyae (see above), and myriad others with their own civilizations (part 22) in the Andaman Islands. In Bactria, he claims there are giant griffons and hippopotami (centaurs) aplenty (part 29). Finally, there are the primitive, cannibalistic, but organized Giants beyond the Vale Perilous (part 31), who grow in size the further the particular species is from Europe -- they start with a breed measuring 28-30' and end with another breed measured at 50-60' by the time Mandeville gets back to sea.

Equally far-ranging is Ludovico Ariosto (1474-1533), the author of *Orlando Furioso.* This particular epic involves a wide variety of animal headed men who fight one of Ariosto's heroes, Rogero (Canto 6). Later, Rogero also fights a pair of Giants, a brother and sister (beginning in Canto 7). The sister of the pair is known for riding a large wolf into battle. Then there is the hippogryph, a unique creature traded around from hero to hero for transportation throughout the tale. Overlapping with Ariosto is Ambroise Pare (1510-1590) who discusses the many Tritons and Sirens (male and female for the same species) in the world (107-108) and the Thanacth -- a human faced tiger in India which apparently appears in large numbers since the natives kill them for food (146-7) -- amongst many others.

More famous than Pare is his contemporary, Edmund Spenser (1552-1599), author of *The Faerie Queene.* This massively epic poem contains a phenomenal variety of creatures, non-humans, sorcerers and knights. The first race of non-humans the audience is introduced to are a group of Satyrs and Fauns living in the woods (I.6). These individuals rescue one of the heroines -- Una -- and, though her beauty and speech, convert to Christianity (whether Catholicism or Anglican is debatable). Later, Redcrosse, the hero of Book I, fights the giant Orgoglio, one of many such beings, and the hydra that Orgoglio creates for his co-villian Duessa (I.7). After Spenser leaves Redcrosse, he moves on to another knight who helps defend Temperaunce from a plethora of animal headed men (II.11). Yet another Giant gets into a duel with Sir Satyrane -- the child of a Satyr and a human maiden -- in canto 7 of the third book. More Satyrs appear in book 3, canto 10 to find and marry Hellenore, a young wife escaping from her rather old and jealous husband. Finally, in book 5, canto 2 we see more Giants and at least one Elf running around for the heroic knight to deal with.

Twin contemporaries, both from the Elizabethan era, briefly touch on the subject as well. First is William Shakespeare (1564-1616) who favors organized groups of faeries in both *The Tempest* (with Ariel and her companions) and *A Midsummer Night's Dream* (with Titania and Oberon's court of faeries in the woods). The other is Cervantes (mid-16th century through 1616) whose hero, Don Quixote, jousts against a bevy of giants and dragons, even if they are all in his mind.

Finally, let's look briefly at Jonathan Swift's (1667-1745) *Gulliver's Travels.* This is quite possibly the most famous pre-20th century travel narrative in print. Throughout the course of his travels, Gulliver meets a variety of non-human races with their own civilizations in relatively remote areas. Amongst these are: the Lilliputians (sub-pigmies with their own emperor), Brobdignagians (giants with an advanced civilization), Laputians, Balnibarbians, Luggnaggians, Glubbdibdribs, and Yahoos. Seeing as Swift is a satirist, each race stands for an example of some aspect of social perfection or social problems for his English audience. However, since the medieval and Renaissance races were also used for similar purposes, this should not exclude Swift's from consideration.

As noted previously, in addition to providing one of the roots of modern fantasy, each of these texts and authors provides a wealth of imaginative ideas for fantasy gaming GMs. Whether the GM decides to throw the players off by introducing Alexander's fire-breathing Cynocephali, digs around in Albert the Great for an obscure monstrous animal, or makes use of *The Bestiary* to modify the stats of their cherished dragons as a surprise, these early stories and collections can be a perfect supplement for the various gaming monster compendia and bestiaries currently on the market.

Bonkers.

This supplement is quite literally bonkers.

Which was my initial reaction to *Damnation Decade,* the latest in Green Ronin's Mystic Vistas line. From its treatment of the [Biblical Age](#), [pirates](#), [Ancient Egypt](#), and an [alternative Soviet Union](#), this series has produced some of the best supplements and source books for the *d20 System,* consistently proving to be interesting and informative. *Damnation Decade* continues this trend, providing not only for *[d20 Modern](#)* and Green Ronin's *[True20 System,](#)* but also for gaming in general, the best supplement on the 1970s to date. Between Wingnut Games' *Solid! The d20 Blaxploitation Experience* and Deep7's *[Disaster! 1PG Survival Adventure!](#)* and "Thunderball Rally," the article in *Dungeon* #93/*Polyhedron* #152, there is not a lot of competition, I grant you, but *Damnation Decade* is not just the best, but also engagingly crazy.

Damnation Decade describes a period wherein every paranoid fantasy, every disaster depicted in movies such as *Soylent Green, Rollerball, The Omega Man,* and others has come true. It is 1976 and President Stanton Spobeck should have resigned two years ago for interfering in an earlier election, but the earthquake that destroyed America's West Coast and triggered an ecological collapse has kept him in power. The Earth's temperature is rising, the polar ice caps are melting, the oceans rising, and nuclear power stations are melting down, poisoning the local environment and creating acid rain, while oil reserves are running out. With distractions at home, America's enemies have taken advantage. What remaining oil reserves there are have been grabbed by a fundamentalist revolutionary, while the Collectivist bloc led by Gogol Yobar has conquered much of Continental Esperanto with its Purity Wall, a black iron wall of tank treads that prevents all escape.

At home, rumors abound of giant animal attacks from killer bees to rabid rats, of the zombies inside the cordoned off state of Alamo, of aliens and reptile men, of the men in cream suits -- the Monday Men who do the President's dirty work, of super computers and android robot replicants, and so on. Many of these are investigated by Herman Pervis on his popular TV series *Beyond the Barrier.* Meanwhile, the people of America are shaking their funky thing at BootyDome franchised dance halls, attending self-help "Hunker Obliterative Processing" seminars, and watching Omegaball, the ultra-violent sport that has replaced everything else. And if that sounds bad enough, a 16th-century astrologer named Abednego Trestle has predicted that the end of the world will come on New Year's Eve 1979. Right now it is July 3rd 1976, the eve of America's Bicentennial, and the fate of the world depend upon who the next President is and what the heroes do.

In a time when the trucker is big on the road, roller skates are cool, computers are big, and bionics cost several million dollars, *Damnation Decade* offers a take on several old *d20 Modern* occupations, such as the Athlete, the Celebrity, and the White Collar worker. To this it adds several particular to the genre, including Guru, Red Collar Worker (someone who works in the sex industry, or dancer, professional companion, or therapist), and Survivalist. The Advanced Occupations are even more suited to the genre and include the Driver, the Groover (who lives for good times), the Omegaballer, the Parapsychologist, the Trucker, and the Urban Cowboy.

There are surprisingly few new skills or feats, but the supplement's new version of the Psychic class, receives a set of new rules that reflect the unstable and sometimes uncontrollable nature of their abilities. Every time a Psychic uses his powers he must make a control roll. This roll becomes the save check number, and is open ended, reflecting the psychic's mental momentum. Fail the control check and a further failed Willpower save causes a psychic mishap. The type depends upon the ability.

The technology section lists various pieces of equipment, enough for most situations. The most notable inclusion though, is that of de rigueur bionics. Expensive, powerful, these replacement limbs, eyes, and other implants represent cutting edge technology and are never freely available to a player character. It should also be noted that the hedonistic aspects of the setting is supported with rules for drug use.

In terms of play style and set-up *Damnation Decade* gives three options. The first is having the characters all similar -- for example all FBI agents or members of the same globe trotting basketball team, whilst the second two allow for a more diverse group to be brought together. This can be through circumstances, perhaps as the result of a disaster, (for which Deep7's *Disaster!* would be a perfect source), or through a patron -- anonymous or not. Naturally this patron is wealthy and has a particular interest in the prophecies of Abednego Trestle. All of which can be tied into the setting's secrets, of which there are many.

Half of *Damnation Decade* is devoted to those secrets and the various foes taking advantage of America's situation and inability to deal with it. No detail is spared here with the background, current situation, and plans plus any necessary statistics for some of the factions, powers, and groups. Besides the foreign threats of Collectivism and an oil consortium dominated by multinationals, these threats include androids, radioactive zombies, demons, brainwashing cults, and so on, their motives described in detail. A GM is free to use all, some, or just a few as is his wont.

The first of two appendices discusses inspirations for the setting -- mostly in the form of films, along with a little reading. The second appendix provides a conversion to ***True20 Adventure Roleplaying.*** This concentrates upon modeling the various Occupations and Advanced Ocupations found earlier in the book, and on how *True20* can handle the setting's other elements, such as bionics and Omegaball.

Damnation Decade is engagingly written and its pages are stuffed to the gills with little facts and elements of color that bring this version of the Seventies to life. Behind the movie-poster-style cover, the artwork is merely adequate, but all of it has a cheesy quality that befits the supplement's "Bad Assed" genre.

Part of the fun of reading *Damnation Decade* is matching its details to the real facts and personalities. In fact, had this supplement used all of the real elements, it is unlikely that *Damnation Decade* would have worked as well, or at all. This does not stop the players or the GM doing so to make it their game, though only the older gamer is going to get most of the references -- for the younger gamer it pre-dates *Star Wars,* a film that will never be all that popular in the era of Damnation Decade.

And that really is the problem with *Damnation Decade* -- you have to be old enough to get its parodying. If not, then it is both mystifying and bonkers, rather than just bonkers. *Damnation Decade* is a fabulous, crazy, platform-shoed, booty-shaking take upon the Seventies, that is not only up to the standards of the Mystic Vistas line, but just about ruins any future supplement on the same period.

Escalation!

57 cards (56 playing cards, one instruction card); full-color, boxed, two to five players; $10

If you don't have one living next door to you then he's across the street; if not there, down at the cul-de-sac. He's a jerk. A bad neighbor. Maybe you lent him your weed whacker and he never gave it back. Perhaps she borrowed a cup of sugar, but when you needed two eggs she turned you away at the threshold. His apple tree keeps dropping fruit on your side of the property line and your kids keep stepping on the bees they attract. Things like this start small, but there's always *Escalation!*

Z-Man Games has brought your neighborhood woes to the tabletop with their new card game of interhouse warfare. Things have gotten out of hand, and the object for two to five suburbanites is to leave your opponents with all the cards.

Everyone gets a hand of cards, and they rotate laying down one or more of them. The cards are numbered one to 13, with three wild cards and two neighborhood watch cards. Each person in turn must put down a greater total than the person before them did. For example, the first person may put down a single "one" card, so the next person need only place a two or higher. On the other hand, they might up the stakes early in the game and play a greater sum. You can play more than one card on your turn, however many you like, but they must all be the same value . . . all "three" cards, for example. The wild cards are numbered "1-7," and they stand in for any card of those values you like. You could announce one wild card as a seven, for example, or play it with a couple of sixes and call it 18.

If a player cannot (or won't) beat the previous player's total, and they don't have a neighborhood watch card (which is used as the same total as the previous player -- if the last guy had a 12, you can play it as a 12, representing a temporary cessation of hostilities as cooler heads prevail), you must keep all the cards that have been played up to then. You then restart the fight with something from your hand and play continues. When the deck runs out, the first player to empty his hand ends the game. Everyone still holding the bag adds their remaining cards to their collection, and whoever has the fewest cards stacked against them wins.

You may not recognize your friends and neighbors among them, but the illustrations here are awfully good for a little card game like this. Bright and colorful, cartoony but recognizable, with clear graphics and more than their share of brutal whimsy. Each card is a bit more unpleasant than the number value that preceded it (and the lengths to which its character is prepared to go become that much more extreme). It's little touches like this that help put a game over the top.

And speaking of that top, no one's going to be making space in the trophy case for the awards such a slight offering may bring, but Reiner Knizia shows once again that the simplest twist on rules can make an enjoyable outing from most any rule set. You don't necessarily get a great feeling for the subject matter -- it's really just a one-note joke around which to hang an idea -- but even as the intermission played between other, larger games, you'll still find yourself playing more than a couple of games. (One suggestion they make is playing as many full rounds as there are players, and adding everyone's scores together to get the winner.)

The strategies are as slim as the subject matter, but they're fun to learn and play. Your goals change slightly as you approach the endgame: Since most hands end when someone can no longer play any cards, but the last round ends with the first player to empty his hand, deciding how many cards you can afford to blow while still keeping enough to make bigger matches becomes more important. The market is filling up with card games that barely break the 10-clam mark, and some give you more value for that sawbuck than others. ***Escalation!*** isn't the best, but it's more engaging than others and has a layer or two more than its competition. Of course, first you have to get that $10 Mr. Fentucchi owes you for that deposit you made for him on last summer's beer keg . . .

Murphy's Rules

The Past Ain't What It Used to Be

This past week had a minor victory for me as I picked up a used DVD set for dirt cheap: *The Best of the Electric Company, Volume 1.* For those who are unaware, *The Electric Company* was the Children's Television Workshop series designed as a follow up to *Seseme Street,* encouraging six- to eight-year-olds to read. It starred Rita Morano, Morgan Freeman, Bill Cosby (for the first season), Spider-Man (playing himself), and lots of other folks, and included bits by Tom Lehrer, Chuck Jones, Mel Brooks, and others. It was a sketch-comedy show similar in format to *Seseme Street . . .* or perhaps *Rowan & Martin's Laugh-In* with a much greater emphasis on phonics.

Thus it was with some trepidation that I watched them. It's the same dread that creeps through my mind every time I revisit some beloved childhood memory: *He-Man & The Masters of the Universe, Voltron, Star Wars* (episodes IV through VI), *The Monster at the End of This Book,* old Infocom games, and others. It's the same terror that keeps me from rewatching *The Karate Kid* or *Superman III.* Because, as I've learned time and again: Nostalgia is a harsh mistress.

The filter of nostalgia casts darn-near everything in the past in a better light. Movies were "better" years ago, as were books, comics, and -- yes -- games. Of course, an objective eye shows that this isn't generally the case; the waves of history allow the cruft to wash away the forgettable masses while the compression of memory allows the gems of "childhood" (defined by scientists as 1980-1989) to glow supernova compared to the limited window of offerings we typically see on movie marquees or bestseller lists.

What I find fascinating is how unselective the childhood mind is at determining what it likes. Although not everything I watched was beloved as a child (I didn't much care for *Speed Racer,* for example), I seem recall liking everything with a roughly equal intensity. Old episodes of *Doctor Who, The Brady Bunch, Scooby Doo,* and *The Rockford Files* filled my childhood afternoon, packing the void where I would've done something silly like make friends or get exercise. And I can vaguely recall thinking that something like *He-Man* and Disney's *DuckTales* were about on par with my mind at the time, but the former is a tough show to watch nowadays while the latter still holds up quite well for me. The same thing happened with *Star Wars* and the Indiana Jones series; the original *Star Wars* trilogy is not terribly watchable for me nowadays while I'm still a huge fan of both Indiana Jones movies.

And, of course, this also applies to games.

Sometimes I wonder how much of the hobby-gaming world is in the "nostalgia" market: the success of retro-1970s-style **d20 System** adventures or **HackMaster,** the continued reprints of game books that came out decades ago, the licensing of worlds or resurrection of genres that havn't been on the public's mind for years.

Of course, the problem of living in a nostalgia world is that reality has a party-pooping habit of intruding, especially if those "classics" are revisited. I'm reminded of an anecdote where two old-school game designers sat down to play a much-beloved old war game, popping out chits, setting up the board, reading the thick rule book (numbered in arcane systems where you might see something like "for wheel rules, see 3.1.4.1.5.9.e"). After going through the extensive setup process and getting about half-way through the rules, they both realized: They didn't want to play. Their tastes had changed and they'd drifted away from chit-tweezering.

Actually, I suspect that not only have their tastes changed, but also the nature of *games* had changed when they weren't looking. In particular, much of the hunger that traditional war games satisfied has been sated by computer games, which offer much of the same appeal but without the need to set up a game on the bedroom floor for days at a time or fear that an errant schnauzer tearing across the bedroom will utterly destroy Europe.

Likewise I wonder how much of the game biz's offerings will be supplanted by the future, reducing their appeal in the eyes of nostalgia to mutterings of, "Well, it was interesting at the time . . ." Unfortunately, it's very difficult to know what games will be "classics" while you're in the middle of their release cycle. For example, the *Ultima* series of computer games was about as popular as the *Wizardry* series that was released around the same time, but the former still has a vibrant fan community who love the games while the latter has been reduced to something of a footnote.

Will the **d20 System** be remembered in the future as the basis for a hit computer game that internalized its best ideas while jettisoning the dross? Will people still prefer the tactile feel of **Magic** cards, even decades after the technology had been perfected to play the game virtually in a local or global environment?

Some games I have a hard time revisiting; for example, many of the old Infocom text adventures, while beloved at the time, are simply too arcane and unforgiving now. But just as many are still captivating; over Christmas we played **Outburst** at the in-laws' household and it was still as much fun as it had ever been. (However, we did need to remind ourselves, "It's a snapshot of the 1980s, so frame your views and mindset accordingly.")

Fortunately, I was delighted to discover that I still enjoyed *The Electric Company,* even though I've known how to read for several years now. And I'm hoping that my own son -- a cute 19-pound sack of squirm who insists on being carried -- will enjoy them himself once he's old enough to worry about letter combinations.

And who knows? Maybe he'll be nostalgic for the show himself in another couple of decades.

For those of you in the Illinois area, I'll be a guest next week at [CodCon](#), being held at the College of DuPage. If all goes according to plan, I'll be running a game, talking a bit about what's going on at SJGames (assuming I know anything, of course), and appearing in a panel on Creative Writing for RPGs. I might even have another surprise or two.

And if you're a *Pyramid* subscriber and plan on attending, drop me a [line](#); I might see if I can't dig up something interesting for you.

Alphabet Enemies
Twenty-Six Nonstandard Nemeses
(Part Three: Q through Z)

by Owen K.C. Stephens

In this article we finish off our list of unusual enemies, begun in "Part One: A-H" and continued in Part Two: I-P."

Queen of Everywhere: She may be the ruler of the fairy court, able to look upon you from every cloud, flower and pond while ruling over dryad and goblin alike. Or she might be the High councilor of the Psychic's Guild, able to keep tabs on you through clairvoyance while deciding what deep-space ships get psi-guides, and which must brave the void blind. She could be the doctor that runs the Paranormal Research Lab, the SysOp of the Grey Hats everyone has to turn to when a worm threatens to crash the Virtual Interweb, or just Lady Moriarty (officially reformed). She can be of any gender, and even any species, as long as she's in charge of a group with vast powers of observation that world powers need, but don't trust.

You're not sure how you become the focus of "her" attentions. You did a job that affected her empire of data and mysterious forces, but so have a lot of people. But suddenly, she's getting you involved in a lot of things. She insists you be the liaison between your government and her, even though that job should go to someone much more senior. She contacts you at random, and discusses your problems in a way that shows she's keeping very close tabs on you. She invites you to councils with heads of state, recommends you to anyone needing a job done, and insists on your services as payment anytime someone needs a favor from her.

She doesn't seem to be working against you directly, but her attention is making life difficult. Suddenly, you are On the Radar of every intelligence gathering organization, band of ninja necromancers, order of Renaissance conspiracy theorists, and royal clan of street samurai on the planet. Since she's interested in you, they have to be as well. And they all want to know how you got in her "good graces" (not that she's explicitly making you life any easier), and no one believes that you don't know. Your friends and allies don't trust her, and her enemies now hate you. She doesn't seem to want anything specific from you, but she's thrust you to center stage in a much larger game of power plays and intrigue than you're used to. And you have no idea why.

She *is* the Queen of Information; maybe she's knows you're going to be important before you do. Maybe you remind her of an old friend, long lost. Maybe she's using you as the man with one red show, a distraction to groups that want to penetrate her lairs of subterfuge and political machinations. She's not telling. Especially not you.

Repeat, Rewind, Replay: Early in your career, you faced a dangerous foe and defeated it. There were many distinctive features about your foe, ranging from a catchphrase to preferred tactics, mystic weaknesses, specific allies, a style of dress, and even a physical description. Just before you dispatched that foe, it warned you it could return to defeat you, and do so seven times, or seven times seven times if need be.

So far, it's been about 12 times.

Its never exactly the same foe, but the similarities are too great to ignore. There's a pacing to the conflicts, from the first assassin jumping you as you get a cup of coffee to the final confrontation with the pirate wielding a hambone. You've codified the encounters down to seven critical steps. When you make sure they occur in the normal order, you gain a slight bonus over your foes and all its allies (+2 circumstance bonus to all d20 checks and rolls). When you don't, things go against you (-2 penalty to all d20 checks and rolls). The only problems are finding items to meet all the conditions every time, and suffering the same unpleasant consequences over and over. If you broke your arm in the first fight, you now must always break your arms, or lose your advantage.

Slasher Conspiracy: You've heard of it, of course. The knife-handed goblin a knight tried to kill, but only maimed. The engineer that went space-crazy and now hires on to cryogenic ships to drive a power drill through the crew while they're meatcicles. The sociopath mental patient that returns to her old high school on the anniversary of prom night to kill anyone nominated as homecoming queen. You'd heard the stories, but you never believed them.

Until now.

The slasher is real, and you survived one of its attacks. Perhaps you and your friends all did. You thought you'd killed it. But you soon learn that it doesn't stay dead. The secret of its origin and its immortality are one and the same, and they are secrets the authorities don't want known. The church doesn't want word getting out that hell really can kick you out. The company has erased all records of the experimental nanites that keep rewriting people with a psychopath's features and memory. The cult that brainwashes people to think they are Sack-Faced Efrem, the Machete Murderer, has enough police and judges to make sure the story is never taken seriously, no matter how many "Efrems" end up in the morgue.

There's a reason the survivor of the "last" slasher attack is always the next victim when the slasher returns . . . you may figure out the secret someone powerful wants hidden. So the slasher keeps showing up, coming for you at your camps, your engine rooms, your high school. No matter how often you kill it, it shows up again. And it will continue to do so, until you uncover the conspiracy of its origin, and destroy the root of its power.

Temporal Threats: The first time someone claimed to be from the future and tried to kill you, you could laugh it off. The occasional deluded psychopath is an occupational hazard. Besides, his claim of having been sent back through time, naked and acclimated to the culture, to kill you for crimes you would eventually commit seemed both too conveniently unprovable, and vaguely familiar.

The second time, you began to suspect a conspiracy. The method of travel was the same, though the future this second "future" killer came from was radically different than that described by your first out-of-time attacker. By the time a third came along, again from a different universe, and blaming you for yet a third set of future crimes, you had to wonder, could it be true?

Every few months a new, highly-trained assassin appears in your life and tries to knock you off for some terrible, world-spanning disaster that ruins the future. You've been accused of destroying magic, creating a deadly virus, overthrowing the natural order, starting a gang war, creating a black hole in your back yard, and releasing ancient evil from their tombs so they could ravage war-torn 1930s Russia. Each time the temporal killer is untraceable with any current-time resources, and claims to be from an even more harsh and ruined world. And each time, the assassin is a little tougher, and a little more ruthless.

If they are from the future, something is going to go seriously wrong. And no matter how many steps you take to ensure you don't create any specific disaster they mention, a new one pops up blaming you for some new catalyst of apocalypse. Could some other force be trying to ruin the future, and placing the blame at your feet? And if so, can you put a permanent end to them, and free yourself of anachronistic assassins?

Ulcer: Specifically a peptic ulcer. Sure, it's just an open sore in your stomach or upper intestine, where acids can eat at your flesh and cause pain. You're a hero, right? Stress and spicy food (or bacteria, or tiny invisible evil demons of foreign food) are going to cause problem, and you got an ulcer. But it *feels* like a foe out to get you, and its random flairing up can be handled like a recurring foe. For fantasy *d20 System* games, have the GM add your ulcer to the random monster encounter chart. When it gets rolled, your ulcer is a major problem for the next scene. (Many other game systems have different mechanics to determine when a recurring foe shows up, your ulcer can take advantage of them. Failing that, set a percent chance of it showing up on any given day.)

When your ulcer acts up, you suffer the kind of minor set-backs similar to being shaken (-2 penalty to most d20 checks). Since the cause isn't actually the same as being shaken, these penalties stack if you actually are shaken. You may be able to alleviate them with potions, salves, antacids, spells, or psionic biofeedback, but doing so takes time and requires resources you may lose in the jungles of Mu. A doctor (or witch doctor) can suggest a course of treatment to

help, but inevitably whatever he suggests is difficult to match with your lifestyle, causing problems nearly as bad as the ulcer itself.

Virgwe: Virgwe is a ghost of a nordic shield-maiden who thought she was a Valkyrie, and now sub-contracts for the Angel of Death. She's a very minor ghost (low CR, no typical ghost special abilities), but gains a +20 bonus to her checks to see if she reforms after being destroyed (guaranteeing success).

Once you've cheated death (actually been raised from the dead, or just come close to death -- especially if you used action points or a similar mechanic to avoid a fatal result), Virgwe is assigned to bring your in to the afterlife. Since she cannot defeat you in combat, she tries to get you killed by giving advice to those who attack you (pointing out your hiding places, or making insulting comments in your voice during delicate negotiations). She won't quit until she has a permanent death to assign to you, though it need not be yours (you might name a chicken as yourself and have it for dinner, or sell your death to someone as a bundle with other valuables).

Wawelski Smok: Wawelski is a smoke dragon (hence the surname "Smok"). Treat his as a red dragon with no spellcasting ability, but the supernatural abilities of fast healing 5 and gaseous form as a vampire. Rather than heal in a coffin, Wawelski heals when near any part of his hoard (which he normally secrets in multiple places around any are he plans to operate in).

Wawelski can heal any damage except that done by the footwear created by a certain cobbler (or sporting goods designer). He has long since killed the cobbler, but now must seek out every pair of boots, slops and sandals the craftsman made, some of which are magic. And unbeknownst to you, you have a pair. Thus the dragon alternates between trying to buy your shoes, make barefootedness fashionable, and kill you. Of course he can't harass you all the time . . . there are other shoes out there. As you gain levels he gains age categories (much faster than usual, based on how many pairs of shoes he's successfully destroyed), making him a matched threat whenever you face him.

You may not know exactly why he wants your shoes, and unless you are a high-kicking martial-arts adventurer it's going to be hard to take out Wawelski with shoe damage anyway. In this case, your best bet may be to take his stuff, *then* kill the monster, since he can't heal from gaseous form without at list a little of his treasure around.

Xenomorphs: It was alien, though alien may mean from another planet, another dimension, or even just from the lightning-and-steam driven labs of a foreign power. It changed its form to thrive in its surroundings. It grew fins in water, armored scales when shot, flameproof mucus coating near lava, and shifting green camouflage in the jungle. You may have been called in to kill it, or your three-hour boat tour might have just shipwrecked on its island., whatever thee case you killed it where other failed, and the world heard about it.

Now, things like it are popping up everywhere. And you're the renowned expert for dealing with them.

You may take such jobs with gusto, or you may try to avoid them only to be drawn in with bribes, pleas and threats. No one else is able to deal with the creatures, at least not with your skill. But the xenomorphs have begun to recognize you, and seem to take your crusade against them personally. Now they hunt you in preference of other prey, and they're getting smarter. How long before they try to get at you through those you love or need? And, where are they coming from. Are they the vanguard of some more terrible force, or the last vestige of a long-lost race? Research is difficult, as they never take the same form twice. Their lack of consistent outline is their only consistency, and even that is beginning to change as they learn to hide from your expert eye.

Yellow: You're not sure when it started. Probably not before you hit puberty, though you just might not have noticed when you were younger. When you first recognized the pattern, you chalked it up to coincidence. Anyone would. After all, why think the color yellow is trying to kill you?

But it is.

The way yellow comes after you, you'd think a group of blue space gnomes had given you a ring to defend the Earth. Bad things happen to you that don't happen to anyone else, and yellow is always involved. A yellow light malfunctions, and cross-traffic nearly rams you. A gastrointestinal reaction at a seafood restaurant traces back to bad

yellowfin tuna. You're blinded in a sword fight by a shocking amount of light reflecting off a yellow amber broach. The security guards pull you aside for extra security checks because the threat level just hit yellow alert. You learned not to gamble with yellow dice a long time ago. You don't dare even stand near a copy of *The King in Yellow*.

If a random encounter is rolled for, you roll twice . . . the second time just to see if something yellow causes you problems. If it does, you suffer a mild -2 penalty to all attack rolls, skill checks and saving throws, as the hated hue works to end you. If a normal encounter includes strong yellow elements, you suffer a -1 penalty to the same checks.

The problem is you're the target of something truly alien, something that's so outside the experiences, perception, and comprehension of mortal people you can't even really prove it exists. The malevolent force working against you doesn't exist in your world, and can only influence it through a subtle, sentient, yellow trend of misfortune. The best you can hope to do is find accounts of others who have shared your fate, most of whom were killed or went mad at about the age you are now. Some claim blood sacrifice to indecipherable elder gods can end your curse. Others believe you must carry a countermeasure, be that an odd shade of purple or two hairs from a nun. There's some way to fend off yellow . . . but it makes no more sense than the threat of a primary color.

Zombie Plague: The first time you faced an outbreak of zombies, it was disconcerting, but not more than you could handle. They're not that tough in small numbers, and once you learned how they spread you got the plague under control. You hay have burned the village to the ground, sunk the long-lost passenger ship beneath arctic ice, marked the dead world as off-limits to colony ships or sealed the scientific compound with bio-hazard stickers, but however you handled it you considered the issue dealt with.

The second time, you realized things were a little different. The zombies were a bit tougher, a bit faster, and maybe a bit smarter. Worse, they spread by a different vector. Instead of biting their victims, they sprayed infectious spittle from their rotting teeth. Or could all be traced back to the same double-blind drug test. Or infected the local ground water. You dealt with them again, but it was harder. And by the third time, you knew something bad was going on.

They always have the same weakness, which you've learned from so many fights (allowing you and those you train to score critical hits against these undead, representing knowing to go for head-shots, or to try to gouge out their black eyes, or drive a silver stake through their heart . . . whatever it is that kills them well). But everything else is different, including speed, incubation time, origin, increased toughness and vector for new zombies. Everything except they keep turning up connected to you, or other who were present when you first encountered them.

You, or something you carry, is the Typhoid Mary of infectious zombies. You may have a bacterial infection that turns dead bodies into zombies if you spend too much time with them. Your favorite sword may have been cursed by the god of death to spawn his rotting followers. You, yourself, may be a zombie . . . just one with such an advanced form of zombism you don't notice you're dead. Whatever it is, if you don't find it, the plagues are going to keep breaking out, and the zombies are going to keep getting stronger . . .

Power Grid

Published by [Rio Grande Games](#)

Designed by Friedemann Friese

Translated by Henning Kröpke & Jay Tummelson

Illustrated by Maura Kalusky

Double-Sided Full-Color Mounted Board, 132 Wooden Houses In Six Colors, 84 Wooden Resource Tokens (24 Coal, 24 Oil, 24 Garbage, & 12 Uranium), Elektro Money, Five Summary Cards, 42 Power Plant Cards, 1 Step Three Card, & Eight Page Letter-Size Black & White Rule Booklet; $44.95

Power Grid is a board game comprised of several mechanics built around a very simple theme. Between two and six players control power companies building power stations, buying fuel, generating electricity, building a grid, and connecting cities across a nation. It involves an auction mechanic, a market mechanic, an area control mechanic, and an escalation mechanic; at its heart, however, *Power Grid* is a resource management game low on luck and high in forethought.

However many players, the aim is always the same in *Power Grid:* Supply electricity to the most cities in a player's network -- 20 or more cities, over three escalating stages. *Power Grid* calls them steps, but describing them as stages is more apt. Turns consist of five phases during which every player acts, bidding for power stations, building networks, buying and expending fuel, generating and supplying electricity, gaining revenue for the power supplied, and finally, regenerating resources. Player order varies between turns, determined not randomly, but by how well a player is doing.

The game board is double-sided, depicting the USA on one side and Germany on the other. Each country is marked with 42 cities, equally divided between six regions. Each city has three spaces marked 10, 15, and 20, the successive cost for supplying a city. A grid of pipelines, most marked with a number representing the cost of connecting a city, runs between the cities. The board also has a Scoring Track, a Play Order Track, and a Resource Market Track. The latter has spaces for coal, oil, garbage, and uranium, and indicates both resource availability and cost. Easily identifiable wooden pieces represent these resources, while the wooden house pieces are used to mark the cities a player supplies.

The 42 Power Plant cards are marked sequentially from 03 to 50, indicating the minimum bid that can be made for each Plant. Symbols at the bottom indicate the resources a Plant needs and how many cities it will supply. A Plant can store twice as many resources as it needs to generate electricity, and cannot use fewer resources to generate less electricity.

The higher a Plant's minimum cost, the more cities it can supply for fewer resources. Some Plants are flexible hybrids, able to run on coal and oil, while expensive and desirable ecological and fusion Power Plants require no resources at all.

At game start, each player receives his wooden house pieces and 50 Elektro, the game's currency. Two house pieces per player are used to indicate play order and score on the board. The resource market is seeded with the various fuel

types and the first eight Power Plants -- numbered from 03 to 10 -- are laid out in two rows. The top four Power Plants are in the Actual Market and are available to bid on, while the lower four are in the Future Market and will come up for auction as the top four are sold off.

In Phase 1 of a turn, play order is determined, which is important because it determines who does what and when in subsequent phases. Initially determined randomly, it is subsequently determined by how many cities a player is connected to and can supply with electricity. The Power Plants in the Actual Market go under the hammer in Phase 2, players able to buy the one Plant per turn. Further a player can have a maximum of three Power Plants, so as soon as he buys a fourth he must discard one he already has.

The players buy from the Resource Market in Phase 3 to fuel their Power Plants. The cheapest resources are purchased first, which increases scarcity and forces a price raise. In Phase 4, the players build their networks, starting from one city in their starting regions, with players paying the city's connection cost. On subsequent turns a player can connect to as many cities as he can afford, paying not only each new city's build cost, but also the connection cost from his existing network.

Initially only one payer can connect to city but this changes in subsequent stages. As soon as a player connects to a new city, his score rises, this being marked on the Scoring Track.

Phase 5 is the bureaucracy and last phase. The players expend resources to generate power and earn Elektro for each city supplied, though if no cities are supplied, a player still earns some Elektro. Finally, the Resource Market is re-stocked, the amount determined by the number of players and the game's stage. The highest-valued Power Plant in the Future Market is placed at the bottom of the deck, with the Future Market being refreshed from the deck.

So far *Power Grid* sounds simple enough . . . and it is. Where it gets interesting is in the play order, and in the second and third stages. Play order determines who does what and when during a turn. In Phase 2, the leading player -- the one with the most cities in his network -- bids for the first Power Plant. In Phases 3 and 5, the build and resource-buying phases, this is reversed. This means that although the leading player has first choice in bidding for the Power Plants, in Phase 3, he invariably pays more for his resources because his opponents have already bought the cheaper ones. Building first or earlier in the build phase only becomes important in subsequent stages, but over the course of the game it pays not be the leading player.

Step one ends as soon as a player connects to all seven cities in his starting region. Playing to this point is also a good method of introducing *Power Grid* to new players, being quick and uncomplicated. In step two, players can expand out of their starting regions and connect to cities in rival networks, as cities now allowed to be connected by two players. The amount of resources available during Phase 5 also changes.

The third phase is more complicated. It begins when the Step Three card is drawn from the deck. At game start, it is placed at the bottom of the deck, and because the highest-valued Power Plants have been pulled from the Futures Market and placed under it, the Step Three card keeps the most expensive and capable Power Plants for the third stage. Up to three players can now connect to a city, although still only once by any player.

The exact starting set up and the number of cities to be supplied in order to win varies according to the number of players. But regardless of the number of players the way to win is to supply the greatest number of cities with electricity.

So far, *Power Grid* sounds like a cross between *Monopoly*x and *Settlers of Catan*, but without the random element of dice. Indeed, Power Grid's only random element is the Power Plant deck; even then, the Actual Market clearly displays the Power Plants available in Phase 2. Everything else is visible to every player, who can take account of it in their planning. *Power Grid* is a game of planning, a player having to think ahead what he is going to do.

However, *Power Grid* has built into it a number of effective balancing mechanisms. The most obvious is the variable player order, which lets players with smaller networks have an advantage over the leading player with the largest. Working in a similar fashion, in stages two and three, it becomes increasingly costly to expand a network, as closer cities become unavailable and longer, more expensive connections need to be made.

What downsides there are to *Power Grid* are minor. First there is only one means of winning: the slow methodical build to victory. Second, the game theme is very dry . . . but then, so is *Monopoly,* and many would prefer *Power Grid* over that. Third, the rule book is too dryly written and could benefit from some color. Fourth, the dry theme and colorless rule book make it more difficult to sell the game to prospective players.

Apart from the rule book, *Power Grid* is a nice looking game. The wooden house pieces are rough in places, and the Elektro money is flimsy, but the resource pieces do stand out. The board is very attractive and -- being double-sided -- furthers its replay value. Expansions are available for the game with more boards.

Power Grid feels slightly unbalanced initially, but in the long term, the mechanics work hard to limit the leading player. It should also appeal to anyone who likes resource management games and who likes to think ahead. The theme is dry, but the mechanics do it justice, and they are *Power Grid's* strength.

Combat Pad

Published by Open Mind Games

8.5" × 11" pad with steel core, 26 punch-out magnets (eight blue PC labels, eight black enemy labels, four green NPC labels, two "Next Round" labels, two "Round" arrows, two "Turn" arrows); wet and dry erase surface; $16.95

Bookkeeping remains one of the toughest tasks in a GM's job description, and combat probably ranks right at the top of that. You have over a dozen participants acting at a dozen moments, and that doesn't even include the bystanders. It won't solve all your woes, but the *Combat Pad* is a big step in the right direction.

Who does what when is secondary only to who's suffered how much damage for troublesome accounting. The pad is a flat cardboard plate, 8.5" × 11" (so it fits neatly in with all the rest of your paperwork), with a metal insert. A magnetic sheet is included, with labels and markers stamped into it. Punched out, these become nametags to be arranged on the pad in initiative order . . . simple enough so far.

If the magnetic feature isn't nifty enough, the entire product has been covered with a wet and dry erasable surface. Either type of marker can be used to write on it, and the lettering wipes away easily. This lets you scribble the characters' names on the labels (the tighter your pen writes, the better), as well as making notes about ongoing effects on the pad itself (like the aforementioned damage to combatants). A small arrow marked Turn points at the current PC's tag. When he's done acting, the arrow slides to the next name. When it gets to the bottom, another arrow along a line of numbers at the top of the pad goes to the next round. That way, if the mage has cast a spell that lasts three rounds, you can make a note of that round in the notes column; when the arrow points to the appropriate number, the spell's effects end.

Some heroes choose slightly different maneuvers like readying or delaying their actions. Two more columns are provided for this. If you're going to take a normal action -- move or attack -- you get stacked up one above the other like everyone else. But if you select one of the special options, your label gets shifted a bit off-center to overlap the ready column, or a little further into the delay line. If this changes your turn in the initiative order, you simply switch the magnets when the time comes. Although this is ideal for the *d20 System* set, it works with most any system that allows similar choices; just about any roleplaying game lets you hold an action, and everyone goes in some kind of order.

The quality of the graphical design is pretty important since ultimately that kind of order and clarity is what the product offers. The pad itself seems fairly firm, though ironically it comes packaged with a thick piece of cardboard to protect the supplement during shipping and sales, and seeing it side by side with that insert makes you wish it was a bit thicker. The magnets hold well, but if you're still worried about them getting scraped off during transit it turns out what's left of the magnetic sheet after you punch all the labels out is pretty handy. It's almost like a piece of magnetic netting that overlays everything and sandwiches the loose counters between itself and the pad.

Some of the writing is a bit on the small side, or shaded too darkly, and the row of numbers is a little tight along the top (at least at the low end; the double-digits expand enough to own more of the pad's breadth). The magnetic arrows take care of that, but it's one of the few parts of the set that looks "busy." If the title was smaller, two rows of numbers might have fit (or it could be numbered to 10 instead of 20). There are also numbers running along the initiative column in multiples of five. These must be just for convenience -- the equivalent of putting "high" at one end and "low" at the other -- because there certainly isn't room to put five labels between 0 and 5, 5 and 10, and so on. Finally the label colors are arguably dark -- blue leans to black, green to blue.

All these digs do not add up to a disappointing result. Old-school players might want to stick with pad and pencil, and that's fine . . . there's something to be said for a bookkeeping device that handles more than these few combat stats. And perhaps there's a minute chance magnets of this level could affect your calculator, laptop, or iPod on the way to the game. But if having a place for everything and putting everything in its place is important -- and more to the point, problematic -- then a sweet and simple gizmo like the **Combat Pad** fills the void in the GM's life perfectly.

The Dark Lore

for *GURPS*

by Ernesto Pavan

This article starts where Kevin J. Chase's article "[Advantage-Based Magic](#)" ends, providing guidelines and samples for a particular kind of magic: the evil stuff.

If you are a GM approaching advantage-based magic for the first time, this material could be the best to start with; dark magic is usually the domain of NPCs, so you will be able to experiment without introducing any new rules to your players (whose main interest would be resistance rolls, expeditious retreats, and oaths of vengeance . . . against the sorcerer, we hope!). If you already use advantage-based magic, you could use this article as a source for adding dark magic to your campaign or to increase your villains' arsenal with curses and vile spells . . . not to mention that you could find the ready-made spells helpful, just in the case you need to improvise.

If you are a player, this material could help you to create or add complexity to an evil sorcerer . . . or to a *non-evil* one! After all, some dark spells are simply too tempting not to be considered at least once in a mage's life: The Vulnerability spell could greatly increase the chances of taking down a tough beast (such as a dragon or giant), while the Soul Germ spell could be just the right punishment for a megalomaniacal tyrant. Likewise, your empathic healer could find casting the Life Theft spell as a legitimate use of magic to save lives, if used on criminals to "recharge" the healer and make him able to save more honest folk. In fact, one of the dangers of evil is that it can hide very well . . . especially in a world without a black-and-white morality.

What "Dark Magic" Means

Dark magic is the magic of evil and corruption. Its ultimate goals are the gaining of extreme power, one way or another; to obtain it, practitioners often go against every moral in exchange for spells they can use against other people. Selfishness and violence are associated with dark magic and its practitioners, who are at the same time corrupted by the darker powers, becoming unconscious (or *conscious*) instruments of their will.

Dark magic often has an *unnatural* feeling: Dark sorcerers twist weather to their own whims, make natural creatures behave in strange ways (such as animals attacking humans with *hate*), and manipulate energies from distant worlds. In some traditions, dark spells cannot harm the innocent; evil fades against those who can stand against it. In others, dark magic is terrible because it can strike *anyone,* and there is no curse worse than the one that can turn strength into weakness, man into monster, hope into desperation. On the other hand, most dark spells involve the worst aspects of nature: Fear, sickness, and sorrow are part of everyone's life, but dark masters know how to afflict others with them at will.

Dark magic is not all about evil outside; it is also about evil *inside.* Indeed, sorcerers are disturbing not only because they can cast evil spells, but also because they seem to know human weaknesses very well. Dark masters can tempt the young and the unwise without showing any of their powers, by using words and a deep knowledge of the human mind.

Dark spells are dangerous, but -- perhaps surprisingly -- they are usually not all that useful in battle. Of course, since slaughtering is Evil's favorite pastime, they are good enough, but in most cases, they do not rely on sheer strength. Destroying is very easy, and anyone wielding arcane powers can do it without the need to summon dark powers; dark magic is feared because it can do evil in a lot of subtle, hard to see ways. In game terms, most dark spells should be based on Affliction (with Malediction; incidentally, *male dicere* means "to speak evil words" in Latin) rather than on Innate Attack.

Sorcerers also seem to lack general utility spells, at least those not involving fire or brute strength. Most "good" mages

can repair objects, heal wounds, and create light; dark mages don't do these things. Rather, they often have servants or slaves doing the work for them. Perhaps evil does not favor the easiest solution, but rather the most harmful outcome for other people's dignity and feelings; this could be especially true in an epic fantasy (or just epic) game. In some settings, sorcerers don't even get access to protective spells, their power being a pure force of destruction. Healing is nearly always out of the question.

From Whence the Darkness Comes

In fiction, dark magic as two main sources: arcane (involving pacts with demons or Things that Man Was Not Mean to Know, or "mundane" forbidden lore) or divine (coming from the will of dark gods). It is *very* rare for it to come directly from inside someone's soul; since dark magic is often tied to the unnatural, anyone it was rooted in would not be completely human. This *could* be true for sorcerers who sold their souls, however! In such cases, the GM should consider allowing players to buy dark spells with the points gained by taking appropriate disadvantages linked to the entity or force that is the source of the power; thus, a sorcerer could gain the knowledge of the Lord of the Flies spell in a mere second . . . but now he must sacrifice a baby once per month to the Nameless One (a -15-point Vow) and do other, very nasty things.

Dark spells often come with the Pact Limitation, especially if sorcerers obtain them from demons or dark gods. If the gods are nothing but very powerful spirits, see below for other suggestions.

In settings where magic is a "neutral" power, untied to any cosmic force, dark magic could be the reflex of people's darker thoughts and emotions. Some gifted men and women can use it as a weapon, just as "white" mages can channel their own love and compassion to heal and protect. In such a world, demons, for example, would not be summoned but created with magic and shaped by the caster's beliefs about how a demon *should* look and behave. Sorcerers could not know that their demonic patrons or dark gods are not real, however! If so, such a setting would not look different from any "classic" fantasy world (even if some clues can be given by the GM, through the words of old masters or high priests). For a sample of such a world, look at Marion Zimmer Bradley's *Avalon* series.

Even *spirits* could be the source of dark magic: They could be demons in a world with deities, or evil spirits in animistic settings. Such entities are often very dangerous, since they have their own goals and agendas, and frequently have a malicious nature; sorcerers should stay aware of what their patrons could ask them in return for their "gifts." Nonetheless, meddling with such evil entities is generally the fastest way to get power, since they are not as distant as ancient masters or as powerful (and thus hard to manipulate) as gods. Spirits are vengeful, however, so even the most powerful sorcerer should avoid angering them.

Spirit powers are Fickle (see **GURPS Powers,** pages 24 and 110); optionally, the GM could allow *situational* modifiers to affect reaction rolls to please the spirits: A suitable sacrifice, performed as a part of the casting, could give between +1 and +3 (the more ritual the sacrifice and the more prized the victim, the higher the bonus). Casting the spell for a goal that meets the spirits' ends (such as destroying the temple of a good deity or weakening the power of good spirits) could be worth +1 or +2. Even mere "special effects" could be worth a +1, if the mage casts a dark spell in the middle of a thunderstorm! On the other hand, using dark spells to perform *good* actions (such as aiding someone, fighting evil, or hindering the spirits' plans) qualifies for penalties between -1 and -5. Since gains and losses balance each other, the power modifier is unchanged.

Who Dwells in Darkness

For the most part, dark sorcerers are callous individualists, striving for dominance and power. The archetypical dark mage is the evil master, an old but unwise wizard corrupted from the energies he manipulates and from which he gains power. The Emperor from *Star Wars* is a perfect example of such a villain, a concentrate of pure evil: His main characteristic is that his goal seems to be *corrupting* more than *dominating,* as he collects power in order to destroy good. A similar sorcerer could be the most dangerous for heroes because of his knowledge and personal power, and because he would not hesitate to sacrifice anybody and anything for his cause.

Another kind of dark mage is the dark lord, combining aspects from the traditional sorcerer with a martial attitude and a strong personal charisma. He differs from the dark masters because he is usually driven either from lust for power or from his own feelings, sometimes predictable (vengeance or hate), sometimes not (he could see himself as *good!*). Dark lords sometimes have a code of honor (perverted or not), which would go against any dark master's plan. J.R.R. Tolkien's Sauron is *the* dark lord, an evil demigod often described as a powerful sorcerer. Sauron is a master of deception, but he does not disdain brute force when it seems the easier way. He too considers corruption a standard practice, but in the form of a promise of immortality and sheer power; the goal is the same, but being Evil more than evil, he ultimately desires more power for himself. Such a villain could be all the more dangerous because of his sheer strength and because he often has hordes of minions at his disposal.

Dark lords and dark masters are typical of high fantasy, a genre featuring "titanic" opponents. More prosaic sorcerers have more mundane goals, and the Brotherhood from Katharine Kerr's *Deverry* novels looks very similar to modern criminal organizations such as the Mob. Low-fantasy sorcerers are usually above fighting in the front line, but they can easily dedicate themselves to immoral activities such as slavery and drug trade. It is simple to develop such characters: thinking about a despised person (real or imaginary) could be a good start. "Mundane" sorcerers are hard to identify, since they tend to blend in with the rest of society, and can strike from unknown directions at any time; thus, they could be the most dangerous enemies for the heroes.

The Dark Magic Power

Sources: Divine, Magical or Spirits (nearly always demons).
Focus: Evil and suffering.

The one presented here is a very generic "dark" power, which can be easily customized in order to adapt it to a given setting. Follow the guidelines in this article to get some inspiration, or use them as a source to emulate any feature seen or read about.

Dark Magic Talent

Talent for dark magic is worth 5 points per level if it is a specialized power, roughly comparable to Evil (see **GURPS Powers** 127) in breadth. If the GM rules that dark magic encompass *any* form of magic use describable as "evil," from creating darkness to summoning demons, he should consider making Dark Magic Talent worth 10 points per level.

Dark Magic Abilities

Since this is a generic power, it is hard to choose a group of abilities that could fit *any* vision of dark magic. Below are some abilities almost every sorcerer should (or could) have access to; feel free to expand or reduce it as desired. Neutralize and Static are included as "counterspells."

- Leech (if the GM rules that spells must Cost Fatigue, Heals FP and Only Heals FP shouldn't be allowed!)
- Mind Shield; Neutralize (Magic)
- Possession
- Resistant, either to the abilities of "good" magic or to evil energies (a knowledge of the dark arts makes the user more protected than an ordinary mage)
- Static (Magic), with Resistible
- Temperature Control
- Terror
- Visualization, with Cursing

Additionally, almost every Affliction 1s possible, provided it causes pain or unease; most of them have the Malediction modifier, but it is not mandatory. Innate Attacks must be Toxic or Fatiguing, possibly with nasty Side Effects or Symptoms and, of course, Malediction.

Being spells, *all* abilities should have the Spell limitation (see below). Exceptions can be made with suitable justifications; an old evil wizard could be Resistant to dark spells due to the fact he channeled evil energies for decades, thus becoming resilient to their effects.

Power Modifier: Dark Magic. The advantage belongs to the Dark Magic power. This modifier is usually Divine (-10%), Magic (-10%), or Spirit (-25%).

Dark Magic Spells

Below are some "generic" dark spells. They are not tied to a specific setting or vision, so they can be taken as written or easily adapted to suit the needs of the setting. Their format is standardized: the spell's name and cost, a description (which includes game mechanics), and the ability itself.

Each sample depicts a "base" version of the spell, which is less costly and easier to learn. Leveled traits are kept at the minimum level, with a few notable exceptions (for Curse of Ugliness, an arbitrary Appearance level has been chosen, and Weakness gives -6 to ST because that is the necessary penalty to make an ordinary healthy human weak as an human child). Master sorcerers would have *far* more powerful spells at their disposal; each description makes some suggestions about possibilities.

Note that each spell has a built-in Costs Fatigue limitation: Feel free to stack it with those suggested under "[Example Skill Levels](#)" from the previous article, or make them the sole cost a dark mage has to pay. (Of course, dark masters could even get a reduction . . . but most often, dark powers do not come without a cost.) The fatigue cost is mainly a balancing tool for the GM; it ensures that sorcerers have limits to their casting powers, so they will have to *think* before entering a battle (it is no coincidence that many fictional evil mages prefer to send hordes of minions instead of just annihilating the heroes) or curse everyone crossing their paths. As Chase suggests, the GM could waive it . . . but if doing so, prepare to face players who try to solve every problem with a spell (which isn't necessarily a bad thing but can become boring quickly).

The Spell limitation is nothing more than the sum of Magic (-10%), Requires Gestures (-10%), and Requires Magic Words (-10%), put together in order to save space and give the right feeling (an advantage-based spell is defined by the fact that it's a spell, not just a sum of traits and modifiers). Note that the power modifier is already included: Do not apply it twice! If dark magic is a Spirit power in the game world, increase Spell's value to -45% (since Spirit substitutes Magic).

Curse of Ugliness [33 points]

This cruel spell transforms the subject into a disgusting mockery of himself. The exact appearance varies from person to person, but he will be extremely hard to identify (especially if this curse is made against multiple people), and only those brave enough to stare at him could try.

This spell costs 2 FP. Make a Quick Contest of Will with the victim, at a -1 penalty for each yard of distance between the mage and him. If successful, his appearance turns to Monstrous. Only the kiss of a person who looks past appearance can end the spell.

Affliction 1 (Disadvantage, Monstrous appearance, +20%; Extended Duration, Permanent, +150%; Malediction I, +100%; Costs Fatigue, 2 FP, -10%; Spell, -30%) [33 points]

Life Theft [15 points]

The caster steals someone else's life force. The user must touch the subject's bare skin to "drain" him: If successful, spend 1 FP. A blood-red light flows from his body to the mage's, healing wounds. The victim loses 1 HP, and the caster heals an equal amount of wounds taken (the character cannot increase his hit points above maximum). Powerful sorcerers can drain more than 1 HP per casting, or drain life through armor and heavy clothing. Life force can lead to

addiction, especially if absorbing it is a pleasant or sensual experience. For the Addiction disadvantage, life force is cheap and (very often!) illegal, for a -5-point disadvantage; if it were highly addictive, Addiction to it would be worth -10 points.

Leech 1 (Accelerated Healing, +25%; Contact Agent, -30%; Costs Fatigue, 1 FP, -5%; Spell, -30%) [15 points]

Lord of the Flies [24 points]

The sorcerer knows the secret to summon a swarm of the most unclean creatures, those who feed on the dead and the rotten. These flies are not innocent insects, but biting pests who can slip into anything but sealed armor, delivering pain and disease.

This spell costs 2 FP. An eight-yard wide swarm appears from thin air anywhere in a range of 100 yards and last for five minutes, attacking anyone entering it with a skill of 14. Trying to kill the flies is useless, because more appear to replace those killed; they can't leave the space they where summoned into, however. Their minds are too chaotic to influence with spells or Animal Empathy.

The flies deal 1d piercing damage per turn. Their bites are poisonous; a victim must roll against HT-3 or be infected with a disease that inflicts 1d toxic damage per day until he makes a successful roll, dies, or has suffered a total of 5d of damage. This plague is magical and can't be cured.

Piercing Attack 1d (Area Effect, 8-yards radius, +150%; Contact Agent, +150%; Extended Duration 30x, +60%; Persistent, +40%; Selective Area, +20%; Bombardment, effective skill 14, -5%; Costs Fatigue, 2 FP, -10%; Nuisance Effect, buzzzzzzzzzzz!, -5%; Spell, -30%) [24 points] + Toxic Attack 1d (Cyclic, 5 daily cycles, resistible, +25%; Follow-Up to piercing attack, +0%; Onset, 1 day, -30%; Resistible with HT-3, -15%; Spell, -30%) [2 points]

Misfortune [32 points]

The mage curses the victim with misfortune. When using this spell, pay 2 FP and make a Quick Contest of Will with the target (at -1 for each yard of distance): If successful, he is destined to fail an important deed, sooner or later; when this happens, the spell breaks. An "important deed" is something *critical* for the target, such as graduating or saving a loved one; Misfortune can cause an automatic failure in a fundamental roll (from a Law roll when dealing with a university professor to a First Aid roll to save his father from a heart attack) or simply make events take the wrong turn (i.e., a shot that misses the victim hits his little brother). It cannot kill its victim, however, just make him suffer (which could be worse).

The spell affects the first "important deed" tried by the victim; the caster has no control over it.

Affliction 1 (Disadvantage, Destiny, +10%; Extended Duration, Permanent, +150%; Malediction 1, +100%; Costs Fatigue, 2 FP, -10%; Spell, -30%) [32 points]

Pain [3 points]

The caster can wound a target from inside, tearing cartilage and muscles. Even if the spell is not powerful enough to kill someone -- the time and effort required would be unacceptable -- it can disturb a delicate task, such as concentration or spellcasting, causing its failure. This spell costs 1 FP. Choose a target and make a Quick Contest of Will with him, at -1 for each yard of distance. If the aggressor wins, the victim suffers one point of cutting damage (DR has no effect).

Having no vulnerable internal parts, Diffuse and Homogeneous targets are immune to this spell.

Cutting Attack 1 (Malediction I, +100%; Costs Fatigue, 1 FP, -5%; Not on Diffuse or Homogeneous, -15%; Spell, -30%) [3 points]

Soul Germ [29 points]

The sorcerer plants a seed of desperation in a victim's heart. This dark germ grows slowly and eventually blossoms into a black flower, suffocating all the victim's hopes and dreams. There is only one way for him to break free from this spell: He must have it proven to himself that his life is worth living. Sadly, this is not always easy to do.

This spell costs 4 FP. Make a Quick Contest of Will with the target, at -1 for each yard of distance. If successful, desperation starts to grow inside the victim, until he gains the Chronic Depression disadvantage (with a Self-Control of 6) after one week. Sadistic sorcerers use this spell to break proud opponents; even among dark spells, the Soul Germ is definitely evil, since it can deprive someone of dignity and freedom of choice. Only the *worst* character types should learn this spell.

Affliction 1 (Disadvantage, Chronic Depression (6), +30%; Extended Duration, Permanent, +150%; Malediction I, +100%; Costs Fatigue, 4 FP, -20%; Onset, One week, -40%; Spell, -30%) [29 points]

Suffering [16 points]

Imagine salt on an open wound. Then multiply that for a thousand of small wounds all over the body. This is what a victim of Suffering feels.

When casting Suffering, the mage hurls a dart of reddish energy against the target, causing him a flesh wound and a great pain. Pain stops well before the wound closes, but until then, the target feels as if he is being skinned.

This spell costs 1 FP. Roll against Innate Attack (Bolt) to hit. The spell deals 1d-2 cutting damage, regardless of any DR; if even one point of damage penetrated DR, the victim must roll against HT (-1 per point of damage) to avoid suffering Agony for (20-HT) minutes. A creature in agony is unable to act and loses 1 FP per round. This spell is often used for torture (threatening someone with a resumption of the pain gives +3 to Interrogation and Intimidation rolls) or to practice the Innate Attack skill; damage is low, so targets last much longer . . .

Cutting Attack 1d-2 (Cosmic, Ignores DR, +300%; Side Effect, Agony, +150%; Costs Fatigue, 1 FP, -5%; Spell, -30%) [16 points]

Terrifying Gaze [12 points]

The sorcerer stares into the victim's eyes and fills her mind with terror. The stronger the user's will, the more terrible the visions; similarly, a strong-willed target could be able to resist the spell completely.

These spells costs 2 FP. Choose a target within 10 yards and make a Quick Contest of Will with him, at *no* penalty; the participants must be able to see each other, but no other condition is required. If successful, the victim must roll on the *Fright Check Table,* adding the margin of success instead of her margin of failure.

Terror (Active, +0%; Costs Fatigue, 2 FP, -10%; Spell, -30%; Vision Based, Reversed, -20%) [12 points]

Unhealing Wounds [31 points]

This vile spell prevents a target's wounds from healing, keeping them open; it does not hinder recovery from disease, poison, or other afflictions, but wounds do not close and bones do not knit until the spell's duration expires.

This spell costs 2 FP. Choose a target and make a Quick Contest of Will with him; the mage is at -1 per yard of distance. If successful, she gains the Unhealing disadvantage for (1,000 minutes × margin pf success). Note that 1,000 minutes are more or less 16.6 hours, ensuring that at least one day of recovery will be lost if the spell succeeds.

The most cruel sorcerers cast Unhealing Wounds (usually an area version) against fleeing enemies, condemning most of them to die of bleeding or infections. A healer can identify the spell's action with a First Aid roll at -3 or a

Physician roll at -1, provided he's aware of its existence, but he can do nothing but call a spellcaster. Every roll is at +5 if one day is passed from the wounding (when the wound should have started to heal).

Affliction 1 (Disadvantage, see below, +30% ; Extended Duration ×1000, +120%; Malediction I, +100%; Costs Fatigue, 2 FP, -10%; Spell, -30%) [29 points]. *Note:* The bestowed disadvantage is, of course, Unhealing (Total).

Vulnerability [20 points]

This horrible curse acts every time its target takes damage, increasing injuries; cuts spread, fractures extend, and stabs deepen. The target takes double damage from any physical attack.

This spell costs 2 FP. Make a Quick Contest of Will with the target, at -1 per yard of distance. If successful, the victim gains the Vulnerability (×2) disadvantage for (the mage's margin of success) minutes. An area version would be deadly in battle.

Affliction 1 (Disadvantage, see below, +40%; Malediction I, +100%; Costs Fatigue, 2 FP, -10%; Spell, -30%) [20 points]. *Note:* Bestowed disadvantage is Vulnerability to Physical Damage (×2) [-40 points].

Weakness [19 points]

Warriors fear nothing more than losing their might, especially if that happens after a mere gesture and a single word of a sorcerer. The Weakness spell does that: It weakens.

This spell costs 2 FP. Choose a target and make a Quick Contest of Will, at -1 for each yard of distance. If successful, the target's Strength is reduced by 6 for (1 minute × margin of success); Hit Points are unchanged, however. An ordinary person would become weak as a child, while a strong warrior would lose so much of his power that even a normal human could beat him. Psychological effects can be even worse than the physical ones: If the mage is good at Fast-Talk, he could convince the victim he'd be permanently weakened unless he does some unspeakable act. Of curse, a powerful caster could be actually able to bestow a *permanent* curse (add Permanent, +300%).

Affliction 1 (Attribute Penalty, -6 ST, +30%; Malediction I, +100%; Costs Fatigue, 2 FP, -10%; Spell, -30%) [19 points]

The Terrifying Plot of Dr. Z!

An Adventure Serial in Six Parts

by Matt Riggsby

What's Going On?

The date is March 1, 1936. The place is Anywhere, USA. FDR is in the White House, the civil war rages in Spain, and everybody is doing the Lindy Hop. The PCs arrive at the home of an old friend to find him dead and his house ransacked. Despite warnings from the mysterious Miss Papillon, they investigate his demise to discover that he was killed by agents of Dr. Z, the secretive Eurasian crime lord and scientist. They must follow him across the globe, fighting an array of enemies and Dr. Z's fiendish inventions to foil his plot to construct a death ray.

No, Seriously . . . What's Going On?

"The Terrifying Plot of Dr. Z!" is an extended adventure for **GURPS** *Fourth Edition* presented in short linked episodes, much like a cliffhanging serial movie. This adventure serial involves chases, fights, captures, escapes, deathtraps, mad Russians, Mongolian hordes, Nazi zepplins, and, yes, hanging off of cliffs. There's some superscience and no overtly supernatural content.

Each episode of the serial is self-contained, in that the GM can run each one before reading future episodes. Important plot points will be noted to help prevent short-circuits ("The PCs will go to Botswana next time, and for Pete's sake, don't kill the bellboy!").

Certain genre conventions should be observed. First, if the players attempt extremely dangerous actions and fail, the GM should try to avoid immediately lethal consequences. For example, characters who fall off of heights or moving vehicles should have a better than average chance of grabbing a protrusion on the way down, or at least have something break their fall, and those lost at sea should find some convenient flotsam to keep them alive until rescue hours or days later. A [drama point system](#) may work well in this adventure.

Second, NPCs are disinclined to fight to the death, be it theirs or the PCs'. Unless otherwise noted, NPCs will flee if severely wounded or otherwise seriously outclassed. If they're winning a fight, they only seek to disable the PCs and get on with what they were doing, or else to capture them for questioning or a rant from their megalomaniac leader. Players should understand that capture is a fixture of the genre, and if a fight goes badly, surrender is a viable and *temporary* option.

Who Are These People?

PCs should be highly talented normals, built on something around 150 points. If the players are amenable, they might include one higher-powered character to whom the others are sidekicks . . . the usual structure for adventure serials. They'll start in a major American city with a port and a large immigrant community.

The group will find it useful to have a mix of a broad range of fighting, interpersonal, scientific, and technical skills. They may want to (though they won't necessarily have to) ride horses, fly a variety of aircraft, fight with guns, fists, and primitive weapons, navigate in a wilderness, sabotage advanced technology, read ancient inscriptions, and communicate with everything from tribesmen to corrupt officials across the world. Characters should have a strong loyalty to one another and to a Professor Edgar Mathers (an elderly scientist, perhaps an old mentor of the PCs), an intense curiosity, a strong sense of justice, or something else which would motivate them to run around the world to

chase down an international criminal single-handed.

The heroes can include just about any character type who might be found in a large city. However, since this adventure will require a lot of travel, characters who are strongly tied to a given place (say, a PI who relies on local contacts or a scientist who is useless without his personal laboratory) probably won't be much fun.

PCs might have a bit of unusual technology, such as a private zeppelin or rocket guns, and even some low-level paranormal abilities might be acceptable. However, exceptionally good ultratech sensing equipment and paranormal sensing abilities (particularly mind-reading) may short-circuit the adventure, so they should be allowed with great restraint or, better yet, not at all.

Dr. Z is the illegitimate child of a German diplomat and a Malaysian princess. Rejected by his mother's family and grudgingly supported by his father's, he attended Europe's finest schools until he was entirely cut off after his father's death. He excelled in the sciences, but it was impossible for a mixed-race reject of the aristocracy to find an academic position at the turn of the century, so he fell into a life of crime.

But he did so very successfully. Both a scientific genius and a skilled organizer, Dr. Z assembled a team which became the most successful bank robbers in Europe. During the Great War, his organization transformed into a vast global smuggling operation, with sidelines in vice, murder for hire, and a wide variety of other criminal activities.

Since then, Dr. Z has become a part-time crime lord, making executive decisions for his network and spending most of his days in research and experimentation. He has used himself as a subject for experiments, producing a secret formula to reduce his need for sleep in order to carry on even more research. He is now plotting terrible revenge against the entire civilized world which has cast him out.

Miss Papillon's picture might be found in the dictionary under "femme fatale." Papillon boasts grandparents from three different countries, giving her an uncategorizable but striking appearance. She is slim, of average height, has dark eyes, perfectly coifed black hair, and pale olive skin. She favors high-necked but skin-tight (and high-slit) embroidered Chinese silk dresses, high heels, dark glasses, opera gloves, fur stoles, and cigarettes in long holders.

Her driving desires are for attention and luxury. If she has to work, she does so as a lounge singer, but prefers higher paying jobs compatible with her flexible morality. She's capable of prolonged attraction, even affection, but she's an opportunist at heart, and while she can be temporarily influenced, she will sell anyone out if the price is right.

Miss Papillon appears in "flashback" in chapter 1 and in the flesh through the series. Keep her alive!

There is little about Sturmbannfuhrer (a Waffen-SS rank roughly equivalent to major) Reitermann which doesn't conform to a recruiting poster ideal: tall, blue-eyed, physically fit, well-educated, and a great believer in technology. He's also fervent racist who will happily sacrifice any number of lesser peoples for the glory of the new Reich. Reitermann is no fool, but he does have an overinflated sense of self-esteem and is capable of being honorable, or at least exceedingly polite. Reitermann thinks he's being polite for not telling Dr. Z that he's a decadent mongrel. Dr. Z is smart enough to know what Reitermann thinks without being told, but it makes no difference to him. Reitermann is useful, and Dr. Z would despise him anyway.

Reitermann appears in chapters 3 and 4. After that, he's fair game.

Although he's scarcely distinguishable from the tribesmen he commands, General Alexei Borovitch Koskoff comes from a more civilized background. Born in St. Petersburg, educated in Paris (though he was thrown out of several schools for drinking and brawling), Alexei was headed for a respectable military career. However, he slept with the wrong general's wife and ended up commanding a Siberian garrison. Though he was angry to be assigned to a dead-end post on the eve of the Great War, it turned out to be just as well when the revolution wiped out the world he knew.

In the chaos around the revolution, he declared himself a general and went into business for himself, leading a group of mostly Mongolian soldiers-turned-bandits. He calls himself the last of the White Russians and definitely hates Communists, but he has no coherent political agenda; despite his anti-Communism, he hates Germans, and therefore the current Nazi regime, as well. Mostly, he raids for loot during the day and drinks, sings and plays music, and recites

poetry (very, very loudly) at night.

Alexei appears in episode 4, though it's possible that he could show up later.

And Now?

The Terrifying Plot of Dr. Z!

Episode 1: Death at the Old Farm

by Matt Riggsby

The heroes brave the chill of early March to visit their old friend Professor Mathers. They set out along the winding country roads to the his family's old farm, now used by the professor as a retreat from his laboratory. It's a difficult trip; they almost wipe out on icy patches several times and nearly collide with a particularly wide Packard coming around a narrow curve in the opposite direction. However, about an hour before sundown, the PCs finally arrive at the farm and drive down the short lane to the farmhouse.

Little of the farm is under cultivation these days, but it provides accommodation for visiting friends and room for long horse-rides. The property is lined with trees and partly surrounded by light woods. The buildings include a large two-story farmhouse and a barn, with a few sheds here and there.

When they pull in, they notice immediately that something is wrong. The front door is wide open to the cold. Inside, they discover that the house has been ransacked. Every drawer and cabinet has been opened, books knocked off of shelves, and so on. Eventually, they find the professor lying on the floor of his study in a pool of blood, stabbed once through the chest. The professor is still alive, but just barely. When the first PC gets close enough to hear him, he whispers the word "dolphin," and expires.

Map of the US

Searching for a Porpoise in Life

It's not immediately clear what the professor meant. A search of the house will turn up nothing dolphin-related, aside from a few books on oceanography and the "D" volume of the encyclopedia. What they can find is a lot of technical work on electronics, chemistry, and engineering. Scientists may (roll vs. Electronics) discover a running theme in the professor's most recent papers, concentrating great quantities of energy through the use of crystals. But they may want to look farther afield. The investigators may know the professor kept a private laboratory in the barn, and looking around the property will reveal a covered well just outside the barn decorated with glazed tiles depicting various animals.

If the PCs approach the barn for any reason, a raggedly-dressed man bolts away from it on a horse, riding bareback. The PCs have a chance of catching up with him on horseback if they take the professor's other horses. None of the horses have been saddled, so whoever chases the fleeing man will have to ride bareback too. The fugitive is fleeing through the uncultivated countryside rather than over open fields, so pursuers must leap over small streams and ditches and avoid low branches, which will make bareback riding that much more difficult.

A car couldn't follow the fugitive through the trees, but a motorcycle might. Even a motorcycle with a sidecar could make it between the trees, though it would have a hard time jumping over a steep-banked stream. However, a car wouldn't have to follow the fleeing man's path. A winding road cuts across the area he's trying to escape through several times. A skilled driver could try to pull ahead on the icy road and cut the man off. Airborne PCs will have bigger problems; they'll only be able to chase from above the trees and could easily lose him under a patch of evergreens or tangled branches. Only mad daredevils

Cowboy Jim Brody

Although he can be a joker and is not above minor pilfering in extremity, Jim is an honest man and a hobo's hobo. He's just a

would follow the fugitive using a rocket pack.

The fugitive gives up quickly if cornered, lassoed, or otherwise immobilized and will not fight unless he is given absolutely no other choice. In fact, once brought to ground, he is as cooperative as the PCs allow him to be. His name is Jim Brody, or "Cowboy Jim" to his friends.

Jim says that he was looking for odd jobs in return for a hot meal and a bed for the night. When he came to the professor's house around noon, he found the door ajar, just as the PCs did, but with a large car parked out front. Looking inside, he saw "a bunch of Chinamen and a real pretty lady" as well as the professor (or, Jim says, "this white-haired old man"). Two men were holding the professor and a third was threatening him with a large, fancy knife, shouting in a foreign tongue. The "pretty lady" was giving the rest of the men orders, slipping into and out of English: "look over there," "it can't be in there, you idiot; try the next drawer," and the like. He remembers her using the word "concentrator" several times; he figures that's what they were looking for, though he's got no idea what a concentrator might be.

Jim was trying to figure out his next move when the lady told someone to look around outside. That decided it. He ran for the nearest shelter, the barn, and hid there for hours. Finally, the whole crowd minus the old man piled into the car and drove off, minutes before the heroes arrived. He doesn't know if they found what they had been looking for, but he knows that they didn't sound happy. He was trying to decide whether or not to leave himself when the PCs arrived. Figuring enough was enough, he borrowed a horse, vaguely planning to leave it a few miles away where it could find its own way home, and tried to avoid any trouble. It didn't work out the way he hoped, but since he didn't do anything, could they let him go, please?

Intensive questioning might turn up details he glossed over the first time: fuller descriptions of all the people involved and a description of the Packard which (on a Per roll) identifies it as the car they nearly ran into on the way over; the grille has a distinctive gold chasing. Other than that, Joe really doesn't know what was going on.

Once the PCs get around to inspecting the well, they'll find that one of the tiles on the well is painted with a dolphin. The tile is loose; behind it is a key with a tag identifying a locker in Brown's Warehouse, a storage facility in town. If they go on to inspect the professor's lab, they'll find a dizzying array of electronic parts, half-finished gadgets, blueprints, and chemicals. Among them, they'll find a rough sketch of a cylinder surrounded by several toruses, labeled "concentrator," but nothing else on the subject.

If the PCs search further, they'll find unending half-finished gadgets, voluminous correspondence in a variety of languages, and souvenirs from the professor's extensive travels, but nothing suggestive of a carload of violent individuals from China. Should they find the professor's other friends and colleagues, they may remember having heard of the concentrator, whose development was funded by a mysterious sponsor. However, there's little evidence of what he was up to, who his Chinese assailants were, and what the concentrator is. If they check out the word on the streets, they'll hear about ongoing gang wars in Chinatown, but no connection to any scientist.

Werehouse '36

wandering soul who wants and offers no trouble. He is particularly eager to avoid the police, who are notably unsympathetic to his lifestyle. He's aware that he survives on the kindness of strangers, so he tries to be as worthy of that kindness as much as a small mischievous streak allows him.

With little formal education but years in the saddle, Jim was a ranch hand in Oklahoma. Like thousands of others, he saw his livelihood dry up and blow away during the dust bowl years, so he took to the road and has been traveling ever since. Jim is big, though neither fat nor muscle-bound, with shaggy hair and a beard. His clothes are a near-random mix of styles: dungarees, Army surplus shirt, tweed jacket, wingtips, and a flat cap. All are second-hand and badly worn, but Jim keeps them clean.

Jim doesn't appear after this, but he could be recycled in future adventures. Though he can provide no immediate reward for anyone who does him a good turn, he may be able to turn up some useful information, do a small (not very skilled) errand, or vouch for the PCs in rough society.

Sooner or later, then, they'll need to visit the warehouse. Brown's Warehouse is a three-story building in a nondescript business district. The bottom floor has a small office in front and shelves and loading docks in back. The upper floors are filled with rows of large closets for more private storage; the key from the professor's house is to a locker on the top floor. They are dimly lit, with dirty windows which let in next to no light even at mid-day. The aisles on the upper floors (ten rows of closets, divided by six perpendicular aisles) are narrow for a storage facility, and the wooden floors, staircases, and doors all creak abominably. Although the staircases are bad for carrying heavy loads, the building has a large open elevator in one corner.

As they approach, the heroes may realize they've got company. On a Vision roll, they notice a particular Packard parked near the warehouse. The gold trim makes it clear that this is the same vehicle used by the thugs who killed the professor, and they're now at the warehouse.

Dr. Z's Thugs

These are the footsoldiers of Dr. Z's criminal army, absorbed from a Chinese triad group which Dr. Z recently took over. They're not professional killers, but they're good enough for a street fight.

If the heroes arrive during business hours, they find that the front doors are locked, although the "Open" sign in the window hasn't been flipped to "Closed." If they arrive at night, the lock on a side door has been picked. In either case, three Chinese men are in the office, two rifling through papers and one serving as a lookout; any on-duty clerks have been chloroformed and tied up. These are three of Dr. Z's thugs digging through the records in an attempt to find out which locker the professor was renting. If they see the PCs, they'll shout a warning to their companions upstairs. They may attack the investigators, but if they appear to badly outnumbered, they'll try to flee upstairs.

Ready, Aim, Fire!

Speaking of which: While three of the thugs are downstairs, eight more are upstairs, ransacking lockers to find the one the professor rented. Their objective is to find the professor's locker and recover or destroy the contents. The heroes have the advantage of knowing where the professor's locker is, but will find it nigh impossible to move silently. If the thugs become aware of them, which they certainly will at some point, they will attempt to stop the PCs by picking them off a few at a time, striking from the shadows of darkened aisles. Their movements may confuse the PCs, who will glimpse identically dressed men darting through one poorly lit intersection after another.

The thugs will also resort to using an old trick to confuse their enemies: pyrotechnic smoke bombs. They're effective for confounding opponents, but they will also set fire to the warehouse's dry, seasoned wood. Once the fight has gone on for a minute or two, the PCs will start to smell smoke. It should quickly become clear to them that they're in a burning building, surrounded by enemies.

What?! Dreams May Come?

As far as webcomics go, Xkcd is fairly consistent in its abilities to provoke thought (along with some some geek-centric humor). A few months ago there was an installment that made me stop and go, "Hmmm."

For those who haven't read it, it points out how absurd it is that we take dreaming and sleeping in stride; they are little more than incredibly common hallucinations. More interesting to me, I note that dreams and sleep are cultural shorthands. Even while conscious we dream of better tomorrows, endure "unending nightmares," "sleep" on decisions, endure sleepless nights, analyze our dreams and sleep schedules, and so on; the acts of sleeping and dreaming permeate the very stuff of our daily lives in thousands of different ways we don't even realize. (As one example, I assume when someone is discussing their "dream house," they don't mean it's filled with hundreds of doors of different sizes and shapes, behind one of which is a long-deceased grandparent who's also a burning lion.)

Curiously -- I note by way of foreshadowing -- this column is not about dreams.

Now, a bunch of RPGs already utilize dreams to a certain extent. **Call of Cthulhu, In Nomine, Changeling,** and others make heavy use of the nocturnal realms. But what I find interesting is how, to the best of my knowledge, few games or game settings make use of a *lack* of dreams, or of alternate universal "truths" that a race or species might have.

The most obvious example is to consider the idea of how other races view these same ideas, either space aliens in a sci-fi setting or other peoples in a fantasy world. Thus a setting's elves might find the practice of entering into a coma for a third of one's lifetime to be a strange idea, or an alien species might find the notion of dreams fascinating enough for a round of orifice probes for any humans they encounter.

But this idea isn't limited to far-future space opera or dancing-dragon fantasy realms. In our own world, we seem to be on the cusp of developing drugs that allow one to forgo the biological need for sleep indefinitely; it's not much of a stretch to envision a society where a certain subset decides *never* to sleep. Envision a group of humans -- perhaps wildly successful humans, since they can theoretically increase their productivity by 33% or so in the same time period -- who resemble their "regular" brethren in every aspect, but who never sleep . . . who have no idea what a "dream" even is first-hand.

Going a smidge further, envision a dystopian future (or perhaps a *Star Trek*-esque planet of the week) whose human citizens have been drugged from birth by its leaders -- or maybe the ever-popular Precursors -- so that they never sleep or dream. What would happen if the insomnia generators were disabled or destroyed at the same time the heroes visited? Could they survive the chaos that resulted from the comatose states and hallucinations that its people endured for the first time?

Looking at it a bit askew, what other universalisms can non-human species possess that forges part of their collective unconsciousness? For example, the sidhe in some game systems (most notably **Changeling: The Dreaming**) live their lives unchronologically; they experience events out of order. (I used this tidbit to great effect for flashbacks and a flashforward or two in the long-running **Vampire: The Dark Ages** campaign.) Such an existence would probably have a profound effect on their collective society. Not only would notions of cause and effect be turned on their sides, but aphorisms such as "tomorrow never comes" wouldn't have the same meaning . . . after all, it's entirely likely that some members experienced tomorrow last week!

Consider that sleep defines almost every aspect of our lives: Human society has a cycle that assumes most members sleep at night; international commerce is complicated by the need for members to sleep; and the limitations of biology often confound those who live in a world of deadlines (having 48 hours until a project is due doesn't mean you have 48 hours left you can work). As such, coming up with sleep-like universal truths of a species is a great way to emphasize their non-humanity.

Some ideas that expand on this:

Envision a race that divides its day in two biological shifts, evenly divided. They have a "Day Self" and a "Night Self," and the two can evolve entirely separately: Different skills, different personalities, different goals and desires, and so forth. Society would probably evolve around the idea of the conflict these two selves present: some might admire those who seek to unify their halves (leaving each "other" extensive notes, for example), while others might respect those with wild divergence between the two ("leading their selves through two lives" might be a popular saying).

Envision a race that, once a week, spends two days entering a hibernation state where they regenerate and shed their old bodies like a snake discards its skin. Assuming a seven-day week, such a society would probably evolve around the seven groups (dependent on what day the shed-healing begins); they might differentiate between five-pals (folks you could spend five days with) or threesers (those who you could only spend three days with because the other is hibernating). They might even make further sub-divisions, such as divided threesers (those who can only spend one or two days together in a row). Such a race would also probably have metaphors and ideals that revolve around their hibernation; they might "shed a skin" on difficult decisions, or they may speak of needing to give, say, a troubled marriage a "two-day heal."

Envision a race that fills up with a buoyant (odorless) gas that normally dissipates naturally when they are awake. However, their dormant state entails the locking of all their muscles, enabling them to "sleep" (they're fully aware, just locked up) while leaned against a wall. As a result, the gas builds within them during this time, and -- if they didn't take steps otherwise -- they would literally float away. Metaphors would probably revolve around ideas such as "wakefall" (the period immediately after exiting the dormancy phase where members release the gas and return to gravity's influence), or letting problems "rise off you." If the dormancy can come without warning, there might be cultural procedures for how other members deal with each other; taking advantage of a dormant body would be one of the utter taboos, while not acting to tether a sleeping person might be a crime.

I personally envision every species possessing some aspects of their base biology that defines them in ways they don't even consider. Coming up with an interesting twist can not only help define an entire species, it can also provide new and interesting gaming potential; For example, the two-phase race mentioned above would be ideal for players who enjoy playing two characters at once, without being unbalancing from a gameplay standpoint.

And if you're looking for ideas, why not sleep on it? Who knows what you'll dream up.

Your Own Electrical Jesus: John Murray Spear And The Spark Of Life

"I sing the Body electric;
The armies of those I love engirth me, and I engirth them;
They will not let me off till I go with them, respond to them,
And discorrupt them, and charge them full with the charge of the Soul."
-- Walt Whitman, "I Sing the Body Electric" (1855)

John Murray Spear was born in Boston on September 16, 1804, named for (and baptized by) the founder of the Universalist Church, John Murray. He followed his namesake into preaching, becoming a prominent Universalist minister. He gained equal prominence as a political activist, working tirelessly against slavery and the death penalty, and in favor of prison reform, women's rights, and temperance. In 1844, a pro-slavery mob in Portland, Maine beat Spear within an inch of his life; his recovery was long and difficult. It didn't silence him, but it may have given him something of a taste for secretiveness -- he became a "conductor" on the Underground Railroad, joined a vigilance committee to undermine the Fugitive Slave Laws, and began building a cell network of like-minded "non-resistants" who believed that allowing the South to secede would easily expunge the taint of slavery from the Union.

But all that slowly receded into the background, as Spear began experimenting with mesmeric trance states and, soon, with automatic writing. His initial intent was to find people in trouble, so that he could go minister to them or provide for their care. He increasingly opened himself up to spirit contact throughout 1851 and early 1852, and toward the end of May, 1852, he received his first communication from the spirit of Benjamin Franklin. Franklin was concerned about a local woman (unknown to Spear) who had been struck by lightning; with Spear's mesmeric aid, Franklin was able to re-absorb "the subtle fluid" that had made his reputation, and heal the woman. As worthy as that practice was, though, Franklin had bigger things in mind for Spear. On April Fool's Day 1853, Franklin announced that Spear was the agent of the "Association of Beneficents," a group of worthy departed including Franklin, Benjamin Rush, and Thomas Jefferson (who had undergone a post-mortem conversion to abolitionism). That Association later proved to be but a sub-committee of the General Assembly of Spirits, which included not just Franklin but Daniel Webster, John Hancock, Lafayette, and Emmanuel Swedenborg. Within the General Assembly, Franklin headed the "Band of Electricizers," tasked with improving humanity by electricity. Franklin passed on to Spear numerous plans for the Electrical Ship, flying streetcars, thinking machines, the Soul-Blending Telegraph, and so forth, all powered by electricity channeled by male and female mediums "mingling into one." Spear toured the country trying to drum up moral and financial support for such schemes. (Among the spots he visited on his first tour was Niagara Falls, where Nikola Tesla would later carry out the spirits' "electricizing" goals on a grand scale.) But the key to them all was the New Motor, which Franklin told Spear had to be built in Lynn, Massachusetts.

"The roofless house, decayed, deserted,
Its living tenants all departed,
No longer rings with midnight revel
Of witch, or ghost, or goblin evil;
No pale blue flame sends out its flashes
Through creviced roof and shattered sashes!"
-- John Greenleaf Whittier, "Moll Pitcher"

Lynn, on the Massachusetts coast between Boston and Marblehead, was a grimy factory town with a bad reputation. ("Lynn, Lynn, city of sin/Ask for water, they give you a gin/It's the damnedest place you've ever been in," or so they said in Boston.) Its girls had a bad reputation, too. ("Lynn, Lynn, city of sin/The girls say 'no' and then they give in.") It was so bad that even its Quakers rioted -- in 1822, followers of the "New Light" busted up a meeting-house in support of their preacher, Mary Newhall, who had "a facility of entering into mystical speculations." Speaking of mystical speculations, Lynn had an intermittent sea-serpent, seen in 1641, 1820, and 1849 -- which would re-appear post-Spear in 1875 and 1947. It even had its own seer, one "Moll Pitcher," not to be confused with the Revolutionary

War heroine. Moll was a genuine Massachusetts witch, who read clouds and cards and told fortunes for sailors for fifty years from Colonial times until her death in 1813. She lived at the foot of High Rock, a 200-foot high outcropping of porphyry where, by Spear's day, the Hutchinson Family Singers maintained a Spiritualist compound and retreat. (Their compound also included Dungeon Rock, where the spirits were fond of hinting at nearby buried treasure.) The Hutchinsons were old friends of Spear's from the abolitionist days, and unlike his more particular allies, welcomed his new turn to the spirit world. They gave him the use of some outbuildings on their property for the construction of the New Motor.

"THE THING MOVES . . . We may say that we have the birth of a new science, a new philosophy, and a new life. The time of deliverance has come at last, and henceforward the career of humanity is upward and onward -- a mighty, a noble, and a Godlike career. All the revelations of Spiritualism heretofore, all the control of spirits over mortals, and the instruction and discipline they have given us, have only paved the way . . . And this New Motive Power is to lead the way in the great speedily-coming salvation. It is to be the physical Saviour of the race. . . . The child is born, not long hence he will go alone. Then he will dispute with the doctors in the temples of science, and then -- "
-- "The Thing Moves," *New Era* (June 29, 1854)

The New Motor was more than just an improved dynamo. As John Benedict Buescher puts it in his thorough biography, *The Remarkable Life of John Murray Spear: Agitator For the Spirit Land,* the New Motor "would collect and distribute the universal motion 'perpetually' present, flowing through all things." In short, zero-point energy, which we've encountered [before](). But this would be more than a New Motor; it would be "the New Motive Power, the Physical Savior, Heaven's Last Gift to Man, New Creation, Great Spiritual Revelation of the Age, Philosopher's Stone, Art of All Arts, Science of All Sciences, the New Messiah." In that shed on High Rock, the Electrical Messiah took shape, built out of $2,000 worth of materials (around $50,000 today). It was roughly man-shaped, built around a steel cross-piece from which depended two steel uprights like legs and two steel spheres containing magnets, extended like arms. A pile of zinc and copper plates -- the "electric reservoir" -- was analogous to the brain, complete with hairlike antennae stretching up to the rafters. It had a flywheel, mechanical-magnetic "lungs," and plenty of other strange parts variously burnished or tarnished in accordance with Franklin's spiritual instructions. The builders agreed that Spear's complete ignorance of the mechanical or scientific arts was a real bonus, as he wouldn't be tempted to "improve" on Franklin's designs.

As construction continued, Spear began to expose the New Messiah to various spirits and to male and female mediums. Its constructors and acolytes ate powdered metals and took on machine-like behavior to mingle themselves with the Physical Savior. Spear himself put on his "spirit armor" (an arrangement of copper and zinc batteries, metal strips, and gemstones "brought into peculiar conditions by various chemical processes") and spent an hour in a trance imbuing the New Motor with "a stream of light" according to clairvoyant witnesses. But the big day came on June 29, 1854 -- about nine months after construction began -- when the medium Sarah Newton, the New Mary (one of many New Marys that had wandered into Spear's entourage) lay on the floor and engaged in sympathetic pregnancy and labor, delivering "a visible vibratory motion" to the New Creation. It lived! The Electrical Jesus was born!

"We do not believe a word respecting a mob breaking into the building and destroying the spiritual machine. We are of the opinion that it was broken by the crafty author of it, whose schemes had come to the exact point of exposing his ridiculous pretensions."
-- Editorial in *Scientific American,* Vol. 10, No. 8 (November 4, 1854)

Sadly, such carryings on -- along with the increasing emphasis on "mingling into one" and the concomitant disintegration of Spear's marriage -- caused the solid citizens of Lynn to protest to the Hutchinsons. Spear, providentially, received a new spirit communication, telling him to take the New Motor to Randolph, New York, to put on an even higher hill. But in August of 1854, Spear was forced to report that an angry mob of Randolph youths broke into the farmhouse where the Electrical Messiah rested and smashed it. "The little mechanism has been assailed, torn asunder, and trampled . . . " Another report said that "the Spiritual Motor" had been "crucified by a lot of boys." Interestingly, though, the only report of the Passion of the Electrical Jesus comes from Spear or his spiritual communards. No independent account in either of Randolph's two newspapers, no diary entries by local anti-Machine vigilantes, no letter or legal document of any kind has come to light. The true fate of the New Motive Power remains unknown.

"At first appeared the Machine or New Motor with some spectators gazing in wonder at it. Then appeared some persons ridiculing or deriding it, while others threw stones . . . But the Machine seemed to grow in bulk and stature, despite their efforts, and threw off from itself smaller machines after its own pattern. . . . The small ones grew also around their parent, and in their turn threw off a multitude of other little ones, covering a great space of ground, and forming a high pyramid. . . . Next there appeared a movement among the machines . . ."
-- from a prophetic dream reported by Josiah Wolcott (July 5, 1854)

After the disintegration of the High Rock commune, Spear resumed his itinerant ways. He joined the Order of the Patriarchs, a spiritual movement in Ohio, which was building a "Psychocosmon," a kind of super scrying device for attracting stellar energy. It could communicate with the dead (specifically Thomas Paine and Hiram Abiff), and the large version would have a special chair in which a medium would sit and contact other worlds or dimensions. Spear attempted to start a new commune around the "magnetic spring" of Kiantone, New York, on the site of an ancient "Celtic Indian" civilization. Spear began to drift further and further into free love territory, eventually forming "a secret body within a secret body" within his new group, the Sacred Order of Unionists. The spirits sent him on a descent of the Ohio and Mississippi Rivers, to build a clandestine network of telepathic revolutionaries who would seize power once the Civil War had exhausted the whole country. He had another spiritual child, this one in the form of a nine-pound baby boy, with a different New Mary, in 1858, while Comet Donati blazed in the skies. During the Civil War, he mostly sojourned in England, trying to radicalize English Spiritualists and spiritualize English radicals, with little or no effect, although he did attend seances in London with Sir Richard Burton and Alfred Russell Wallace. He returned to America in 1865 and founded "Blue Anchor," a spiritualist utopia in the New Jersey Pine Barrens. It, too, fell apart. Spear died in 1887 in Philadelphia -- Benjamin Franklin's city.

"Von Junzt did not devote much space to it -- the bulk of his grim work concerns cults and objects of dark worship which he maintained existed in his day, and it would seem that the Black Stone represents some order or being lost and forgotten centuries ago. But he spoke of it as one of the Keys -- a phrase used many times by him, in various relations, and constituting one of the obscurities of his work."
-- Robert E. Howard, "The Black Stone"

So what was speaking through John Murray Spear? What rough beast slouched into Lynn, Massachusetts in 1854? Let's begin where Spear did, with Benjamin Franklin. We've already seen that Franklin was a devious magus with a gift for manipulation -- why should that have ended with his death? Surely if anyone could survive for generations in the form of an electrical spirit, it would be the man who tamed the lightning. Spear's first automatic writing included "also geometrical drawings and strange unintelligible figures, of which no interpretation was vouchsafed." Lovecraftian experiments in hyperspace magick? In body-switching? Did "Franklin" want Spear to build a New Messiah, or just a New Adam Kadmon for his spirit to animate? As we've theorized, Franklin may have been the bodily shell of Johann Konrad Dippel -- whose own "death" in 1734 eerily coincides with Franklin's Masonic initiation -- and whose alchemical experiments and claim to Frankenstein Castle eerily prefigures the electrical golem built in High Rock.

And what about "High Rock," that conglomerate of electrically-potent quartz and granite, material of Pharaonic sarcophagi, embedded on the edge of the spectral city of Lynn? Is it a silicon-based life form, a Powersian nephilim, a Cybele-entity (perhaps a Gin crone?) dwelling in the High Rock baetyl, giving off the "New Light," drinking and returning sexual energy from the bad girls of Lynn and the increasingly ecstatic New Marys in Spear's "secret body"? Is it entirely coincidental that Lynn should produce two other visionary utopians, the founder of Christian Science Mary Baker Eddy, and the American fascist and spirit-contactee William Dudley Pelley? Did the electrical ghost within the High Rock baetyl reach out and shock John Hancock, or jump to Franklin somehow via some Philadelphia Experiment? Was a piece of Lynn porphyry the "philosopher's Stone" that the alchemist Samuel Danforth sent to Franklin in 1773? However it got to Franklin, and to whatever degree Franklin willed it, the baetyl spark waited until the Grand Earth Trine of 1854, when Mars, Venus, and Jupiter were all 120 degrees apart. With male and female equidistant, the androgyne could form and the Great Work emerge, on June 29, the middle of the old Saturnian year, on the day of the Rock and the Visionary (SS Peter and Paul), the patron day of diamond workers. It wasn't quite right -- Comet Donati didn't come along until the Spears' Moonchild was born four years later -- but it was enough to undergo its blasphemous Passion and Occultation. And now, somewhere in a "magnetic cave" along the Mississippi, or in a cellar in London or Philadelphia or San Francisco, the Electrical Messiah waits and grows, breeding "smaller

machines to its pattern," building "a secret body within a secret body," and whirring silently to itself.

Where's the Nearest Money Laundromat?

What exactly is money laundering, and how is it done?
--Shawn Havranek

Money laundering is the process of taking the profits of criminal activity and "cleaning" it so it can no longer be traced to its illegal roots. Since the majority of criminal activity is transacted with cash, it is predominantly focused on getting enormous quantities of physical cash paid into banks, washed through a variety of electronic transactions, and eventually either withdrawn or used to make legitimate investments.

Money laundering is integral to the drugs trade. A series of studies have shown that between 65% and 100% of all U.S. dollar, British pound, and Euro banknotes in circulation are contaminated with cocaine, heroin, and ecstasy. While many of these notes may have been contaminated by drug users rather than drug dealers, the reality remains that the cash in your pocket is likely to have been in contact with dirty money at some point in its life.

It's not just the drug cartels that need to launder money. Dictators and government heads like Saddam Hussein, Manuel Noriega, Ferdinand and Imelda Marcos, and Idi Amin stole billions of dollars from their countries, while the Mafia and every other criminal gang in the world has to find a way of getting thousands of used bank notes into the modern electronic banking system.

There are three stages to money laundering: immersion or placement (getting cash into the banking system), layering (hiding the tracks), and integration (getting the clean money back into the legitimate economy).

Immersion is the maximum point of danger for a criminal enterprise. Getting $10 million in cash into a bank without raising suspicion can be a very difficult thing to do. Contrary to popular belief, you can't fit $10 million in an attach case. $10 million would stand over 30 feet tall and weigh more than the average person. Physically transporting such a large amount of cash is a challenge in itself.

You might just be able to fit a million bucks in a large attach case. A stack of hundred dollar bills worth $1 million would contain 10,000 bank notes, would stand 40 inches tall and would weigh 20 lbs. All the notes need to be crisp, new and in high denominations though; crumpled tens and twenties (which is just the kind of cash a street-dealer handles) would make the case burst at the seams.

An additional challenge is that most jurisdictions have a reporting limit on the amount of cash that you can deposit with a bank before they have to report the transaction as a potentially suspicious deposit. In the United States, this amount is $10,000, with additional requirements to report a series of suspicious transactions (for example all at $9,900), or aggregate transactions to the same account in a short period of time that breach the threshold. The launderer therefore has to get around this system, typically by using a system of runners which are often nicknamed smurfs. Every morning, the smurfs stop by the launderer's headquarters and pick up twenty or so bundles of $1,000 each. They then travel around the banks of a suburb (suburbs are most popular -- rural banks are too empty, and tellers usually know all their regular customers so a new face is memorable, while city banks are too busy and take too long), depositing the money in a series of a different accounts. After a few days, the money can be wired out to a different account and the layering phase can begin. This method can be a very slow process: it takes a team of 10 smurfs 10 weeks to get $10 million into the banking system if they're banking $20,000 a day each.

There is another way. Many jurisdictions, including the United Kingdom, Switzerland, Hungary and Luxembourg, do not require banks to report transactions above a fixed amount. Their reporting requirements hinge on the subjective nature of the word "suspicious," and while it significantly eases the flow of legitimate commerce, it is also a boon to the launderer.

In these territories, "know your customer" is the mantra. Banks in these territories are only required to report a suspicious transaction if it is significantly different from the normal course of business. A small family shop that banked typically $5,000 a week and suddenly started banking $20,000 would a day would be seen as suspicious. But that regular cash income of $5,000 would be regarded as normal given their business. Even the United States has a get-out clause for this type of business, allowing the banks to file a form that says that this customer regularly has significant cash deposits and hence the reporting requirements should be lifted, or the threshold raised.

To satisfy the banks on this point, the business must have a legitimate need to handle a lot of cash. For example, much activity in the building trade is still transacted in cash, including the purchase of heavy machinery such as backhoes, excavators, and cranes. It is entirely possible to purchase this equipment for cash and then sell it, sometimes even at a profit, to a purchaser who is prepared to pay via a bank transfer. Similarly, much of the global diamond trade is transacted in cash, making it a natural haven for money launderers, with the additional benefit that diamonds are lighter and more transportable than either gold and cash. Money launderers prefer to deal in polished stones, which any jeweller will buy for cash, rather than rough diamonds which only a very few diamond houses are willing to purchase.

Gold can be challenging to launder. In 1983, a gang of armed men broke into the secure Brinks-Mat warehouse at Heathrow and -- after terrorizing the guards by dousing them in gasoline and threatening to burn them alive -- left with 6,400 gold bars, worth approximately $40 million and weighing over three and a half tons. To launder them, the gold was shipped to a crooked gold bullion dealer in Bristol. There it was smelted down to remove the identifying hallmarks and serial numbers and mixed with copper and silver coins. It was then sent to the government Assay Office in Sheffield where each bar was weighed, taxed and legitimized, and could then be sold to legal bullion dealers who would re-smelt the bar to remove the impurities. The laundered proceeds were then transferred around the world via the Isle of Man, Liechtenstein, Switzerland, the Channel Islands, the United States, and Panama. Eventually significant amounts of money were repatriated to the UK and at least 5.4 million pounds invested into legitimate property development in London's Docklands.

Gambling provides a fertile ground for launderers. Casinos provide many services that are similar to a bank, including cashing checks, exchanging currencies and paying out in cashier's checks. It is an effective place to turn a stack of small denomination bills into fifties or hundreds. It is also possible to argue that you walked into a casino with $1,000 and emerged with $500,000, but you need to have a compliant casino management to back up your case. Of course, if you own the casino, it's even easier. You would just stuff the cash in the till and get the accountants to mark it down as money lost by a few additional imaginary punters. The U.S. government has clamped down by requiring casinos to report cash transactions in the same way as banks, but casinos remain notoriously difficult to regulate.

Casinos are not the only gambling activity that are targeted by launderers. At a racetrack, a winning ticket is a negotiable instrument. Some punters are only too happy to sell their ticket at a discount to avoid paying taxes, while the laundryman gains a document proving that he has come into his winnings legitimately. Similarly, a big lottery win can be used. Many major lotteries pay out their winners over a long period, so a $20 million win becomes $100,000 per annum for 20 years. Many winners are happy to sell their annuity for cash upfront, and the laundryman buys a totally legitimate income stream for the next two decades.

Restaurants, cafs and bars are particularly popular businesses for launderers; it is no accident that so much fiction shows the Mafia operating out of pizza parlors. These places typically take in significant amounts of cash, and hence depositing cash with banks seems like an ordinary business transaction that would not rouse suspicion. It's not just about running a business, though; the important element is to deposit more cash than the business is actually taking . . . otherwise the laundering is going to be very slow.

One solution is simply to overstate how much money your restaurant is making. If Joey's Pizza Parlor claims that it served 40 pies when it only served five, Joey can place eight times as much money in the bank. Once the money is in the bank, the next stage, layering, can take place.

The objective of layering is to make the audit trail as complex as possible, so that it is difficult for the authorities to track down the money. The layering phase is the focus of highly specialized law enforcement professionals, particularly forensic accountants, who have painstaking work in following the money flows around the globe.

A launderer transfers the money from his business account around the world. There are two objectives: a) to make many transfers so that the audit trail is difficult to follow and b) to travel through a variety of jurisdictions, preferably ones that are insistent on protecting banking confidentiality. So a U.S. mobster might transfer the money via Italy to the U.K., and then further to the Bahamas, Cayman Islands, Panama, Switzerland, Canada, and then back to the United States. For the American authorities to follow the trail, they would have to get cooperation or warrants from the governments in eight countries, four of whom are very protective of the privacy rights of their banking customers. Following this trail is time consuming, difficult, and frequently fails to lead to convictions or confiscations, despite the occasional high-profile case.

Certain jurisdictions see banking confidentiality as a competitive advantage in a global economy. Alongside the traditional banking havens of Switzerland, the Grand Duchy of Liechtenstein, and the Cayman Islands, recent entrants include Aruba, St. Kitts, Nevis, and Panama. Although the days of the numbered Swiss bank account where no name was associated with the account are now gone, in all of these territories, banking discretion is prized and the governments are acutely aware that much of their income and influence comes from maintaining that veil of secrecy.

In fact, in some of the smaller jurisdictions, drug cartels and other elements of organized crime prop up the regimes with the primary motivation of encouraging them to maintain banking secrecy against international law enforcement officials. When the financial clout of organized crime gangs is so much greater than anything the local economy can provide, there is little that local people can do about it.

To add to the levels of secrecy, the banking transactions frequently take place between different companies. It is easy and cheap to acquire a new company (a simple off-the-shelf corporation can be bought in many jurisdictions for as little as $200), and there are professional organizations who will, totally legitimately, provide a company complete with directors and a registered address (which is usually just a plaque screwed to a wall). The directors may not know who the shareholders or beneficial owners are, which adds an additional layer of protection for the money-launderer.

Layering can be also combined effectively with integration, usually through a complex web of interrelated companies. Returning to the restaurant theme, imagine that Joey's uncle Giuseppe owns a food supply business. Joey orders 20 kilos of anchovies from his uncle, receives an invoice, and instructs his bank to pay the supplier electronically from his bank account. Giuseppe's bank will not see any need to file a suspicious transaction report, since the transaction was electronic rather than cash, and is a usual transaction for the food supplier. The money has just started being layered.

The twist in this case is that Giuseppe will only deliver five kilos of anchovies. The bank will never know that 75% of that invoice was fictitious, and Giuseppe's business will seem to be thriving.

An alternative system is the informal banking systems created in India and China before the creation of the modern Western banking practices. Known as hawala in India, and as "chit" or "flying money" to the Chinese, it is entirely trust-based, contains no paperwork, and is essentially impossible for authorities to track. In essence, the system works by transferring money without moving it. If a man wishes to transfer money from London to his family back in Bombay, he approaches a hawala dealer and gives him his cash. The man is given a password or unique code which he tells his family in Bombay. They then visit an equivalent hawala dealer in India and receive their money. It is entirely based on trust and has worked for centuries. (The Knights Templar had a similar system which gives them claim to being the first modern bankers in the world). For a money launderer, this archaic system can flummox the most sophisticated of law enforcement officials.

The final stage, integration, is the safest. By this point, the money has been immersed by a team of smurfs, transferred through multiple jurisdictions and repatriated to the country where it started. It is then typically used in a legitimate transaction, frequently investing in property. The cycle is complete.

Money laundering is a risky business, and a skilled activity. Professional launders can charge fees that may rise as high as 50%, but are typically between 5% and 20%. Additional costs -- such as the smurfs, legal and accounting fees and so on -- add to the bill, plus there is the risk of confiscation or assets being frozen. On the whole a criminal enterprise would expect to receive between 50% and 75% of its dirty cash back in laundered, integrated money.

Of course, woe-betide the launderer who gets greedy. Many a financier has been murdered for the suspicion that he has taken more than his fair share of his client's money.

Sky Raiders of the Caribbean

by Paul Drye

The Great War came to an end with Germany the victor, if a pyrrhic one. Russia was engulfed by revolution, the morale of the French Army had collapsed after the Nivelle Offensive, and the UK was threatened into submission with starvation. Nominally the new masters of much of the former French Empire, the Germans found themselves with "Victor's Disease": the complete inability to prevent rebellions all over their new possessions, and even an abortive communist uprising in Bavaria. In the chaos, the Old World's economy collapsed by 1921; the United States followed two years later after the assassination of President Wood and the endless riots in New York and Philadelphia.

Faced with a choice between economic strength and imperial prestige, both the French and British took a long look at the economics of their colonies; if it cost money, it was cut loose. The region affected the most by the new policy was the Caribbean, where all the possessions of both countries gained their independence (whether they wanted it or not). At first they were federated according to their former colonial masters and location, but these larger governments all fell apart in the 1920s and 30s.

Political and economic troubles continued to stalk the western world while this was happening, and the Caribbean became notorious as a refuge for the losing sides of revolutions and criminals who found their home countries suddenly too hot. In 1931, the first major piracy of a ship in the Caribbean took place, and by 1935 bandits were routinely attacking shipping. The present day is 1940, and the United States -- though still stretched by troubles at home and a civil war in Puerto Rico -- is trying to crack down on a new golden age of piracy in the Caribbean.

Tactics

The twist this century is that the raiders are using a glut of float planes made available by the black markets now endemic to the western world. All countries are sufficiently dislocated that it's not too hard to obtain an amphibious vessel and, despite official disapproval, arm it with medium-weight weaponry for freebooting.

Most pirate gangs have at least two planes to use; all put at least two in the air during any attack. They either have a specific ship in mind, fingered by observers in port or a compromised crew member, or else they cover large swathes of ocean on the major trade routes until a target presents itself. Both planes buzz the ship in an attempt to intimidate it into surrender, and if it doesn't strike colors they'll open fire. Eventually their target will give in -- it certainly can't run away -- or end up going to the bottom. The latter result is a disappointment, but most of the modern pirates consider it a necessary sacrifice *pour encourager les autres*. In the past, they cultivated a reputation for mercy toward those who surrendered, leaving them their ships (or at least their lives and some means to get back to port). The idea was to make it more palatable to surrender than fight, and it worked, but it's worth noting that there's been a recent trend towards grimmer treatment.

In any case, if the ship surrenders then one plane will land on the water under the cover of the other circling above. Pirates transfer to the vessel, strip it of worthwhile cargo and personal possessions, and may even hijack the ship if they're close enough to their own base.

As well as lifting cargoes, the gangs make a living by kidnapping for profit (which requires good intelligence, but is often worth it), and outright protection rackets run on local shipping lines and governments.

Great Inagua

The main pirate base in the Caribbean is Matthew Town on Great Inagua Island. Technically part of The Bahamas, the impoverished central government can't afford to patrol Inagua, the southernmost island in their domain. For all intents and purposes, it's independent.

Matthew Town is on the southwest side of the island, with the Atlantic Ocean to the south and Lake Rosa -- one of the largest freshwater lakes in the whole Caribbean -- just to the north and east. This vital source of drinking water led Ignacio Rossi to settle here from Sicily in 1933, and start catering to the growing outlaw population in the area. Matthew Town is now his fief, controlled with the help of a few dozen thugs and the implicit support of several main pirate bands who like the town the way it is.

The town has a regular anchorage for both float planes and supply ships -- woe betide any pirate who attacks one of the latter if it's under Rossi's protection. In times of trouble, the planes can be driven or tugged over to the southeast of the town, where the old salt evaporation ponds have been reconnected to the sea by a short canal, and light artillery set up to protect the enclosure.

Saint-Barthelemy

While Great Inagua may be the prime raider base, it's not the only one. It's poorly positioned for attacks on shipping around the Windward Islands, and there are some who don't like its relatively restrictive (even if completely criminal) government. Bandits bothered by either issue end up in Saint-Barthelemy, a former Swedish and French colony abandoned to its fate despite being entirely too small to stand on its own. It rapidly became a complete anarchy, which was co-opted by Caribbean raiders looking to take advantage of Gustavia Harbor's nearly complete enclosure and lack of tides. At any time, as many as 20 seaplanes will be floating there, protected from all but the most severe weather while their crews enjoy shore leave.

The only notable settlement on the island surrounds the three sides of the harbor. Its mouth points north, with Rue Jeanne D'Arc running along the peninsular side of the city, Rue Oscar II (named for a former Swedish king) down the landward side, and Rue de Centenaire connecting them in the south. By far the largest building in the city is the former cathedral at the foot of the harbor, which has been turned into a hotel-slash-brothel-slash-speakeasy since the pirates took over.

The major disadvantage to Saint-Barthelemy is its relative proximity to Charlotte Amalie, the major American policing base in the region.

The US Virgin Islands

Obtained by the United States just a few months before the end of the Great War, Charlotte Amalie on St. Thomas Island is the major source of law and order in the Caribbean. This world's America passed Prohibition at about the same time as Homeline's, and hasn't repealed it yet. Organized crime based out of the Bahamas has been rum-running for the last 20 years, and have inevitably joined up with the sky raiders; now the US fights both out of the capital of this territory, as well as supporting the loyalist side in the Puerto Rican civil war.

Charlotte Amalie is the very opposite of other Caribbean towns. The islands were incorporated as a territory in 1925,

and as a state in 1938, and so they're subject to the American constitutional ban on alcohol and state blue laws regarding gambling and prostitution. The whole town has a remarkably Puritan feel, with clean, well-dressed citizens bustling around on business, and new motor-cars plying the streets. Discipline on the Coast Guard's Twentieth District base is strict, and there's little tolerance for "boys-will-be-boys" shenanigans while "in the States." That's what Havana and Port-of-Spain are for

The town has a population of about 11,000, making it by far the largest town in the Virgin Islands. It faces south onto a good deepwater harbor, and is built around two east-west streets: Waterfront and Droningens Gade. Small, dark alleys run north and south between the two. Further to the north is the richer part of town, the Queen Quarter, which climbs a hill as one moves into it. Adventurers might also spend much of their time in the southwest of the city, where the US Coast Guard has its quarters, and where "important people" cluster during the day in the neighborhood around the state legislature building.

Cuba

Past history has kept Cuba the US's closest ally in the region. Unfortunately for the States, they need the Cubans on-side to have any chance of suppressing piracy, and Cuba's notorious corruption makes it difficult to push the pirates as hard as is needed.

Havana here is much like Havana was on Homeline in 1940, or Tijuana's reputation is in the modern day: it's the place to go for licentiousness. Women, alcohol, gambling, and jazz -- you name it, it can be had. Traditionally, the city has been a magnet for Americans, and their policing operations in the Caribbean are often staged from here when Charlotte Amalie is inconvenient for some reason. For a while in 1938-39, Manzanillo on the southeast coast of Cuba was used instead in an effort to enforce moral standards on American seaman. This was suspended when it became apparent that cutting them off from their vices just made them more susceptible to bribery.

Operations Against the Sky Raiders

For all different kinds of actions, the defining factor in how they run is the nationality behind them. American operations are strident, and generally quite effective; pirates know to cut and run when the Stars and Sixteen Stripes of the Coast Guard come over the horizon. If Cuba is against them, though, there's more of a live-and-let-live attitude. The pirates usually escape, and it's just a question of whether or not they can get some loot before they go. On occasions when one of them does need to be captured in order to make the Cubans look a little better, it's not very long before kickbacks to the authorities somehow arrange for the prisoner to break out or be let off.

The exception to this rule is whenever American pressure gets a competent and law-abiding Cuban into the field. That unlucky man knows he's on his own; his own force doesn't actually want him to succeed for very long, and tips are leaking out to his quarry at a prodigious rate. The various bands in his area of operation will join together long enough to kill him or otherwise stop his hunt, then the status quo returns. As The Bard, one of the more important bandits, has been quoted as saying: "With the Americans, we get drama, and the Cubans give us comedy. But an honest Cuban sets up a tragedy."

Major Pirates

Javier "El Caribe" Desanto: Desanto styles himself as the heir of the Carib Indians (though he is, in fact, Mexican). His planes are decorated with Indian motifs, and he constantly smokes indigenous-style cigars -- essentially loosely rolled bundles of tobacco leaves.

Desanto's gang, Los Mugres, has seen better days. One of the first major groups of pirates, they're one of the few of the originals left. They're down to just two working planes, his personal SOC Seagull (stolen from a very surprised Cuban

As it diverged from real world history two decades back, aeronautical engineering won't have produced exactly the same models of planes from being developed here. For simplicity's sake, however, the gang descriptions below include actual float planes from the

crew who had only just taken delivery of it from the US) and a Short S.8 Calcutta equipped with two machine guns but used primarily as a "troop carrier" for boarders. In theory he also has an old Aeromarine AS-2 to use, but it's so decrepit that it's usually beached at Saint-Barthelemy and is near useless even when it isn't.

Everett "The Bard" Colby: Reputedly an Oxford don who left England in the wake of the Student Riots in 1933. Now based out of Matthew Town, he is arguably the pirate hold's most famous citizen. Even if his rumored background is wrong, he plays up his reputation as a cultured man.

Colby has five planes at his disposal: his flagship plane *Ophelia* (a Supermarine Walrus), two Saunders Roe Londons armed with Lewis Guns, and two machine-gun-laden CANT Z.506 Herons for fighters. His personal badge is a pair of theater masks in red and white.

Tsubasa the Butcher: A former officer in the IJN Air Service, Fukushima Tsubasa was cashiered after a massacre under his command during the Japanese invasion of Hainan; his superiors didn't mind, but there was an American newspaper photographer on scene. Fukushima drifted around the world for a while before settling in the Caribbean in 1937. Since then, he's carved out a big piece of the raiding action through the bodies of several rivals. Most gang leaders get along with each other, but Tsubasa epitomizes the new breed. Depending on how much force they can command, other leaders are either wary of or fear The Butcher; there is reportedly bad blood between The Bard and The Butcher, but whether that's just peoples' expectation or the truth remains to be seen.

Fukushima's band is called the Kokuryu, a deliberate attempt to call up the image of the Japanese Black Dragon Society -- he wants to leverage the Society's notoriety in the West. While Tsubasa was a member of the real Kokuryukai while he was in Japan, there is no connection between the two organizations. The raiders can bring five planes to bear: an Aichi E13A which is his personal plane, a Kawanishi H6K/97 armed lightly with machine guns but outfitted to carry boarders, 2 Nakajima E8Ns as fighters and air cover, and an old Vickers Vedette that is normally only used when there's a desperate situation near the Kokuryu's base in Matthew Town.

Homeline and Centrum Interaction

The Sky Raiders don't know it, but they live on Kaiserreich-1, a Quantum 6 timeline that is being steadily penetrated by both Homeline and Centrum; it is one of the worlds on the front line of the Infinity War.

Unfortunately for Infinity agents, the Centrum got here first. The UK is -- naturally -- their base, and they've infiltrated it quite completely. Their goal appears to be sparking another war against Germany, a funhouse-mirror version of WWII, and using their technical expertise to redeem their client's failure in the Great War. Other important nations have moles in place, and since all have veered towards totalitarianism in the last 20 years, it's been difficult for Homeline to get a toe-hold in the face of secret police.

While far from ideal in other ways, Kaiserreich-1's Caribbean has been Infinity's choice for their safe house on this line. The near-complete lack of government has made it impossible for Centrum to track down Infinity's operation, though the enemy outtimers are aware that Infinity is in the area. Their main base is on Saint-Barthelemy, where they front themselves as a non-descript pub and fence for stolen goods, the Calico Meg.

Characters

Rear-Admiral Aaron Sapinski: While not the highest-ranking US Coast Guard officer at the Caribbean station, Sapinski is the point of the spear. He's an RDML, which makes him essentially a captain in charge of more than one ship, or a commodore if the Coast Guard had that rank in the 1940s. He commands the USCGC *Kingfisher*, an 80-ton patrol boat, and helps direct the United States' four other patrol boats when they are on a mission.

Sapinski is, from the standpoint of Infinity, worryingly competent. He's a skilled seaman, strict without being

unrealistic, and honest while avoiding fighting unrealistically against the corruption of the Caribbean. Some agents on Kaiserreich-1 are of the opinion that it's just a matter of time before he ends up on Coventry.

The Rear-Admiral is optimistic about most things, and believes in the face of considerable evidence that he will eventually succeed in his mission to keep Caribbean shipping safe. He likes being in an exotic posting, though not too exotic; he's broad-minded, but more in a voyeuristic way than in his own personal habits. He does not drink, or smoke, or even indulge in coffee (which is nearly unheard of on-board ship and a constant source of wonderment to his crew).

He is 55 years old and slim, with very pale skin, gray hair, and gray eyes.

Andre "Skeezix" Plante: A Homeliner, Plante was a fence in Montreal until two years ago when the Surete de Quebec finally caught up with him. Facing a stretch in prison, he was recruited to Infinity for their Kaiserreich-1 operation; his sentence was commuted to five years of exile.

Acquiring a suitably Forties-style nickname upon arrival, Skeezix is the main contact between Infinity and the timeline's sky bandits. He uses his experience as a fence for the Montreal underworld to acquire and re-sell goods lifted from ship cargoes through the Calico Meg; his native French also lets him serve as a liaison with Quebecois rum-runners out of Montreal engaged in "triangle trade" (whiskey to the prohibition US, cash to the Caribbean, rum back to Canada) as well as the locals on Saint-Barthelemy.

On the other hand, while he is an excellent source of information on the bandits, he doesn't necessarily want to pass it along. He considers being a fence to be his occupation, and his accommodation with Infinity to be a necessary nuisance. He will resist giving up useful intelligence on the grounds that he "needs to keep in the pirates' favor." While this is true as far as it goes, it's not the arrangement he has with his employers. Still, he relies on his distance from Homeline control and general usefulness to wiggle out of as many of his obligations as he can.

Andre is tall and of average weight, and aged 33. He has black, curly hair, and brown eyes.

Adventures with the Sky Raiders

What's Mine is Mine: The group have booked passage on a "safe" merchant ship -- armed, and under an American registry -- for some parachronic equipment that needs to be delivered to somewhere around the Caribbean basin. Unbeknownst to them, the captain and some of the crew have been paid off and barratry is in the works. The ship is to be handed over to a pirate gang while at sea, and the conspirators will be able to retire to a beach somewhere. It's an open question as to whether or not the pirates have somehow got wind of the group's cargo, or if there's something else in the hold that's attracted their attention. If they want an answer, they'll have to get it while in motion: the first sign that something is wrong is the ship coming to a stop in the open ocean, and the raiders' planes buzzing in from over the horizon.

The Great Inagua Turkey Shoot: Lake Rosa on Great Inagua is home to a truly enormous number of flamingos. True to form, the bandits of Matthew Town spend a lot of time shooting them for fun. Back in 1932, Madcap Jack and Marie the Hoodoo decided to settle their long-time feud with a mass hunt: the one with the most flamingos shot would win. Since their epic battle, the bandits have taken it on themselves to recreate the event (if not the subsequent surprising wedding). Everyone on the island goes shooting on the 28th of April, with bragging rights as the prize.

The Big Bang: In their role as fences, Infinity's operation in Saint-Barthelemy has stumbled across a major intelligence coup. A minor pirate band has brought in a cargo of refined weapons-grade uranium. This presents a pretty problem: no-one on Kaiserreich-1 knows about nuclear fission weapons, or so it was supposed. The only likely suspect would be Centrum, but introducing nuclear weapons runs counter to everything they do when subverting a timeline. But if it's not them, then who? This is not to mention "how?" or "why?"

Amber Alert: Tsubasa the Butcher has made a daring night raid on Charlotte Amalie, landing on the east coast of the island and striking across land to kidnap Rear-Admiral Sapinski's young daughter. His motivations are uncertain -- some think he's trying to stir up the Admiral to destroy The Butcher's rivals in the search for young Wendy, while

relying on his own ability to weather the storm.

In any case, the crime has offended several old-school air pirates and they're in on the hunt for the girl, offering a truce and their help to the distraught Coast Guard man. Infinity thinks it wise to chip in, carefully; too much glare of publicity might uncover their secret.

Treasure Island: Legend has it that Henri Christophe, 19th-century dictator of nearby Haiti, buried his fortune on the northwest point of Great Inagua. It's been sought so many times it's become a joke, and most are convinced it's just a story. But now troubling rumors are flying that a minor gang, the Wolves of Providence, have turned up a map or some other piece of information leading them to the cache. A free-for-all is underway for it, even though most at least suspect a trap of some sort. Trap or not, most of the pirate leaders are romantics at heart.

"Human Hair. From My Back.": Somehow, the adventurers end up stranded on a deserted island, possibly in the aftermath of "What's Mine Is Mine," above. There's little food and no water, and no likely prospect of a rescue.

"Served Cold, Hot, Whatever -- I Just Want Revenge": While on a mission some way away from Saint-Barthelemy, the agents discover that they are the target of a vendetta by one of the main groups of sky raiders, who have been cheated by Skeezix Plante. They can satisfy the raiders by either dying the death of dogs or, should that fail to appeal, somehow getting back to base, discovering that the fence has sold on the object of contention, and engage in another mission (dogged by the pirates) to retrieve it and make amends.

In Nomine Voodoo

by Eric Funk

"My friend the witch doctor, he taught me what to do"
-- Ross Bagdaserian, Jr., *Witch Doctor*

This Pyramid article is intended to show how Vodoun shamans and practitioners can be inserted into an *In Nomine* campaign. Beginning with power investiture in humans, it describes how the loas and creatures from *GURPS Voodoo* can be compatible with *In Nomine*'s ethereals, ghosts, and "monsters." Finally, it gives suggestions on how celestials might stack up against these powers. Following the advice on page 7 of *GURPS Voodoo,* this text will refer to the general system of beliefs as "voodoo."

This crossover tries not to break *In Nomine's* canon but there are no rules for partial possessions or Voodoo Initiations. While *GURPS Voodoo* adds the four new "factions" from the Shadow War (Voodoo cults, Loa Lodges, dark cults and loa, and chaotic devourers) to the *In Nomine* setting, the canon attitudes of the Superiors will remain as described in the books. Comments about opinions exist in this article solely as adventure hooks. Only the relative power of ethereals changes.

There are many parallels between *In Nomine* and *GURPS Voodoo* beyond the invisible war behind an otherwise mundane, contemporary setting. For example, in *In Nomine* most people do not meet their ultimate destiny or fate in their lifetime, and thus reincarnate. Reincarnation plays an important part in the world of the Shadow War (see pages 23 and 58). In *In Nomine*, voodoo ("voudon") is defined as a semi-divine religion with some Essence going to divine destinations, and some to ethereal ones (see the *In Nomine Game Master's Guide,* page 65). The dark lodges send Essence to the infernal side of divine religions with ritual murder and torture (see *GURPS Voodoo,* page 38). The *loas* are known as powerful spirits who are not specifically good nor evil. In *In Nomine*, this perfectly fits the conception of ethereal beings and ghosts. Ghosts are somewhat important to the Voodoo setting, and have their place in *In Nomine* as well as remnants (their celestial counterparts). Many loa, spirit guides, and troublemakers are specters (see *GURPS Voodoo* page 53; *Corporeal Player's Guide,* page 80; and *Liber Umbrarum*).

Power Investiture in Humans

"You remind me of the babe
What babe? The babe with the power
What power? Power of voodoo"
-- David Bowie, *Labyrinth*

Initiation in voodoo cults, lodges, and followings of dark beings uses similar mechanics, even if the trappings and rituals appear different. The process is a combination of Sorcerer (exorcist) and Pagan Dream Soldier (see the *Corporeal Player's Guide*, pages 65 and 71; and *GURPS In Nomine,* page 27).

In all cases, the overall process proceeds as follows:

1. The Initiate is introduced by a "cabal" to the ethereral being to see if the candidate has the potential for 6 Forces.
2. If so, then the subject is Awakened and Initiated, and can begin to learn Corporeal Songs (see the *Corporeal Player's Guide* pages 28, 45, and 70).
3. Part-way in the journey the incumbent receives a Partial Ethereal Connection (as per a "Partial Celestial Connection," but with powerful ethereal beings) to contact the ethereal on their own. They can now be empowered ("possessed") by the being (see the *Corporeal Player's Guide* p. 28).
4. As a full member, an initiate is granted the full Ethereal Connection, and can perform Ethereal Songs.

There are 10 known levels of Initiation (see *GURPS Voodoo,* pages 58-62). While the bonuses from the paths quickly

add up such that a 10th level Initiate gains from 6 to 9 Forces (bringing him up to 11 to 15), this is tempered by the fact that each level of Initiation posses four times fewer individuals as the rank below it. It is a mere rumor that there are more than two dozen 9th level Initiates in the world, to say nothing of the few elusive 10th level Adepts. Most PCs will be uninitiated to Fourth level Initiates with 5 to 8 Forces, well below the levels of a starting celestial. Initiation levels proceeds as follows:

1. Sixth Force, granting Symphonic Awareness, Essence Control for skills; Optional: Autotrance.
2. +2 Charisma (Special); Optional: Songs and sorcerous rituals to communicate with spirits, +1 Perception, Partial Ethereal Connection*
3. +1 Celestial Force†; Optional: Servant/2, Metabolism Control/6
4. +1 Celestial Force; Optional: +1 Corporeal Force, Ethereal Connection*
5. +1 Ethereal Force, +1 Charisma (Special); Optional: Channel Spirit, Faith Healing, +1 Charisma, Celestial Form, auto-destiny
6. Song Mastery; Optional: +1 Corporeal Force, +1 Charisma (Awe)
7. Three ethereal Servants at level 4; Optional: +1 Corporeal Force
8. Exorcism at will; Optional: +1 Celestial Force
9. Primal Luck, +3 Charisma (Awe, ethereal spirits only), Intimidation/6 (vs. ethereal spirits only), Agility/6 (vs. mundanes)
10. +2 Celestial Forces, Seraph of Flowers (vs. mundanes only), Charisma +2 (Awe).

* Optional at this level of initiation, but required later.

† Mortal humans (and quite probably immortal ones; see the Power of Fives) may only have 5 Forces per realm, for a total of 15; if the maximum in a realm is reached via Initiation, the player chooses which other realm the Force will go to. (A GM may wish to undo the errata and allow humans to posthumously be able to attain 18 Forces in all, 6 per realm.)

The ritual magic from *GURPS Voodoo* can be represented as Songs with different training. The longer voodoo rituals can be explained as different normal Song performances in that most of the time the voodoo practitioners take extra time for skill (see *In Nomine,* page 47).

Loas and Guardian Spirits (pp. VO87-93)

"You make me wanna break the laws of time and space"
-- "Weird Al" Yankovic, *You Make Me*

Loas are simply old ghosts and powerful ethereal beings in *In Nomine.* They can invest power into mortals. The living humans' belief in the fact of their power grants them Essence through rituals (similar to the Worship Rites from *Corporeal Player's Guide*, page 67). To complicate matters, the belief in these non-divine powerful entities spawns ethereals who believe themselves to be these ghosts, and may replace their inceptors.

Each ethereal loa has its own threads that control its influence. The most powerful also possess Primal affinities (see the *Ethereal Player's Guide,* in particular page 50). In addition, the Loa confronted by the Host appeal to their sense of honor that they are not manifesting on the corporeal plane, but simply aiding humans to purge murderous In-Betweeners and Devourers which would prey on their people. The ghostly loa present a new challenge as the "mortals" can possess up to 18 Forces, and still activate dissonance conditions of some Choirs and Bands.

Possession

A major aspect of human interactions involves channeling other beings' power to aid in supernatural confrontations. Initiates first learn to channel the raw essence of a being, during which time they must engage in a contest of Will each round in order to decide what to do. Usually, the possessor will attack a summoner's enemies first, but there are always exceptions. Most possessions increase Strength. In *In Nomine,* this also increases Body Hits. Lost Hits of any sort will

be taken from the possessing entity before its human host suffers any damage. This can allow a human to leave a dangerous situation unscathed . . .

The Mayabe are primitive -- but often potent -- ethereals which are officially seen as tools by most of the cults and lodges. Secretly, they are ever gaining in power in the organizations. They are one of the problems the celestial generals see, even if the ethereals are usually isolated (see **GURPS Voodoo,** pages 2 and 93-95). Lodges are American street gangs with voodoo training. They can conflict with, or usurp some of David's gangs (see pages 96-98).

Voodoo's Nonhumans in *In Nomine*

The In-Betweeners from **Voodoo** (see pages 38 and 98-102) can be described as Gorgons (mortal halfbreeds with an ethereal parent) or ethereals (see page 38 and the ***Corporeal Player's Guide***). Neither have very good reputations with Judgement or the Game. In-Betweeners with multiple corporeal forms are likely "pureblood" ethereals with multiple Vessels, whereas those without multiple vessels might just make do with the Celestial Song of Form. Some In-Betweeners can be reasoned with, and thus cannot be smote out of hand. Many lodges accept in-betweeners as full members. Sane lodges only accept Cat People into their fold, as all the other common "races" seem to require ritually killing humans as part of their nature.

Voodoo's Monsters in *In Nomine*

They are, in short, darkness and fear given form. *Mayabe* and *Devourers* are primal desires beyond the call of nature into mankind's darkest passions. The Heavenly forces and the Game want this connection cut off. Devourers are insidious powers to the extent that loas, angels, and demons might team up for a moment.

Saminga simply seeks to shorten life spans with corporeal or soul-death, if possible. For the average person, corporeal death forces reincarnation. Baal encourages this, as those who do not seem likely to meet their fate will get a chance to do worse. The powerful ethereals which Force-strip humans to nothing rob the celestials of a valuable resource -- Essence. If the souls are disbanded before reaching their final rest, then the celestial economy is hurt. Angels will also be morally outraged. This is part of the justification of subtle involvement in the human organizations, to both sides of the War, as opposed to just wading in with swords.

There are primal, predatory creatures which do not reason, only hunt. The worst of these are called devourers, terrifying many-Force ethereals on par with ancient ethereal gods and Word-bound Seneschals. Sent out by the hundreds, sendlings are their eyes and ears. These horrors are one of the few things which can unite voodoo shaman, lodge member, angel and demon together for a common cause -- for a moment. Devourers always have a vessel/6, and 12+ personal Forces (see pages 102-103, and page 68 of the ***Ethereal Player's Guide***).

Celestial Operations

"Some roads will get you to heaven
Some roads will wear down your shoes
Some roads you know will be hell-bound"
-- Gowan, *Soul's Road*

In general, the Archangels and Demon Princes are reacting to voodoo as a pagan cult, and trying to dismantle it from within in addition to overt hunting of the ethereal influences in the Marches. In general, both sides are reacting in generally the same way, with some Superiors aiming to restrict ethereals to the Marches, and others seek to hunt down and dissipate any who dare set foot on the corporeal plane. The fact that Divine Essence is flowing in because of this religion is troublesome.

Those ethereals who merely seek influence on the corporeal plane will be judged based on their merits in the Marches. The groups' *modi operandi* are also similar in that over the eons, the "celestial" branch of voodoo have aimed to make

their images more "angelic"/"demonic" to channel more and more Essence to the celestial pool. They emphasize that the Loa are merely agents for a single "supreme being."

This is complicated by the fact that many loa are actually human souls, and belief Essence creates ethereals in the Marches which will grow until they can replace the originator or support his cause. Many of the relatively benign loa and voodoo spirits can be left alone for now, as they are low priority targets who will serve as a good buffer against the more dangerous, predatory spirits, such as mayambe and devourers.

One edge that celestials will always have over ethereals is their ability to grant Celestial Songs. Celestials can perform the Song of Affinity on a linked human to find their Loa. Celestial resonances, especially those of Mercurians, could pick up the otherworldy connections and possibly resonate completely on the ethereal (as per detecting Shedim). Kyriotates and Shedim suggest that their human allies take mild hallucinogens combined with suggestions about what they "might" see before revealing their presence. On the other hand, ethereals can have any sort of "non-living" vessels (see page 68 of the *Ethereal Player's Guide*).

Revealing the War to the Shadow War

In the end, many voodoo spirits and loas can be negotiated with, and accept the role of keeping the *mayombe* back. Celestial intervention is a mixed blessing for a number of pantheons. Some can accept the constraints that come with aid, while others would rather strike out alone. Then comes the work of convincing the humans they work with . . . In the end, it might be best to keep the War secret from those involved in the Shadow War.

Divine

Several Archangels will hesitate to kill a human just to kill an ethereal. Note that there is an "unspoken agreement with Heaven (*The Marches*, p. 104)" and "Laurence's angels generally ignore [these spirits], as long as they behave" (p. 58 and 65, respectively). There is a rumor going around the heavenly ranks that it was the infernals that started the voodoo belief to channel Essence away from Heaven.

Infernal

Voodoo's "flesh eater" spirits are, to some extent, under the sway of Baal and Beleth, but not to the extent that they would lead the Host to believe. Beleth revels in the terror they inspire and create. Thus, Beleth restricts her aid to the corporeal efforts to a minimum, focusing her hunts only on those terrors which kill the quickest. She encourages those ethereals which kill slowly while other humans are watching. Most of the Princes (and to some extent, Jordi) are trying to find some uses for these lesser dark beings of chaos, while the "soul-eaters" are universally hated, at least officially. Unable to completely destroy them, the armies of Hell have resorted to simply directing them to prey on the populace.

Fate (through Sorcery) is fighting with Nightmares about who should control the rituals to summon ethereals. Media is trying to discredit the ethereal part of this battle between good and evil, but unsolved death means ratings, man! Saminga's minions teeter between the extremes of "control these minions of death" and jealousy at their efficiency. Saminga himself remains uninterested in matters ethereal, and is only interested in results. Saminga believes ethereals to be of no consequence, as they are not alive. Other factions model deadly Vessels after them . . . inspiring more nightmares, some of which break free . . . There is a rumor going around the infernal ranks that it was the angels that started the voodoo belief to channel Essence away from Hell.

Neutrals

Some voodoo priests know of spirits than can never be forcibly summoned or mastered (angels) as well as insidious spirits who can never be trusted (infernals, including Habbalite "angels"), but can be bargained with. Just as very few humans are indoctrinated as celestial soldiers or Soldiers, a very few Initiates might be found worthy or pliable enough

to be inducted into the War. A carrot-and-stick approach that might work involves the Partial and Full Celestial Connection offered by celestial Superiors. This connection allows the Initiate Soldier to perform the coveted Celestial Songs, while allowing the Superior to keep an eye on them. It can even be revoked as punishment.

Campaigns

"Weeee dooo vooodooo . . . "
-- Fraggle Rock, Season 5

The two **Voodoo** campaign settings that will blend most easily into the **In Nomine** setting are the Spirit Warrior campaign (see page 117) and Secret Master campaign (see page 118).

Celestial Parties

Celestials have powers similar to mid-level Initiates, but will still be surprised to encounter humans with similar power and Force levels. Warrior celestials might even be physically out-matched by human Spirit Warriors! The first step will be to find out how deep the rabbit hole goes, to discover the number of people affected by the voodoo cults and loa lodges. There are hundreds, perhaps thousands in each major city. The heroes can encounter a string of murders related to a certain social club, and just as they start to narrow it down, a man sends a taped confession, and is found gagged at home. Then, the PCs encounter something which looks like the man they saw on TV just a minute ago. Was he a skin changer? Are the attacks by ethereal "demon-dogs" somehow related to that crazy old man with the shrunken head-on-a-stick? How will PCs react to a second War going on on the Earth? All the occult trappings lead deeper into the realm of voodoo. Next comes confrontation with chaotic evil forces, even moreso than the mad forces of Belial. The Mayombe want destruction, and don't care about the War or cover. It is the voodoo cults and lodges who cover up for them, just as angels often cover up for infernal operations.

Power Invested in Celestials

GMs might allow celestials to receive Initiation, but their superiors will likely be unhappy about their minions receiving Forces from mere ethereals or humans. However, it could be a path for Renegades or Outcasts to progress quickly.

Ethereal Campaigns

Similar to the Secret Master campaign (page 118), the PCs can be guardian spirits or Loas trying to advise and protect their own group, or separate groups, of humans. They must protect them from devourers, mayombe, opposing groups, and . . . unknown spirits (angels and demons).

Introductory Adventures

Under the Wrong Stars: The adventure begins as a dependent of the PCs (or their patron) has a bout of bad luck. When passing by to cheer him up, a friend who is not supposed to know of the War suggests that a curse is upon the dependent. A Song of Plagues is identified as being in effect on the dependent by using an experimental Forceprinter or some Aura Glasses (see **Liber Reliquarum,**, pages 51 and 62).

By the Power Invested in Me: The celestials need to rescue a Kyriotate (or Shedite) from a "voodoo cult." He went undercover, but has not checked in. The voodoo group has a Force Catcher (**Liber Reliquarum,** page 61). They describe it as a net to catch enemy spirits, such as dark loa and mayombe.

Absolutely: A nearby Cherub (or Djinn) is dissonant. He is becoming corrupted by the power of guiding a voodoo group and has been abusing his Choir and Superior's Dissonance Conditions. Having worked his way into the social

circle, he is actually the power behind their leader's abilities. He was attuned to the leader of the loa group, and the load is taking its toil.

Problem's Clearing: A Cherub/Djinn in the area is dissonant. An experimental Lightning-Destiny (or Technology-Fate) device that happened to be connected to the attuned at the time reports that the soul vanished without leaving the corporeal plane. As a case that had qualified for their destiny/fate, they wanted to track its progress to the celestial realm. Tech teams have been able to locate the last point to within a few city blocks. The heroes must find the source and stop it before another valuable resource disappears. Are the heroes prepared for the voodoo quarter, and possibly a devourer behind it all?

Dark Variance

What if voodoo is an entirely demonic project, headed by Beleth, Saminga, Belial, and Kobal? It was started as mockery of Catholicism so beloved by Gabriel and Dominic (which drew in Kobal), but elements of paganism crept in as Beleth's ethereals became involved.

The neutrality of "loa" is a lie: there are too many ways to harm people, and even evil creatures can heal someone sometimes, if it suits some sinister purpose. The role of ethereals is secondary -- after the Purity Crusades there would not be many surviving ethereal spirits powerful enough to play the roles of loa. Devourers are actually large puppets for celestials -- often Calabim of Belial might have their forms recast.

Benefits to this treatment are many. The first is that "loa" may have simple Roles -- they don't hide the fact that they are supernatural, and thus are in character. The voodoo cult provides a steady flow of Essence through the mundanes' rituals for those who need it. Finally, certain Discord (such as Murderous) is tolerated or even encouraged in the participating celestials, and thus can be a dumping ground for the most dangerous individuals.

Some of the objects in my possession that I consider "treasures" include:

a holographic representation of *X-Men #1* that was a retailer incentive in the early 1990s a copy of the *Mystery Science Theater 3000 Movie* DVD a framed display of six sequential $2 bills from the year they were introduced into circulation a cup full of modern $1 coins of various types (Susan B. Anthonys, Sacagaweas, and George Washingtons) a collection of various Infocom boxes, including the collectible "feelies" my great-grandfather's pocket watch, given to him for decades of service to the railroads

All told, I suspect these items would probably be worth about $500 or so. However, the mere listing of these items is more evocative and, frankly, interesting than saying "I have $500 lying around," or even, "I have stuff worth $500 lying around."

This is the central premise behind the ***Mother of All Treasure Tables,*** a supplement designed as an aid for ***d20 System*** campaigns but useful for any low-fantasy (or greater) setting where heroes expect to get paid by taking the loot of their fallen foes. The book is divided into sections according to value: 10 gold pieces, 50 gold pieces, 100 gold pieces, and so on, up to 50,000 gold pieces and "epic" treasure. (Actually, all sections have some margin of error, so rolling on the 10,000-gold-piece table results in entries that range from 9,800 gp to 10,200 gp.) These sections are also given descriptions for what the assumption was to get to that level of wealth; for example, the 10-gold-piece chapter is subtitled "What has it got in its pockets?", while the 100-gold-piece section is given the description, "Do I really want to cart this with me?"

Each section then consists entirely of a random table devoted to describing what the person finds at that level of value. Entries explain what is obvious or immediately noteworthy about a pile of loot, with italicized bracketed asides providing more information (such as value, object specifics, and so forth). Although this book is devoted solely to mundane treasures (no magic items here), these tables are nevertheless fascinating and offer creative and detailed descriptions for what the person might find. And these descriptions are *detailed;* there are no instances of, say, an entry on the 1,000-gold-piece table consisting solely of, "You find a diamond ring worth 1,000 gold pieces." No, even the less valuable items are chock full of bits. For example, here's one of the 100 possibilities from the "500 gold piece" section:

> You find a canvas sack *[1 sp]* holding two items. The first is a flat, rectangular wooden box *[2 gp]*, which is closed with a hasp but not locked. Inside, the box is lined with green velvet and contains a set of steel cutlery with knives, forks, spoons and serving spoons, six of each. The handles are inlaid with mother of pearl and the blades of the knives bear the hallmark of a well-known steel foundry *[cutlery, 300 gp]*. Tucked into one side of the box is a green leather bag *[2 gp]* and inside it is a silver pot of ink. The ink is still usable and the pot is inscribed with images of fern leaves *[75 gp]*. As well as the inkpot, the bag

contains a tiny set of weighing scales made from brass and suitable for measuring the weights of spices *[25 gp]*. The second item in the canvas sack is a box made from walnut wood with a tiny statue of a fairy on top. *[This is a music box, and the statue rotates as the clockwork mechanism plays a pretty tune; total 100 gp]*. *[Total 504.1 gp]*

The book wisely limits its scope somewhat according to how often it's expected that adventurers will encounter such treasures. For example, the 10-gold-piece and 50-gold-piece chapters are 100-entry tables, since it seems quite likely that adventurers would get loot worth those amounts dozens of times. However, the 10,000-gold-piece section has only 50 entries, and the 30,000-gold-piece section has a mere 20. Some might be bothered by this; however, if a gaming group ever needs more than 10 epic treasure piles (each worth more than 100,000 gold pieces), then they probably won't mind if they get some duplicate unique troves.

The Mother of All Treasure Tables feels well researched and gives an air of its authors having put considerable thought into each entry. For example, it mentions that the inspiration of one entry was the Terracotta Army of Xian and provides advice for how to adapt that entry to other cultures and conditions.

The biggest use that *The Mother of All Treasure Tables* has is in giving an excellent means of allowing games to step off the "pile of loot" rat race. Without creativity, it's difficult to differentiate between various treasures worth the same rough amount, and finding a second pile of 500 gold coins isn't anywhere near as exciting as finding the first. But this book helps stave off the desire to escalate by offering numerous options at the same values. And these entries are much more evocative (and, in many instances, problematic) than piles of cash; after all, what would the heroes do with a silk parasol, a heavy bed and its solid silver bedposts, or a set of six large hoops in various metals (actually rings sized for a giant)? Time and again, reading these entries should spark further adventure possibilities all by themselves.

If this book has any problems, they are mostly inherent in the conceit of the piece itself. Many of the entries -- especially in the more expensive latter sections of the book -- are huge, taking up a half-page each or more, and would take a while to read to a gaming group. It's a special kind of gamer who has need for the kind of detail included in these inverse shopping lists. In addition, the random nature of tables may require the DM to mark off used sections; since each trove is unique and highly focused, it would be obvious if a duplicate were rolled.

Because of the nature of these descriptions, some results require rerolling or modification. For example, killing a critter with lots of expensive loot in a 10'×10' room might yield random treasure consisting of a cavernous vault filled with statues and tapestries, and heroes might wonder how a seemingly unintelligent monster acquired something like an ornate death mask covering a crystal skull bearing the name "Annalisa."

But for those gaming groups with a desire to go beyond enumerated piles of coins and humdrum random jewelry, this book is top-notch. It feels just like the kind of article you'd find in a classic *Best of Dragon* compilation, only expanded to 154 pages. If you're part of a group who would find a product like this useful, the *Mother of All Treasure Tables* delivers exactly what you want, and it does it with class and style.

Spirit of the Century: A Pulp Pick-Up Role-Playing Game

It is time to stand up and do what is right. The year is 1922, and Doctor Methuselah's time-zeppelins assemble in the skies over Europe to tear open a path to a new future. Gorilla Khan, conqueror of Atlantis, has armies ready to take Africa. Der Blitzmann, scientist gone awry, commands the forces of electricity to nefarious ends. The Great War is over, and even as the Allies struggle to recover, dark forces threaten to plunge the world back into conflict.

Between these dark forces and the world stand the Centurions, the inner circle of the quietly influential and philanthropic Century Club. Born on January 1st, 1901, each Centurion is an exceptional person: long-lived, and capable of actions nearly impossible for the ordinary man in the street. Each player takes the role of a Centurion.

This is the simple, broad set up for *Spirit of the Century,* arguably the best Pulp Action RPG since the Origins-Award-winning ***[Adventure!](#)***, and regarded by many, including *Adventure!*'s co-designer Bruce Baugh, as being even better. And this in a year when four Pulp genre RPGs bucked the ongoing trend of re-designed nostalgia titles. Its Century Club set up device allows the genre's varied character types to come together. So it does the Gadget Guy, the Gentleman Criminal, the Junglelord, the Man of Mystery, and the Primitive just as it can do the Two-Fisted Pilot.

For this, *Spirit of the Century* employs Evil Hat's house mechanics, the Fate system, a ***[Fudge](#)*** variant wherein Fate points play a vital role. They are spent to gain a bonus to a roll, invoke a character Aspect and bring it into play, tag another character or location related Aspect to bring it into play, power a Stunt, or to make a Declaration, adding some small element to the story. The Fate system also ditches traditional attributes, instead defining characters by skills, Aspects, and Stunts.

Skills are what a character can do, and are self-explanatory. Stunts enable a Centurion to push the envelope of an associated skill. For example, with the Drive skill, an ace wheelman can drive something better with the "Custom Ride" or "Prototype Car" Stunts, or maneuver more easily with "Defensive Driving," "One Hand on the Wheel," or "Turn on a Dime." Amusingly, "Unsafe at any Speed" doubles the damage a car does to the surrounding environment, being as much a bane as a bonus. With "Car Mechanic," the Drive skill can substitute for the Engineering skill, allowing a driver to specialize in car mechanics. Many Stunts have prerequisites, and many follow this divide between being innate abilities or object based.

Aspects are more difficult to quantify, more akin to Advantages, but can be a relationship, a catch-phrase, a description, a possession, and can be negative or positive. Examples might be, "I Know a Guy," "Betsy, my faithful .45," "I've got your back," "Hellbent," and so on. Players are positively encouraged to take some negative Aspects, as they not only make a story interesting, but by Compelling them into play, a player earns Fate points. In play, Aspects are used by both GM and players to get the characters interacting with each other and their locations, driving both

game and story forward, by getting the Centurions into and out of situations. How each Aspect operates must be worked out between player and GM, for none are defined, but fundamentally, no Aspect can be boring.

Character creation involves 15 skills, five Stunts, and 10 Aspects. A Centurion possesses one Superb rated skill, two Great, three Good, four Fair, and five Average. Beyond the mere numbers, a Centurion needs a slick name, some background, and a motivation. Centurion creation also involves describing the pulp novels he has starred in, and the guest roles taken in the novels of other Centurions, which further brings the characters together.

To undertake an action, a player rolls 4dF (four Fudge dice) against a target difficulty, figuring appropriate skills, Stunts, and Aspects. Match the target and a player succeeds, but a better result generates Shifts, and Shifts can be spent to decrease a task's time, or to improve its quality or subtlety.

In combat, Shifts represent damage, inflicted as Stress and marked off a character's Health track for physical damage, and his Composure track for mental or social damage. Stress damage is transitory, usually lasting a scene, but suffer too much, and a character is Taken Out, his immediate fate decided by his opponent. Alternatively, a character can take a Consequence instead of Stress, the Consequence acting as a temporary Aspect that can be invoked or tagged. In this way, combat in Spirit of the Century emphasizes its effects not the numbers.

Of course, gadgets are part of the genre, and *Spirit of the Century* handles them with aplomb. The Engineering skill enables a character to build and modify devices, while Stunts like Prototype Aircraft, Prototype Car, Personal Gadget, and Universal Gadget let Centurions have the signature devices so beloved of the genre. Nor does a gadget's every function need defining before play, instead described as needed during play, and some Stunts allow gadget functions to change session to session. Magical artifacts are built in a similar fashion, but Magic does not figure greatly in Spirit of the Century, which emphasizes the wonders of science. The Mysteries skill handles all things occult, including the construction of magical artifacts, and is backed up with Stunts like Fortuneteller, Psychic, Mesmerist, and Spirit Companion. Centurions wanting something flashier need to construct artifacts rather than possessing innate wizardry.

Spirit of the Century devotes much of its page count to explaining how Stunts and skills work and can be used in play under various conditions. The advice boils down to keeping the game action orientated, its tone optimistic, and to embrace the wonders of science. Beyond these basics, the advice given as "Tips and Tricks" is nothing short of excellent. It discusses the elements of the Pulp adventure -- the dangers, certain Doom, plot twists, the final showdown, and the post-showdown breakneck escape; how to handle deathtraps, information, color, and so on; even right down to, "When all else fails, send in the Ninjas." It's all very sound advice, but also discussed is one further feature inherent to *Spirit of the Centur:.* it's designed as a "pickup game."

Of course, *Spirit of the Century* can be run like any other RPG, but it is written to help the GM improvise and then run, and the players roleplay, an adventure at short notice. It is possible to create characters during play, defining and setting character attributes as needed. Indeed, one section gives pickup Stunt packages that can help define a Centurion quickly and easily. The GM is provided with a quick and dirty guide to the Pulp Era and how it might be in his game, plus a sample scenario that pits the Centurions up against the game's signature foes.

Given that *Spirit of the Century* is designed as a pickup game with a revolving cast, it is not intended for long-term character advancement through the traditional method of experience points. Except for Fate point rewards, advancement if any, is meant to be en masse, whether as rare skill improvement, additional Aspects or Stunts, or shuffling skills, Aspects, and Stunts around. This latter represents character change if not growth.

Physically, *Spirit of the Century* is serviceable, with sparse, but decent artwork. However, the writing never fails to engage, with advice and examples aplenty. It may be 422 pages long, but *Spirit of the Century* is a pleasure throughout.

Although the game and its settings and secrets are set in 1922, there is nothing to stop a GM from advancing its timeframe or dropping the slight setting all together. The 1930s are an obvious choice, but the game would work as well in the late 1940s and early 1950s. Further, the mechanics might be tweaked to run other Pulp-style genres, from Space Opera to Swords & Sorcery fantasy with just a little thought and some name changes.

As a gamer, I have wanted (among various others) three things. A good Pulp Sci-Fi RPG. A good pulp RPG. A Pulp version of **_Feng Shui._** So far, the first is yet to appear, and the third is unlikely, but in *Spirit of the Century,* I have the good Pulp RPG. And while its simplicity and shtick-like Stunts make *Spirit of the Century* feel like both Pulp and *Feng Shui,* the Aspect mechanics both feel Pulp-like and -- if used as intended -- drive an adventure forward, encouraging character participation and good storytelling. Above all, after reading *Spirit of the Century,* I want to run and play the game, its mechanical simplicity and the generous advice only making the prospect easier and almost intuitive. *Spirit of the Century* exuberantly exemplifies the pulp genre, and is not only the best Pulp RPG of 2006 and best Pulp RPG in a long time, but one of the best RPGs of 2006.

Pros at Cons -- Random Thoughts for CodCon 2007

This past week was my son's first convention, as he, the missus, and I were guests at [CodCon](#), the convention alluded to in last week's installment. A good time was had by all, secret plans were revealed, and a few dozen people got the exclusive super-secret promotional CD-ROM that we whipped up about 90 minutes before we headed out the door.

As such, this week's installment will just consist of a few random thoughts that spawned from that con.

* * *

This is a photo of my son and me with a Stormtrooper, and my son and me with Darth Vader.

Yes, I look like I've been inhaling the fumes of a biodiesel car. No, I don't normally look like that. I was laughing very hard during both photos; Sam, for his part, was smacking both Stormtrooper and Vader, treating two of the greatest symbols of fear in the galaxy as injection-mold drums.

The following is my funniest story of the convention. There were a lot of kids at this con . . . certainly more than I was expecting. Almost all of them were about five or younger, meaning that the game industry should be in great shape in a decade or two, once these kids move beyond "What do blue crayons taste like?" to making their own fiscal decisions.

Anyway, one of the kids was somewhere between one and two . . . old enough to toddle and have a few words. This tyke was suitably impressed by the Stormtrooper, and went up to his mom excitedly. "Mommy! Mommy!" the kid exclaimed, pointing at the Stormtrooper.

"Yes," said the mommy, with some amusement in her voice, "do you know what that is?"

Without pausing for a moment, the youngling proudly exclaimed, "Snowman!"

Out of the mouth of babes . . . only imperial snowmen are this accurate.

* * *

As one of the serious points I thought I'd bring up with this column, I note that I was delighted that Sam was amused and entertained by Lord Vader and the Stormtrooper. There was even a Boba Fett and I believe an Emperor running around that I would've been tickled to photograph him with.

During one of the quieter moments of the con, I posited a question to the missus. "Isn't it curious that I have no problem with Sam being photographed with Stormtroopers, and -- indeed -- I think it's pretty cool they're running

around? I mean, if folks were here dressed as, say, Nazis, I'd be pretty bothered by that." And it's especially interesting because the Stormtroopers themselves take their names from their World-War-I German counterparts . . . not exactly Nazis, but still pretty close.

I've written before about how I suspect that the attraction for groups that we think of as "evil" isn't a matter of evil, per se, but often more a matter of "freedom." While most modern sensibilities would be offended by the actions of pirates, the *idea* of pirates is still pretty neat to many folks, and I think it's because mentally one can focus on the "good" parts of piratey life: sailing on the open seas, fighting against other pirates, and so on. I think this is much the same appeal that surrounds the "names" of the *Star Wars* universe: Darth Vader, Boba Fett, and so on. It's not about evil so much as freedom to be bad-ass.

But that's not really the case with Stormtroopers. When I think "freedom," joining the Imperial Navy and getting schlepped to some forsaken backwater desert planet isn't the first thing I think of.

Besides the Nazi discomfort, there are other "fan-costumes" out there that would make me uncomfortable. For example, I've always been a bit apprehensive about talking with Civil War reenactors, especially those from the South. They've almost always been pretty cool folks, but every so often I'll get one who's a bit *too* into the mindset, and he'll talk about how it's not for the North to interject its views of slavery upon the South.

Perhaps the best explanation I can offer for my lack-of-squeamishness regarding Stormtroopers is that they are, for the most part, utterly "harmless" (unless you're Uncle Owen and Aunt Beru). They're not very effective, they're more of a nuisance than anything, and conflict in the *Star Wars* universe seldom involves the actual blood and guts of warfare. Whether or not this is a *good* thing is a matter of debate, but it's easy for me to envision any individual Stormtrooper as being the hapless guy who conks his head on the Death Star.

* * *

Speaking of folks being dressed up as things I'd be uncomfortable with in the real world . . .

Tony DiGerolamo -- the writing gent behind Super Frat and *d20 Mafia* -- hosted a *Mafia* live-action event at the Con. (Tony has an amusing anecdote about this LARP that appeared at his blog.)

Suffice it to say, this LARP suffered from a situation I've seen happen all to often at con games (especially LARPs). Namely, the situation is established as some sense of equilibrium or balance before the game begins: certain groups of mobsters/vampires/noble houses/whatever control certain sections of the city. And then, once the game begins, all hell breaks loose . . . usually within the first 20 minutes. It often resembles the first move of a *Supremacy* or *Balance of Power* game being, "I nuke everyone!"

I suspect Tony has encountered this before, because he imposed a one-hour ban from initiating combat. This means that, literally, the bullets started flying in the 8:00 p.m. game at 9:01 p.m.

While it ensures a lively evening, it also makes it very difficult to understand *how,* exactly, the city hasn't erupted into total warfare on any night previously. (The answer is usually inherent in the systems used; initiating combat is a good way to get your character killed; it's also a good way to get another character or two killed in the process. Unfortunately, in a con game, the *players* may not have knowledge that their *characters* possess about how deadly combat is.)

I don't have an easy fix, but I'm always amused whenever I read about a premise in a con booklet that begins something like, "For 10,000 years the nation-states of Foobar have existed in delicate balance." I think to myself, "Well, that's gonna fall apart sometime about a quarter past char-gen."

* * *

Downloading images from a communal camera always means there are bound to be some surprises on the film (or, in our case, memory card). For example, the following image was taken presumably by the missus at some point early in

the con:
Given the composition of this picture, it seems the exit was foremost on her mind for some reason.

Which seems like a good note to end this installment on.

Signs and Portents

A Model of Magic for *GURPS*

by William H. Stoddard

In *GURPS,* thaumatology is the systematic study of magic. It's used to perform magical research, including inventing new spells and identifying unknown spells. But those uses are portrayed fairly abstractly; there's not much attempt to picture what mages are actually doing that calls for Thaumatology rolls. The level of detail is rather like that of science fiction scripts that say "insert technobabble." For many fantasy games, and for certain genres of fantasy, that's fine. But what if you want a fantasy analog of hard science fiction, where the theoretical concepts embodied in magic are actually important to the storyand where the players have a chance of thinking through a problem about magic?

This article offers one model of what magic is and how it works. It's partly inspired by the treatment of magic in *GURPS Cabal,* and partly an expansion of some passages in *GURPS Fantasy* that discuss the nature of magic. It's not the only way to approach magic, but it's one way of doing so. GMs who want a theoretical foundation for answering questions about magic may find it useful in several ways: for visualizing how spells are cast in more detail, for guiding players' efforts to work out new spells, or for building a world where magic works.

The Theory of Signs

In this approach, the basis of magic is semiotics, or the theory of signs. Semiotics was developed by an American philosopher, C.S. Peirce, in the nineteenth century, though his ideas on it were partly inspired by medieval scholastic theories. In the 20th century, linguists and anthropologists picked it up and ran with it; it became a major influence on the French structuralists, for example.

In the technical language of semiotics, a sign is anything that stands for something else. Signs are divided into three subtypes: indices, which signify something that caused them, as smoke signifies fire; icons, which signify something that they look like, as a portrait signifies the person portrayed; and symbols, which signify something by social convention, as the English word "cat" or the Japanese word "neko" signifies a common household pet.

GURPS Fantasy uses the same three categories, but less technical names, in *The Three Laws of Magic.* It uses the word "symbol" more broadly, for signs of all kinds. It calls the three subtypes *evidence, likenesses,* and *words.* The rest of this article will use those names, not the technical ones, except that it will use the more general word "sign" instead of "symbol."

The Practice of Magic

A common element in a lot of magical traditions is that the magician operates on a sign with the goal of affecting the thing it signifies. For example, a black magician might make a wax image of a human being (a likeness), name it after an intended victim (a word), with some of the victim's blood, saliva, or hair mixed into the wax (evidence) -- and then inflict injuries on it as a way of inflicting the same injuries on his victim.

In this version of thaumatology, this link between the sign and the thing it signifies is the theoretical basis for all of magic. Magic itself is a collection of methods for applying this theory. Every magical operation involves coming up with ways of acting out a desired outcome, using signs of various kinds. The more detailed the acting out, and the more the mage's mind is focused on its intended meaning, the more effect the operation has on the real world.

GURPS Cabal provided a detailed set of rules for this approach to magic, in its rules for the laws of sympathy (pp. 73-74). *GURPS Fantasy* adopted those same rules as the basis for correspondences (pp. 163-164) and correspondence

magic (pp. 160-161).

Two of the laws of sympathy come from Sir James Frazer's classic study, *The Golden Bough.* The Law of Similarity says that things that look or act alike *are,* or, in a magical sense, are the same thing. A photograph, a good painting, or a sculpted image of a person is the person; a series of musical tones is the cry of a cuckoo; an orgy in the fields about to be plowed fertilizes the soil and makes it fruitful. This is founded on the use of likenesses or icons: the "similarity" on which magic is based exactly fits the semiotic relation between a thing or action and its likeness.

The basis for the Law of Contagion was less obvious. It states that two objects that have once come into contact remain connected. A person's blood or fingernail clippings, or his clothing or possessions, is magically linked to him and can be used to cast spells on him. But where does this link come from? Randall Garrett's Lord Darcy stories, set in a world where magic has been turned into a science, explains the connection as a matter of relevance: a garment that has been worn once, for a short time, is not significantly affected by the wearing, because it would be much the same if someone else had worn it, or even if no one had worn it at all, so it has little magical link to its wearer; but a garment that has been worn repeated will have been stretched and worn by the shape of its wearer's body and by his habitual motions, making it different than it would have been had it been left on its hanger. This amounts to saying that its current state has to have been causally affected by its wearer, and is a causally based sign of his having worn it. This is the kind of sign that forensicists look for, which is why **GURPS Fantasy** adopted the name "evidence" for it. The relation of contagion that links two objects amounts to one object having affected the other causally at some point; it fits the semiotic relation between evidence and the thing it evidences.

GURPS Cabal brings in a third magical principle: the Law of Names, which says that knowing the name of a thing gives power over the thing. This obviously fits the semiotic relation between a word and the object or action it refers to. The complications come from the idea that some words are more perfect fits than others -- in the extreme case, that people, or spirits, have true names that give total power over them. (In Jewish legend, for example, Lilith gained her supernatural powers by learning the true name of God, which granted her immunity to God's omnipotence.) The Words of Power of **GURPS Cabal** are the ultimate realization of this principle: words that in themselves can create the things they name. (In the terms of **GURPS Powers,** each Word of Power amounts to a form of the Create advantage, directed to the specific objects and phenomena included within its decan, with some form of the Cosmic advantage, but also with the Trigger and Uncontrollable disadvantages. Bear in mind that the things the various Words create are often fairly abstract!)

Coming up with a spell involves coming up with ways of exploiting these semiotic relations. The spell needs to contain a sign of the thing it affects, and a sign of the desired effect. For a more extreme version, the spell may need to contain signs of all three kinds! In the latter case, the GM should allow the use of "placeholder" correspondences, which grant a zero modifier, but count as correspondences for the purposes of making spells work.

The following table lists correspondence modifiers, including placeholder modifiers:

Any object the subject has ever touched:	+0
An object the subject has handled enough to affect it substantially:	+1
An object the subject has made:	+2
Dead tissue from the subject's body:	+2
Living matter from the subject's body:	+3
The subject's corpse:	+3
Anything shaped like the subject (e.g., a wax doll for a man):	+0
A sketch of the subject:	+1
A natural object that shares one of the subject's attributes (e.g., a heart-shaped leaf for the heart):	+1
A formal portrait by a skilled artist:	+2
A close blood relative, or a vampire's sire or get:	+2
An identical twin or clone:	+3

Any phrase that describes the subject:	+0
An identifier such as a serial number:	+1
A nickname or "use name":	+2
A name used as a signature:	+3
A true name:	+4

Signs as Portents

One important category of magical abilities is divination and soothsaying. Most languages treat perceiving and knowing as actions and represent them as verbs, so it's possible to assimilate them to the standard pattern of "acting on the sign to affect the thing." But the actions involved are more internal than ordinary physical actions. Ordinary perception largely involves knowing things by the signs of those things, so magical perception can rather easily be assimilated to it.

The Law of Contagion makes it possible to know things through other things that they have been in contact with, as in psychometry or psychic tracking. An extension of this is to deliberately arrange the contact to make divination possible, as in reading someone's fate from the leaves at the bottom of his teacup. In addition, this law includes knowing a person's or object's inner nature from its visible exterior, as in palmistry, physiognomy, or the diagnostic procedures of Esoteric Medicine. This sort of awareness is akin to physical sensation, in which an organism experiences an internal state of its own body, such as warmth, cold, or pain, and reacts to the environmental conditions that caused it.

The Law of Similarity gives knowledge of things through other things that resemble them, typically through the creation of pictures or images. Many systematic schemes of divination rely on pictorial models, such as the I Ching, with its hexagrams being described in terms such as "Fire over Mountain," or the Tarot, with the pictures on the faces of cards being laid out in standard patterns that create a kind of story. Even astrology can be interpreted in this way, with the arrangement of the planets against the constellations creating a kind of diagram of a person's mind or destiny. Many of these arts add a touch of the Law of Contagion, as when a Tarot reading begins with the subject choosing one of the cards as his "significator," the image that represents him. This sort of awareness is akin to perception, in which an organism responds to patterns in its environment through senses such as vision, hearing, or sonar.

The Law of Names can be applied in two related ways. In the first place, it allows knowing things through the properties of their names, as in numerology, which assigns numerical values to the letters of a name, adds them up, and gives a meaning to the resulting numerical score. But in the second place, it allows sortilege, or divination by throwing lots, in which the diviner assigns a meaning to each possible outcome of an event such as the fall of a die, and then performs an action that randomly selects one outcome. (Viewed as a magical procedure, playing *GURPS* would involve repeated magically divining the fates of characters through dice rolls!) The level of human awareness that goes with names is conceptual thought, aided by language, in which the production of a word or symbol triggers memory of the thing it names or refers to.

Signs and Realms

GURPS Cabal offers an elaborate magical cosmology, in which Earth and the entire physical universe are only the lowest of four metaphysical realms (see pp. 43-54). It's possible to describe these realms in terms of the theory of signs, and by doing so to gain a clearer image of how things work in each of them.

Assiah, the material plane, is the realm of causal signs, or evidence. That is, its internal functioning is governed by the laws of cause and effect, as studied by the natural sciences. Distance in Assiah, for example, is a function of how far apart two things are in terms of causal pathway -- with the speed of light being the universal limit on causal relationships. Beings in Assiah are made up of matter, whose basic attribute is the ability to be affected by causal agencies, and energy, whose basic attribute is the ability to do work, or to be a causal agency. Their awareness of the world is based on physical stimuli that affect their sense organs causally. The only exceptions to the rule of cause and effect in Assiah are interference effects from the higher planes.

Yetzirah, the astral plane, is a different kind of place entirely. Its internal functioning is governed not by cause and effect, but by representational signs, or likenesses. Distance in Yetzirah is based on how far apart two things are in appearance; for example, two places that both contain roses will be close together, and it's easy to travel from one to the other. This gives Yetzirah a dreamlike logic.

Some parts of Yetzirah are "close" to Assiah: that is, they contain objects and places that look very much like the material world. Others are distorted, surreal, or outright fantastic. Practically any art style that humanity has come up with, from ancient Chinese landscape paintings to Byzantine mosaics to Salvador Dali's surrealistic distortions, can be found in some realm within Yetzirah. The most distant reaches of Yetzirah approach pure abstract geometry, and are "close" to the higher realm of Briah.

Beings in Yetzirah are not made out of matter, though they may resemble material objects or creatures. Rather, they're made out of images and patterns. As a result, the biology of Yetzirah is different from that of Assiah. Some biologists have speculated about "morphic fields" that exist within organisms and control the shape and growth of their bodies; the creatures of Yetzirah *are* morphic fields, existing independent of material bodies. (So far as the morphic fields theory is true in Assiah at all, it's because Yetzirah impinges on Assiah in some measure.) Awareness in Yetzirah is direct perception of patterns without the need for a physical stimulus, or, literally, ESP: extra-sensory perception.

Beyond Yetzirah is Briah, the iconic realm, or the realm of forms. This actually is a secondary attribute of Briah: not how Briah is in itself, but how it is seen from Yetzirah. The far reaches of Yetzirah, devoted to abstract forms (ranging from Euclidean right angles and parallel lines to fractal geometries), are the realms where it overlaps with and resembles Briah. What Briah is in itself is the realm of words, and of related entities such as the symbols of abstract mathematics. Ask any mathematician: diagrams *represent* geometric objects and relationships, but those relationships actually are matters of abstract logic than transcends images.

Entities in Briah are therefore pure abstractions, such as the aethyrs of the 36 decans. Relations between them are grammatical or logical. The distance between them is conceptual distance, a matter of their sharing or not sharing logical attributes. Their space is thus structured like a matrix in many dimensions, with each cell of the matrix representing a specific combination of logical possibilities. Travel through Briah is not a continuous process of movement, through either physical space or the imagistic space of dreams; it's more like moves on a game board. Awareness in Briah involves an intuitive grasp of a concept in its pure form, independent of any perceived or imagined object that the concept refers to. Action involves defining entities, postulating their occurrence, or proving things about them.

Finally, beyond Briah is Atziluth, the realm of the godhead. No category of signs corresponds to this realm. Rather, it's a domain of unity, where the sign and the thing signified are not merely linked, but identical. As in Hindu thought, attaining this level involves setting aside every form of dualism. Magical effects in Atziluth are produced, not by casting spells, but by a simple exertion of will, requiring a Will roll. Similarly, knowledge is attained, not by rituals of divination, but by direct intuitive awareness, requiring an IQ roll.

Icosahedron Adventures

More Modern Magic: Arcane Armament

by Owen K.C. Stephens

Designed for *d20 System* games that include magic and are set in a modern or near-modern time period, this article presents some magic and alchemical modern weapons. Although purchase DCs and dollar prices are given for these items, in many campaigns non-charged items will be encountered only during the course of an adventure, rather than in even the most well-equipped of magic shops.

Ammunition

One of the most common uses of modern magic and alchemy is ammunition for firearms. Many supernatural threats require unusual material to damage them, and in truth normal silver makes for a lousy bullet. The art of arcane and alchemical ammunition is also among the oldest modern magics, dating back to the Musketeers and having been developed extensively by the Texas Ranger (who hunt down evil forces with alchemical silver bullets).

Alchemical Silver

Alchemical silver bullets are nether as soft nor as expensive as real silver rounds. They deal 1 point less damage, but all the damage penetrates DR as a silver weapon. They appear to be silver plated, and can easily be passed off as cheap souvenirs.

Alchemical silver ammunition is alchemical, rather than magical.

Cost: +1 to Purchase DC per reload, or +$5/round

Churchshot

Developed in the 1890s, churchshot is a shotgun load that mixes alchemical silver, cold iron, jade, white oak, and numerous other materials antithetical to various supernatural monsters. Churchshot deals only half damage (many of these materials are poor ammunition choices), but penetrates any DR that can be penetrated by a special material.

Churchshot is alchemical, rather than magical.

Cost: +2 to Purchase DC per reload, or +$10/round

Desplosive

Desplosive rounds deal normal damage. However, whenever they hit an explosive of any type, that explosive must make a DC 18 Fortitude save or cease to be explosive. Upon examination, such deactivated explosives seem to have been duds from their faulty manufacture.

Cost: +4 to Purchase DC per reload, or +$100/round

Hammer-Point

Hammer-point ammunition doesn't deal any additional damage, but all the damage it does deal is bludgeoning damage. These rounds damage objects in the same way a sledgehammer does, making them much better at knocking in doors

and knocking down foes. Anything hit by a hammer-point acts as if a Strength check break attempt (using the item's break DC) or Trip attack (if a target able to be tripped) was attempted, with a total of 1d20+ damage dealt.

Cost: +3 to Purchase DC per reload, or +$20/round

Ice Jacketed

Ice-jacketed ammunition doesn't deal any additional damage, but all the damage it does deal is cold damage. Additionally the rounds melt like normal ice starting one round after they are fired, which often means there is significantly less ballistic evidence remaining after a shooting.

Cost: +3 to Purchase DC per reload, or +$20/round

Sorcerous Safety Slugs

These bullets never hit anything other than the target selected by whoever fires them. That's not to say they always strike the desired target -- the rounds are no more accurate than any mundane ammunition. But if they do miss their desired target, these bullets disappear harmlessly. They can never harm anything or anyone not intended to be their target at the time they were fired.

The sorcerous safety slugs are limited by the perceptions of the character that fires them. If a gunman shoots at a good friend who is under an illusion to look like a zombie, the bullets can hit him as he is the intended target, even though the gunman wouldn't have made that target selection if he'd had all the facts.

Cost: +2 to Purchase DC per reload, or +$10/round

Bull-Rush Grenades

These one-use magic weapons deal 6d6 nonlethal damage in a 20-ft.-radius, and perform a Bull rush maneuver against every target in the area. The bull rush total is treated as being equal to the damage dealt by the grenade, and all targets that fail their strength checks are shoved as far as possible, and knocked prone. Each grenade has a range increment of 10 feet.

It takes a DC 20 Spellcraft check to realize the damage dealt by these grenades is nonlethal. To outward perceptions, the grenade seems to be a typical fragmentation grenade, and targets are all amazingly lucky for not being more seriously injured.

Type: Weapon (magic); *Caster Level:* 9th; *Purchase DC:* 25 or Cost $9,000; *Weight:* 0.1 lb.

Coat of Swords

While wearing this coat, you may Quick Draw a masterwork sword of any style by reaching into the coat's folds (even if you don't have the Quick Draw feat). Any sword produced by the coat breaks into useless scrap if used by anyone other than the coat-wearer, or if left outside the coat for more than 24 hours.

A coat wearer may place a sword of their own into the coat, making it impossible for anyone else to draw or locate it. The coat only holds one such sword, and it acts normally if removed.

Type: Wondrous Item (magic); *Caster Level:* 8th; *Purchase DC:* 31 or Cost $50,000; *Weight:* 1 lb.

Decapitator

The *decapitator* appears to be a mundane chainsaw that has seen heavy use. It is always dirty and slightly stained. It resists all efforts to take it apart or open its fuel cap, and always sounds as though it is almost out of fuel.

In fact the *decapitator* is enchanted to function well as a weapon, especially against undead (though it also works well in the hands of undead). It deals 2d6 slashing damage with a ×3 critical multiplier, and is treated as a 2-handed, Medium, simple melee weapon. It never runs out of fuel, but on any natural "1" attack roll it stops working and requires a DC 15 Strength check (a move action) to restart. Against undead, the decapitator deals 3d6 damage and can actually deliver critical hits (despite undead's normal immunity to critical).

When used by an undead, the *decapitator* deals 3d6 damage to any living humanoid, and has a threat range of 19-20 in addition to its ×3 citical multiplier.

Any time the *decapitator* reduces a target to -10 or fewer hit points, it decapitates them.

Type: Weapon (magic); *Caster Level:* 16th; *Purchase DC:* 35 or Cost $175,000; *Weight:* 1 lb.

Lone Revolver

The *lone revolver* is a legendary modern magic item. It appears to be a perfectly preserved silver-plated Colt 1873 Single Action Army/Peacemaker revolver. Legend claims there are two such pistols, but if so they have not been seen together for more than a century. Additionally, the pistols would seem unlikely to work together, though it's possible they consider each other exceptions to the "lone weapon" rule (see below), or that they could be made to function together by a noble enough man, or native Amrican shamanistic magic, or some similar mechanism.

The magic of the *lone revolver* functions only when it is the only firearm carried by its wielder. When this is the case, it acts as a *+1 weapon* that allows ranged attacks to be made as disarms with no penalty, attack of opportunity, or chance of the opponent disarming you if your disarm roll fails. Additionally, all damage from the *lone revolver* is treated as silver, and it never drops a target to less than -5 hit points (nor do its wounds bleed, preventing any roll for characters at negative hit points to stabilize).

Lycanthropes are the exception to the -5 hp rule -- the *lone revolver* not only kills lycanthropes normally, it deals an additional 2d6 points of damage to them on any successful attack.

Type: Weapon (magic); *Caster Level:* 12th; *Purchase DC:* 35 or Cost $150,000; *Weight:* 2 lbs.

Rottweiler Grenades

These one-use magic weapons summon a trained, battle-ready rottweiler (use stats for a wolf). Each grenade has a range increment of 10 feet. The round after the grenade is thrown, a rottweiler appears from the grenade in a puff of smoke. The thrower of the grenade may give the rottweiler order's or it will attack the first living creature it sees. Each rottweiler lasts 2 minutes or until slain. In either case, its body (including any blood or body parts lost) dissolve into smoke at the end of two minutes.

Type: Weapon (magic); *Caster Level:* 9th; *Purchase DC:* 25 or Cost $9,000; *Weight:* 0.1 lb.

Saizuchi Ring

As a free action the wearer of this ring can summon a comically oversized wooden mallet. The mallet is used as a melee weapon, the wielder is automatically proficient with it, and the mallet disappears if it ever leave the wielder's hands. The mallet deals 1d4 points of damage, and forces anyone struck by it to make a Fortitude save (DC 10 + ½ wielder's class level + wielder's Charisma bonus) or be stunned for 1 round.

Type: Weapon (magic); *Caster Level:* 12th; *Purchase DC:* 37 or Cost $300,000; *Weight:* 0.1 lb.

Spellstick

A *spellstick* is lipstick that can be used to store any touch spell. The *spellstick* can only hold one touch spell of 3rd level or less at a time. When the lipstick is applied to a pair of lips (a full-round action), the lips' owner may deliver the spell as a melee touch attack by kissing its target. The spell remains in the *spellstick* even when its has been used to coat a pair of lips, so a second spell cannot be loaded into the *spellstick* until the first has been delivered.

Obviously, no attack roll is required if the kiss is delivered to a willing target out of combat.

Type: Wondrous Item (magic); *Caster Level:* 7th; *Purchase DC:* 20 or Cost $2,000; *Weight:* 1 lb.

Sword Spray

Sword spray is an aerosol can that projects a magic mist that deals slashing damage to all targets in a 30-foot-cone. The spray deals 3d6 damage, with a DC 13 Reflex save for half damage. A typical can has 20 uses and is disguised as hair spray or breath freshener.

Type: Weapon (magic); *Caster Level:* 6th; *Purchase DC:* 23 (20 if 3 or fewer charges remain) or Cost $5,000; *Weight:* 1 lb.

Vigilance Pistols

The *Vigilance Pistols* are a magic pair of nickel-plated M1911A1 Colt .45s that have been carried by various heroes in the past several decades. The pistols never run out of ammunition, and their wielder acts as though he had the Double Tap, Precise Shot, and Shot on the Run feats.

Type: Weapon (magic); *Caster Level:* 12th; *Purchase DC:* 35 or Cost $150,000; *Weight:* 2 lbs.

Taming the Wild Skill

Variant Uses for the *GURPS* Wildcard Rule

by Phil Masters

GURPS wildcard skills (page 175 of the **Basic Set**) are primarily designed to emulate the broad abilities of cinematic characters. However, they can also be used for other purposes -- to represent training that encompasses a very wide range of techniques, while avoiding specific problems that arise with narrower, ordinary skills. This should be handled with restraint in non-cinematic campaigns, but even there, wildcard skills can have a useful place.

Point and Pull

For example, consider the problems faced by undercover agents working for the Infinity Patrol in the *Infinite Worlds* setting. These people may sometimes need to carry firearms, but if they're going to preserve their cover, they'll have to use local weapons. (No doubt Technical Analysis Division can manufacture sidearms that *look* like "local" weapons while actually being, functionally, Homeline models -- but that won't fool close, educated inspection or competent forensic specialists, and the Patrol don't want to generate too much interest from gun nuts and forensics experts across a hundred timelines.) The trouble is, that means such agents will have to carry and sometimes use sidearms from tech levels from 4 to 12, in a wide range of formats, and sometimes incorporating divergent-TL or superscience technologies. In game terms, tech-level penalties will stack with weapon format and general familiarity modifiers, to the point where the agent's standard Patrol pistol or rifle training will be no use whatsoever -- he'll do better to work off a rather poor DX- based default.

Or . . . Infinity institutes a special training course for these people. This isn't designed to familiarise them with every sidearm that they might possibly have to use, anywhere (although students do get to try out an amazing variety of implements of mayhem acquired from across the Infinite Worlds); rather, it represents a broad grounding in the basic theories of weapon design and use, and techniques for adapting rapidly to unexpected formats and behaviours. It doesn't produce great marksmen; it produces people who aren't ever thrown by the oddities of any given gun, and can use anything well enough to survive in a fight, if they're sensible.

In other words, in game terms, it teaches Gun! skill, which disregards TL and familiarity penalties. Students can shoot anything from a Britannica-6 Grey Maggie rifle to a Caliph fusion jezail or an Azoth-7 ruby-pistolle, and do more damage to the target than to themselves. PCs shouldn't usually put more than, say, 6 points into this in non-cinematic games -- more does begin to look too wild -- but with that, a DX 12 agent can handle any sidearm with skill-10 and no arbitrary penalties, and also gets to attempt things like Fast Draw and Armoury with a base 50% chance of success, whatever the setting.

A similar approach might be appropriate for, say, a professional doctor in a multi-species interstellar SF campaign. In a galaxy with hundreds or thousands of sapient species, nobody could learn everything about the medical requirements of every possible patient -- but doctors in a *[Sector General](#)*- style hospital might be expected to provide treatment to all comers regardless, using whatever equipment they have to hand. Hence, a wildcard skill (Xenomedicine!) might be used to represent a very broad "first principles" training regime, combining basic biological and xenological theory with highly practical applications.

Scholarship!

Wildcard skills can also be used in settings where teaching and scholarship aren't organized along quite the same lines as the **GURPS** skills list, and where students are expected to acquire a good, integrated understanding of many different topics -- and where some of what's taught this way serves very practical purposes. For example, medieval

and renaissance European scholarship was based round a set of categories only loosely related to modern concepts of the arts and sciences; see the *Pyramid* articles "Old School" and "Those Who Pray." Realistically, this sort of thing can usually be represented by taking a range of skills at moderate levels, perhaps with optional specialties, or sometimes by taking Expert Skills such as Natural Philosophy (page 194) -- though those last are supposed to have rather limited practical applications. However, GMs running slightly less realistic historical-Europe games, or those based in settings such as ***Banestorm's*** Yrth, may want this sort of learning to be *useful* on a practical level, without breaking things down in the complex detail required to fit it to standard ***GURPS*** skills. Hence, scholarly characters in some games might be permitted to spend a few points on wildcard skills related to the structure of period university educations. The following are a couple of possibilities:

Artes Liberales! (IQ). This not only encompasses the formal content of the medieval liberal arts, but assumes that the character paid close attention to *all* of his initial university education, including the classical texts and references which were used in teaching. He must be literate in his own language, and put at least two points into written Latin. Artes Liberales! replaces Astronomy (Observational), History (all classical-period specialties), Mathematics (Applied), Law (any Ancient Roman specialty), Public Speaking, and Writing. It also covers aspects of Linguistics which relate to the analysis of grammar (but it can't be used to speed up language learning), Philosophy (any "classical" specialty) with regard to basic terminology and formal logic, and anecdotal and historical aspects of Theology (Christian) but not analytical/theoretical aspects. Also, if the character has at least one Musical Instrument skill, it replaces Musical Composition.

Natural Philosophy! (IQ). This is much deeper than the like- named Expert Skill; in a game where it's available, it reflects how the world is actually put together, and can be *useful.* In many ways, it's a low-tech version of Science!, but with rather more metaphysics. It replaces Astronomy, Biology, Chemistry, Geology, Mathematics (Pure and Statistics), and Physics, and also Philosophy (any "classical" specialty) as it relates to the nature of the material universe, and Theology (Christian) as it relates to the creation of the universe and the relationship between the supernatural and the physical. In some campaigns, the Philosophy and Theology may be as relevant as the other sciences to understanding how things *really* work!

Giving your medieval scholar-wizard a few points in these two skills along with his explicitly magical abilities should help supply him with the appropriate style, enabling him to debate Aristotle or Aquinas with rhetorical precision and formal rectitude. For that matter, GMs creating fantasy worlds can create whole new systems of learning, based round arbitrary theories or concepts, and link all the relevant abilities into a wildcard skill, giving masters of a field breadth and effectiveness while adding to the setting's specific flavor.

Drive to Tears, Take a Left

FOX television, home of the soul-crushing maw that has shunted many a promising show into the inky abyss of cancellation, has done so again with a promising series called *Drive,* which -- as near as I can tell -- was canceled about one-third of the way through the pilot. An intriguing premise (and one with lots of gamerly potential), about . . . oh, heck. Let's just quote What the Internet May Become, [Wikipedia](#):

> The series is set across the backdrop of an illegal automobile road race with the central focus being on the competitors and eventually on the puppet masters behind the race. Regarding the tone of the show, [series creator Tim] Minear has described it as "a secret, illegal, underground road race can be anything from *Cannonball Run* to *The Game* to *North by Northwest* to *Magnolia*-on-wheels. Ours is all those things."

Sounds like a pretty good pitch for a gaming series, eh?

Sadly, after four episodes, *Drive* will now be driven as much as a 1972 AMC Pacer. I haven't had a chance to watch the series yet, but from listening to disgruntled fans, it seems that very few of the series' central mysteries are going to be resolved.

Curiously, I wrote an almost-identically themed version of this column [a year ago](#), when FOX axed a different series: *Reunion* (which, itself, could be transformed into another neat premise for a campaign). Back then I presented a few tips for how GMs might "cancel-proof" their games.

This time, however, I'm going to tackle the subject from a different angle: What responsibilities do players and GMs have when forming a campaign? Or, indeed, all those who partake in games?

At its most basic level, *all* games are social contracts. Everyone plays by a set of rules that are pre-agreed upon, more or less. (I say "more or less" because there are situations where gamers don't agree on the rules, or some gamers might not know the rules well enough to agree to the rules, per se. However, there is the contract that there *do* exist rules, upon which all agree, for the game to continue.)

As social contracts, all players need to come to an agreement about expectations. And, in my opinion, it's bad form when those expectations aren't met. Most of the time these expectations are easily resolved. For example, those who might forgo common sense and play a game of *Monopoly* may need to hammer out whether or not Free Parking is anything other than a waste of turn; the brief debate over this one issue will, no doubt, prove more lively and soul-affirming than all the best aspects of all the most heart-warming games of *Monopoly* ever played by humans.

However, some issues aren't resolvable ahead of time, and can lead to considerable problems. For example, let's say that a big group of friends -- ideally a number equaling some factor of two -- sets up a ping-pong elimination tournament over the course of a couple months. However, each round, some players drop out (even those who have won previous rounds. This places the entire tournament into question; should chosen opponents of dropped players get a "pass"? Should the tournament be tried again from scratch? What's fair for the other players? (The omnipresent shoulder-reading spouse of your humble columnist, fresh from a tour of duty having indexed **GURPS Martial Arts,** suggests having the GM resolve a Quick Contest for both players. Methinks the lines between "reality" and . . . um . . . "whatever" have become dangerously blurred for the missus. Indexing does that. For my column next week, I'm just going to make a Writing check and be done with it.)

Of course, what's fair is the problem never having happened in the first place, which is why those who organize such tournaments often try to get ultra-firm commitments from prospective players. Of course, no matter how much players jump up and down and declare that they're in a game for the long haul, there's little to prevent them from promising the moon and dropping out. (Maybe a $50 deposit from each player, returned if they complete the series and otherwise spent on pizza for the other players.)

This is also fairly common in RPGs. I've been involved in dozens of campaigns -- on both sides of the GM's screen --

where grandiose plans have fallen apart, and what was meant to be a long-running series died in the first session or two (or, as has happened more than once, during character creation). Unfortunately, players have little recourse for how to respond to such developments (whether they are the result of the GM's actions, the actions of other players, or the involvement of fate). Worse, at least in my experience, players take experience from one gaming group session and apply to future campaigns; in my circle, it was very challenging to get players to invest anything more in characters than the bare-bones minimum required to get the campaign going . . . which tended to sabotage those other campaigns as well.

In a lot of ways, the BBC model of television-series production is much fairer. As I understand it, they produce all the episodes of a series before running the first one of the "season" (as they laughably call their six-episode batches). In this way, fans of the series at least know that they get one "season" out of a series they enjoy, and don't need to worry that they've invested time and attachment into something that isn't going to have a payoff.

Conversely, many TV series here in the States don't have this problem, either, since they are structured such that it doesn't matter if they are canceled. For example, *The Tick* live-action series (also on FOX!) was such that episode-to-episode continuity wasn't necessary for the audience, meaning that the batch of extant episodes can be enjoyed by themselves.

Unfortunately, the drive (ha!) to create the next *Lost, 24, Alias,* and *Desperate Housewives* has resulted in many new series premiering that promise a long-term story of mysteries and intrigue that will be revealed, but then die before they provide any resolution. This can result in a death spiral for networks and fans; many viewers (such as myself) refuse to get involved in watching new series because they want to wait for the inevitable DVD release if the series takes off. As a result, these shows don't have the ratings they need to stay on the air, and they die. (The same thing can be seen in the comic-book-publishing world, replacing "graphic novels" for DVDs.)

Two solutions, then: If there's a chance that a game series won't be a long-running one, either design it around the idea of episodic adventures, or get firm commitments for short "seasons" (or, as I call them, mini-series). I find the latter more satisfying, and it's usually easy to wrangle folks for firm commitments for three to six adventures than it is to get them to give up a Saturday night indefinitely.

No one likes to reflect on a contract as being a bad deal, and that applies to the social contract of gaming. Fortunately, by making sure to reduce the potential pitfalls of that would-be contract, and then working to ensure that everyone can abide by them, you can help keep more games from falling apart.

In the meantime, I heartily recommend against watching any series with long-term plots on FOX. Ever.

Dungeon Master for Dummies

Published by Wiley Publishing, Inc.

Written by Bill Slavicsek & Richard Baker

Edited by Jean Rogers, Virginia Sanders, Christopher Perkins, Laura Albert, Jessica Kramer, & Tammy Todd Art, graphics by Rich Tennant, Carl Byers, Andrea Dahl, Lauren Goddard, Denny Hager, Wayne England, David Griffith, Doug Kovacs, Chuck Lukacs, Chad Sergesketter, Arnie Swekel, Andrew & Trabbold

408-page b&w softcover with DM cardstock reference insert; $21.99

A successful product doesn't keep you in business for long if you don't learn how to market it. A rather open-ended *Dungeons & Dragons for Dummies* book covered that game in general for the new roleplayers among us, but *Dungeon Master for Dummies* offers more specific advice for the put-upon referee specifically.

The best news is that this book is a more worthwhile reference than the previous gaming . . . *for Dummies* volumes, at least to its target audience. Aimed at those who know the game and want to take their turn behind the screen but haven't the experience, it focuses on the topics most important to the fledgling Dungeon Master: how to start a world, expand it, and make it real; keeping character rewards and challenges on an even keel; and creating memorable adventures.

Of course, what it does first and foremost is explain what a DM is and what he does while lurking behind that shield. If all this sounds rather pedestrian, you're probably not the consumer they're targeting; they see this as a companion piece to the three core volumes, their previous advice book, and maybe the basic starter version of the game. They express some hope that the seasoned folks find useful material here, but that's not very likely.

It's the sort of primer you'd like to see in any roleplaying game you pick up at the shop, but the tips they offer are mostly old hat so they dance dangerously to that which has gone before. If you've been lucky enough to read an RPG with a decent pedigree as far as the referee's advice goes, or sat in on several good sessions with a capable GM, even as a newbie you may be a bit jaded with a lot of what's here. Peppered throughout are some good suggestions, and there's never any telling which facet of one's game style needs attention; the trouble is sussing out the wheat amid all the chaff.

Topics are dealt with in a straightforward manner. Not only do they cover the essentials and do it in an order that lets you wet your feet in an intuitive sequence, it expands the DM's knowledge base in like fashion. You start small, and by the end of the book you have what you need to move your campaign into epics and vast tapestries. There are examples of many of their observations, but there could always be more. Too often you get the feeling the authors are building up, perhaps even on the verge of saying something profound, only to have them finish a piece of advice and move deftly on. If you have to hear war stories, why not get them from the most grizzled soldiers?

There are a couple of adventures, simple and used to illustrate certain concepts, though just one would have worked, too. They offer a home for the adventurers -- a small town called Griffinford -- that neatly demonstrates a springboard for the team with minimal damage to the book's word count.

You should be pleased with their counsel on the whole. If you recognize subjects like the different kinds of players and their motivations for playing the game you're probably past this, but tricks on making traps work for all the right reasons are pretty good, and anyone should be able to get something out of the high-level tips ("Are the PCs going to just fly or teleport past everything I throw at them?"). This isn't the norm for the book, so the danger lies in letting them throw too wide a net over potential readers.

There's more art in this book than you find in the rest of the series, and though you instinctively know, even as you complain about the lack of it, that you don't need it in a reference manual, you're going to be glad it makes a comeback here. It's spiffy stuff, classic character illustrations and soaring landscape pencil drawings for the most part, and it feels great to have it back.

This brings up some oddities in the infamous Part of Tens, however. There are 10 ready-to-use encounters, similar to those randomly inserted snippets you see at irregular intervals in Wizards of the Coast's hardbound books, but these are blissfully (and a little ironically) surrounded by the context that's lacking in the main line. While these bits can easily be dropped into any adventure and have all the details you need to make them work, the maps included are anything but professional. Perhaps they were going for a postmodern feel, but they're all presented as though you were looking at the actual sketches from your DM's graph-paper choked notebook.

Another "part" describes 10 classic adventure modules . . . for nostalgia, it would seem, since they're talking about classic in the sense of first-edition releases. Swell. They then add insult to injury by pointing out the 10 *Dungeon* adventures they recommend were chosen because you might be able to get your hands on them without a fat wallet and an eBay account. Most of these baffling additions are confined to the back of the book where cutesy self-indulgence is expected in some measure, so it's no reflection on the rest of the tome. The book's "cheat sheet" is quick-reference cards for characters and monsters. With three copies of each, some could've been magic item stats instead, but so it goes.

Dungeon Master for Dummies is a solid book chock-full of sage wisdom, and the suggestions it offers aren't even limited to the ***Dungeons & Dragons*** property; referees can put a lot of the work to use by changing the word "bugbear" for "enemy spy" and so on. But again, while there are a few gems of true insight for veterans, their dollars are better spent getting the latest supplement to top off their mental tank, and even newcomers may find the book has a short shelf life in their library.

Bleeding Edge Adventure #2: Beyond the Towers (for the *d20 System*)

The Bleeding Edge Adventure series from Green Ronin Publishing for the **d20 System** is designed to present scenarios with a more contemporary sensibility. This places an emphasis upon roleplaying, investigation, and action over the current trend in nostalgia best typified by Goodman Games' Dungeon Crawl Classics line. Nominally set in the same world as *Freeport: City of Adventure,* each Bleeding Edge Adventure is also generic enough that it can be run in almost any setting.

Designed for 1st- to 3rd-level characters, *Bleeding Edge Adventure #1: Mansion of Shadows* initiated the series, landing them on the continent away from Freeport and got them caught up in a Gothic tale of horror, family strife, and pitchfork-wielding torch-waving villagers. As the scenario ended, the adventurers were on their way through a mountain pass, on the other side of which lies *Bleeding Edge Adventure #2: Beyond the Towers*. This is a wilderness scenario for a party of four to six characters of 2nd to 4th level, one of whom should be a Druid or Ranger, and another a Rogue.

As the adventure opens, the party has made its way out of the Narrow Pass, the easiest route through the Towers mountain range (hence the scenario name), and is on the road to Lonely Shore, a rough little outpost on the edge of the Carrion Swamp. Several reasons for their being there are suggested: seeking adventure, hunting bandits in the swamps, wanting to explore the swamp in search of an ancient civilization, or traveling to meet a patron who has hired them as guards. Beyond the Towers combines these last two reasons for its plot, the patron being Professor Abraham Stewart, a member of the Antiquity Scholars order with an interest in the Hetepkan Empire, a civilization once thought to flourish in the region. With the Carrion Swamp known to be the haunt of bandits and the Professor's team already having been attacked once, he wants fresh and better protection. This of course, is where the adventurers come in.

[SPOILER ALERT!]

Beyond the Towers consists of a short trek to Lonely Shore where the adventurers can collect their patron and learn about the dangers of the journey to come. Best done by boat, this gets them to the adventure's main stage: the ruins. These are dominated by an ancient ziggurat, once a temple complex and retreat that was part of the Hetepkan Empire. However, between the adventurers and the ruins lies another problem. This is the camp out of which a sizeable group of reptilian bandits that have been threatening the area. It is composed of two new draconic species: the easily cowed Sesheck and the stronger, more intelligent, shape changing Sevren. In a stand-up fight the bandits represent too difficult a challenge, so the party may have to use the same guerilla tactics that the bandits are so good at.

Once past the bandits, the ruin is revealed to be a four-tier pyramid amidst a series of overgrown pools. Below lies a four-level temple complex of relatively simple design. Partially collapsed in places, it is still heavily trapped, hence the

need for a Rogue. It is also quite light in terms of martial threats, though the few encounters are quite tough. Similarly, it is light on treasure, the bulk of which is made up of archaeological finds that the Professor will reward the characters for. The temple also contains a potential long-term threat in the form of an entrapped priestess, who -- once free -- has designs upon restoring the Hetepkan Empire.

[END SPOILER ALERT]

A two- or three-session adventure, **Beyond the Towers** is a linear affair in comparison with **Mansion of Shadows.** There is just the one alternative staging option: having a rival party searching for the ruins, either as NPCs, or as actual rivals complete with a second DM and group of players. This is in addition to the usual methods of making the adventure suitable for lower or higher level characters. Several loose ends are left to tie up, including chasing down the bandits, searching for more ruins, and even tracking down the Hetepkan priestess if she escapes to the wider world.

Physically, **Beyond the Towers** is a reasonable-looking book. The art varies in quality, but the maps are nice and clear. Lisa Wood's cover is unnecessarily gruesome, though. Although there is plenty of detail given in the scenario -- certainly enough to help a DM create further adventures in the area -- the book does feel a bit short. It is. Compare the page count for this book with its predecessor, and **Beyond the Towers** comes up short by a third, even though the price stays the same.

As a sequel, **Beyond the Towers** is an easier affair after **Mansion of Shadows,** simply because it is more linear. As an adventure itself, it is solid enough, but considering that it is part of a line catering to a contemporary audience, it nevertheless still feels old-fashioned. It feels like that "next scenario after the first one," the one that is a wilderness adventure after that first dungeon bash. This isn't a bad thing, but where this might be a good release from any other publisher, this is merely adequate for Green Ronin. The problem is not that **Bleeding Edge Adventure #2: Beyond the Towers** fails as a scenario; it does not. Rather, it is neither contemporary nor "bleeding edge."

Mélange of Magical Creatures V

for *GURPS*

by Eric Funk

Once again we look at a [cavalcade](#) [of](#) [curious](#) [creatures](#). Watch your step, and don't feed anything unless instructed to do so.

Shield Snake

"We watched from the boat as negotiations broke down between our landing party and the natives of the island. It seems that two 'champions' will fight it out. Both parties stepped away, letting a man with feathers and a spear square off against a man with a chain shirt and a crossbow. The native shouted to the sky, thrust the butt of his spear into the ground, and reached into a sack on his back. The guard aimed his weapon at the man's leg. Shouting 'Na-lay-a-lay-a-lay!' he seemed to produce what first looked like a silvery whip from a bag on his back, which then coalesced into a shield. Spotting the archer's attention, the feathered man crouched at the last moment, catching the quarrel between the coils of the shield; the head and fletchings of the bolt visible to us. In a fluid motion, he readied his spear and charged the shaven man who had but barely begun to draw his sword."
-- Kievur's Journal, *Voyage of the Rising Yak*

This metallic reptile is a favorite "pet" of warriors from the native tribes of many islands and desert regions. Now found in many warm and sandy regions of the world, these silvery-gray snakes are renowned for their ability to take a rigid circular shape, and to be able to resist many weapons. It is uncertain whether they learned to take this state of rigid torpor as a defensive ability to protect their young from predators, or whether it was bred into them through centuries of subtle tinkering. Appearing to be a glistening cross between a coral snake and a rattlesnake, these non-venomous reptiles are too heavy to swim, but can hold their breath for many minutes to crawl under a river. They have been known to prey on [mining birds](#). In addition to normal prey, they also require sand, which is digested in a separate stomach.

Encountered

They are normally kept in a bag slung on one's back, with a small bag containing a mouse buried in sand inside. If the snake wakes up hungry, it will eat the tiny bag. When using a shield snake in combat as a shield, a warrior can attempt a shield bash at -3 to hit (see page 406 of the **Basic Set**), and the snake will attack the target, who can no longer make an active defense. The -3 penalty can be trained up as a technique. Snakes in shield form normally protect as per a solid medium shield with a DB of 2. In regions with many cutting weapons, the snakes can be trained to assume a second, more ornate form, which requires a Ready action to signal the snake, and one second for the snake to change positions. In this "ornate" form they protect against melee cutting attacks as per large shield (DB +3), but without extra combat penalty (See page 392). However, in this state, all other attack types treat this shield as a small shield (DB +1).

Industrial Uses

"The powers of these snake charmers have been exaggerated in popular fiction. It can't be possible to use the same animal as a shield, a whip, a rope, and a pry-bar. Can it?"
-- Memoirs of General Kievur, "The War of the Gilded Sands"

Older or critically wounded shield snakes are often given a fiery burial to extract the mineral content. Tradition dictates that half be given to the warrior it served the longest. Some traditions hold that the "second" stomach of the snakes is its mana organ, and, after removing the sand, eating it will grant one the snakes' regenerative powers.

Adventure

A strange warrior approaches the swashbuckler, or otherwise lightest fighter of the group, and announces that he sees potential in that person's combat abilities. If the adventurer can pass a few "simple" tests, this native will teach him the way of the snake. If the potential pupil is reluctant, the warrior will understand and return the next day with the same offer. It is not a test to be undertaken lightly. Either way, after the man leaves, a figure showing a badge from a local warrior's guild approaches the would-be student, and makes an offer that the techniques be re-taught to him, or a representative of his. He emphasizes that it could be very worth his while.

Shield Snake

Appearance: A glistening, silvery snake approximately eight feet long.
Category: Reptile.
Diet: Carnivore, Lithovore.
ST 8; **DX** 12; **IQ** 3; **HT** 14.
Will 10; Per 10; Speed 6.5; Dodge 10; Move 5.
SM -2 (-1 in shield form); 15 lbs; DR 8; HP 15.
Traits: Breath Holding 2; Cold-Blooded (50°); Congenial; Constriction Attack; Fangs; Domestic (or Wild) Animal; Horizontal; Metabolism Control 1; Regeneration (Slow); Regrowth; Resistant to Poison +8; Striker (Tail: Crushing); Vermiform; *Knack:* Iron Arm.

Bouncing Tomatoes

"The pickpocket ducked down the alley. Looking both ways, the thief hid in a shadow for untold heartbeats. As soon as she relaxed, something red bounced off the wall across from her, and exploded at her feet. Engulfed a glue, she could only watch as a silk-clad female dropped from the wall and said, 'There are penalties for ignoring guild rules . . . '"
-- Triza Odlis, *Rulers of the Gutters*

These tasty tomatoes are native to hilly regions, often in valleys. The fruit grow on vines on trees. The tomatoes bounce downhill, yet many birds eat the fruit, and carry the seeds up to their nests in high altitudes. The husk is strong, and chemically resistant. This protects them from decomposing too early, and makes the fruit resistant to pests.

Encountered

The most likely place to encounter these fruits is in weapons caches, or as targets for them in combat. Being struck by a properly seasoned and roasted tomato can feel like being struck with a rubber mallet. This makes them popular non-lethal weapons in crowd control.

Industrial Uses

"Oui. And now, be careful not to bruise ze fruit, grasp it like zo, and gently press with the steak knife, slicing evenly across. Zese slices, they will make a good salad, no? Keep slicing around, until you are left with ze core. And now, to disarm ze detonator . . . "
-- Master Sergeant Philipe Fortin, EOD

When cooked lightly, the skin of the tomato becomes tough and solid. Thus, many alchemists and herbalists choose to use them as potion dispensers; some coat the interior with wax. Depending on the situation, these could contain alchemical potions, holy water, nanomachines, or chem grenades. Those who have the throwing skill can throw these with a -2 penalty, worked off with eight hours of practice per -1. In any case, a miss by 2 means the tomato hit square, but bounced off instead of taking effect at that moment (unless that result does not make sense, such as in a lava monster). Some enchanters have used these fruits to enchant bouncing and defense traits, as well as working in minor talismans and charms to resist magic.

Adventure

There is a tomato-throwing championship going on. The heroes can participate, but it requires training with the Throwing skill. The first challenge is a DX-based Throwing roll to get the tomato through a hoop at a 45° angle. The degree of success is important, with a minimum of 1. Next, a ST-based Throwing roll will determine how far it went. The degree of success is significant, minimum 1. A failure means ½. The two degrees of success multiplied together are added as a percentage to the range (see throwing, page 355; and Extra Effort, page 357). e.g., Success by 4 on the **DX** roll, and a failure on the ST roll nets $4 \times ½ = 2$.

Bouncing Tomatoes

Appearance: tomatoes, with species varying from green to yellow to red.
Category: Plant.
Diet: Photovore.
HT 12; HP 1.
SM -8; 1/2-1 lb; DR 2 (tough skin).

Impetu-ites

"Ah, yes. One of the more radical treatments of the Josu Tika weight-loss clinic. They say it is mildly uncomfortable, and one should certainly eat the diet presented and wear the safety equipment. Stopping suddenly is bad for one's health as well. I heard that one girl was summoned away quickly when her grandfather fell ill. She also suffered an unusual illness . . . "
-- Lady Tier Buena, *Trials of the Count*

These mosquito-like insects break fat cells and steal the chemical energy. The advantage is that a person's fat cells are literally broken down, allowing the lost weight to stay off. The problem is that the insects use mild radiation to do it, leading the surrounding cells to break down from radiation. Unfortunately, there is always radiation left over in the host. An unusual side effect is to cause the person to become impatient with the world about them (See below). This has yet to be clearly explained.

Encountered

These pests are most likely to be encountered taking energy from the heroes at night by a campfire. Magical, alchemical, or ultra-tech healing is the only cure. It is recommended that it be applied as soon as possible. Untreated, it causes sensitivity and internal injury (see page 436).

Industrial Uses

"These little beasties can be found naturally in a specific kind of death-aspected area. Some sages have literally spent their entire lives studying abominations like these so that we can have spells to detect and cure the scars these creatures leave in our souls. Many have succumbed to the dark rays they generate. May their souls rest in peace. Now, let us turn to chapter one . . . "
-- Petriw Thald, *Lectures on Energy*

These carnivorous insects can be used to tenderize meat while the animal is still alive, reducing the fat count. Other uses may include "herbal" treatment for growths repeatedly applied to a small surface, perhaps using a glass.

Adventure

A woman comes to the heroes. Apparently, her child is getting sicker, with no visible cause as he stays in bed for

weeks. The healers are stumped. Checking for magical links proves fruitless. Eventually, they will find that they are getting sick as well. A foe is unleashing special (invisible?) mosquitoes that bring a sickness resistant to normal magic . . .

Impetu-ites (see Swarms, page 461)

Category: Insect
Diet: Carnivore
Traits and *Skills:* Treat as per bees, except that the attack inflicts 1 rad damage instead of poison (see Radiation, page 435), and an Affliction (Impulsiveness (6), Nuisance Effect: Graduated: Requires four doses for full effect). Each Affliction increases the Impulsiveness by one level (e.g. from (12) to (9)), but each dose wears off separately, see page 36).

Variant: Giant Impetu-ites

ST 4; **DX** 12; **IQ** 2; **HT** 14.
Will 10; Per 10; Speed 6.5; Dodge 10; Move 6.
SM -2; 10 lbs; DR 3 (Sealed) (No DR on wings).
Traits: Affliction (Impulsiveness (6), Nuisance Effect: Graduated: Requires four doses for full effect (see above));
Extra Legs (Six); Fangs; Flight (Winged; Air Move 12); Innate Attack: (follow-up attack: 1 rad of radiation damage);
Peripheral Vision; Quadruped; Wild Animal.
Skills: Acrobatics (Air)-13; Brawling-14; Jumping-12.

Siren Islands

"Aye, the pirate schooner was gaining on us. 'Twas then that the lookout spotted something ahead and starboard. 'A small island with the glint of gold,' he called down. Immediately, Old Tom shouted across the deck 'Nay, 'tis a cursed place!' Perfect, aye thought, and set a course to skim it. Sure enough, the pirate ship dropped anchor and went ashore. We managed to get away. The odd thing was that either the sea was perfectly calm around the island, or it was moving with the tides."
-- Captain Ihgioft of the ship *Fenris*

"Siren islands" are actually large marine animals with a complex life cycle. Their diet consists of krill and seaweed supplemented by seabirds and scavengers. The animals casually strain for krill and seaweed. At the same time, it also extracts minerals from the water. On the top, a siren island has at least one special tree, which produces lots of fruit. The creature then exudes the gold and some other shiny non-oxidizing metals and coalesces them into nuggets, dropping them at the base of the "trees." These have a tendency to attract birds such as ravens. The tree base also exudes an odor resembling dead fish, attracting sea birds and scavengers.

As the birds approach the lures, they are attacked by the tentacles coiled in the trees and pulled inside. These factors have also earned the islands the names "venus fly island" and "honey pot." The tentacles are only able to lift 200 lbs each, but will target anything up to about 500 lbs, with more tentacles coming to help. Most tentacles will be attacking from above, leaving the victims at -2 to defend (see page 402). Attacks to the rear are also effective, as most victims cannot defend (page 548).

If all this isn't enough, the most unusual aspect of this creature is its life cycle. The "island" form grows the plant-trees on its shells. These trees drop fruit, which are carried away by birds. Birds that escape and eat the fruit drop seeds in the ocean. These seeds hatch and mature into the form known the siren islands. (See *GURPS Biotech* for more details on odd life cycles.)

If these creatures find themselves in water of a depth of less than twice their total height, they begin to panic, rising as far as possible out of the water, and moving at full speed to deeper water. If it finds an overabundance of food in an area, it will call more of its kind. It is only after a first encounter with others of its kind upon reaching maturity that its

plants' seeds are fertile; it caches the genetic material.

Encountered

The oldest siren islands can have full ecosystems on their backs, and an outside observer might not notice any difference between the palm trees scattered about. The attacking tentacles can grab most victims and quickly bring them to the mouth. Any clothes but skin-tight protect the victim, giving the tentacle -5 in the contests of ST, although thin layers of cloth may be torn off. Unfortunately for most of its victims, the dress code for men in tropical areas is no shirt . . . A stereotype of larger islands is "native" inhabitants. Myth holds that descendants of shipwrecked castaways survive on the fruit by sacrificing fish to the trees.

Industrial Uses

"Some wonder if it is truly possible to domesticate these creatures as a source of gold and fruit while not attacking people."
-- *Liber Bestiorum*, Volume III

Many naval and pirate fleets have tried to use these creatures as both a depot and as a mineral resource. Some have even had success towing the creature and anchoring it in a deep bay. Some sea-based cultures with few mines rely on tamed or captured siren islands. Some of these countries even export the fruit, not understanding the life cycle. Some cultures and pirates exhibit a "Slash and burn" policy, killing the creature and getting all the gold it currently has, a few more handfuls per tree.

Adventure

The heroes are assigned to locate, secure, and bring back a small siren isle. If no party member knows the Current spell, they are assigned an item that casts the spell, although someone must still provide the energy. Complications include competitors, pirates, natives who want to sacrifice outsiders to the god of the island, and weather.

Siren Island (see also Aspidochelone from the *Fantasy Bestiary*)

Appearance: An island with one or more palm trees.
Category: Mollusk/cetacean hybrid.
Diet: Omnivore.
ST 100; **DX** 8; **IQ** 4; **HT** 12.
Will 14; Per 10; Speed 5.5; Dodge 8; Move 5.
SM +10; 10+ tons; DR 20, DR 30 shell.
Traits: Aquatic; Extra Arm (Striker, 1+); Extra Legs (Eight+); Quadruped; Sonar Vision; Subsonic Speech; Temperature Tolerance 3; Wild Animal.
Note: These statistics represent a young adult specimen that is only 10-20 yards across, and has only one "tree" at its center. A GM should feel free to bring in an adolescent with a scale number of ST, HP, and DR, while an ancient could possess 10× to 100× these statistics.

Palm Tree Sub-aspect

Appearance: A palm tree.
Category: plant.
ST 30; **DX** -; **IQ** -; **HT** 13.
SM +2; 2,000 lbs; DR 15.
Note: Each tree contains at least one tentacle, see below.

Tree Tentacle Sub-aspect

Appearance: A brown, fine-barb-tipped tentacle.
Category: Mollusk/plant hybrid.
ST 10; **DX** 14; **IQ** 4; **HT** 14.
Will -; Per 10; Speed 8; Dodge 11; Move 8.
SM +1 (6 yards); 200 lbs; DR 2.
Traits: Flexibility; Mute; No Fine Manipulators; No Legs (Sessile); Wild Animal.
Notes: On a human scale, these tentacles have these statistics.
A tentacle damaged down to 1/2 its hit points will release its prey and recoil, not emerging until it has healed to at least 3/4 its max hit points.

Variants: If the GM is uneasy with the idea of tentacles that can lift a man, perhaps the sweet fruit are subtly poisonous to humans, and the tentacles can strangle men.

Beam Cows

"Well, the boss was unsure of the extra cost of importing those first few beam cows. It wasn't long before word spread of 'expensive new cows.' Soon after, we were able to round up a ring of bandits, caught in the daze of a half-dozen scared cattle. Two of the men had serious injuries from being trampled."
-- Kievr Taidn, Lead Farmhand.

This subspecies is similar to mundane cattle, albeit with unusual powers. The most obvious ability is that they can dazzle people who get too close. The second is that they can walk on air. Using a rainbow of force, they appear to walk over thin air, not rising or falling as they do so. Although they seem to have no limit, an animal will rarely go over a body length in the air. An unusual aspect of the subspecies is that those with the above powers always have solid-colored fur. Some alchemists have developed potions that, when fed to a bull, permanently change the fur color of its offspring. Note that the most popular brands of such potions change only the fur's color, and not that of the animal's milk or meat. Potions with such side effects have limited sales, but sometimes are passed off as the more desirable kind.

Encountered

As an engineered, domestic animal, these creatures are generally considered a success in frontier areas. The powers form a mixed blessing, the added protection and resistance to ankle problems from gopher holes is countered by the danger of herds wandering wherever they want. Their mobility is a mixed blessing, and obviously leads to escapees. Some homesteaders have taken to flattening the land of small pens, or building fences higher than the highest point in the pen. In the wild, animals with this power tend to have an advantage in the pecking order, and will confront threats to the herd.

Industrial Uses

"Greetings, and welcome to the 15th annual crystal competition. Here, we have the best of the local heifers. They will be judged on form, sheen, and the quality of beam bridge they project."
-- Orin Wilden, Officiant

In some areas, one or two of these animals can be used instead of bridges and ferries. There is a strong demand for oxen with these abilities. As all-terrain vehicle, they are more versatile than a static bridge. In enchantment circles, the hooves can be used to aid in items to help one to walk on air. The eyes can be used to aid in enchantment of a wand of bedazzlement. Some say the horn can be used to confuse people.

Adventure

A cowhand approaches, looking for help. Some rustlers have taken his prized Rainbow Bulls during his watch and

seeks to get them back before the lead hand comes to check the herd. Discreet inquiries will back up his story. Following the trail leads through a trapped forest. The trail eventually leads around to the nearest town. From a hill overlooking the town, the heroes can see the dozen cattle hovering at the top story of a museum. The criminals have put dark cloth over the cows to blind them and hide the light.

Beam Cows

Appearance: A single-colored steer.
Category: Mammal.
Diet: Herbivore.
ST 27; **DX** 8; **IQ** 3; **HT** 12.
Will 14; Per 12; Speed 5; Dodge 8; Move 5.
SM +2 (3 hexes); 2,500 lbs; DR 5 (light).
Traits: As per Oxen, p .B460 (Domestic Animal; Claws (Hooves); DR 2 (Skull only); Enhanced Move 1 (Ground Speed 10); Impaling Striker (Horns); Peripheral Vision; Quadruped; Striker (Tail: Crushing; Limited: Rear); Weak Bite.
Plus: Affliction 1 (HT; Daze with Moderate Pain following; Malediction; Nuisance Effect: Rainbow beam); Walk on Air (Nuisance Effect: Rainbow beam).

Oxen Add: Neutered.

Ice Crabs

"These creatures were first discovered in the polar expedition of '06 and were an immediate success back on the continent, having only lost two men to the beasts. The crew took to keeping them in cages off the sides. Hanging them fore or aft caused problems."
-- Captain Ihgioft of the trading ship *Fenris*

What are popularly called ice crabs are actually two species of crustacean found in polar regions. The first is a larger, dark-blue variant found on the sea floor. This type serves mainly as a self-chilling meal. The most often encountered subspecies is a surface-dwelling crab that uses its ability to freeze the surface of water to cross it. What both have is the ability to keep the environment cool. In all but the strongest heat, they can move in a comfortable zone. Even after they die, their meat stays cool, until exposed to flame or acid.

Encountered

These light-blue surface crabs are most likely encountered in captivity, used to chill rooms and ice boxes. They are likely to be bought and sold at prices proportional to the seller's distance from the polar areas. The other aspect most likely to be encountered is that their meat does not go above 40°. Thus it can be packed with other meat and foods. In the wild, adventurers who travel in the arctic regions may find these creatures. Although they shy from fire, they have little fear of adventurers, and seek out living creatures. They then kill, cool the meat, and eat it.

Industrial Uses

"That reminds me of a time a giant snow crab got loose in the bazaar. It was scavenging from the fish stands, and broke some water jars. It terrorized the area until some guards thought of lighting a match and were able to corner it. Healers say over two dozen people caught minor cases of frostbite during its rampage." -- Inspector Bonlieu, Metro West P.D.

In some regions, especially tropical ones, these creatures can be used in all areas of life, from industrial processes to home cooling. The breeding of these creatures is a growing industry. Home and commercial use includes central air conditioning as well as cooling specific rooms. Finally, their meat, while tasty, is essential for long-term storage of

disposable products. Some companies have also designed an icebox with a cage underneath to allow the goods to cool to freezing temperatures. Large-scale projects can also make for artificial skating rinks. To some environmentalist groups, these creatures are near the top of their lists of creatures being abused. Uses in enchantment logically include the preservation of food, and ensorcelments involving cold. Other uses can include simple desalinization by freezing water and thawing the separated ice. High-tech uses can involve freezing out heavy water for nuclear reactors. Ships could fuel themselves indefinitely. The problem with herding them comes in that they frighten off all other animals.

Adventure

The group is hired to deliver a giant snow crab across town. Complications begin with containing and safely transporting the creature, and end with escape, illness, and theft. Frostbite might be a danger, so handlers must dress warm! (As a variant, the heroes might be asked to transport a dozen regular-sized ones instead of the giant one.)

Ice Crab

Appearance: Light-blue crabs.
Category: Crustacean.
Diet: Omnivore.
ST 6; **DX** 9; **IQ** 2; **HT** 12.
Will 10; Per 10; Speed 5.25; Dodge 8; Move 5 (sideways).
SM -4 (1' long); 10 lbs; DR 2.
Traits: Amphibious; Claws (Cutting); Extra Legs (Eight); Fatigue Attack 1d (Emanation; Emergencies Only; Freezing; Link); Frightens Animals; Horizontal; Infravision; Overconfidence (15); Phobia (Fire: *Pyrophobia*) (12); Quadruped; Sharp Claws; Temperature Control 1 (Accessibility: Will not work in Vacuum; Cold only; Emanation; Enhanced Range); Temperature Control +9 (Accessibility: Will not work in Vacuum; Cold only; Emanation; Emergencies Only; Enhanced Range; Link); Temperature Tolerance 3 (Accessibility: Will not work in Vacuum; Cold Only); Wild Animal.

Variant: Giant Ice Crab

ST 10; **DX** 8; **IQ** 2; **HT** 13.
Will 11; Per 10; Speed 5.25; Dodge 8; Move 5 (sideways).
SM -2 (3' long); 35 lbs; DR 6.

Razor Birds

"The lookout moved along the narrow ledge outside the top of the building. Suddenly, a gray-brown form darted past him through the air. Pain shot through his right arm. As he realized that he had been cut, he looked about for an archer, but spotted none. Suddenly the blur passed in front of his face. Clutching his forehead in pain, the man started to double over, and fell off the ledge."
-- Lt. Poind Widke

These modest-sized steel-colored birds seem to be related in shape to ravens. What makes them stand out is the gray color and glossy feathers. Even up close, its most remarkable adaptation is still invisible to those who do not know what to look for. The leading feathers on the birds' wings act as knives, which can damage flesh as they move. In the wild, these creatures use this adaptation to be able to dive through branches and brambles to attack prey beyond such cover.

Encountered

These dangerous birds are most often seen in trained acts on street corners or in circuses. Thus, many people consider these animals to be mere parlor tricks. The real truth, however, is that they can be useful tools and deadly weapons. It is unlikely that the average citizen will own one, as a license will likely be required to train, or possibly even own such

a beast. Some assassins poison the wings just before they release the bird to attack. Some lose many birds using this technique.

"Then, the bar fight took a turn for the worse. We needed a quick exit. It was then that Spike got the idea to send her bird to bring down the chandelier. The bird swooped up, and after a few passes, the cable was severed. Unfortunately, the doors were blocked, so she held the bird, and cut down some curtains with it. After throwing the curtain down the stairs, we left by the window." -- Uri Enckov, Years of Adventure

Industrial Uses

Trained birds fetch a good price in thieves' guilds, mercenary companies, and military scouts and special ops units. By-products of the feathers some use in exotic melee weapons, such as combat fans, and finger claws. Some gladiators use them as signature weapons, weapons and finger claws. A few barbarian clans have also made a sort of "scale mail" armor using these feathers. Don't wrestle with persons wearing this armor. Enchanting spells of sharpening and increased damage are made easier by by-products from these avians.

Adventure

In the last year, the some overzealous, pigeon-hating citizens had vigorously been poisoning pigeons. Unfortunately, the local lord's prized hunting falcon died because of the poisoned prey. Thus, it has become a great crime to harm a bird. Thus, it is a great quandary to PCs under attack by even a handful of razor birds.

Razor Bird (see falcon, pp. BE14, B457)

Appearance: A brown to gray raven.
Category: Bird.
Diet: Omnivore.
ST 3; **DX** 12; **IQ** 3; **HT** 11.
Will 11; Per 12; Speed 6; Dodge 9; Move 3 (Ground).
SM -4 (1' long); 3 lbs; DR 1.
Traits: Acute Vision 1; Domestic (or Wild) Animal; Cutting Attack 3 Damage (Wing Buffet) (Armor Piercing (10); Linked; Melee); Enhanced Move 0.5 (Air Move 18); Flight (Winged; Air Move 12); No Fine Manipulators; Peripheral Vision; Sharp Beak; Claws (Sharp).
Skills: Brawling-15.

Note the *GURPS Fourth Edition* FAQ that indicates that *relative* Size Modifier is used in combat (to a maximum bonus of +4 in melee). Thus attacks to a human's Face are only at -1 (see page 399)!

Variant: Giant Razor Bird

ST 4; **DX** 11; **IQ** 3; **HT** 12.
Will 12; Per 13; Speed 6; Dodge 9; Move 4 (Ground).
SM -2 (3' long); 10 lbs; DR 3.
Traits: As above, but the Cutting Attack is 2d.

Beyond Fantasy

This article describes seven creatures, most of which could appear to physically exist in a hard-science world, even if the more wondrous aspects could not. There can be snakes with iron skin, fruits with rubbery skin, short-lived insects that inject radiation, and megafauna that can be mistaken for islands. Cows can have a piercing gaze, endothermic blue crustaceans are possible, and birds could have extremely sharp feathers.

Department of Universal Quality Control

by Eric Funk

"We regretfully inform you that your universe has performed an illegal operation and needs to be restarted. During this period of transition, and for an unknown period of time after, we will require viewpoints familiar with 'normality' to observe, and, to some extent, correct these anomalies. Those that perform well may be offered positions in future projects."
-- Letter of offer from the Department of Universal Quality Control

Introduction

The heroes -- either separately or collectively -- encounter some kind of distortion or ripple in reality. It may be as simple as seeing the same ball fall off a roof several times, as weird as green glowing winged sewer rats, or as remarkable as being in an imminent car accident in which the cars pass through each other, arriving safely out the other side, and no one else seeming to notice.

Each adventurer will then receive a visitor some time in the next day. Although the individual's description cannot be remembered clearly, they will be handed a sealed envelope. On the front is marked a warning: "Urgent, this letter is available for only 24 hours after delivery." Inside there is a letter which reads: "Dear [true given name], If you wish to learn more about your strange encounter at [location], [time], please come alone to the [nearby park] fountain, two noons from the delivery of the message." True to its word, the envelope and contents vanish after exactly 24 hours.

At the appropriate time, there is a man in a a gray trench coat waiting for them at the meeting place; his appearance is unmemorable, and the heroes' eyes will have a hard time picking out any distinguishing characteristics. He talks about how various factors cause holes in the universe, and that they must be patched. He will continue to detail the job's duties, as determined by the GM in "Quality Control Teams," below. If the adventurers seem interested, he will then hand them identical envelopes as last time. Opening them reveals duplicates of simple, one-page job offer contracts. They begin with the opening paragraph of this article, and mention that for those passing their probationary period, "all needs will be taken care of." If asked, the man explains this refers to meals, water, shelter, and education. Upon termination of this contract by consensual means, a full employee may choose to retire on any world he has served, assuming it still exists. With director permission, full benefits may be continued as a reward for good service.

Quality Control Teams

A Quality Control (QC) team is generally composed of rookies doing the footwork, reporting to a veteran agent. This gives the heroes full autonomy to investigate and close holes in reality. In any such campaign, if the troubleshooters are not careful or fast enough, police and other authorities may begin to link them to strange happenings. They might even assign their own version of Mulder and Scully to the case, making it an "X-File."

If it fits the campaign style, the Office can gradually grant powers related to the mission. It might begin with a power to "repair" holes in reality of up to three-foot diameter at a time, taking a minute of concentration to activate, where the agent must be within 10 or 20 feet of the event during this time. Multiple agents acting simultaneously will not make the rip close faster, but will serve as good backup in the event that one loses concentration (e.g. if attacked). Any aspect of this power can be improved as a reward for good service. Another likely power is the detection of such rips in reality. It may begin with a general awareness of the location of such -- for example, that there is a rip within 100 yards -- but not where, or how strong. Upgrades can include clarity and range, as well as the ability to detect beings from other planes, and eventually to detect people and items affected by such beings' powers.

Connecting Campaigns

The fastest way to introduce this campaign idea with a minimal impact on the continuity of an ongoing campaign is for the adventuring party to find something "weird," encounter a QC team on the case, and together solve it. Afterward, the second team disappears, never to be heard from again.

Example: Rats are infesting a sewer and are driven up into a warehouse. Local rat catchers can't do enough, and so ask the PCs to investigate. After angering the rats, they notice that they all appear to have the same patterns of movement, the same mannerisms and appearance, and so on. Meeting the investigation team and comparing notes, they work together, the PCs distracting or destroying the rats while the QC team deactivates or destroys the rip that is cloning rats.

An adventuring party could also be working for QC agents. If the QC Patron feels stretched out and cannot get enough "inside" help on a problem, he is well within his rights to call on the heroes. Finally, one or more of the adventurers may be QC operatives, albeit those never expected to be called in during the lifespan of the campaign. The GM may, therefore, reduce the Duty and Patron to a Quirk and Perk, respectively. Next comes a campaign where the Duty is not insignificant, but calls the PCs to action, sometimes in conflict with others' disadvantages. Such interactions can be exciting to roleplay and reward.

Example: "No, your black phone can't be ringing now! My blood enemy, Dr. Destruction, was just spotted downtown!"

Finally, the all-QC party may also possess these dynamics to a limited extent with "mundane" commitments, even if they have super powers. In the ongoing campaign where weirdness keeps happening, the PCs may be blamed!

Adventures

Weird adventure seeds can come in a variety of forms. In some, the technical aspect is easy, but the moral or social choices are hard. For example, the heroes discover an older lady who can actually heal people; she has found a room that accelerates healing rates, while distracting the patients with new age mysticism. Other tasks involve combat or a physically challenging event, such as a ghost refusing to depart, actively fighting the PCs' progress toward its anchor. It could be as dangerous as the villain from *The Frighteners* or as silly as the ghosts in *Beetlejuice.* Finally, there may be doorways to otherwhere and things that come through them. What will the adventurers do with the mail they find below the mail slots?

Adventure Seeds

A Luring: Local children have discovered a small hole in a tree stump. The other end seems to float over a different vendor in the nearby open market each day. Thus, using fishing lines, they angle down and take candy.

"Broken Tunnel?": One end of a disused tunnel is in a dark area of the campaign city, the other in Cairo, Egypt. The heroes might want to stop criminals from using it for getaways. Of course, using the tunnel may prove problematic, since those on both sides may not speak the language on the other side.

Electron Counts: Water passing through a certain section of the park turns into something with a similar effect to alcohol. It is extremely intoxicating, and causes a gasoline engine to run at near 100% fuel efficiency, giving off dark red smoke.

Wining and Dining?: Books in a small private library are weeping wine. Inhabitants below begin to complain about strange grape stains. The challenge may be social: gain access. Where is the owner? Evidence shows that some small things have pulled him through a doorway. Will the PCs investigate, or close the hold behind him? Investigation shows that he was last seen just before a new moon; in fact, that is when a portal opens in the middle of the library. Cleaning just the shelves will not affect this.

Evil Inside: Fluorescent lights in a warehouse change hues, and are inhabited by electric spirits, which have

frightened away the workers there. In addition, they seem to be collecting various metals, forming a structure in the center of a maze of metal boxes. In addition to being an eyesore, they have a penchant for electronics and may corrupt technical spirit-breaking tools.

When You Wish Upon a Star: At a tiny wishing well, superstition works! Wishing on a star, opening fortune cookies, tossing salt over one's shoulder, even breaking a mirror . . . Can the heroes bear to close it down?

Complications can be added to any above in the form of mundane investigators, from the unscrupulous to the honest, depending on the GM's mood, be they reporters, police detectives, or FBI agents. They all want something to report back, and to be the first to get the scoop as to exactly what happened, "who" did it, and how it can be prevented.

As an additional complication, one of the above agencies contacts the PCs, asking for help in solving a mystery due to an anonymous tip that they have occult knowledge that might help. It is possible that it is a coincidence, and a murder was arranged to look like a ghost killed them. It may be a distraction planned for the heroes to hide a PHASE operation (see below). The crime is related to a rip, such as air being let out of car tires in a parking lot. It happens that air is disappearing from the entire parking lot, slowly. Finally, and most dangerously, it could be a low-level PHASE operation.

Opposing Forces

Nevercorp

The PHASE Department is called Phenomenal Harvesting and Signal Exposition on paper, and Paranormal Hunting and Secure Elimination by its victims. These suits are looking for and securing places where water runs uphill and cheese turns into gold. The level of secrecy, weaponry, and tactics varies by campaign, but their city's headquarters shouldn't be within the reach of PCs, except perhaps at the end of a story arc. These agents will often attempt to distract heroes nosing around their operations by mysteriously "revealing" or amplifying existing holes that are worth no profit. These "humanitarian" cases can even make the news at times. e.g., a lone picture that drips blood might become "contagious" if brought into a museum.

Known PHASE plans involved the harvesting of odd molecules for their various effects on the human body (see ***GURPS Calahan's Crosstime Salloon***) and building a turbine in a perpetual waterfall.

Variants

*"Actually, I heard where the wizards were saying that the universe **was** destroyed all in one go, but instantly came back all in one go."*
-- Terry Pratchett, *Going Postal*

Disconnected

By agreement, the PCs could now live outside a normal human life. They are "saved" at the moment of "restore" such that they have memories of the agreement, and slightly augmented bodies. Meanwhile, a twin continues normal life, with family, friends, and a day job. The office provides a modest cash salary to pay for incidentals, such as cab fare. The augmented bodies do not need to eat or sleep. Contact with old friends and relations is, of course, forbidden.

No Fears

People "cleansed" using these powers may have their memories removed or fogged from the time they were first "infected." This can have a *Men In Black* effect when dealing with ordinary citizens. Heroes should have some immunity to extradimensional corruption, although trying to piece together one's memories is a staple of horror and science fiction. Many agents are working for a company just to try to find themselves!

GURPS

Some **GURPS** advantages may help the PCs may include Illuminated and Oracle to find the real news in papers and tabloids, Arcane from **GURPS Mage: The Ascension** p. 44 to avoid notice, Resist +8 (Extradimensional Corruption) [3], Immunity (Extradimensional Corruption) [5], Power: Purification: Healing (No Signature, +20%; Costs FP 1, -5%; Preparation Required: one minute, -20%; Not Melee: C, +40%; Melee: 4, -15%; Dimensional Rip "Disease" only - 80%; Net: -60%) [12]; Sense Rips 1: Detect (Rips: rare; Vague, -50%) [3]; Sense Rips 2: Detect (Rips: rare) [6]; Sense Rips 3: Detect (Rips: rare; Precise, +100%) [12], as well as the more usual Regeneration (Slow) [10] and Sanitized Metabolism [1] to reduce evidence. The office is also a powerful Patron that can reattach limbs, and cause them to regrow. It is recommended that one get a cast to wear as it heals. Popular enhancements to powers include Cosmic, +50%, Selective Area, +20%, and Reliable +1, +5%.

In Nomine

The even-increasing amount of disturbance in Symphony has crossed a limit, and now reality is breaking down. Each note of disturbance caused by celestials is actually causing tiny rips in the fabric of space, leaking in pieces of the Marches. After all, angels and demons aren't native to the corporeal plane. The party, in this case, might be the "janitorial team" operating in the areas with high celestial traffic. It even might be composed of agents from both sides of War, celestials and Soldiers alike. The sponsors could be Yves, Eli, Michael, or even Baal and Kronos. Subtle opposition could come from the "pro-Armageddon" Superiors.

As a variant, suppose that the day to day disturbance caused by intruders to the corporeal plane has ruptured reality! What seems to be all Hell breaking loose is actually a flood of ethereals down a number of Tethers around the world. If not capped soon, then all humanity may believe that the end is now, thus causing the tears to instantiate this belief, which causes world havoc, which in turn . . .

Variant Cataclysms

A Banestorm or [Manaclysm](#) unleashed upon a pre-*Technomancer* world can also wreak havoc. Such events may destroy civilization as the players know it, to the extent that it is not longer fun to game in.

The Cabal could accidentally cause something from beyond to enter the world, which promptly escapes. This creature then summons more of its ilk until the number of holes to its home dimension eventually causes the Earth to sink into the parallel world, destroying the universe.

Illuminated cataclysms can include the use of a world or mind-shattering device causing a mass disturbance in the collective unconscious of humanity. The death throes of billions cause all suppressed telekinetics to destroy the earth, as well as give all Jedi in the universe migraine headaches.

It's The End of the World . . . Not Really

If the GM has been backed into a corner by decisions or die rolls, then a restore of this sort may be in order for a new direction in the campaign.

Numina: Angels of the Old World

for *Warhammer Fantasy Roleplay*

by Jody Macgregor

"The common man's belief in Angels seems harmless enough; the idea that the gods have human-like servants who protect and shelter us must be of comfort to them. But it is also purest heresy. Sigmar needs no servants save us, it is the dark gods of Chaos who do their work through intermediaries. Those who claim to deal with Angels are really the dupes of cunning Daemons and must be shown the ultimate mercy of purifying fire."
-- Abelhelm Mueller, Witch Hunter

The Old World is harsh and unfair, yet its ordinary citizens persist in seeing the hands of beneficent gods in every piece of rare good fortune they have. It's a natural part of the way Humans personalize fate, removing the randomness of existence by anthropomorphizing it so that when something bad happens it was caused by evil spirits, and when something good happens it was the action of Angels. And in the Warhammer World, they're right.

Daemons and Angels do walk the earth. Not very often, admittedly, as both are beings of the Realm of Chaos and cannot survive long in the magic-poor Warhammer World, just as Humans cannot survive long underwater. Angels are even rarer than their counterparts; whereas Daemons have their gateway at the center of the Chaos Wastes to enter the world by, Angels must either wait to be summoned or force their own way through the veil when the Winds of Magic blow strongly. For this reason, while Daemons may come in hordes, the Angel usually arrives alone.

The summoning of Angels -- or Numina, as the scholars call them -- was practiced by Priests in the Old World's earliest days, but in the Empire and Bretonnia it ended with the rise of Sigmar and the Lady. Neither nation's god has been seen to have Angelic servants, although ignorant peasants of Bretonnia have insisted on believing the Grail Damsels to be such. Zealous followers of Ulric have even used this lack as evidence that Sigmar is a false god, causing the Sigmarites to retaliate by having belief in Angels declared heretical and artist's impressions of them burned.

In other nations the practice persists, and Priests of Myrmidia and Morr especially continue to summon Numina when dire need arises. The rituals of summoning are dangerous to perform -- they have been known to call down the wrath of the gods when overused or performed incorrectly -- and even when all goes well the Numen in question may not react as the Priests wish. Numina are immortal beings with their own desires and plans, and may ignore the orders they are given to pursue agendas of their own, whether because they see a greater purpose for themselves or because they have unfinished business from their last visit to the world. A Numen may insist on completing a previous mission before attending a current problem, or in the case of Numina of the gods of war, insist on avenging themselves on someone responsible for driving them from the world on a prior visit.

Religious authorities in Tilea, where study of Numina is most common, have it that each Numen is a fragment of the god they serve, given purpose and personality to perform a specific task in the world. This suggests that the gods have limits on how directly they may influence the world, an idea certain cults object to, but it would explain much. Why is it that certain places seem cursed or blessed while other havens of villainy or purity go unpunished or unrewarded, if not because the gods have limits?

Of the other races, only the Elves have any mention of Angels in their cosmology. Throughout history, chosen Elves have been capable of drawing down a part of their gods and embodying them as avatars, and they see Sigmar as a rare Human who was capable of becoming such an avatar. But when a worthy host cannot be found these embodiments walk the magic-soaked Elven lands on their own, doing the work of their gods.

The Numina give themselves use-names while among mortals, often typical names for the culture they find themselves among that derive from the name of their god. A Numen of Ulric in the Empire may call himself Ulfred or Ulli, while

a Numen of Rhya would be Renata or Rhiannon. Those Numina who visit frequently may grow attached to their use-names and persist in keeping them even when among other cultures, so some Numina will have names in very old languages indeed. The true names of Numina follow the same construction as the true names of Daemons, which gives those who consider them one and the same yet more proof.

In the Empire a secret society exists that is dedicated to perpetuating the worship and summoning of Numina. Called the Angelici, this society smuggles forbidden texts and works of art that heretically depict the Numina from the nations of Tilea and Estalia. They are led by Father Jon Denk, a Priest of Verena who keeps his identity secret lest he be cast out for heresy. He believes that his discovery of the book *A True and Faithful Relation of Angelic Conversation* was a gift from the Goddess of Knowledge herself, and has dedicated himself to learning the secrets of the Numina, gathering a group of likeminded members of disparate faiths around him. At their secret library near Totensee the Angelici gather and practice their summonings, praying that mistakes in translation haven't changed their rituals into summonings of darker beings. . .

Catspaws

Numina of Ranald, God of Tricksters

"He said his name were Rannalt. Seemed like an ordinary napper. I let him in on the job on Ralf's say-so. Did his part well enough -- good climber, I remember that. Scurried straight up that wall like a lizard. But after the job things got interesting. When we counted it up, there wasn't as much dosh as there should have been. Sombebody was holdin' out, see? But we couldn't say who. Next day, we found Slippery Eckhardt tied to a tree with no pants on, cryin' like a babe. Soon as we cut him down, he coughed it up, handed over every penny he'd nicked from us. Said it were Rannalt that twigged him. We never saw Rannalt again, but to this day Slippery Eckhardt pays a tithe to the shrine club and jumps whenever he sees a black cat. And he never welshes on his mates no more."
-- Leonard Massmnster, Entrepreneur

Ranald's Catspaws (sometimes known as Crowsclaws) look like ordinary males of a criminal persuasion. The only things they have in common are jet-black hair and that they wear fingerless gloves so that their claws can be unsheathed at a moment's notice. The Catspaws rarely use their claws for violence, and will only do so in self-defense. Their main use is for climbing while committing acts of burglary.

A Catspaw may join a gang of thieves who are planning a masterful heist if the target has somehow angered Ranald, perhaps by exploiting the poor or closing down one of his favored gambling halls or grog houses. The only thing Catspaws frown on more than exploiters and killjoys are thieves who break his tenets, either by employing unnecessary violence or robbing other members of the cult. Catspaws have a mean sense of humor, and are only too eager to play their tricks on those who don't do right by their god.

Ferrymen

Numina of Morr, God of Death and Dreams

"When the moons are two sharpened daggers,
With points that could draw blood from stones,
They fly through your dreams on black wings,
And the trees in the moonlight are bones."
-- Old Tom, Drunken Streetcorner Poet

The Ferrymen are dark, skeletal figures who wear long, black robes and have raven-like wings growing from their backs. The superstitious place small statues of them in the Gardens of Morr to aid the dead in their journey, although these icons are called Morr's saints in the Empire to avoid charges of heresy.

The Ferrymen appear in places where the ethereal Undead dwell to show them the way to Morr's realm, by force if need be. They wield swords and scythes capable of harming even insubstantial Ghosts. Infrequent reports of Ferrymen come from the cursed city of Mordheim, the only place where they have been seen in numbers in the last thousand years.

Merciful

Numina of Shallya, Goddess of Healing, Mercy, and Childbirth

"She came to us cured of a plague that we had been unable to treat, but refused to explain how the cure had been brought about. Oh, she had some fanciful story about a Merciful Angel who wept while she wiped away the buboes with her touch, but we saw through her lies. The only way to cure her disease was with the aid of the Plague Lord. We turned her over to the proper authorities, and now she receives a punishment far worse than any plague. It is no less than she deserves."
-- Grietkin Beck, Imperial Priestess of Shallya

Such an intense aura of holiness surrounds the Merciful that, even if they did not fly on dove-like wings, they could not be mistaken for mortal women. With this aura of holiness comes an aura of sadness; the Merciful weep perpetually for the torments of mortals. These tears have sometimes been collected by Priests and used as potent holy water.

The Merciful are capable of curing diseases or healing wounds with a touch, and when they visit the Old World they quickly exhaust themselves among lepers and plague victims before fading away. They leave behind devout followers who often go on to join Shallya's cult or found new temples, spreading the word of how they were part of the Healing of the Hundred or the Cleansing of Spielburg.

The expressions of pity and sorrow on the faces of the Merciful only vanish when faced with agents of Nurgle, the

Plague Lord. Then they are replaced with tears of fury, and the Merciful draw their burning swords to visit quick and merciful death upon their opponents.

Myrmidisir

Numina of Myrmidia, Goddess of War

"I served under General Cobbe for a time, before the Storm of Chaos. He was an inspired tactician; Cobbe's Traverse is still taught to students today. What they aren't taught is that behind Cobbe there was a woman, a mysterious Tilean lady who was only rarely seen outside of his tent. The men thought she was a mere courtesan, but I knew Cobbe better. She was his closest advisor, and on the eve of battle he would allow no one else but her to see him. There was gossip of course, but I believe they spent their nights talking of nothing but stratagems, for surely such inspired tactics came from an extraordinary source."
-- Colonel Senf von Scharf, Imperial Army (Retired)

The Myrmidisir, the watchers of war, appear as strong-featured women of noble temperament, although in times of crisis eagle's wings grow from their back and they stand revealed in all their terrible glory. These watchers are fascinated by the to-and-fro of battle and are sometimes glimpsed by soldiers, looking down on them from hills or even soaring overhead. They prefer to watch the warfare of intelligent races; the brute force and lack of subtlety displayed by the Orcs and their kind bore them. They interfere with a battle only when the rules of combat are grievously broken, such as when an army mercilessly slaughters civilians or prisoners. On these occasions they fly into battle wielding spear and shield, fighting with a fury that is terrible to behold. Few have ever lived to tell of an attack by the Myrmidisir.

The Myrmidisir have studied strategy closely and are among the greatest tacticians in the world. They only share their secrets on rare occasions, but just as Myrmidia was smitten with the mortal Ottokar according to legend, the Myrmidisir may grow fond of mortals who display a mastery of strategy and grant them their favor and knowledge.

Scripsisters

Numina of Verena, Goddess of Learning and Justice

"I have seen evidence that the famed engineer Leonardo of Miragliano did consort with an otherworldly being who answered to the Classical name 'Nemosynian,' that he kept her magically chained and bound that she would help him in his endeavors and fabulous inventions. These inventions, therefore, came from a heretical source and the possession of such amounts to a grave crime. The Emperor will not hear me, but still it is my holy duty to remove these abominations from the world."
-- Vinzenz Falkensteiner, Witch Hunter

The Scripsisters appear as ordinary women of a scholarly bent. When entering the world by their own means they gravitate to great libraries and centers of learning where they use their powers to secretly aid devout scholars in their research, leaving relevant books in exactly the right place to be stumbled across or placing enchantments on them so that they seem to snag the fingers of those who touch them. For this reason some Verenans trail their fingers along bookshelves when browsing them in case a Scripsister has left such an enchantment behind.

Some scholars have also summoned Scripsisters to aid them in important works. They make excellent research partners as they know unerringly where to look for the right information, even in seemingly tangential or irrelevant texts.

servant of the dark gods fell. He was truly terrible to behold, yet glorious at the same time, a god in his righteous fury. I've heard no one else tell of it, but he was truly what saved Middenheim that day. Yes, all this came after I took the blow to the head. What of it?"
-- Johann Schlitz, Soldier of Middenheim

Wolfskin take the form of broad-shouldered men, as large as the largest Norscan, with a thin coating of fur over most of their bodies. Their heads are those of fearsome wolves. It is said that in the days before the Empire's founding a Wolfskin mated with a woman who then gave birth to children who were able to take the forms of wolves or men, but few give credence to this tale.

The Wolfskin love nothing more than battle, and when called they can be difficult to control. There are tribes of raiders in Norsca who have summoned a Wolfskin to aid them only to fall before his attack themselves after the battle was thought won. They are indifferent to mortals, and care only for the shedding of blood, though they will attack the followers of other gods in preference to followers of their own.

Numina of Other Gods

Rumors persist that Numina of other gods than those described above exist, although they have been sighted so rarely they make the Numina here seem common. An underwater creature with the body of a man and the tail of a fish seen by some sailors has been called an Angel of Manaan, King of the Sea. Strange, mean-natured spirits or "Spites" seen within the forest of Athel Loren may be servants of Taal and Rhya, the nature gods. Followers of Ahalt the Drinker speak of corn-men who absorb blood through their roots, and followers of Handrich, God of Trade, may be convinced under duress to speak of the unlikely Angels of Accountancy.

Aura

Description: Numina are made of the very stuff of magic and this protects them when they are in the mortal world. Any time a non-magical weapon hits a Numen, the Numen's Toughness Bonus is treated as though it were increased by +2. Additionally, the Numen's own attacks are considered to be magical. Lastly, Numina are completely immune to the effects of poison and suffocation.

by Nikola Vrtis

Need a new weapon for your sci-fi/space-opera campaign? This script randomly generates game characteristics for one, complete with a technobabble name. Some combinations are more "space opera" than others, so you might need to create a few guns before you get something that suits your needs. The details of the gun's history and technology are left to you.

Marriage Is Two Different Entities That're More Interesting Together

My poetry professor in college, [Dr. David Kirby](), did what many good professors do in instructing their classes: He wrote the book we used. The book in question, *[Writing Poetry: Where Poems Come from and How to Write Them,]()* contained an overview of the various "shapes" a poem can take. Most of the shapes don't have much direct relationship to gaming (for example, there isn't a direct RPG corollary that I can think of for the "formal" poem, which encompasses sonnets, haikus, and the like), but a couple of them have a direct application to the gaming world. This week and next I'll be discussing those forms that make sense to plumb for ideas, in the neverending quest for inspiration.

And, as an extra "bonus" bit of shameless file-drudging, I'll be digging up a poem or two from my archives. This one is over a decade old now, and I can even pretend it's directly gamerly related because its inspiration is taken from a gaming book.

Fly in the Cold War Ice

In addition to sabotaging machinery, spies can sabotage events. These operations often resemble enormous practical jokes. . . . [One] such incident occurred at the Chinese Communist Culture Exposition in Japan. CIA posters advertising that event promised, "Lots of free Chinese food." Over 18,000 people appeared for an event expected to involve 400.
-- Thomas Kane, **GURPS Espionage**

The free world was protected by pranksters,
the ones once vanquished to corners in conical hats
and forced to "think about what they'd done."

But war made for strange bed fellows,
and the global powers made experts in short-sheets.
We slept at night for their heroic efforts:

the East Berlin Doggie Doo Drop,
the Krushchev UN Whoopie Cushion Plot,
the Korean "I've Got Your Nose" Maneuver.

Episodic, these years were spent waiting,
waiting for payoffs, punch lines, the inevitable
that never seemed to come, except by surprise.

Children hid under desks, frightened and snickering;
the terror of the U2 falling with its clown nose
payload, shot down by a Soviet pie launcher,

the slow menacing spread of Sarcasm
to China -- North Korea -- Vietnam,
the Cuban Exploding Cigar Crisis.

But the wall was torn down, destroying
graffiti that read, "There once was a man of Datong. . ."
and the pranksters are old and forgotten.

These times are tame, with little to think about.
We don't live in fear of Brezhnev's handshake,
but no one smiles anymore as they're shot in Dallas.

That's an example of a marriage poem, so called because it marries two disparate concepts . . . in this case, "espionage" and "pranking." Marriages generate a lot of their energy based on the level of difference between the two ideas.

When it comes to campaign ideas, "marriage" is probably the most common form for a lot of concepts. More often than not, one of those partners is "magic": "magic and cyberpunk" (*Shadowrun*), "magic and Victorian" (*Castle Falkenstein*), and so on. "Horror" is another popular marriage partner (with "magic" usually tossed in for free as part of that bargain), as seen in *Call of Cthulhu* (horror/pulp) and *Deadlands* (horror/Westerns). But, really, marriage can come from uniting pretty much any interesting ideas and figuring out *how* they mesh. Want to marry sci-fi with fantasy? Well, that's *Star Wars* (or most other space-opera settings) or *Spelljammer,* depending on the mix. Or how about marrying fantasy with anime (*Exalted*), post-apocalyptic (*Dark Sun*), or pulp (*Eberron*)? And, of course, you can choose how you want to mix things; tweaking the "horror/fantasy" marriage can result in *Ravenloft* or *Earthdawn.*

But marriage is good for more than campaign ideas. Really, almost any two disparate concepts can be thrown together and make an interesting character: "con man who wins the lottery," "highly skilled bureaucrat who's legally dead," or "bloodthirsty assassin who's a parent." (Really, "who's a parent" is a great hook to hang a bunch of character concepts; just about any of your standard adventurer tropes become revitalized by giving 'em a child.)

And, of course, it can be a neat way of thinking up new adventure ideas, too. Marry a "recover the antidote to save humanity" plot with "elaborate bank robbery caper," and you've got something pretty new: the heroes learn of some selfish-but-skilled folks' efforts to break into MegaConEvilCo's headquarters to steal an antidote to a soon-to-be-released pathogen, and the good guys need to assist and tail the robbers' efforts well enough so they can help them succeed, while still hoping to apprehend them in the end. Or, as another example, marry a traditional "boy meets girl" romantic subplot with . . . oh, *Hamlet.* How will the wacky antics of the new love interest play out when it's revealed that that the interest believes his uncle killed his father?

Unlike the viewpoint of most churches, there's nothing to limit the number of elements in a marriage to two. Of course, the more you add, the trickier it becomes to balance everything and make sure none of the elements are being underutilized or left out in the cord (not unlike a real-world marriage, I suppose). But, still, "con-man assassin who's a parent" has a nice ring to it.

While there are no new ideas under the sun, there's still plenty of fertile ground to be found my mixing and matching extant ones. And there's a good chance that the married couple is more interesting than either element left to its own devices.

Rippers: Horror Roleplaying in the Victorian Age (for [Shane Lacy Hensley's Savage Worlds](#))

140-page full-color hardcover; $29.99

The Plot Point campaign books for _Shane Lacy Hensley's Savage Worlds_ have done several genres, from post apocalyptic fantasy to swashbuckling magic, from superheroes to oddball fantasy. What it has not done is the horror or Victoriana genres, but it brings these together in **_Rippers: Horror Roleplaying in the Victorian Age._** The year is 1892, and everything you read in the penny dreadfuls is true. Monsters stalk the gaslit streets of London and haunt the deep forests of Eastern Europe, while the ancient undead plot from beneath the sands of Egypt. Against a strengthening threat known as the Cabal stand the redoubtable men and women known as Rippers. Strong of heart, Rippers not only use the arcane lores of magic, miracles, psionics, and weird science against the growing monstrous threat, they also possess a new biotechnology -- Rippertech. Quite literally they rip parts from the bodies of the monsters they slaughter and either make potions from the organs or implant them directly into their bodies.

Rippers is a game of supernatural horror that references many of the 19th century's most notable authors, including Sir Arthur Conan Doyle, Jules Verne, Robert Louis Stevenson, Mary Shelley, H. Rider Haggard, Bram Stoker, and H. G. Wells, as well as Alan Moore and Jeffrey Grant Rice. It provides a campaign model that centers on Rippers operating from a player-created Lodge, which the Rippers must maintain and garner support for, as well as maintaining their own social standing and keep hidden their monster-hunting activities. The campaign itself throws the Rippers up against some of the genre's most notorious monsters, delves deep into the secrets of Rippertech, and forces them to tread that fine line between great power and mind wrenching insanity.

Possible roles include crime fighting acrobats, mind probing alienists, gun-slinging cowboys, detectives, doctors, explorers, scientists, soldiers, gadgeteers, vampire staking slayers, fury driven vengeants, and gadget using vigilantes. The most notable include the London based vigilante Spring Heeled Jack, and the slayer Johan, adopted son of Abraham Van Helsing, the man who leads the Rippers. The Rippers are divided into factions: the Masked Crusaders, the werewolf hunting Old-Worlders, magic using Rosicrucians, the Slayers, The Order of St George, and the Witch Hunters.

Character creation for _Rippers_ follows the standard process for _Savage Worlds,_ but adds two new statistics. Status can be used for influence rolls, but must be maintained through the necessary expenditure, while Reason is a measure of a Ripper's mental faculties. It can be positive or negative, and is used as a modifier for all Spirit-based rolls and rolls on the Fright table. Through scares and frights, Reason can only be lowered to zero, and the only way to make it negative is by installing rippertech. A host of new Hindrances and Edges are added, many being faction related, but the only new skill added is Knowledge (Rippertech). This is necessary to research, build and implant Rippertech.

And thus Rippertech lies at the heart of the campaign. Implant a piece of Rippertech and a ripper has amazing abilities though with some side effects that can be avoided with a good Knowledge (Rippertech) roll. For example, implanting Bone Stiffening grants extra Toughness but reduces Agility. Implanting a Hellfire Heart grants the subject fire breath and protection from cold, but prevents a ripper from entering consecrated ground. Alternatively, a ripper can imbibe an extract made from the donated material, often preferable to the Reason-reducing effect of an implant. Rippertech also has a far darker side effect that becomes apparent only during the campaign.

Most of the Plot Point campaigns published for **Savage Worlds** have been quite tightly scripted and dependent upon character experience level. **Rippers'** Plot Point campaign is more driven by player decisions, beginning with the creation of the characters' base or Lodge, by default based in London. This Lodge is measured by four stats -- Influence, Membership, Resources, and Facilities -- which take time and money to increase. Improvements reflect a Lodge's growing importance to the Rippers, and also how it can support the characters' efforts to research Rippertech and face the Cabal. The players must pay attention to their Lodge not only for the benefits (and roleplaying aspects) it provides, but also because it actually caps character level. Further, when a Lodge reaches a certain size the Rippers can assign recruits to lesser missions.

The bulk of Rippers' Savage Tales need to be GM created, and are categorized into Hunting, Investigation, Recruitment, Research, and Socializing adventures. A series of tables ease this creation process, but really act as a set of pointers for the GM. The given campaign is shorter than most Plot Point campaigns because it is intended that the GM add to it. Its focus is on delving into the setting's secrets, on travelling the world, and on presenting opportunities for the Rippers to meet some of Victorian literature's most notable monsters. Beyond the campaign itself, **Rippers** introduces a method of handling sanity loss along with this host of classic horror monsters to the Savage Worlds system.

Because the campaign requires more input upon the part of both the GM and players and there are fewer pre-written scenarios, the downside is that, unlike other Plot Point books, **Rippers** is not as easy to pick up and run. **Rippers** is easy to play though, owing its horror to the pulp end of the genre and even the Hammer Horror and Universal Monster films, and so calls for all those involved to play up to the associated clichés. Yet despite it being a game of supernatural horror, it owes something to the Cyberpunk genre in that Rippertech is akin to cybertech, although much, much grislier. In comparison with the Cyberpunk genre, the emphasis in this campaign is very much upon fitting into society as much as it is upon fighting monsters, although **Rippers** gives more support to the monster hunting than Victorian mores.

One part "The Ripper-Files," one part "Molly Millions: the Vampire Slayer," one part "Kolchak by Gaslight," **Rippers: Horror Roleplaying in the Victorian Age** brings two genres to the **Savage Worlds** system, but in emphasizing the monster hunting, leaves the period's history and manners in the hands of the GM and players.

The Art of Dragon Magazine

Published by Paizo Publishing, LLC

Compiled & edited by Erik Mona

Art direction by Sean Glenn

160-page full-color hardcover; $34.95

Everyone has a favorite memory about gaming, and for many that means a particularly striking piece of illustration in a manual or, for you **Dungeons & Dragons** fans out there, the flagship magazine. It's worth a thousand words and all that. Since the venerable old roleplaying game has turned 30, a number of items have been produced as part of the celebration, and for the graphically inclined there's **The Art of Dragon Magazine.** Editor Erik Mona and his team went through several years of back issues to uncover the best. That's a relative term, of course, but it sure seems like they've scored some of the most iconic imagery.

There are five sections, each focusing on a different element of what makes this the game it is. Just as in the core rules, character comes first. "Adventurers" is all about your in-game alter ego and how cool he looks when portrayed by some of the most talented names in the business. "Magic" adds the most special of effects, and "Monsters" populates the pages with vicious foes. Sadly, that second part zeroes in on a lot of humanoids, particularly the undead or foes in armor identified only by their glowing eyes. There are some dinosaurs and beholders and the like, but too few real critters to claim anyone struck a good balance. The "Worlds" chapter isn't a letdown, but it is a bit harder to justify those shots. You get a little taste of everything -- martial arts, some steampunk, the near-future -- but there's doubtless a good reason this section is so brief.

There isn't a section called "Dungeons" (c'mon -- you know what the background is going to be for many of these pieces) but the book does finish strong with "Dragons." **Dungeons & Dragons'** bread and butter, an assortment of the big lizards in various modes of activity (and at either end of the fantasy food chain) spans the pages. Had the "Worlds" been sacrificed there might have been space for more of the mag's *raison d'ê:tre*, but maybe the editors have similar feelings on just how far a few fire-breathers take you.

Some of it is stirring stuff, and you wish more of them had titles just as evocative. Who suspected the ride would last three decades? If they knew someone was going to enshrine them after all that time, they probably would have taken a few more minutes to come up with something spiffy. This does lead into one of the few problems with the book, however, and that's consistency in labeling the illustrations. When two pages are taken up by one or two full-page entries, there's no place for the titles. The names are instead placed on the page preceding it, unless they're placed on the page after it. They call them spreads, except where it's "overleaf." If it's two distinct pieces, they put the left-hand piece's title first, above the right-hand piece, unless they reverse that order. Which way they go is obvious from the parenthetical "left-right" labels, save those occasions where those are omitted.

They must have concentrated on the rest of the writing, of which there isn't much. There's some introductory text at the front of the book and again to kick off each chapter, but what there is is deftly written and to the point. The compilers are as fond of their recollections as the rest of us, and they know when to leave off talking and let the art speak for itself (come to think of it, that's the title of the introduction).

The biases, if there really are any, don't seem all that overt. Some pieces, it must be said, fade into the background (it takes real skill to make the umpteenth dark elf stand out from a crowd), but the styles, subjects, and source materials

come from across the spectrum and focus on no one era of the periodical's history (yes, issue one is here). Some artists get more time than others, but it's not a parade of the same names on an endless loop.

It's going to be hard for anyone to look through it and not find something terribly familiar, something that recalls a fond afternoon at the game shop or in the rec room. It's a shame things are so up in the air about the fate of the magazine these days, but *The Art of Dragon Magazine* reminds us that art lasts forever, and so many familiar frames indicate the shared experience goes far deeper than the printed page.

The Omniscient Eye

Is That a Nuclear Weapon in Your Pocket?

During the last 60 years, nuclear weapons were miniaturized from a load for a B-29 bomber down to a six-inch artillery shell. At the same time, both higher and lower yields became available.

I'm gaming in far-future science fiction backgrounds like *Traveller,* so let us ignore the messy (and probably classified) details of building a physics package and focus on the physical limits in terms of weapons-grade stuff:

- **Is there a formula to calculate the yield of a nuclear weapon from the weight of the materials, and does it apply to very large and very small yields?**
- **Some SF games talk of "micronukes." Are rifle bullets in the 0.001-kt range possible using physics (not engineering) as we know it?**
- **How large would a gigaton-range weapon be, and it is possible to build fission, fusion and AM weapons with this yield? Or are there reasons beyond sheer bulk why larger warheads tend to be fusion bombs rather than fission bombs?**

--*Onno Meyer*

This is a surprisingly complex question. To take each part in order:

Size Doesn't Matter (Much)

No, there is no direct formula to relate weapon mass (or the mass of reactive material it contains) to its yield. All current weapons rely on an initial implosion, but the way this is triggered has a huge effect on the efficiency -- the fraction of the material that fissions -- and in the case of a multi-stage weapon, the emphasis is less on trying to maximize the yield from the initial trigger and more on tuning the way the energy comes out to suit the second-stage (and possibly third-stage) assemblies. The Little Boy bomb used at Hiroshima contained 64kg of uranium, of which 0.7kg underwent fission and 0.6g became energy. There is an upper limit to the yield, which would be achieved by putting all of the reactive material through whatever transformation is being used; however, increasing this efficiency is an asymptotic process involving more and more complex (and thus heavy and bulky) trigger devices, worsening the yield per mass of the device as a whole.

Nuclear-weapons designers work essentially with a given volume and weight budget, and try to get a useful yield out of that. This has proven practical. Current nuclear weapons systems have warheads rather smaller than previous ones; from the 1970s onwards, a great deal of effort was put into improving the accuracy of missiles (some of which spun off into today's smart weapons) rather than making bigger bombs; getting a bomb to half its predecessor's distance from the thing you want to blow up has roughly the same effect as increasing its yield by four or more times, and can usually be done more easily. Aircraft and artillery bombs need to have low-enough yields that the firing unit stands a chance of survival. And so on. These current weapons can typically generate a yield of one or (at most) two kilotons per kilogram of weight (achieved at the end of the 1950s), but this is not a formula that should be projected into the future (or past) or outside the range of contemporary devices.

For a given yield, the smallest and lightest bomb is not the one with the least reactive material -- the more complex trigger will outweigh any savings in mass of nuclear explosive. This is just one of the tradeoffs of nuclear weapon design; cost is also important, making a reasonable level of efficiency desirable (the reactive material is usually the most expensive part of the bomb), as well as reliability of detonation. The mass of fissile materials in current and

historical nuclear weapons is less than 10% of the mass of the device. Even selection of isotopes for weapons very rarely considers their yield per mass; other factors, such as low spontaneous radioactivity (so that the weapon can be stored for a long time before use) and ease of machining, are rather more important.

How Does a Nuclear Weapon Work?

All nuclear bombs work on basically the same principle: Bring enough radioactive material close enough together (to form a critical mass) that the neutron emitted from one decay event has a high chance of hitting another atomic nucleus and prompting another decay event . . . and so on, with a prompt energy release. Perhaps fortunately, this is quite hard.

The amount of material that constitutes a critical mass varies with the specific isotope in use; for a bare sphere of uranium-235 it is about 50kg, and for plutonium-239 10kg. Use of a neutron reflector can allow a nuclear detonation with only 15kg of uranium-235.

One problem is getting sufficiently pure radioactive material; non-radioactive isotopes will dilute the effect and may prevent it from occurring completely. (Which is why purifying -- or "enriching" -- uranium is such a big deal.) Another problem is that, when you do bring the pure material together, it starts to generate lots of radiation and heat. That's what you *want* to happen . . . but the initial mini-explosion has a nasty tendency to blow the bomb apart before most of the contents have had a chance to react. That gives you a much lower yield than you might have expected, and lots of radioactive material all over the landscape.

There are two basic solutions to this. The gun-type fission bomb (as used at Hiroshima) fires a slug of fissile material into a pit in another piece of fissile material; it's moving quickly enough that the deceleration from the initial energy release doesn't slow it down sufficiently to prevent an efficient reaction. More recent devices have relied on large quantities of explosive, carefully arranged and detonated with sub-microsecond accuracy, to crush a hollow form of fissile material into a compact space.

Fission bombs rely on heavy elements such as uranium or plutonium, and cause their atomic nuclei to be split. Fusion bombs (aka "hydrogen bombs" or "thermonuclear weapons") use lighter ones, such as deuterium or tritium (isotopes of hydrogen), and cause their nuclei to be combined. In basic form they are essentially similar to fission devices, but they release rather more energy and require correspondingly more energetic initiators; rather than conventional explosives, all fusion weapons to date have used a fission device as the initiator. Some three-stage weapons have used one fission-triggered fusion bomb to trigger a larger fusion bomb; the Russian 50MT Tsar Bomba was of this type, and there is in theory no limit to how large a fusion device could be set off in this way.

An alternative three-stage treatment is a fission-fusion-fission device, which wraps a conventional two-stage fission-fusion bomb with more enriched uranium, which is detonated by the internal explosion. This can substantially increase the yield for a relatively modest investment of fissionable material.

What Happens When It Goes Off?

The radius damaged by a nuclear explosion in atmosphere increases with the size of the bomb, but not in an immediately obvious way. Air is essentially transparent to thermal radiation, so destructive radius increases as the square root of the yield just as with any other electromagnetic radiation; however, larger bombs emit heat slightly more slowly so the damage per joule of heat is reduced. Blast is a volume effect (energy is deposited in each piece of material through which the blast wave passes), so it decays as the cube root of distance. Nuclear radiation is an inverse-square effect in vacuo, but in atmosphere it is strongly absorbed by the air so decays even more quickly than blast effect. The rules of thumb are:

r_thermal = $Y^{0.41}$ (enough for third-degree burns)
r_blast = $Y^{0.33}$ (4.6psi overpressure)
r_radiation = $Y^{0.19}$ (500 rem)

where Y is measured in 2.5kt units and the radii are in kilometres.

It seems likely that thermal and blast effects for an antimatter explosion would work in much the same way, though radiation effects would be very much lessened; however, the total quantities of antimatter produced to date are so small that this can only be theory for the moment.

Small Bombs

In the micronuke arena, the only plausible way with current physics is by using antimatter. There is a good rule of thumb that you cannot build a nuclear device, no matter how hard you try, that weighs less than a bare critical mass of whatever fissile material is chosen. Even with exotic transuranic elements, this imposes a minimum mass around the five-kilogram mark (Californium-251). Something that might improve on this would be vastly more powerful chemical explosives, but a bullet-sized nuclear device is still well beyond what can reasonably be expected.

The antimatter-warhead bullet would have to contain a long-term storage system sufficient to survive firing stresses. However, if a gram of antimatter could be made to react completely, it would develop a yield equivalent to about 20 kilotons of TNT. (Technically it would be twice this, since an equal amount of matter would be annihilated, but roughly half the yield is as neutrinos which have little or no interaction with other matter.)

It might be desirable to seed an area with a large number of small antimatter bombs, in the style of modern cluster weapons. This would destroy targets in a larger area without wasting energy on vaporizing the center as a single bomb does. This will depend very much on the mission and on the target profile.

Big Bombs

When it comes to gigaton-range weapons, a fusion device is smaller, lighter, cheaper, and -- above all -- safer than fission. Fission bombs beyond about 200 kilotons tend to be awesomely inefficient with (expensive) fissile material, and also unsafe; you can't spread the critical mass out far enough to make the weapon comfortably subcritical, and still assemble it quickly and reliably enough to get a detonation. Possibly the most awful specimen that was ever deployed was the British Green Grass device (used in the Violet Club and Yellow Sun Mk I air-dropped bombs), which barely reached 400kt yield and was created as the result of politics (the government had promised the RAF a "megaton-class" weapon); the safety device (10,000 small ball bearings) had to be removed before an aircraft carrying it could take off, which meant that it could not be taken on missions where there was the possibility that it might not be dropped . . . similarly, the American W47 warhead was safed by a boron-coated wire inserted at the time of manufacture, which could not be replaced once it had been removed. This had obvious implications for both training regimes and war-fighting procedures.

If the yield per mass of nuclear weapons could be improved by a factor of five, which seems physically plausible given vastly better conventional explosives to initiate the process, a megaton weapon would fit into 100kg and a gigaton into 100 tons. An easily portable gigaton weapon is going to have to use antimatter (a minimum of around 50kg of it).

If you have a technology that enables you to manufacture and store gram quantities of antimatter, the principal problem with using it for bombs is getting it all to annihilate at once. While all of a piece of antimatter exposed to normal matter will certainly explode, the explosion generated by the initial contact with matter tends to repel the antimatter from the point of contact, delaying the next small detonation. This would tend to spread the energy release over time (estimates vary as to just how long -- not enough antimatter has been produced to try it in the real world -- but possibly several seconds), rather than producing the very prompt release necessary for explosive applications. It is not yet clear how to get around this problem. Using antimatter bit by bit in a particle accelerator (*GURPS Ultra-Tech's* "pulsar" weapons) might be rather more effective than making a bomb with it.

How Do You Store Antimatter?

It has to be kept isolated from all normal matter. There is one technique used for doing this at the moment: suspending antiparticles in a collection of powerful magnetic and electrical fields such as a

Really Big Bombs

Bombs stop being useful when their destructive area is larger than any target you want to aim at. In "tactical" terms the largest target would probably be a division or corps. Nobody has yet seen fit to develop a weapon with a yield greater than 100MT, which the Tsar Bomba could in theory have reached; its blast circle, with a diameter of up to a hundred miles, would leave a huge hole in the enemy forces, but it would have to be well back from the battlefront to prevent friendly casualties. There would also be constraints on destroying strategic resources or valuable cities. Once all the "off limits" areas are marked on the map it might be hard to find a place for even a 20-mile wide blast (2MT).

If destroying enemy cities is acceptable or desirable, you still have the problem of only wanting to blow up one country at a time. Even the Soviet Union had areas less than 2,000 miles wide north-south. A bomb with a 3,000 mile blast diameter (400GT, assuming the relationship holds at this sort of scale) is going to have very few useful targets, unless you're waging war on an entire continent at once; this scale of energy release seems likely to cause huge disruption of weather patterns as well, spreading its effects round the world even before fallout is considered.

On the other hand, if your aim is to reduce planets to rubble, you want your weapon deep underground. Methods of emplacing it have been devised; one proposal involves dropping a series of megaton-range nukes into the same crater at 10-minute intervals to dig a deeper and deeper hole. You have to go to bigger ones gradually to maintain a slope on the hole and keep it from collapsing. (Lava will also be a consideration.) When you're down a thousand or so miles -- the biosphere was toast a long time ago -- you drop your gigaton bomb into the crater, set off a few large ones outside the crater to fill it in a bit and get some tamping, and then blow a chunk of the planet away at more than its escape velocity. (Actually blowing the Earth into infinitesimal pieces takes rather more energy: 30 zettatons at the absolute minimum. But that is another article . . .)

Penning trap, which can even contain neutral antiparticles if they are sufficiently cooled (to small numbers of milliKelvin above absolute zero). This is a power-consuming device, which would not be suitable for warehouse storage; current models contain only small numbers of particles, nothing like enough for a useful bomb.

A hypothetical storage technique is to insert negatively charged antiparticles into a molecule of fullerene; the electron cloud of the cage structure of the fullerene should repel the particles and keep them centered within the molecule. This has not yet been demonstrated, but seems the best bet for a hard-science storage system.

Nuclear weapons are complex and intrinsically fairly safe; many things have to happen with just the right timing in order to produce a nuclear explosion. By contrast, an antimatter bomb will detonate given any failure of containment -- perhaps not in the most effective way possible, but certainly releasing its full quota of energy.

The Terrifying Plot of Dr. Z!

Episode 2: The Lair of Dr. Z

by Matt Riggsby

When we left our heroes, they were trapped in a burning warehouse, surrounded by thugs. If a character can fight his way through Dr. Z's thugs, he could make it to the professor's locker before conditions get too bad.

The closet contains folios full of papers, notebooks, and bits of unfinished equipment, including an object closely resembling the sketch of the concentrator. The concentrator, a hollow, ringed metal tube about a foot long and six inches across, weighs no more than five pounds, and most of the individual folios and notebooks are likewise quite light. However, the other equipment is very heavy, and the combined weight of all the papers is over 100 pounds. With the air turning smoky, the heroes have to pick what to take in a hurry.

Getting to the closet wasn't too difficult. Making it out is another question. First, a few thugs may be creeping around the warehouse, ready to leap at passing PCs. Second, the fire spreads rapidly, filling the aisles with smoke and flame. Will the PCs take the rickety stairs? Shimmy down the elevator shaft? Crash through the windows?

Regardless of their solution, by the time the investigators get outside, the police and fire department will have arrived. The police are inclined to detain anyone who looks like they may have been involved in a fight or in setting a fire. The thugs are uncooperative and will be dragged away in a black Mariah, but before things get straightened out, the heroes may also have time to pickpocket one of the thugs or ask one good, intimidatingly phrased question with a reasonable chance of getting a short answer.

If the PCs convincingly claim to know nothing or don't appear involved, they get away with no more than cursory questioning. However, the police are suspicious of anyone carrying stacks of papers or unusual hardware, so the investigators may want to temporarily hide whatever they've recovered.

The PCs may now have several leads. First, if they recovered some notebooks, study by someone with scientific skills reveals that they detail the development of a device which takes electrical power and turns it into a focused beam of energy through a large, carefully shaped crystal. The notebooks contain sketches, obscure calculations, musing about specifications, and the like. There is speculation that different crystals will produce different energetic effects: light, heat, radio waves, etc.

There are several references to going to Occident-Orient for more equipment, and several blocks of formulae have been copied into the notebooks from another source, with notations that the originals have been destroyed. One of the notebooks uses a red paper napkin as a bookmark. The napkin is stamped in gold with "Lee's Seven Happiness," the name of a nightclub in Chinatown which, on a Streetwise roll, is identified as a front for criminals.

A Physics or an appropriate Engineering roll identifies the ringed tube as a working prototype of the concentrator. With the aid of the notebooks, an electrical power source, and a large quartz crystal, a character with Engineering could rig it into a remarkably powerful spotlight.

Second, the thugs may provide clues. They don't speak English and are uncooperative in Chinese, but physical evidence indicates their loyalties. Most carry matchbooks from Lee's Seven Happiness and have tattoos indicating (on a Streetwise or Heraldry roll) membership in a gang called Triumphant Fist. Some have business cards for the Occident-Orient Import-Export company, with an address near the docks about a mile from Chinatown, and these are clearly men who rarely see business cards. If the PCs spotted the Packard, they can trace the license number to a Mr. Shang Ti Lee.

It all ties together. Lee is a prominent figure in the Chinatown underworld. His

legitimate business interests include ownership of Occident-Orient and Lee's Seven Happiness (where Miss Papillon currently performs). His more lucrative interests involve gambling, protection, and smuggling, with muscle provided by Triumphant Fist, a Chinatown street gang.

Of course, it'll take legwork to make the connections. At some point during the investigation, the most attractive (in case of a tie, the most attractive and wealthiest) male PC receives a visit from Miss Papillon. She appears when the character is alone, perhaps lounging on his sofa one night when he gets home or in the passenger seat of his car when he goes for groceries. Miss Papillon knows, broadly, who the heroes are and what they're doing. She also knows where the PC she's talking to keeps his weapons; she'll place herself between him and them if possible, and has a gun-toting thug nearby just in case.

Miss Papillon has come to warn the hero away. He is, she says, too cute to die in an ugly way. Professor Mathers's death was unfortunate, but there's nothing she could have done to stop it (which is close enough to the truth). The professor got in too deep with things he didn't understand, and the investigators are on their way to doing the same. She won't provide more detail than that, and after a few minutes of shameless flirtation will slink away into the night. If the hero tries to stop her by force, she won't hesitate to fight dirty, distracting him with seductive banter until he finds a knife in his back, a pistol in his gut, or a knee somewhere uncomfortable . . . and she does have the aforementioned thug to call on.

Presumably, the heroes won't accept her warning and will eventually get to Seven Happiness or Occident-Orient. On the surface, both the nightclub and the import-export warehouse are normal-looking businesses. Seven Happiness is a large, busy club with a bar, kitchen, dance floor, and a stage for the big band. It is garishly decorated with red-and-gold dragon-patterned wallpaper and Chinese good luck symbols. If the investigators appear during business hours, Miss Papillon is performing; she'll wink at her PC contact but won't associate with any of the party. The import-export warehouse is physically a larger version of Brown's Warehouse, packed with rice, cheap clothing, toys, machines, and other goods entering or leaving the country.

Shang Ti Lee

The heroes might want to go after Lee. That's a bad idea. He always has a few gunmen with him, and more available on short notice. He also rarely leaves his home turf in Chinatown. If they somehow manage to isolate him, he'll avoid answering questions as long as possible (denying that he speaks English, is Shang Ti Lee, owns businesses, etc.). He knows next to nothing about Mathers and will only remember him after a detailed description. Even then, he knows only that his organization funneled money and equipment to him on the orders of Dr. Z, who also "borrows" members of Triumphant Fist from him, but he doesn't concern himself with details.

Lee's ineffective in combat, but he's ruthless, devious, and will happily lead the PCs into a trap. If captured, he'll try to lure the investigators to his club or warehouse for a nasty surprise.

Both hide a layer of criminality. Back rooms at Seven Happiness host illegal gambling, and some of the bundles at Occident-Orient contain opium. All are guarded by a handful of thugs; the police have been paid off and won't come close to either place unless something spectacularly illegal happens.

The important parts, though, are underneath. Secret stairways lead to underground chambers used for hiding fugitives and prisoners, smuggling large quantities of goods, and storing weapons and money. The chambers are always occupied many thugs, and more are available at a moment's notice. The club and warehouse chambers are linked by a disused subway tunnel, allowing Lee to move contraband freely between them.

Heroes infiltrating either establishment will eventually find whatever doors lead underground (perhaps pointed in the right direction by an easily intimidated busboy or shipping clerk, or perhaps seeing too many people go down a dead-end hallway and not come back). The underground rooms are a maze: boiler rooms, basements from older buildings the current ones replaced, sections of disused sewer, and new excavations to link everything together.

Between the cramped quarters and the presence of guards, infiltrators will eventually be discovered. Each PC can avoid detection by making a Stealth roll every minute, at a cumulative -1 per minute (they might be able to hide indefinitely in a closet, but there wouldn't be much point in that). Among the rooms, they'll find a mix of contraband, financial records, weapons, and ammo, plus makeshift living spaces used when people need to lie low. Some contain

suitcases packed with lightweight clothing, and a few of those contain maps of North Africa and Egypt.

Once detected, guards raise the alarm and attempt to capture the heroes. The PCs may initially outnumber their opponents, but more come from all directions, cutting off avenues of escape and eventually heavily outnumbering them. If demands for surrender, unarmed combat, and light gunfire don't work, they'll try one of Dr. Z's new inventions: sleep gas grenades. Characters exposed to the gas lose one FT per turn of exposure and must roll against (Will - Fatigue loss) every turn to stay awake.

Eventually, at least some heroes will be captured. Wounded characters receive first aid and unconscious characters are awoken. All prisoners find themselves guarded and chained to the end of a metal shaft over a pool in a large underground room. A vaguely Asian-looking man enters, followed by more guards and Miss Papillon, who shrugs apologetically at her PC contact. This is the villain, who has shown up for some exposition:

"Good evening, my young friends. I am Dr. Z. It appears that despite warnings to the contrary, you have persisted in meddling in my affairs, just as your clever friend Professor Mathers did. But since you shall not live to see a new order with me at its head, I shall satisfy your curiosity. Your professor wondered about the capabilities of the device I had him design and what I would do with it. So much the worse for him when I sent for the last of his papers. So now I shall abandon this dreary place for the tomb of Khuthmet, which shall make me the world's ruler, and you shall meet your maker."

For PCs slow on the uptake, Dr. Z will spell it out: He hired Mathers to develop the concentrator on the condition that Mathers retain no models or records of the project. However, he ordered Mathers killed when the professor asked too many questions.

He also explains the device they're strapped to. It's part of an abandoned experiment to use tides as a source of energy. When thrown into operation, the rising tide raises a float on the far end of the shaft, which is in a chamber on the other side of the wall. As it rises, the other end falls, slowly putting the PCs under several feet of water and keeping them there for a few hours. If this deathtrap seems too simple, you can certainly [make your own](#).

"And so, my young friends, I leave you. May your new knowledge make you happy in the next life." Throwing a switch to start his infernal device, Dr. Z turns to leave the room, followed by all the guards; Miss Papillon blows a kiss on her way out. The water starts to flow, and the heroes start to descend to a certain death . . .

A terrifying plot revealed! A watery death! How will our heroes escape? Come back next time for the next episode of The Terrifying Plot of Dr. Z!: Tomb of the Lost Pharaoh!

Cineplexity

full-color boxed game with 504 cards, two plastic card trays, & rules; $24.99

Sometimes you get the feeling Hollywood is getting its ideas for movies by throwing darts at a bulletin board covered in theatrical elements and using the results to crank out a title and script. If you can imagine this process in reverse, you'd have a pretty good sense of how to play *Cineplexity.*

The object of the game (for four to 10 players) is to be the first player to score the requisite number of game cards.

To get the party started, someone is chosen to play the part of director for the turn. He takes one of the dual-slot trays full of cards from the box and pulls a card from each slot, placing them in the middle of the table and announcing them so everyone knows what's in play. They list movie elements from nine different categories: theme, setting, critiques, genre, characters, scenes, actors, production, and props.

Players begin calling out titles, trying to offer something that covers both cards. For example, if you have a card that says there's a scene in a bathroom and a prop card that says there's a gun in the film, you could choose *Saw, The Godfather,* or *True Lies,* but these bits don't have to be in-frame at the same time so it could also be *Teachers* or *Starship Troopers.* The director selects the first right answer he hears, though discussion is allowed and reference material may be brought to bear to convince him an earlier suggestion was right. Attention must be paid to who is playing director at the time since it's his interpretation that applies (critiques in particular ask for an opinion). For example, if a card says the movie has "gratuitous nudity," was "overrated," or contained a "noteworthy kiss," those are all in the director's view.

The right answer earns the player one of the two cards; the other stays on the table and is paired up with a new card for the next turn. The tray moves clockwise to the next director who now adjudicates the action. If no one can combine the two cards in play, a third may be added to widen the options; players must match two of these cards, not all three. If these three don't generate an answer, a new set of cards is chosen. The fewer players you have, the more cards they must score to win the game, and the first to rake in that many cards wins.

In an industry that seems to be skimping on cardstock of late, it's good to see cards so full and stiff they could draw blood. Not only are they firm enough, they're colorful and the text on them is as large as the creators could make it, to forestall complaints that the round was over before you could read the cards. The illustrations are small and usually just functional icons, but they're there for you Kovalic (and Quinn-Kinney) completists.

If the shrink-wrap and the website are anything to judge by, the initial offering of this game is the "premiere limited edition" and has more than 200 bonus cards. This obviously suggests the second go-round at the printers will have fewer cards (the components are packed tightly into this iteration). 300 cards is still a tidy number and should provide plenty of options for play, but you go through the cards a lot faster than "500" might hint at. Extra cards may also explain why some card backs are blue while others are darker, almost purple.

The game is another of those painfully simple ideas that produces an entertaining pastime, though it must be noted: The more you know about movies, the less challenge there may be to the game. It's still a lot of fun trying to pull something from memory to fit the requirements (and to be the first to do so), but much of the time it's just not that hard to do if you're a buff. There will always be occasions when an awkward pairing turns out to be tougher than anticipated, but those moments come too seldom, and it's a shame because that's when you feel the adrenaline and the heat. (Try coming up with a movie when one card lists Steve Martin, Steve Buscemi, or Steve McQueen, and the other John Goodman, Cloris Leachman, or Gene Hackman . . . *without* using the [Internet Movie Database](.))

As simple as the rules are, there's still plenty of debate flying as the game progresses. Most of it is the "all in good fun" brand and not the "holes in the rules" kind, but tempers can flare so get your house guidelines about what you will and won't allow in order as soon as possible. Use of outside materials can slow things down if you don't already have a laptop and a video guide propped onto the table (a game can take as little as 10 minutes). Also take heed that you need at least four to play.

There's plenty of replay value, and since the company does junior and alternate versions of many of its games, it stands to reason sequels and supplements can't be far off. ***Cineplexity*** is another good movie game, forcing you as it does to reverse-engineer your own trivia, and another winner for the Out of the Box Publishing crew.

Reversal, Reverse All

[Last week](#) we started looking at the types of poems cribbed from the book *Writing Poetry: Where Poems Come from and How to Write Them* by Dr. David Kirby (my college poetry professor), in an effort for some easy inspiration; the first installment was about marrying two ideas together. This week we wrap it up.

The other idea of those presented in the book -- one which has direct application to gaming -- is the idea of the reversal. In other words, take something you know to be true, and reverse it, so that the opposite is true. So say you write a poem about Little Red Riding Hood, only you reverse it; Red is a hunter, roaming the woods looking for wolves to kill . . . perhaps using her seeming innocence as a lure.

The idea of reversals is nothing new in gaming. In fact, probably the biggest tabletop gaming explosion of the past couple of decades resulted from a reversal: You *are* the vampire/werewolf/mummy/whatever . . .which is a reversal of the idea of "vampires/werewolves/whatever are these enemies which the PCs are expected to fight." Likewise Drizzt Do'Urden, the good "dark elf" from the **Forgotten Realms** setting, is a quintessential reversal from a character viewpoint.

Many other movies and television shows have premises that are reversals in some aspect: "the cops *aren't* the good guys, and can't be trusted to do the right thing" *(The Shield),* "the usual good guys are now bad guys" ("Mirror, Mirror" from *Star Trek,* among other places), and so on.

So, let's start with some campaign ideas that can arise when you assume some kind of fundamental reversal.

Okay . . . pretty much every generic fantasy game world assumes a great deal of freedom of religion. Shrines to various deities are permitted on most corners, and even temples to more questionable gods are usually allowed without too much fuss. ("Hmmm . . . how will this Tower of Set affect the resale value of our house?") But what if this is reversed such that there is *no* religious tolerance, akin to modern China? No temples, no miracles, no discussion of deities, etc. With this twist, the priest, one of the most common character types -- indeed, one of the most important of most fantasy groups -- becomes an outlaw. Do the heroes fight for more religious tolerance (even if it means giving a foothold to less savory religions)? How does the party react to encounters with seemingly benevolent religious forces?

Or let's look at a cyberpunk campaign. One of the fundamental ideas of many cyberpunk worlds -- or other dystopian near-future settings -- is the ability of the protagonists to communicate instantly and with some degree of anonymity, whether via cell phones, e-mail, BBS systems, or the like. But what if this wasn't possible? What if *all* electronic traffic were either blocked outright (in the case of analog radio waves), or monitored such that any communications would be instantly intercepted and acted upon . . . either blocked if obviously encrypted or otherwise undecipherable ("A.I. detects possible code usage at 87.9%. Blocking message, sending investigatory unit."), or recorded and stored for future analysis. In one fell swoop, this setting becomes an Elizabethan Cyberpunk campaign, where *all* actions against the Powers That Be need to be conducted in person or by non-electronic means. (Cybernetic carrier pigeons!) Most of the modern tropes of the standard setting -- instant communications, personal and goal positioning, walkie-talkie coordination -- become impossible. Suddenly a lot of interesting avenues are opened, with one simple reversal.

Of course, reversals can also be used for adventures. As one example, the typical dungeon crawl consists of traveling from a village to the bottom of a dungeon. Let's reverse it: As the heroes bed down one night in the sleepy town of Plotonia, the entire village awakens to find itself at the bottom level of a large dungeon. The heroes now need to escape *out* of the dungeon (either leaving the village to its own devices or helping to lead everyone out). Even a standard-seeming dungeon crawl becomes a lot more claustrophobic when the heroes aren't working from an area of safety downward.

Or let's look at a typical modern-day tale: the hostage situation. Reverse it. The heroes learn of a hostage situation at a local bank, and are contacted by their Mysterious Morally Ambiguous Benefactor to not interfere, and to keep the police from resolving the situation; the hostage-taker is actually uninterested in the bank's contents, but is attempting to extract important information from one of the hostages (who may confide in the "robber" out of fear, or in one of

the other hostages . . . who's actually another plant). Do the heroes agree with this mad plan and work to escalate a hostage situation? Do they become involved and attempt to find out this information via another way? Or do they do something else? Regardless, a relatively trivial reversal throws the players' (and characters') expectations into wild disarray.

Finally, a reversal can become a good means of whipping up different characters. For example, let's look again at the religious situation of our typical fantasy world. Now, in most of them it's assumed that priests are pious, devout individuals, fully dedicated to their patron deities. But let's reverse that presumption. It must be possible to devise a priest of a deity who entered the profession because it's just another job; maybe they wanted to be a healer or have access to some other perk of the priestly profession. Sure, they do what's required -- prayer, devotions, vows -- but without any more passion or dedication than a police officer repeating Miranda rights. (In a fantasy world with a large enough pantheon, it must be possible to envision a deity who doesn't care *why* someone is performing the right devotions, just so long as they are.) Again, this conjures up a completely different view of an otherwise oooooold concept: "Okay; as a follower of Ewbuntu, I'm required to try to convert you to our faith before administering a healing miracle. I'll keep it brief. HaveyouconsideredthewonderfulthingsEwbuntucandoforyou? Okie-doke . . . let's get on with the healing."

Or envision your typical super-heroic origin of "child orphaned when parents were killed by baddies." Flip the lever on the Reversomatic, and what pops out? A hero who *says* he was orphaned when his parents were killed. In fact, the hero was always ashamed by his parents, and took the opportunity of a childhood attack by a bad guy to leave his old life and associations behind. How would the rest of the Justice Club when they learned that Batguy's parents were alive and well, and living in a trailer park?

Of course, reversals are one of those spices that can only be used so often; if nothing is as it seems, then the players will quickly learn to look for the twist in everything. But as a means of taking something seemingly familiar and turning it into something different, you can't go wrong by going right to a reversal, an old idea that turns things new.

Paths of the Damned: Forges of Nuln (for [Warhammer Fantasy Roleplay](#))

Published by [Black Industries](#)

Developed by [Green Ronin Publishing](#)

Written by Robert J. Schwalb

Cover by Christer Sveen

Illustrated by Tony Parker & Christer Sveen

Cartography by Shawn Brown

96-page b&w hardcover; $24.99

With *Forges of Nuln,* Games Workshop and Green Ronin bring to a close the Paths of the Damned campaign for the second edition of *[Warhammer Fantasy Roleplay.](#)* Begun in the core rulebook's "Through the Drakwald" adventure, it got into its stride with *[Ashes of Middenheim,](#)* and continued with *[Spires of Altdorf,](#)* telling of how a stalwart band of adventurers traveled across the Empire in search of the three artifacts containing the essence of a Daemon of Khorne known as Xathrodox Incardine. With the first two items -- the Brass Skull and the Dagger of Yul K'chaum -- having already been destroyed, there remains just one more, the Chalice of Wrath. If it is not destroyed and the Chalice falls into the wrong hands, there is still the chance that Xathrodox the Red Flayer will walk the Old World again and lead a Chaos army into the lands of men that are still reeling from the Chaos incursions of the "Storm of Chaos." All of the clues indicate that the Chalice of Wrath has been taken to the city of Nuln, "the Jewel of the Empire."

Once the capital of the Empire, Nuln is built upon the ruins of an ancient High Elf settlement. Hit by both great plagues and Orcish hordes in its long past, Nuln is the true home to the Cult of Sigmar, and also the Imperial Gunnery School. As the Empire's technological and industrial heart, its great forges constantly belch a pall of thick smoke, all to produce the artillery that gives the Imperial Army an important edge in battle. The successful casting of every gun is noted and celebrated by every Nuln citizen, but the forthcoming unveiling of The Magnus, a wholly new design that is a marvel of engineering and craftsmanship, is drawing nobles and merchants from across the Empire for the week's worth of partying and celebration that is Black Powder Week.

It is during this week that the adventurers must come to Nuln to search for the third artifact; their efforts are hindered by the influx of people come to celebrate. Just as much hindrances are rumors of a mutant attack ready to boil up out of the sewers, of plagues festering in the city's poorest regions, and of a murderer stalking the city streets striking victims both high and low born. Although they do not know it, the week long celebration is also the exact time limit within which the adventurers must locate the artifact and prevent other plots playing out in Nuln from coming to a head.

As with the first two parts of Paths of the Damned campaign, *Forges of Nuln* is one part city sourcebook, one part campaign. Roughly a quarter of the book is devoted to describing the city, its history, its layout, its characters, its inhabitants, and its customs. Mixed in with this description is a diverse mix of adventure hooks, the bulk of which pleasingly do not involve a Chaos threat whatsoever, which is a nice change from *Spires of Altdorf.* Also unlike *Spires of Altdorf,* the map in *Forges of Nuln* of the city is larger and better, though there are some similarities between the

maps in the two books. Along the way the author references the canon's major sources on Nuln: "The Oldenhaller Contract" adventure from the original *Warhammer Fantasy Roleplay* rulebook; and the novel *Skavenslayer,* in which the book's heroes face a Skaven incursion. Two new careers are included, both with an industrial (even Victorian) feel, being the Chimneysweep and the Dung Collector. Both can replace starting careers from the core rulebook. Finally there are notes on finding other work in the city, this in addition to the scenario, "Sing for Your Supper," found in ***Plundered Vaults.***

The adventure itself begins back in Altdorf, with the adventurers triumphant after the successful destruction of the Dagger of Yul K'chaum. Clues -- and the GM will need to work hard to ensure that his players understand their significance -- to the last item's location point to Nuln, and conveniently, there is a bodyguard job that gets them there. This is via a luxury riverboat, a trip that harks back to the classic adventure, Death on the Reik, and solving the almost obligatory murder mystery aboard gets the party a weighty purse and a leg up on the social ladder. Both of which will probably help them in the days to come.

[SPOILER ALERT!]

It is the seven-day time limit that presents the toughest challenge to players (though it will not necessarily be obvious to them) and GM alike. There is a lot for the characters to do and a lot for the GM to keep track of in a scenario that is heavy on both investigation and social interaction. The search for the Chalice leads the party into the scenario's various parallel plots that in turn involve a series of murders, a plague outbreak, mysterious happenings near The Magnus, and a Mutant attack. Of these, only the first is related to the search for the Chalice of Wrath, the others increasing the difficulty that the adventurers will face at the scenario's end if not dealt with. In an unfortunate and uninspiring move, dealing fully with one these plots actually gives more for the GM to do, essentially having to create as many as nine mini-dungeons for the player characters to trudge through. The climax itself is essentially one big fight, primarily against a Frankenstein's Monster-like creature, which if not defeated will kill enough victims to enable the return of Xathrodox Incardine. Defeating him requires another fight (of course).

[END SPOILER ALERT]

Although ***Forges of Nuln*** is a busy affair, its climax feels drawn out, almost a series of individual climaxes that deal with each plot one after the other. It works well enough if ***Forges of Nuln*** was a scenario on its own, but as part of the Paths of the Damned campaign, it feels underwhelming and uninspired. For the players there is also little in the way of reward for their efforts, which is to be expected in a ***Warhammer Fantasy Roleplay*** campaign, as the authorities will not want the recent events widely known and the heroes unlikely to be awarded medals. Even so, the discussion of the aftermath is rushed and only covers loose ends.

Looking back, the Paths of the Damned campaign trilogy has been an uneven affair; and, of course, the campaign as a whole suffers in comparison with the classic that is ***The Enemy Within,*** lacking the latter's scale and grandeur. Yet, just like the original *Star Wars* trilogy, its middle part, ***Spires of Altdorf*** remains the best episode. ***Ashes of Middenheim*** was too simple and emphasized combat over the setting's other elements, though ***Spires of Altdorf*** redressed this imbalance to pleasing effect with a more involved storyline and more for the characters to do. ***Forges of Nuln*** is really not a bad scenario, but it does nothing more than continue in the same vein as ***Spires of Altdorf;*** ultimately, it brings the campaign to a close rather than a climax.

Dynamo

for *GURPS*

by Reverend P. Kitty

Hamilton Stewart just wanted to finish his thesis. Honestly.

The first in his family to earn a degree, Hamilton was pursuing his doctorate in the field of robotics development. He was chosen to head a DARPA-sponsored research fellowship to develop powered armor for special operations. While different sub-teams tackled seperate engineering issues, Hamilton worked on synergizing their results into an actual design. Eventually, he had a schematic . . . but, fearing public failure, he played "creative accounting" with the grant money to build a prototype at his house. It was buggy, but it functioned. Hamilton fed the "theoretical" problems to the appropriate sub-groups, letting them work out the solutions. More misappropriated grant money allowed him to implement the fixes, and the prototype gradually developed and grew.

It was then that DARPA cut their funding. Unhappy with the amount that the fellowship was spending on "just research," they decided to focus on another team which was producing results. Hamilton wanted to unveil his prototype, but realized that he'd probably be arrested for embezzling military funds if they looked at the records. So he quietly spent the next few months tweaking the design, until a nearby four-alarm fire spurred the armor's first field test. Without thinking, Hamilton ran to the apartment building and began saving people. The crowd cheered for their new "local superhero" afterward, which did wonders for Hamilton's flagging self-esteem.

The ego boost faded quickly the next day, when Hamilton received a blackmail call from Dr. Wayne Sullivan, the professor who had been overseeing the DARPA fellowship. He had suspected Hamilton of misusing research funds, and now knew that there was physical evidence as well. For a thousand dollars a month, he'd keep his mouth shut, and would even pass along useful new research. And if he asked for a favor from time to time, he expected it done. Hamilton could see no choice but to agree.

Desperate for money, Hamilton struck a deal with Marty Sizemore of Sizemore Bail Bonding Services (SBBS). He'd bring in the supers who jumped bail, asking for only a decent paycheck (under the table) and complete anonymity. Sizemore weighed the legal danger against the potential cash flow and agreed.

Years later, Hamilton has expanded his initial prototype into an array of specialized suits. Known publically as Dynamo, he brings super villains in for justice, while maintaining his secret identity. Of course, he's working for SBBS illegally while occasionally having to destroy or compromise research projects belonging to one of Dr. Sullivan rivals, but he's praying that no one's realized that Dynamo is behind that. Or Hamilton Stewart.

And he still hasn't finished his thesis, darn it.

Hamilton Stewart a.k.a. Dynamo   *1,000 points*

Hamilton is a slim, 25-year-old, light-skinned African-American. He keeps his hair short and wears clear plastic-rimmed glasses. He typically wears cargo shorts or casual slacks and a t-shirt with an obscure geek reference.

The Battlesuits

Hamilton's various suits are bought as Alternate Forms, as he can only wear one at a time. The custom limitation reflects the fact that he has to have a particular suit physically present to change forms, which adds 250 pounds of dead weight unless he stashes it somewhere and risks it being stolen. Every suit lists several *Breakable* "systems" of generators and servos which power the advantages shown. Each system has HT 10, HP 10, SM -4, and is protected by the suit's DR. Realistically, *any* attack which penetrates DR might hit vital equipment instead. Roll 1d; on a 1, a random system is damaged instead of Hamilton. Extra Effort also damages a system -- it loses HP instead of FP when "pushed." (This is a special effect, trading critical system damage for Hamilton losing HP or FP.) The *Suit Features* line encompasses integral traits which are not *Breakable*.

Within each writeup, *Injury Tolerance (No Eyes; Protected)* reflects that the suit protects Hamilton's eyes against damage and (non-supernatural) blinding attacks. *Electrical* and *Maintenance* are full disadvantages; a powerful surge can knock Hamilton out while wearing a suit and extended wear can be hazardous without proper upkeep.

L. D. B. (Land Domination Battlesuit)

Hamilton beefed up the armor on the original suit and added fast-acting hydraulics that give it a deadly right hook and the ability to jump up to 96 yards forward or 21 yards straight up at Move 20. Like all of Dynamo's suits, it has ST 20 -- but in emergencies he can overload the servos to boost Lifting ST to 110 (BL 1.21 tons). This is Dynamo's suit of choice for taking out a single strong super. He relies heavily upon aimed taser shots (which get Acc 6 with his 200-yard range Radar) and will All-Out Attack (Determined) if he believes his opponent can't penetrate his DR.

- *Basic Radar:* Imaging Radar (Breakable, -30%; Extended Arc, 360, +125%; Targeting, +20%) [43].
- *Communications:* Radio (Breakable, -30%; Secure, +20%; Short Wave, +50%) [14].

A. D. B. (Air Domination Battlesuit)

Dynamo's second suit was designed for engaging multiple fast opponents. It emphasizes awareness and mobility, flying at Move 12/192. The radar can detect subjects at 11 miles out, make out fine details at 1/10 that range, and lock onto up to five targets within 500 yards. Once locked on, Dynamo can release a salvo of up to 15 mini-rockets (either HEAT or Taser) amongst the targets; the rockets ignore range penalties, attacking with Move 100 and effective skill 16 plus any RoF bonus. Hamilton stays defensive with this suit, making heavy use of retreats and acrobatic dodges.

- *Advanced Radar:* Radar (Breakable, -30%; Extended Arc, 360, +125%; Increased Range ×10, +30%; Multi-Mode, +50%; Targeting, +20%) [59].
- *Communications:* Radio (Breakable, -30%; Secure, +20%; Short Wave, +50%) [14].
- *HUD:* Enhanced Tracking 4 (Breakable, -30%; Multiple Lock-Ons, +20%) [18]; Hyperspectral Vision (Breakable, -30%; Extended Low-Band, +30%) [25].

- *Suit Features:* Accessories (Onboard computer; Searchlight; Tool kit) [3]; DR 40 (Hardened 1, +20%; Can't Wear Armor, -40%) [160]; Electrical [-20]; Injury Tolerance (No Eyes; Protected, -20%) [4]; Maintenance (One Person; Weekly) [-5]; Temperature Tolerance 5 [5].

S. D. B. (Sea Domination Battlesuit)

This suit has yet to see action. Life support is distributed and redundant, proof from attacks. Its electrified surface keeps enemies at bay while submerged and remains a useful melee weapon on land. In LPI mode, Dynamo's sonar can lock onto a target over 5 miles away, allowing him to launch an explosive or sonic stunner mini-torpedo (with Move 50, effective skill 16, and three chances to hit) at it. (See p. B415 for explosions underwater.) On land, the sonar and torpedos have 1/100 their normal range. Given the dangerous environment, Hamilton will likely try keeping his distance when using this suit.

- *Communications:* Radio (Alternative Ability, ×1/5; Breakable, -30%; Secure, +20%; Short Wave, +50%) [3]; Sonar Comm (Breakable, -30%; Increased Range ×50, +50%; Secure, +20%) [14].

E. C. B. (Electronic Countermeasures Battlesuit)

After getting his systems scrambled by an enemy gadgeteer, Dynamo returned with a new suit composed of optical and fully hardened systems. Its EMP does 5d (quadrupled for knockback) to those nearby, but only electrical systems take actual damage and risk being shut down. The launcher can load one lethal "stingray" dart or three nonlethal versions at a time; the difference is the size of the capacitor. Additional accessories can locate power sources and hack computer systems. Hamilton prefers to use the system hacker and dart launcher to slow down an opponent before closing in to use the EMP.

- *Communications:* Radio (Breakable, -30%; Secure, +20%; Short Wave, +50%) [14].
- *Dart Launcher:* Burning Attack 6d (Armor Divisor (10), +200%; Breakable, -30%; Increased 1/2D ×10, +15%; No Incendiary, -10%; Rapid Fire, RoF 3, No Wounding, +25%; Side Effect, Stunning, +50%; Surge, +20%) [111]

C. I. B. (Covert Infiltration Battlesuit)

This suit looks nothing like the other three . . . not that anyone has ever gotten a good look at it. (Or so Hamilton prays every night.) He uses it *only* when forced to sabotage some project for Dr. Sullivan, even though there have been times when it would have been useful for more legitimate work. The suit incorporates audio dampers and light-refractive technology, as well as an automated computer system scrambler. The arm-mounted grenade launchers fire a nonlethal nerve gas derivative that Hamilton obtained from Sullivan. He designed the grenade casings to launch quietly and self-destruct afterwards.

- *Audio Dampers:* Silence 10 (Breakable, -30%; Dynamic, +40%) [55].
- *Baffled Ducted Fans:* Flight (Breakable, -30%) [28].
- *Communications:* Radio (Breakable, -30%; Secure, +20%; Short Wave, +50%) [14].
- *Grenade Launchers:* Fatigue Attack 6d (Area Effect, 8 yards, +150%; Breakable, -30%; Contact Agent, +150%; Hazard, Missed Sleep, +50%; Increased 1/2D ×10, +15%; Low Signature, +10%; Persistent, +40%) [291].
- *Life Support:* Doesn't Breathe (Breakable, -30%) [14].

Campaign Role

Whether Dynamo fills the role of hero, tragic hero, or anti-hero depends primarily on the intentions of Dr. Sullivan and SBBS. Any version of Sullivan is a manipulative cad, but a light Doctor only sends Dynamo out to sabotage experimental projects from other professors and scientists with questionable motives, while a dark version will force him to wipe out a cure for cancer if it threatens his funding or position. Similarly, Marty of SBBS may be a nice guy who keeps Hamilton afloat with a decent job, or he may send Dynamo out to settle old scores or as a hired thug (unknowingly) by showing Hamilton forged bail paperwork.

Dynamo could also be used as a pregenerated PC. If so, it would be in-genre for his player to keep 18 bonus character points saved whenever possible. Those points could then be spent to design and build a new suit overnight, adding it to the collection.

Adventure Seeds

Bring 'Em Back Alive!: Heroes are always getting arrested for things they didn't (or sometimes *did*) do. Those that bail out tend to immediately violate the terms of bail in the name of finding the evidence to prove their innocence (or justify their actions.) If they have powers or similarly unusual abilities, Dynamo is the logical enforcer to track them down and bring them back.

Presenting My Scientific Breakthr--huh? Scientist and gadgeteer adventurers are always creating something useful, while rich philanthropist PCs support such things. Dr. Sullivan has gotten word of one such project which would render one of his inventions obsolete. The next morning, guards wake up from bein gassed, all of the records are wiped clean, and the project is ruined. While Sullivan has the motive, he clearly doesn't have the means . . . right?

Whose Criminal Is It Anyway? The supers are fighting the latest supervillain team to form up, when help arrives in powered armor. Regardless of their wishes, Dynamo focuses on taking down a single enemy and then getting away with him. Since he cannot reveal his true motive for capturing the bail jumper, will they take his word that he just *has* to be the one to take this one super-crook to jail?

A Mélange of Magical Creatures VI

for *GURPS*

by Eric Funk

Reality presents more creatures to confound and confuse those who deal with the natural (and not-so-natural) world.

Shock Worms

"We charged the enemy lines in the confusion. The enemy replied by sending their lances toward us. Suddenly, some halfling mercenaries popped up out of hiding. Slinging worms at us, they were able to neutralize our cavalry with repeated volleys. It hurt."
-- Lieutenant Kievr, 4th Cavalry.

These long, solid-colored earthworms are suspected to have developed under high-iron trees that are often struck by lightning. One of the first signs of their appearance is an underground electrical disturbance, resulting in a static electricity buildup at the surface. The gap across their head to tail can be many volts, enough to stun a bird. If such a worm contacts one's limb, the appendage is stunned for some time. If it hits one's head or torso, the whole person is rendered unconscious. A wax or rubber coating will keep them away.

Encountered

These vermiforms will likely be encountered wherever people leave wire and metal on the ground. When attached to their prey, these worms look like lampreys. Left long enough, they can slowly leech the conductive metals out. They can also be found in buried treasure, much to the chagrin of many a thief. Sleeping shoed horses can also be targets, and stepping on a worm could injure the horse. They are a favorite weapon for undersized humanoid slingers against unarmored foes, or foes in metal armor.

Industrial Uses

"Two men stood surveying the last slightly singed junction box. The dark machinery about them was testament to its function. The older man was the first to speak.
'Ok, lad, pass me two 225-volt lengths, and that will about do it.'
The apprentice reached into the shielded box with his thick rubber gloves and, one at a time, passed the older man the worms he had asked for. The veteran carefully laid them into the panel, and each completed connection lit up small lights in the panel. Finally, he stepped back, and testing the apprentice, motioned to the master breaker. The lad carefully examined the box, flipped a reset switch, and pulled the breaker. The machinery about them came to life."
-- Machinist's Guild training book #3.

The current prevalent use of shock worms is as a non-lethal weapon. Special treatments can lower the worms' metabolisms, causing them to emit lower voltages which permits them to be used in muscle therapy. Conversely, they could be caused pain, increasing their voltage to levels high enough to be agonizing while also causing the worm's death. A TL4+1 society might be able to use a string of worms as conductors or batteries in an organic power system. They could be used as filaments for light bulbs when air evacuated, or internally in battery production. Live worms could be sustained for hours in mostly-full jars of metal salt water and used as batteries. Enchanters might find uses to help in items of Lightning, Flexibility, Body of Metal, or Conduct Power.

Adventure

A popular warrior has held the public's admiration for a long time. Recently, the duels he fights in private have been shorter than usual. His supporters claim it is due to his experience and training. Detractors say many foes he has bested lately have been lacking in experience or training of their own. The relative of one such foe begs the heroes to break the rules of engagement and watch up close, for the honor of her family.

Assuming they do, they will find a diminutive woodsman hiding in a similar spot across the path. With each clash of the celebrity's weapon, the woodsman flings a small worm at the foe's back, along with some twigs. When the combat is over two pages rush over, and help polish both combatants' armor, while ushering them from the scene.

Light Bugs

"O insect of light
Carry the sun's message far
Ride the summer's warmth"
-- Prayer to the sun goddess Liandera, Book 36, Stanza 116.

These lofty insects are suspected to be the handiwork of sequestered monks of the temple of Liandera, the goddess of the sun and healing. These small light-colored bettles can be seen riding light waves above the clouds. Attracted to the border between light and dark, they will dance around the sharper shadows left by clouds on each other, as well as the ground. They are considered by some to be a bane of vampires, even though they do not cause them harm or dread. In reality, light bugs are merely frightened by other beings with no shadow, including some vampires and will-o-wisps. It is suspected that these creatures draw nurishment from the interplay of light and dark, especially from plants' shadows and those cast by flame.

Encountered

In the wild, these creatures can be glimpsed at dusk and dawn, chasing the penumbra across the land. At other times, they can be seen dancing in the clouds. In cities, they can live in mirrors, often getting trapped there. Some puppet shows and dramas use them as stage lighting to highlight shadows. Light bugs are popular at parties. The host would have a strong light in the center, and then release the insects to dance along guests' shadows.

". . . and that is why they claim that the rainbow and its 'pot of gold' is a swarm of these insects at the end. The temple

of Gmortch has long held a rainbow in a mirror in one of its more sacred places. From interviews with those permitted to enter, it appears to be a silver mirror with many light bugs imprisoned within. It is said that sacred writing put there will be highlighted for all to see . . . "
-- The sage Benouillous, on lighting effects.

Industrial Uses

Preserved light bugs make for exquisite curios, especially when hung as mobiles or sun-catchers. If one traces a permanent shadow inside a mirror, these bugs will highlight it, creating a sign. Some researchers are experimenting with the idea of using them to carry messages. The most successful use for live bugs in the security field is to locate living shadows (or people using spells to become so). Enchantment uses can include spells to see invisible, and grant dark vision.

Adventure

A wizard's child has been kidnapped, and forbidden to turn to the authorities, the parents ask the heroes to go after the crooks. As the heroes pass by points, and their torches strike the wall the right way, they cause shadows to fall where light bugs have been stuck, causing a shimmering effect. The adventurers will then have arrows and clues to help find the lost child. The kid does seem to have some magical power.

Blink Scorpions

"It was our second day driving these wagons through the desert. I then spot what looks to be another mirage . . . a patch of green dead ahead in the gulley we're following. Just before we're upon it, it looks to be a bunch of eyeballs on stalks turning to look at us! Not hearin' nothing b'neath our hooves, I glanced back, and our trail was clear, but slowly closing back in."
-- Jack "Ace" Calloway, lead hand on a *Centaur Express* caravan.

Blink scorpions have no stinger, but an upward-facing human eye in the tail, and sharper claws. From a modest distance, it is relatively easy to visually distinguish from a normal scorpion (+2 to skill rolls to tell them apart, e.g., Naturalist or Survival rolls). Insects, however, rely more heavily on scent, and thus are at -6 to realize that this is not the predator they fear. If the tail is covered slowly, it will not blink. This aids in capture and trapping.

Encountered

The natural habitat of this creature is desert-like regions, particularly those that get lots of sunlight. Due to the unusually grotesque appearance, most people would suggest avoiding this creature on principle. Entophobes are at an additional -1 to control rolls against these creatures. Its gruesome appearance is used by a few particularly vicious desert cults as part of their logo.

Industrial Uses

There has been some success in using the creatures in the field of detecting enemy fliers, and using the scent glands to protect users from insects, even giant ones. There is much experimentation in growing eyes to replace lost eyes, giving Restoration a chance for "instant" healing (see **GURPS Magic,** p. 93). Work continues in the area of using them to send messages across walls, and flipping switches. The field of enchantment has long used these creatures' various products to aid in the creation of blink items, Wizard Eye foci, as well as smell protection. A relatively recent development is an inconspicuous hat that grants 360° vision, upward or around one's head.

Adventure

A noble sends the heroes on a quest for a familiar for his young wizard child. The heroes must obtain -- and bargain for -- a blink scorpion of a particular breed . . . it must match his son's rare eye color: orange-green. It is also a rare eye color for scorpions. The closest breeder is the only one who has such a creature. Unfortunately for the heroes, it has already been paid for by a powerful lord. Depending on the campaign's direction, the PCs might be able to bribe the merchant to "lose" it. Perhaps the adventurers could purchase a different one and change its eye color; perhaps the higher noble did not really choose the creature for its looks, but simply because it was rare, and could be persuaded to trade for two slightly less valuable scorpions; or perhaps the noble did like the color, but the *creature* is optional . . . if the heroes could find another orange-green monster, he might trade it.

Dust Moths

"I had followed the card shark to a abandoned warehouse. I had told him I was gonna get back tha' money he stole from me. As I rounded a corner, he took a swing at me from outta nowhere. I returned the favor. Next thing ya know, we had knocked over a few card tables, sending dust flying. That was the last thing I saw until I got myself the tha' healers . . ."
-- Fiev "Knuckles" Sanchez

These moths are powdery white and seek dust to lay their eggs. Their larva filters the silt for dust mites and other such creatures. The tracks in the dust are the only sign that this life process is underway, but by then it is too late for many

individuals. A female moth that has just laid its eggs might attack a nearby predator to wound it and give its offspring a chance.

Encountered

These creatures are places where there are extreme dust buildups occur. Frontier towns, mines, quarries, gravel roads, beaches, and even riverbanks after a flood or places with volcanic silt can cause population booms. Any disturbance of the dust could incite the mother moths to attack passers-by.

Industrial Uses

"NiteHawk223's regular shipment of dust moths has been diverted to our outlet in the city of Dante. Exactly how did our contact say he knows that the nearby volcano will cover it in ash next month?"
-- Internal message on the BioMart, Inc.

Some corporations have made use of these creatures to keep storage rooms clean. One down-side is that they attract dinge bats. Still, if the crate retrieval services are automated by forklift, golem, or steam automata, then there is little problem. Enchantment uses include the berserk potion and the Sterilize spell.

Adventure

During a ritualistic coming-of-age ceremony, people have been falling and disappearing. The adventurers are asked by a parent of the next child to take a trial. As disinterested observers, they can observe, and hopefully prevent the same thing from happening to their child. The problem takes place when the ascendant is to cross a bridge alone. Custom dictates that all villagers must be on the other side of the temple. Only a few mute priests can watch from the top of the temple. The crossing is checked, and there is no oil or such upon it.

What is happening is that someone is using this opportunity to kidnap healthy youths for a slave camp. Soon they will have enough to send a shipment back. Soon before the trial, they powder the middle of the log, release some ready dust moths, and when the aspirant crosses, the moths are angered, making him fall. The kidnappers pull the youth to the side where the priests cannot see, and lock him up.

Dust Moth Swarm

Appearance: Gray Moths.
Category: Insect.
Diet: Carnivore.
ST -; DX 10; IQ 1; HT 12.
Will 10; Per 10; Speed 6; Dodge 9; Move 6.
SM -10 (<2" long); 1 lb; 12HP to disperse.
As bees, but it is a contact poison that bypasses DR with "Tough Skin." Note that as SM-10 creatures, they can attack humans' eyes without penalty and bypass worn armor (see ***GURPS Powers,*** p. 76).

Giant Dust Moth

ST 6; DX 12; IQ 2; HT 14.
Will 11; Per 10; Speed 7; Dodge 10; Move 7.
SM -2 (20"-23" long); 2 lbs; DR 1.
Traits: Affliction (Choking; Environment: Air; Variable); Enhanced Move 0.5 (Air Move 13); Extra Legs (Six); Flight; Night Vision 2; Quadruped; Teeth (Sharp Teeth); Wild Animal;

TK Mice

"What began as a experiment to test new drugs went awry. Four batches of mice escaped before some higher ups noticed them missing. By then, of course, it was too late. On the up side for civilization, their dominant genes will mean that they breed slower. Fortunately for cats, litters are also smaller."
-- Professor Anthwerp, *History of Emergent Intelligences 101*

These mice have a talent that seems to have begun as the ability to pull food from a distance without endangering themselves, but has blossomed into much more. They are gaining in mental power without an individual intelligence. Some fear that it serves as step toward a gestalt intelligence. A close measurement of their skulls reveal an increased cranial size.

Encountered

These creatures will most likely be encountered before they are seen. Food will be missing. Traps will be disabled, and doors opened. They can cause problems for wizards who do not have spells to detect psionics. One of the few things that keeps them in check is a heightened fear of cats.

Industrial Uses

"No traps worked. The ship's cat was scared to leave my cabin. The ship's wizard said there was something amiss before he, too disappeared. I guess it's just me and the mice, now . . . wha---" -- Last written log of Captain Franklin of the *Ruckus Ranger*

Industrial computing might be possible, if one could keep the collective happy. Surely governments would like a computer with IQ 16 . . . although the 4,000+ mice needed to reach that level would take up a lot of room, considering that about 12-24 mice are a 1-hex swarm. It is operated by using the mouse in front of the screen to issue commands. Enchantment uses will be for Apportation, Air Golem, and Communication spells.

Crunchy Numbers

Each doubling increases collective IQ by 1. Thus two mice means IQ+1, four IQ+2, eight IQ+3 . . . sixty-four mice together will have human-level IQ, but that is a rare gathering. (Unfortunately, when they are sufficiently powered up to IQ 8 at 16 mice, they are unaffected by "Animal" spells . . .)

For the combining of telekinetic powers, see Linking Up, *GURPS Powers,* p. 170. Summed up, all the mice's powers are of the same power and origin. Assume The Leader's Power is 3, and has N followers, the net power is 3 + N/2. Thus with 12 followers, they have Power 3 + 12/2 = 9. ST9 is enough to lift a small person of 128 lbs (see p. B17, B353). (4,096 mice total ST 2,050, with a lift of 3,362 tons . . . a 15-story 4,000 square-foot building.)

Adventure

The heroes are hired by a young dependent to find her pet mouse. She last saw it near a warehouse. Her mouse has joined a collective. They are annoying the dock workers, who are about ready to call a big-time exterminator. Apparently the cheap exterminator automatons they buy keep getting demolished. Taking the single mouse will be impossible; negotiation with the collective is the only way . . . (What happens next might involve murder plots, flying daggers, missing ships loaded with cheese, or a secret government ruling the city through puppets.)

TK Mice

Appearance: Mice, with a slightly lighter head color.
Category: Mammal.
Diet: Omnivore.
ST <1; DX 15; IQ 4; HT 13.

Will 10; Per 12; Speed 5; Dodge 8; Move 2.
SM -7 (5" long).
Traits: Acute Hearing +3; Discriminatory Taste/Smell; Gregarious; Night Vision 1 (shifted); Night Vision 2; Peripheral Vision; Phobia (Cats: *Ailurophobia*) (6); Quadruped; Reduced Consumption 2 (Cast Iron Stomach); Resistant to Disease +3; Resistant to Poison +3; Striker (Crushing); Telekinesis (1-3); Wild Animal;

Giant TK Mouse

ST 4; DX 14; IQ 4; HT 14.
Will 12; Per 12; Speed 5; Dodge 8; Move 5.
SM -2 (2' long); lbs; DR 2.
Traits: As above, but Telekinesis (4-6);

Storm Knockers

"Historians have concluded that this species was the product of the vengeful wizard-king Rithkal. It seems that the King was once bitten by one of his cousin's pet squirrels. It was much later that he fomented revenge in the form of these giant carnivorous woodpeckers."
-- Scribe Tithindel, *Follies of Human Kings, Volume XLI*

Storm knockers prey on tree-dwelling prey, such as squirrels, owls, and bats, and they build nests in high places. These large scavenger-hunters prefer to have valley walls or tall trees to dive from. The primary hunting grounds for these vulture-like birds are in wooded areas, although towns can support this breed. Nominally created to handle a "pest problem" in King Rithkal's kingdom, many migrated or were exported abroad, and storm knockers now can be found worldwide.

Encountered

Storm knockers are often a nuisance for druids and dryads who shoo them from their favorite trees. City dwellers find them a mild nuisance, but are glad to have owls and mice removed from their attics. On the flip side, many rural areas consider a storm knocker knocking on the house to be an ill omen.

Industrial Uses

"This cross between a condor and woodpecker was cited as a reason for international regulations on the development of new creatures."
-- Year in review, *Metacreatures Monthly*

Some lumber mills have experimented with using storm knockers as drills or routers, especially in low-mana area. With clipped wings, these birds make good mousers in a warehouse. Uses in enchantment include as sensors, such as Wizard's Tongue, and in wood-piercing arrows.

Adventure

One villager claims to have spotted a storm knocker, and is afraid that the local shaman will see it and declare it an ill omen. The heroes must prevent ill omen by staying on the roof all night, keeping such birds away. If the shaman's meditation is disturbed, he might consider *anything* an ill omen, so the heroes must also keep their mission a secret from him. Unbeknownst to them, opposing villagers want to relocate the settlement, and are thus trying to coax such birds to attack the shaman's home. (As a twist, instead the heroes must be the ones to bring about change, outsmarting villagers on the roof.)

Storm Knocker

Appearance: A large eagle with a sharp beak.
Category: Avian.
Diet: Carnivore.
ST 5; DX 12; IQ 4; HT 12.
Will 10; Per 12; Speed 6; Dodge 10; Move 3 (Ground).
SM +2 (10' tall) (SM+0 with wings furled); 12 lbs; DR 1 (DR 8 beak).
Traits: Acute Vision 2; Affliction (DX-1; Link; Stun); Combat Reflexes; Discriminatory Smell; Enhanced Move 1.5 (Air Move 18); Extra Arm (Tongue: flexible, reach 1 yard); Infravision; Melee Attack Modifier (Armor Piercing; Link; Wood only); Night Vision 1; Peripheral Vision; Striking ST +10 (Beak Only; Wood Only); Teeth (Impaling); Vibration Sense (Tongue only); Wild Animal
Skills: Brawling-16.

Giant Storm Knocker

ST 10; DX 11; IQ 4; HT 13.
Will 11; Per 13; Speed 6; Dodge 10; Move 5 (Ground).
SM +4 (30' tall) (SM+2 with wings furled); 50 lbs; DR 2 (Beak DR 16).

Conch Spiders

"The conch bug is yet another example as to how natural creatures will almost always beat gengineered creatures. They can stand up to most predators, and can scavenge what they want."
-- Master Maximilian Trisel, *Lost Heritage of Natural Creatures*

This gray slow-moving crustacean covers its shell in rocks. It uses a special excretion from a spinneret to stick them to its shell. When predators attack it, the shell ablates, with the newest pieces stuck to the predator's strikers. One can identify a conch bug's habitat by the stones that are collected on it.

Encountered

In the wild, these creatures are most likely encountered on rocky beaches, or in natural quarries. Larger versions can be seen around some modern construction sites. The mortar is also useful for making casts to help protect broken bones.

Industrial Uses

"The gangs have a new way to get rid of someone. To each of his bare feet, they stick a conch bug, then toss him into the river."
-- Detective Tonners, 3rd Precinct

There is one use for which these creatures are being bred larger -- their glue. It is first scraped off the insect along with gravel, and stored in a barrel that prevents hardening. Kept warm, and in gyration, this conch excretion is taking off as an industrial mortar. It has been discovered to be even more effective if one lays a grid of coke-steel first. The resin itself might be useful to create a sort of bio-plasic, as armor or building material when a cloth or paper is soaked in it . . . Aside from the mortar business, enchanters find the glue glands make for powerful spells of binding, be it Hex, Hold Fast, Knot, or Paralyze Limb.

Adventure

The heroes have been called upon as part of a covert operation to catch criminals in action. The order calls for the adventurers to innocuously drop some special food in the hopper for the conch spiders fuelling a construction project

on the edge of town. The contact says it doesn't matter whether they talk their way in, or sneak in, but there must not be any violence. Publicity is bad for the mission. (As a complication, perhaps the "undercover police contact" is really a rival who has sent them to poison the food, and produce poor mortar.)

Conch Spiders

Appearance: A cross between a hermit crab and a spider.
Category: Insect/crustacean hybrid.
Diet: Scavenger/omnivore.
ST 2; DX 11; IQ 4; HT 13.
Will 8; Per 8; Speed 6; Dodge 9; Move 2.
SM -2 (1' long); 20 lbs; DR 2 (ablative).
Traits: Claws (Sharp); Extra Legs (Eight); Lifting ST +2; Quadruped; Reduced Consumption 2 (Cast Iron Stomach); Resistant to Disease +3; Resistant to Poison +3; Teeth (Sharp Teeth); Wild Animal;
Skills: Armoury (Armor)-16.

Giant Conch Spider

ST 8; DX 10; IQ ; HT 14.
Will 9; Per 9; Speed 6; Dodge 9; Move 4.
SM 0 (3' long); 200 lbs; DR 10 (ablative).
Traits: As above, but Lifting ST +8;

Humungous Conch Spider

ST 15; DX 9; IQ ; HT 15.
Will 10; Per 10; Speed 6; Dodge 9; Move 6.
SM 0 (6' long, 2 hexes); 600 lbs; DR 20 (ablative).
Traits: As above, but Lifting ST +15;

Beyond Fantasy

This article describes seven creatures, most of which could appear to physically exist in a hard-science world, even if the more wondrous aspects could not. Shock worms could have bioelectric powers similar to those of electric eels, while bugs are often light-sensitive. Hybrid creatures can appear to be disturbingly human. Creatures can find nourishment in the strangest places, even dust, or around volcanic vents. Mice can often seem smarter than they look, and several movies have featured escaped lab animals. Why can't large woodpeckers exist? Natural enzymes can follow processes that dazzle science.

Roleplaying Mini-Campaign #1: The Planet of Dr. Moreau (for *Battlestations*)

Published by **Gorilla Games**

Written by Jeff Siadek

48-page b&w softcover; $14.95

From the *Justifiers* and *Albedo* RPGs to *SkyRealms of Jorune* and *Traveller,* science-Fiction roleplaying has a long tradition of anthropomorphized animals, or humans in furry animal suits. Of course, this tradition is a bit old fashioned by contemporary mores, and today it is more likely that you will find an Elf or an Orc in a spacesuit than your cat, dog, or gerbil. This trend though, is bucked by *The Planet of Dr. Moreau,* a new supplement for the hybrid RPG/boardgame, *Battlestations,* which brings the anthropomorphic critter back to gaming.

The Planet of Dr. Moreau is not only a new supplement for *Battlestations,* but a new *type* of supplement for the game. In *Battlestations,* the players take the roles of a Universal Republic Expeditionary Force (or U.R.E.F.) ship's crew, undertaking a series of *Star Trek*-like missions, the game combining roleplaying and frantic personal action with ship-to-ship combat. The crew must run between stations, operating and repairing them as required, and even fending off boarders, all the while maneuvering to get the best shot on the opposing ship. To date, the two *Battlestations* supplements support this style of play along particular themes, including civil war with *Galactic Civil War* and exploration on the new frontier in *Pax Galactium.* This new supplement supports this style of play also, with a standard five-part campaign. Its central premise, however, is a different kind of play style, one that emphasizes roleplaying in another five-part mini-campaign of loyalty, memory loss, mystery, and ovine revolt.

The inspiration for *Roleplaying Mini-Campaign #1: The Planet of Dr. Moreau* is obviously the H.G. Wells novel, *The Island of Dr Moreau,* in which the survivor of a shipwreck is washed ashore an island populated by strange Beastmen creatures created by a brilliant, but shunned vivisectionist. Despite the efforts of the amoral scientists, the Beastmen eventually assert their true nature and -- upon discovering their origins -- turn on the Doctor.

The Planet of Dr. Moreau transplants the story to *Battlestations'* sci-fi setting, Dr. Moreau becoming a renowned genetic engineer whose brutal research methods would have led to his arrest had he not fled Earth first. Retreating to a private planet that he paid very well to keep hidden, Dr. Moreau has continued his work, unfortunately aided by the arrival of a fresh set of subjects aboard a passing spaceship.

The first of the campaigns in *The Planet of Dr. Moreau* is the roleplaying campaign. The "Beastmen" campaign casts the players in the roles of the Doctor's loyal creations. In return for their loyalty, the Beastmen receive constant medical attention; have a place to sleep, plenty to eat, and all the sheep that they can hunt. Invaders come though, threatening the paradise that the Doctor has created, and as members of Alpha squad, the player critters must crew the interceptor that is the Doctor's first line of defense.

[SPOILER ALERT!]

During the five-part Beastmen campaign, the characters will see off incomprehensible alien invaders, put down a sheep uprising, and thwart an escape attempt by another squad, all before the full weight of the authorities comes

crashing down on Moreau's world. They may also learn of their own origins, although the Doctor has been suppressing any interest towards this via a medical monitoring device. If the Beastmen do discover their origins -- simply an inversion of the Beastmen origins in the novel in that they were originally human -- and realize their status as partially mind-controlled slaves transformed by the Doctor, an extra scenario details any escape bid.

[END SPOILER ALERT]

To support the Beastmen campaign, **The Planet of Dr. Moreau** provides rules for creating anthropomorphic characters along with 13 new species, from Avianoids and Crocodilians to Rabbitoids and Rhinoceroids, each with several special abilities. One species, the Sheepling, is included as Red Shirts and lunch. The campaign also adds a new sub-skill for the Science skill with Notice, useful because the Beastmen campaign does not have **Battlestations'** standard perfect knowledge granted to every character though head up displays and so on. A full map of Moreau's Compound is included along with a set of campaign handouts and the layout for the Beastmen interceptor ship. Also, unlike a U.R.E.F. standard campaign, where death means rebirth in a cloned body, in the Beastmen campaign, death is almost -- but not quite -- final.

The second "Seeker" campaign is played as a standard **Battlestations** game, with the crew of a U.R.E.F. vessel hunting the source of bestial raiders operating in the Meeks sector. Eventually they will learn that Moreau's world is that source and the campaign ends with an assault upon Moreau's compound. To simulate the investigative part of the campaign, another Science sub-skill, Interrogation has been added.

Physically, **The Planet of Dr. Moreau** is a slim booklet containing everything necessary to play bar the core game. Advice on running the Beastmen campaign is light; essentially that it needs to be run with a more flexible approach than the standard Battlestations game requires. The layout is a little cramped though, and the book does need another edit.

Two small things irk. The first is that the overview of the Beastmen campaign is not as thorough as it should be -- some story elements only become apparent during the reading of the campaign. The second is the choice of names for the Beastmen species -- why not keep to one style of names like Felinoids and Ursinoids that owes to the Latin, rather than the silly sounding Rabbitoids and Snakoids? Doctor Moreau *is* a scientist, after all. One option not covered is the suggestion that the two campaigns could be run in parallel with each other or with two different groups. In roleplaying terms, this might be a little too complex for **Battlestations.** Indeed, for the straight board gamer who plays **Battlestations,** the roleplaying aspect of the Beastmen campaign might be too much. However, roleplayers will have fun with it.

Minor niggles aside, **The Planet of Dr. Moreau** is actually a likeable affair. It is undoubtedly rough around the edges and perhaps outdatd in gaming terms (though that is really down to its genre), but it adds several new things to the **Battlestations** game, most obviously the Beastmen species. Of course, a GM does not have to add the Beastmen to his campaign. As the author explains, he never intended to have them in the game, but he has reason enough . . . since they can be killed off easily enough. Just a little old fashioned and rough around the edges, **Roleplaying Mini-Campaign #1: The Planet of Dr. Moreau** takes **Battlestations** in a pleasing new direction, and hopefully, future Roleplaying Mini-Campaigns will be a little more polished.

Medieval Diplomacy

by Matt Riggsby

The most obvious historical models for traveling adventurers are soldiers and merchants. There are other travelers, of course: religious pilgrims, itinerant entertainers, Gypsies and other ethnic minorities who might have a difficult time settling down, and so on. But there's another class of historical traveler who combines mobility with power, wealth, and romanticized depictions which might appeal to players: diplomats. This article discusses the practice of diplomacy during Europe's Middle Ages and into the Renaissance, and, of course, how PCs can get involved.

What Was Diplomacy, Anyway?

Most diplomatic activity was concerned simply with sending messages. In an age without phones, telegraphy, and even formal postal services (the Byzantines, following on their Roman ancestors, had an extensive postal system within their empire but not beyond, and in western Europe, postal systems didn't reappear until the 15th century), every communication sent to someone else was a unique event, and every bit of news was important. It's difficult to imagine in this information-rich age, but at the time, just knowing that a nearby kingdom had a bad harvest or a new heir to the throne was difficult information to get and very useful to know. Moreover, most people in power were usually busy with their own realms, and few could afford to leave their homelands for very long, so "summit meetings" were a very rare event, usually held at carefully chosen spots on the border of two neighboring countries. Moreover, not all rulers were quick but even-tempered negotiators. Therefore, messengers and emissaries, carried by people with the skills and temperament for the job, were by far the most common instruments by which international relations were handled.

In the earliest years of the Middle Ages, an ambassador was anyone sent on someone else's behalf. Townsmen would send them to their episcopal overlords, minor lords to their lieges, and so on. The prevailing pre-modern situation of difficult travel was compounded by loosely organized feudalism, which made just about every interaction between lords, bishops, and other powerful entities a one-off arrangement rather than something informed by a comprehensive body of law. A variety of terms, largely interchangeable at the beginning, evolved to describe these representatives: legates, nuncii, procurators, ambassadors, and others. As the political situation stabilized and Medieval law, class relations, and diplomatic practice shook out, those terms all took on more specific meanings and "diplomacy" came to be regarded as something which took place between countries and rulers. Rather than get into the frequently inconsistent specifics of the titles, we'll refer to "diplomats" in general, whether they're carrying out delicate negotiations or just, as they usually did, delivering messages.

Although there was only the faintest possible legal tradition surrounding early Medieval diplomacy, we can pick out a few significant principles: First, peace is good, and people who can promote it should therefore be protected. Few would disagree with the first part, but European diplomats and writers on diplomacy were particularly keen to push the implication that supporting diplomats meant supporting peace. The second is that diplomatic negotiations took place between equals. It's a very weak definition of "equal," of course. No one would pretend that, say, Milan or Florence would be a patch on Spain or France. However, there was a tacit acknowledgement that neither power in a diplomatic negotiation was the subject of the other. If the kings of France and Spain reached an agreement, it was because they chose to, not because one owed it to the other as a duty. This is rather different from diplomacy farther east; such powers as the Byzantine empire, China, and later the Ottoman empire had a large ideological investment in being the theoretical masters of the world, which limited the diplomatic concessions they might be willing to make and tinged the tone of their diplomatic dealings. For example, the emperors of China reflexively addressed foreign monarchs as subordinates, and the Ottoman sultans would receive diplomats, but didn't send them. It's also worth noting that the countries of western Europe shared a similar legal, cultural, and religious background and even a vague sense of community. The same can't be said of the big empires to the east, which had to deal with profound cultural differences past their borders.

Who Were the Diplomats?

A ruler sending a diplomat had to balance several competing considerations. First and foremost, the diplomat had to be trustworthy. Both rulers involved needed to be sure that messages would be relayed accurately, without editing or embellishment, and that the diplomat would not overstep his bounds when negotiating. It served no one to have the middleman distort what went on at either end of the communication. In a related vein, in this only moderately literate era, diplomats had to have good memories. They were often sent in pairs so that one could correct the other if either forgot or misremembered something.

A diplomat had to be able to communicate with whoever he was sent to see, which often meant he had to be bilingual. At times, that was remarkably difficult. For example, it wasn't hard for the king of England to find someone who spoke French -- indeed, many kings and large sections of the court spoke it -- but harder to find someone who spoke (say) German, and it probably would have been impossible to find someone who spoke Hindi or Chinese (the first recorded Chinese speaker in England arrived in the 1690s). Here, the flexible structure of early feudalism sometimes came to the rescue. A nobleman who had sworn fealty to two different kings often spoke both rulers' languages *and* had a relationship with both rulers, which meant that he could be trusted all around. Failing that, people from noblemen to minor clerks sometimes found themselves employed at a foreign court (an English knight in Spain, a German count in England, and so on). Such people were natural messengers for diplomatic correspondence going to their homeland. They knew the lay of the land and both relevant languages.

Finally, a diplomat had to be of a minimum social status appropriate to his message. If a mere clerk or a simple knight, who could reasonably be sent for routine messages, were sent to discuss a royal marriage or a military alliance, the recipient of the message would be deeply insulted that the sender wasn't treating the issue with sufficient seriousness.

Potentially, therefore, diplomats were by preference drawn from a number of classes and professions:

- *Heralds*. Heralds had at least nominal freedom to travel and immunity to arbitrary punishment. This made them useful for carrying messages to hostile rulers who might feel inclined to execute lesser messengers carrying unwelcome news, such as declarations of war. However, as the military feudal class declined later in the Middle Ages in favor of royal bureaucracies and noblemen more inclined towards commerce or urban life, heralds and their use faded as well.
- *Warriors*. Heralds were good for difficult destinations, but for difficult journeys -- for example, to carry messages to destinations on the far side of a nation at war -- experienced soldiers, particularly knights, were often chosen. However, few warriors had the education or an appropriate temperament for serious diplomacy.
- *Clergy*. Catholic clergymen had a number of attributes making them good diplomatic messengers. They had built-in respectability from their station and had in common a knowledge of Latin, allowing them to communicate with other Catholic clergy everywhere. Of course, the problem there is that many rulers *didn't* know Latin, which meant messages would have to go through a double translation. Clergy also had dual loyalties: to their own ruler, and to the papacy. Consequently, their loyalties in more sensitive negotiations could be questionable. Western Catholics weren't the only ones frequently depending on holy men for diplomacy. The Byzantines often depended on missionaries to carry diplomatic messages for them; they often knew or at least soon learned local languages and would frequently meet local rulers. Missionaries weren't necessarily ideal diplomats, but since they often had to cross more cultural borders than their western counterparts, they were typically

I'll Have To Ask My Mom

While this article mostly covers formal diplomacy, important *informal* diplomacy could be carried out by visiting relations; heads of state might not be able to visit other countries, but their close relatives could. During many periods, the ruling families of any number of territories were intertwined with one another. For example, in the 16th century, Catherine de Medici, a relative of the dukes of Florence, married Henry II, king of France. Her children, in turn, married the king of Spain, the queen of Scotland, the duke of Lorraine, and an Austrian duchess who was the daughter of the Holy Roman Emperor. This meant that for much of the century, the rulers and major noblemen of most of western Europe were cousins or, at least, married to cousins of other rulers. Similar situations cropped up now and again on scales from the provincial to the international.

the best available.

- *Merchants.* They travel regularly, usually to countries in which local rulers will have an interest, and they may know foreign languages. If one can be found heading to the right destination, he can be a reasonably good messenger. However, like a priest, a merchant may have conflicting loyalties.
- *Major noblemen.* The traditional respectability of a herald, the durability of a warrior, the sanctity of a priest, and the flexibility of a merchant are all well and good, but for the really important work, one must send a peer of the realm. Important nobles who are close associates of the ruler, and whose fortunes rise or fall with his, have both good reason to negotiate in good faith and the prestige necessary to establish that their commitments will be respected by their principal.

Preparing for Discussion

Having chosen the messenger, someone sending a diplomat also had to compose the message. The first thing a diplomat had to do was to establish that he was, in fact, able to negotiate on the behalf of the ruler he claimed to represent. In the earlier, less literate Dark Ages, signet rings and other personal symbols often stood in for the written word. By the later Middle Ages, it became common practice for a diplomat to present the ruler he was visiting with a letter from his own ruler to establish his credentials. These letters came to be known as "letters of credence." They became highly formalized, with sections greeting the recipient, vaguely setting out the sender's reason for dispatching a messenger, and describing the messenger himself.

But such letters were more identification than communication. Although they usually outlined the writer's concerns, great trust had to be placed on the courier himself. Rulers and administrators recognized that written word, though in some ways potentially more authoritative than the spoken word, wasn't sufficient to transmit all necessary information. There was always the chance that some important fact the reader was interested in would be omitted or that a poorly chosen phrase would be misinterpreted. They were also insecure, and if a letter fell into the wrong hands, so would the sensitive information it contained. Therefore, diplomatic letters usually contained a brief outline of concerns. More importantly, though, they commended the courier to the reader, pointing to him to fill in the reader with the bigger picture and making him available to answer any questions the reader might have.

Still, while a detailed letter to the recipient of a diplomatic mission might not be the best thing, rulers did often prepare memoranda for the diplomats themselves, setting out the message they were to convey and the limits of their authority in negotiation. In addition to a verbal briefing from the ruler (or, for less important missions, a minister or advisor acting in the ruler's name), diplomats would usually receive a memorandum called, confusingly enough, a credence. Again, though, a credence might fall into the wrong hands, so particularly sensitive details would only be discussed, not written down. Nevertheless, at times the ruler the diplomat was being sent to see might be inclined to demand to see the diplomat's instructions to assure himself that the diplomat wasn't speaking beyond the bounds of his mission. Therefore, the diplomat might be given a second, secret set of instructions, perhaps reminding him that a particular outcome, while technically authorized by his credence, would not be preferred.

This was sufficient for routine communication, but more serious matters (for examples, transfers of land or money, military alliances, granting of significant rights for foreigners) required yet more documentation and authorization, called a procuration. This might take the form of a nearly completed agreement, with a few important details left blank, to be filled in during negotiation. Missions with procurations were important, but formed a small minority, just as modern

This made it possible to do "back-channel" diplomacy through family visits. Instead of going through the very public business of diplomatic correspondence which might otherwise upset an ally or alert an enemy (where both allies and enemies include foreign powers and important figures in one's own kingdom), a ruler could, for example, suggest that his sister visit a cousin or an in-law in another nation. That relative, or one of that relative's retainers, could have unofficial conversations with someone ultimately answering back to the local ruler, and eventually arrive at a useful understanding. Such diplomacy wouldn't be very useful for concluding formal agreements, but it could lay the groundwork for such agreements to be made with remarkable speed once the possibility publicly arose.

What Documents Look Like

Since physical copies of

diplomatic contacts are mostly communication of routine information rather than treaty signings. And missions with procurations certainly *were* important, in a social as well as a political sense. Much as [monastics distinguished between simple and solemn vows](#), so did diplomats distinguish between simple and solemn missions, the latter having procurations. A series of simple missions usually laid the groundwork for a solemn mission concluding in a significant agreement.

Conducting the Mission

Once the diplomat was briefed and given his papers, he had to take the long, expensive, and occasionally dangerous journey to his destination. The custom developed that someone sending a diplomat would reimburse him for expenses on the road, including transportation and maintenance of a suitable entourage (that's the theory, anyway; returning diplomats had to document their expenses and wrangle payment out of an often reluctant exchequer). Once the diplomat reached his destination, the hosting party would support the diplomat for the duration of his stay as they would any other guest.

There was also subsidiary documentation which went beyond credences and letters of credence. Medieval diplomats did *not* have the current version of diplomatic immunity, under which it's essentially impossible for a host country to punish a diplomat for any crime without his native country's approval and the hosts can do no more than permanently expel a misbehaving diplomat. However, they were not without legal protections, some enshrined in legal tradition, others spelled out in letters from the rulers who would host them. With their respected position as peacemakers, diplomatic parties were exempted from customs duties, inspections, and other restrictions which made travel more difficult. Anyone who attacked or hindered a diplomat would have the local ruler to reckon with, with a number of crimes against someone on a diplomatic mission punishable by death; even angry rulers were legally prohibited from taking out their frustrations on visiting diplomats. They were even entitled, under certain circumstances, to financial aid from local governments, even if they were in a country other than their ultimate destination. They were still subject to laws against espionage, violent crimes, fraud, and so on, and could be tried and punished in courts they were visiting, but could only be tried in the highest court in the land.

Once the diplomat arrived at his destination, events typically followed a predictable progression. If the message's recipient knew a diplomat was on his way (usually the case for solemn missions but not necessarily for simple ones), the diplomat was greeted by an escort of suitable size and composition to fit his status. He presented his identifying letters to whomever he had been sent to see, typically the ruler but, again, possibly a lesser official for minor missions. After being formally welcomed, the diplomat was politely and temporarily dismissed; no one, after all, would assume that a ruler could immediately drop everything the moment a messenger appeared. After a few days, when the ruler had assembled appropriate advisors and freed up time to consider important diplomatic matters, the diplomat was summoned again to formally deliver his message, answering questions posed by the ruler and his councilors. The diplomat was dismissed again for several days while the ruler composed his response, which was typically presented in the form of a counter-credence and verbal briefing on how the diplomat was to respond to his principal at a third

treaties and letters were indispensable in early diplomacy, it's worth knowing what form they might take. Many documents were single, large sheets of parchment with writing on one side. More public documents weren't enclosed (the technical term is "sealed patent"); they might be rolled or folded and kept in a case. Those which were enclosed didn't have separate envelopes. Instead, they were folded into as small a package as possible, with a thin strip cut along the bottom of the sheet but not quite separated. The strip was wrapped around the package, looped through itself, and sealed. Some were pierced, with a thong passed through the hole and tied or sealed to help keep it closed.

Wax seals were obligatory for authenticating documents. A number of rulers could use multiple seals and delegated the use of some to ministers, choosing one depending on the circumstances (by the end of the Middle Ages, the kings of England could choose from four). Grand royal seals indicated the ultimate in solemnity, but would seem excessive under some circumstances. Some were also so large that they could completely envelop the small letters they sealed. Their use might also be delegated to senior officials. Therefore, a ruler might want to use a less impressive personal seal to indicate his personal involvement with a diplomatic mission, as opposed to routine business carried out by officials.

One form early treaties took was the chirograph. The text

meeting.

Delays could interpose themselves, of course. During difficult negotiations, a diplomat might have to send a courier home with a request to clarify the initial credence. Obviously, this would take weeks, and wouldn't be an option in some circumstances, but a delay was generally thought preferable to ending negotiations in failure. And even a fully prepared diplomat might not meet a fully prepared king. A few rounds of clarifying questions, resembling repeats of the second meeting, might have to be held.

Deviation from the usual procedure might be regarded as a snub. Not greeting the diplomat with an escort or sending an insufficient one could imply a disregard for the diplomat or his principal. However, judging the diplomat's reception might be difficult. Diplomatic precedence could become quite complicated, since it had to take into account the status of both the diplomat and whoever sent him. A mid-rank nobleman sent by one king, for example, would take precedence over a priest sent by a king of equal standing. However, the priest might take precedence if he had been sent by the Pope, who takes precedence over temporal rulers. On the other hand, a duke sent by a ruling prince could take precedence over both, since his personal status would be *much* higher than that of the other two envoys, despite the relative status of their respective principals. If a ruler quickly received a diplomat, demanded to hear his message at once, and sent back an immediate reply, that might imply that he was treating the message lightly, not giving it any thought. On the other hand, constantly asking for clarification could be taken as stalling.

During his visit, the diplomat was likely to be lodged near the ruler he was sent to visit and expected to act like any other courtier. This mostly meant being on hand for appropriate events (hunting expeditions, plays and concerts, weddings, religious ceremonies, and the like), deferring to the ruler's tastes and judgments, and performing small errands. Socializing with members of the foreign court was a useful forum for informal negotiations and dealing with sensitive issues which neither ruler is eager to set down on paper just yet. Of course, it also provided the diplomat and his staff with a chance for espionage and intrigue with amenable local factions.

Once he had received a formal reply, the diplomat asked permission to take his leave (not to ask permission would be a profound insult, though not to grant that request would be insulting as well). The host might also present the diplomat with some small gifts. It might take a few days for all the appropriate letters to the diplomat's principal to work their way through the bureaucracy, but at this point the diplomat would pack his bags, gather up his entourage, and return home. Once he returned home, the diplomat would deliver a report on his mission, presenting the counter-credence along with a verbal debriefing. The diplomat's job was done; the next move was up to his principal.

Diplomatic Adventures

So how are the PCs going to get involved in all of this? As with merchant adventures, heroes can find employment as guards and other hangers-on, helping someone richer and more important than themselves get around and visit far-off lands. A diplomat might want warriors to help him get through hostile countries, guides, servants, and other assistants. A particularly important diplomat would have a sizeable party with him, which could include a personal physician and confessor priest (and, in a fantasy world, personal magician). Most of the usual set of PC professions are suitable for accompanying a diplomat.

And, of course, a PC can be a diplomat himself. A low-end diplomat is essentially a glorified mailman, a common clerk or very minor nobleman who is close enough to a more important lord to be sent off with messages to his allies and enemies. They might work solo or in small groups to carry routine messages to important rulers, important messages to less-important rulers, safe-

was written twice on the same piece of parchment, with one copy above or beside the other, separated by a line of text or other symbols. Both parties to the treaty could read it, satisfy themselves that the texts were identical, and sign or put their seals on both versions. The authenticated treaty was then cut in half, through the line symbols separating the texts.

Permanent Diplomacy

Until the Renaissance, diplomacy was an occasional activity; an embassy was an expedition, not a place. But as the Italian city-states became wealthier, more powerful, and more sophisticated, it became clear that one-off diplomatic missions weren't enough. They began to place permanent, resident ambassadors with one another. It's not surprising that this custom arose first during the Italian Renaissance, where

passage requests for more important diplomats, or unwelcome words which may endanger the bearer. A reasonable long adventure might involve a clerk and a knight carrying a message to a distant ruler, the merchant adventurer on whose ship they have hired passage, and a few hangers-on and assistants.

A high-end diplomat, on the other hand, is a powerful person in his own right: a bishop, an important nobleman, or even a member of a royal family. He'll have wealth and power of his own, and likely a batch of competent allies and followers. His journeys will be largely secure from random bandits and minor bureaucrats, but there may be armies in his way and, since he'll be responsible for negotiating major agreements, intrigues to deal with both abroad and at home.

many states were relatively close, and therefore more likely to run up against one another, but as governments became more sophisticated and complex through the rest of Europe, they took up the practice as well. By the 1600s, permanent missions had replaced *ad hoc* ones through the continent.

In addition to all of the adventure possibilities posed by long journeys (unexpectedly changing routes, bandits and civil unrest, haggling for mounts or sea passage, etc.), the work of diplomacy is very good for characters built with an eye toward social and political wrangling. They may have to deal with factions hostile to their interests in the court they're visiting, hostile diplomats from other countries, and rulers who are disinterested in their message, unable to understand it, or eager for more than they can provide. The GM can create an entire vocabulary of ceremony to suggest how rulers, their courts, and other diplomats regard one another and let the PCs decode it. Does the length of the greeting on his letter of credence communicate high regard, or is it mildly sarcastic? Has the ruler he's being sent to provided an escort led by a nobleman in disgrace as a slight to the diplomat or a chance for the nobleman to recover face? In audiences, do ministers do most of the talking because the king wishes to appear a lofty judge, or simply indifferent? The purely professional problems can be compounded by personal ones: inadvertently insulting local courtiers, becoming involved in dangerous affairs, or being drawn into irrelevant but potentially dangerous side issues (for example, a Catholic diplomat visiting a pagan king in western Asia once found himself debating religion with a Byzantine missionary and several Muslim holy men also at court).

Here are some more specific adventure ideas for PCs as part of a diplomatic mission:

Spy vs. Spy: In a time without ready communication, any first-hand intelligence is useful intelligence, so it can be difficult to draw a fine line between spying and just looking out the window. However, any attempt to find out something not immediately obvious probably qualifies, and covertly trying to influence him certainly does. The diplomat or some member of his entourage has been charged with using the mission to gather information (for example, military intelligence or whispered rumors about the dangerous affairs members of the court are carrying on). At the same time, members of another country's diplomatic mission are attempting to do the same thing. Members of each mission must gather their information but try not to look like they're doing so while under the watchful eye of the other; being exposed would certainly mean a diplomatic defeat. And it'll be all the more dangerous if *both* sides are trying to influence a weak-willed ruler's decisive but mentally unstable favorite . . .

A Little Favor: A diplomatic party is visiting a kingdom afflicted with a simmering internal conflict. The king asks the diplomat to escort a young cousin on her way to an important social occasion, a coming-of-age party informally announcing her availability for marriage. It should be clear that this is an honor for the diplomat and a favor it would be unwise to refuse. On the way there, the party is attacked, and the masked attackers (common thugs hired by a shadowy figure not on the scene) attempt to abduct the young lady. If the diplomat and his party fight the attackers off, they'll have the king's gratitude and that of most of his dominant faction, but will have aroused the anger of some in the opposition and, strangely enough, of the girl herself. If they fail, they earn the king's mild displeasure for having lost the girl (though not outright disapproval; they were on a social call, after all, not a combat mission), as well as the serious enmity of scattered members of both sides. What's going on behind the scenes is that the girl has fallen in love with a major heir of the opposition. They decided to marry secretly before she could be presented as marriageable, a socially necessary pretense which would lead quickly to an arranged match. The planned engagement to a member of her own faction was a lightly-kept secret, so the prospective husband and his supporters will be unhappy with the PCs if they don't keep the girl safe. However, her secret lover, who is ultimately responsible for the abduction attempt, will be all the more upset with the PCs if they succeed, as will a few people on both sides who oppose the match and have figured out the truth on their own. The PCs have a long struggle ahead of them to figure out why they've got new

opposition in court and how to fix it. And when they've done that, they might start to wonder who set them up for this no-win scenario . . .

The Purloined Letter: It's hard to overstate the necessity of documents in regular diplomatic discourse during this period. Without a letter of credence or similar authentication in hand, a diplomat -- even one likely to be trusted if acting on his own behalf -- would probably be turned away. As a diplomatic party arrives at its destination, the senior diplomat discovers that his important file of letters has gone missing. If he can't find the file, the mission will fail and the party will return home in disgrace. However, they've got a few days before the king they're visiting returns from a visit to the provinces and their lack of documentation can no longer be concealed. They can retrace their steps as they very quietly search for the letters (or the person who took them), and perhaps even agitate events which will delay the king's return, but getting caught looking by their hosts (or rival diplomats) would be a disaster.

Rhazes-2

by Stephen Dedman

Rhazes-2 is a world loved by Infinity's researchers, but less popular with others in the organization. It's relatively safe, but not considered a holiday spot. It does, however, offer considerable potential for adventure.

World Name and Current Year: Rhazes-2, 535

At some unknown time, probably in the late Pliocene, a mutation in the genus Saccharomycetales turned all naturally-occurring alcohols on Rhazes-2 into a biotoxin as deadly as arsenic (**GURPS Basic Set,** page 439).

Infinity's anthropologists are still trying to ascertain whether this alone was enough to change the course of human culture, or whether there are other divergence points yet to be discovered. Whatever the explanation, few of the cultures or languages on Rhazes closely resemble those of Homeline. While civilizations rose in many of the same places, they left fewer signs of their passing: no Pyramids in Egypt, no Great Wall of China, no Parthenon, no Stonehenge, and few large castles or fortresses. There are cities on the same sites as Cairo, Istanbul, Shanghai, Mumbai, Marseilles, Lagos, Lima, San Francisco, Singapore and Sydney, but these are much smaller than their counterparts on Homeline. Cities and towns have their own guardsmen, who usually cooperate with their neighbors, as well as a militia of reservists. On most parts of Rhaze-2, two-thirds of guards encountered will be male; women make up half of the night watch, artillery, and cavalry divisions, while the infantry and navy are almost exclusively male domains.

Rhazean nation-states are also small, and most are ruled by monarchs who pass power onto a popular subordinate rather than an eldest son. Their wars seem to have been smaller, shorter, and less bloody than those of Homeline -- though some researchers suspect that this is partly because Rhazean art and literature downplay conflict and death, treating them as embarrassing rather than glorious. There have been no religious wars except between the Mesoamerican theocracies.

Most Rhazeans dislike snow, and cold and mountainous regions are mostly populated by prospectors, hunters, bandits, and outcasts. Mammoth, woolly rhino, dire wolves, and sabertoothed cats still exist in small numbers in the far north, attracting hunters from Homeline.

Coffee, tea, and marijuana play a big part in most Rhazean cultures and religions, and coca and peyote less so; all of these are forbidden in different regions, making trade problematic and sometimes risky. Rhazeans have bred new strains of all of these plants, which White Star Trading exports for the luxury market. Homeliners find most Rhazean cooking rather bland, and Rhazean art and entertainments have not become popular on Homeline, but Rhazean designs for furniture and utensils are widely copied.

Most Homeliners find adapting to Rhazean cultures difficult for reasons other than the unavailability of drinkable alcohol. For one thing, Rhazeans have fewer nudity taboos than TL9 Homeliners. Workers of both sexes usually wear nothing more than protective gear (usually a loincloth or a backless apron, boots, and a broad-brimmed hat). Middle-class and formal wear for men is a long-sleeved shirt, a jacket, and an alarmingly short kilt; pants or leggings are only worn for protection. Formal wear for women is usually a sari that leaves one breast exposed, or a split skirt with a thin bodice (older women are more likely to wear opaque jackets or short capes). Though homosexuality is no more common than on Homeline, kissing is a common greeting between people of all sexes; cosmetics, perfume and jewelry are worn equally by both genders; and Erotic Art is taught from adolescence in most schools. Savoir-Faire (Rhazes-2) and Savoir-Faire (any Homeline culture) default to each other at -5.

Rhazeans mostly have the same advantages and disadvantages as other TL4 humans -- except for Alcoholism and alcohol-related perks and quirks. All forms of Pacifism are slightly more common; Illiteracy extremely rare.

Cannon and flintlock muskets have mostly replaced catapults and crossbows as military weapons, though bows and slings are still popular with hunters: flintlock pistols are rare and expensive, and mostly owned by high-ranking cavalry. Melee weapons and military equipment are similar to those of Asian TL5 societies on Homeline. Stickfighting styles similar to Escrima, and unarmed martial arts resembling Jujutsu and Savate, are widely taught to both sexes.

Current Events: The Andean God-king Hatirikinu is aging, and it is likely that on his death the empire will plunge into civil war between the supporters of his eldest son and former heir, and those of his youngest son and chosen successor (the only child of his favorite wife). Merchant vessels are being fitted with cannon to protect against increasingly heavily armed pirates. Suicide cults which use alcohol as a poison are on the rise in parts of Japan and northern Europe. A gold rush in Australia has led to a population surge, mostly from India and Japan, causing conflict with the indigenes.

Divergence Point: Unknown

Major Civilizations: Orthodox (multipolar). Japanese (empire with satellite states). Indic (diffuse). Andean (empire, potentially fragmenting).

Great Powers: Mediterranean Alliance (oligarchy, CR 3). Japanese Empire, includes Korea and Western China (constitutional monarchy effectively ruled by bureaucracy, CR 4). Bengali Raj (feudal principalities stretching from Afghanistan to Vietnam, CR 3-4). Andean Theocracy, Mexico to Chile (CR 5).

TL: Rhazean technology is TL4+2: there is little in the way of mass production, but their grasp of mathematics, astronomy and some aspects of physics is surprisingly sophisticated. Their inventors have produced a few steampunk devices, including submarines and dirigibles, though these are mostly toys for the very rich. Medicine, chemistry, and other sciences are mostly TL5.

Ying Alene   100 points

Ying Alene teaches self-defense and erotic art at high school, and is a gunnery training officer for the Saghir (Marseilles) city guard. In her eight years of service, she has never fired a shot in anger, either from her musket or the cannon in the city's guard towers.

Alene is a fairly typical Rhazean Guardsman; characters with similar skills and gear might be found in any culture on Rhaze-2, including among the bandits and pirates.

Tokalau Dan (Daniel Torres) *210 points*

Dan Torres was a wealthy businessman with a knack for languages and an art collector's interest in other cultures. When his wife and son were killed in a helicopter crash, he went on a short but intense drinking binge; after sobering up, he tried to distract himself by throwing himself into his work, and soon became White Star Trading's resident expert on Rhazes-2. When he was offered the job of running Infinity's safehouse and trading center on Rhazes-2, he saw it as a way of getting away from everything that might remind him of his loss and accepted.

Taking the common Rhazean name Tokalau Dan, he gradually learned to blend in with other merchants in the marketplaces of Hamalat (Istanbul), buying cloth, coffee, tea and marijuana for export to Homeline. He was sufficiently successful that he has become a respected figure in town. Apart from trading, he and his staff also work hard to see whether any Homeline or Centrum technology (particularly alcohol) has emerged on Rhazes-2, and to investigate any possible breaches. When dealing with Rhazeans, Dan is famously close-mouthed -- partly for fear of influencing their culture, and partly because discovery of his secret could lead to him being imprisoned and interrogated by Rhazeans eager to learn how to make more advanced weapons.

As well as warehouses and an inn, Dan's caravanserai boasts high-tech resources useful for parachronic travelers: medical facilities, an impressive armory, computers with information on Rhazes-2, and so on.

Adventure Seeds

Behind Enemy Lines: The PCs are in Ecuador, transporting 500 lbs of jewelry and assorted artworks (worth $240,000 on Homeline, but only about $40,000 as trade goods) back to the White Star Trading office in Lima, when the Andean God-King Hatirikinu dies and civil war breaks out.

Hatirikinu's elder son, Huileokupi, governs the Central American region; his half-brother Huzunikuri, Hatirikinu's favorite and chosen successor rules in South America. Their armies have met in Panama, now a war zone. Huzunikuri distrusts all foreigners; Huileokupi is more broad-minded and businesslike.

The PCs have their saddle horses, three small mules, and what personal equipment they can hide on their persons or disguise. They can go north, try to cross the war zone, and head for the office in San Francisco; hide in the jungle, and take their chances with the wildlife and bandits; continue south to Lima, through territory controlled by Huzunikuri's army; or call for pickup by Search and Rescue, and forfeit half of the value of their cargo.

If the traders can consistently convince Huzunikuri's patrols that they are working for the new king, they may get to Lima unscathed. A Neutral to Good reaction means that anything of military value (animals, weapons, food, etc.) will be confiscated, but nothing worse. On a Poor or worse reaction, the soldiers will attack. Characters of handsome/beautiful or better appearance may be taken as slaves; others will be killed.

An Ill Wind: A xenophobic mob attacks the White Star office in Lima. The staff and the conveyor are still safe in the shelter under the warehouse -- but by the time the PCs arrive, the warehouse is on fire. Worse still, the bales of marijuana are burning: to reach the shelter, the PCs will have to fight their way through the spectators, the flames, and mildly hallucinogenic smoke.

And a Bottle of Rum: A pirate chieftain named Nistar has been robbing ships in the Mediterranean. What disturbs Dan Torres even more is that Nistar reportedly challenges prisoners to a drinking contest. Is he immune to the effects of Rhazean alcohol, or is someone supplying him with offworld booze?

Torres asks the Patrol to track Nistar down. It's reported that his loot is being sold in Saghir, so the PCs would find it useful to team up with the city watch.

Blowups Happen: A team of vulcanologists travels to Rhazes-2 to see whether Krakatoa erupts in 535. When it does, many of them get too close to the volcano, and Search and Rescue have to be called in.

Fimbulwetr: The eruption of Krakatoa causes a volcanic winter: summer snows, cloud cover that blocks the sun more often than not, and major crop failures worldwide. Hunger causes unrest everywhere, particularly the still war-torn Andean empire. More young people in Europe and Asia join suicide cults, and bandit and pirate raids for food become more frequent.

Dan Torres and the Miracle Workers do what they can to help the people of Hamalat by importing food from other timelines, but when it's rumored that he has huge stores of grain, honey, and salt in his caravanserai, the compound is besieged by a horde of brigands and desperate citizens. Torres and the PCs (Miracle Workers, traders, scouts, or field researchers) have to help defend the base. Torres wants to keep casualties to a minimum, but preserving the Secret is

even more important.

Dead Drunk: After 19 people are found dead in a bar in Campbell, Infinity's biochemists discover that a major brewery in St. Louis has been contaminated with Rhazean Saccharomycetales and has already shipped out thousands of barrels and bottles of poisonous beer. I-Cops have to stop the beer being distributed without endangering the Secret. Complicating matters, a truck loaded with bottled beer has been hijacked by mobsters, and the PCs get the job of tracking the stolen cartons down before they're sold on the black market.

Cuddles the Miniature Horse

by Caias Ward

In an obscure part of Warehouse 23 is a miniature pasture. On it, a miniature fence, a miniature barn with a miniature door . . . and a miniature horse. Attached to his mane is a short blue ribbon with one word: "Cuddles." He has a small saddlebag hanging on his side full of tack and treats.

Cuddles is a closely guarded secret of Warehouse 23. Still, he escapes from time to time, and those responsible for watching Cuddles spare no effort to find him . . .

The Magic of Cuddles

Cuddles is a miniature horse, standing about 32 inches at the withers. Chestnut in color, his mane and other hair is thick almost to the point of appearing feral, a trait that adds to his cuteness. Thickset yet agile, Cuddles appears eager and friendly, often making friends with whoever is supposed to watch over him. He uses this opportunity to escape and explore the world.

Cuddles often appears to those who are having trouble of some sort not entirely their fault. A major illness causing financial difficulties, job loss due to layoffs, or simply a personal failing that a person is trying to overcome, Cuddles will find it and try to make it better. Should the person react favorably to the miniature horse wandering up to him, Cuddles will start attracting positive attention for the person. Perhaps a person will want to "hire" Cuddles for a photo shoot; maybe a girl will find Cuddles cute and talk with the shy owner . . .

The new "owner" will find many of the reasons why he couldn't keep Cuddles mysteriously solved: a normally uncooperative spouse will relent and put up with Cuddles "just until we find his real owner," landlords won't bat an eye, and Cuddles will find bags of apples lying around. As people spend more time with Cuddles, they will change in behavior and outlook. People will be more positive, work harder and be in better health. Slowly, the owner's life will turn for the better; despair will fade, more people will enter his life and his old relationships will improve, he'll build the better perpetual motion machine . . .

Then, just as he arrived, he mysteriously disappears, either vanishing or his real owners from "some warehouse company" showing up and paying a substantial reward for his return. As sad as everyone will be to see him go, they will know Cuddles has more good to do in the world . . .

Powers of Cuddles

Cuddles has an amazing series of quirks and gifts that make him very powerful:

- Cuddles is unusual. Being a miniature horse attracts a great deal of attention, especially from people of the gender the owner may seek. For shy or unconfident people, this is a godsend, and will result in lots of social interaction and even dates without the owner having to say a word. Being as he is also friendly, Cuddles will go out of his way to drag his owner to new places and wait patiently outside shops and other buildings. Also, Cuddles is distracting, making the most serious and focused person playful and carefree.
- Cuddles is incredibly intelligent and perceptive. Included in his tack is a set for assistance animals, which he seems fully trained in using as a guide animal. Those who have met Cuddles swear that it's like having a bright six year-old who notices everything.
- Cuddles is resilient and strong. He resists exposures to pathogens, chemical attacks, radiation, and explosions with little worse than a few nicks and scrapes. Direct small arms fire will cause a great reaction but will result in nothing more than a graze that will heal in several days, all the while not slowing him down. He has resisted attempts of several superhuman men to pick him up and kidnap him, and has also knocked down strong wooden

doors.

- Cuddles listens. His owners have reported solving their own problems by discussing them at length with Cuddles, whose reactions trigger amazing insight in people. Crime victims, shut-ins and the battle-scarred have all shown incredible progress after some time with Cuddles. Meanwhile, scientists report incredible breakthroughs.
- Cuddles is resourceful. Besides providing for himself, he will "find" things that are needed at the time. Missing car keys, a brown paper bag with money in it, a mint Honus Wagner . . . anything that will help solve a problem. Barriers, impediments, and delays pose no problem; Cuddles will find himself inside locked buildings and open the door with his mouth, clear away obstructions and make the trains run on time.
- Cuddles commands respect. No matter what the cause, having Cuddles behind it makes it seem far more important and moral. Rumors persist of a strange horse Rosa Parks met days after her arrest . . .

The Danger of a Miniature Horse

For all the good Cuddles causes, there is a reason Warehouse 23 keeps him under tight wraps. Despite his friendly nature and good character, he is still a horse, easily misled by a bad person who is particularly charismatic. All of Cuddles' abilities in the hands of an unscrupulous person would result in crime sprees and whole regions gripped in fear. Distracted police, plutonium just showing up in the hands of terrorists, and evil masterminds having a sounding board for their outlandish schemes would be but part of the madness inflicted on an unsuspecting world.

Adventure Seeds

- A crime spree grips the city, where banks, jewelry stores and museums discover the crime after the fact. No one can describe the perpetrators, except for vague references of a miniature horse showing up and garnering lots of attention.
- The heroes engage in a normal extraction of an unwilling targeting, only to find themselves subject to a series of terrible circumstances and misfortunes. Several times, as the PCs escape from pursuing police or other interested parties, they spot a miniature horse with someone to rescue and vengeance on his mind . . .
- The adventurers, in a jam way beyond their means (trapped in an impassible dungeon, caught in the basement of a government building with the Feds on them, or the like), find a door opened by Cuddles that leads out of their predicament. The fun starts when Cuddles needs some help with a challenge of his own and drags the characters along.
- A very offensive political candidate or faction (from a wicked baron and his court to a reprehensible state senator) has his popularity skyrocket, much to the suffering of oppressed minorities and the poor. Strangely, few oppose the villains despite efforts to rally them, believing "anyone Cuddles likes can't be that bad." The PCs will have to kidnap Cuddles and convince a tiny horse that he backed the wrong human . . .

Murphy's Rules

Old Stuff Is the New New Stuff

I was reading a retrospective article on the *Ghostbusters* video game for the Commodore 64 (which I believe you should be able to read online).

For those of you who never had the pleasure, *Ghostbusters* was really an arcade economic simulation wrapped around the supernatural. You controlled a Ghostbusters franchise, and earned money to power up your gear and car. (The engine was apparently based on some similar code for some game called "Car Wars." I wonder whatever happened to that one . . .) Anyway, it was very popular for its day, and it became one of the most ported games ever.

Now, in *Ghostbusters,* you're never looking to replace the Ecto-1 with a newer, better car; instead, you're always improving it. What I find interesting, from a gaming standpoint, is how rare (relatively speaking) a codified system of improving your Stuff -- whatever "Stuff" may entail -- is in RPGs. The purest example I could come up with is **Birthright,** the innovative **Dungeons & Dragons** where players portray the rulers of nations, who can have adventures as individuals or as the leaders of their nation's resources, troops, and so on.

That's not to say that games are devoid of stuff-improvement. Rather, most games do not treat "stuff" as anything that is, necessarily, worthy of improvement. For example, in an **Autoduel** game, players may take considerable effort into improving their characters' cars. But -- and here's the key -- they may just as likely scrap their cars altogether and just buy new ones. In other words, the attachment comes not from *improving* the stuff so much as making sure it's the *best* stuff available.

Compare this with, say, *Star Wars.* Can you imagine Han Solo giving up the *Millennium Falcon* for any reason other than it had been reduced to subatomic particles? And, even then, wouldn't Han and Chewie's first reaction be to get a new ship with a ramscoop to try to sweep the site of the Falcon's destruction, capturing every subatomic particle they could?

Likewise a stuff-improvement **Autoduel** campaign would look a lot like . . . well, *Knight Rider.* After all, KITT was upgraded several times over the course of the series, but it was never even an option for KITT to be replaced.

At its core, the stuff-improvement campaign treats its stuff as characters. The items may be mute, nonsentient, and/or inanimate (or not!), but they are as irreplaceable as any other members of the gaming party . . . which, hopefully, means "not terribly." They should be upgradeable in some meaningful ways, although it's possible -- or even likely -- for them to "max out." (For example, it's likely the *Millennium Falcon* was about as tricked out as it could be.)

So let's look at a few examples at how such campaigns might resemble (or, quite probably, "elements of a larger campaign"). In all of these, GMs might encourage the development and improvement of the Stuff by, say, splitting experience equally between the character and the Stuff (for systems that support such abstractions, such as **Champions** or **GURPS**).

The Blades of Nobility: In this campaign each character inherits a sword upon coming of age; this magically imbued weapon assumes the characteristics of the types of battle and conflict the character undertakes. Thus a sword that is taken on lots of sneaky missions might grow shorter and more dagger-like, and improve the stealth of the wielder; while a weapon that is taken on bloodthirsty rampages may become thicker, heavier, and tinged with a bloodthirsty rage. Intended as the only armament of its wielder, each weapon is the sum total of that character's experience; as such, not only does it provide considerable benefit for the wielder (and only him . . . these swords aren't interchangeable nor do developed abilities work quite right for others), but the weapon's loss would be a considerable blow to the hero's overall ability.

Mindbots: Characters take the role of pilots of large robots (akin to *Voltron* or *Robotech* . . . they can transform or not, as desired). An essential component of each characters' robot is its central core module -- no doubt looking like a glowing, seamless hovering orb -- around which the rest of the robot is developed. This core has sentience and can communicate with the pilot; improvements can be made to the robot, but only if the core approves of them. There are a

very limited number of these cores in existence -- maybe only enough for the heroes and a small number of closely related adversaries -- so protecting the core over the course of its robot's upgrades and modifications is a key concern.

Broadswords and Board-Room Parties: This meta-concept assumes that all characters are multi-millionaires (or more) in charge of their own companies in a larger campaign (such as a private investigatory and security firm in an *X-Files*-esque universe, or a high-technology company in a supers universe). Thus adventures can focus on the micro level of the individuals trying to advance their goals (say, a Tony Stark-type character becoming Iron Man) or they can relate to the companies as individuals (for example, protecting the company from hostile takeovers, attempting to develop product lines or services that will boost revenues and funding to supply revenue for larger projects). Really, this is just a re-envisioning of the ***Birthright*** concept for modern times . . . although it's up to the reader to determine what the modern-day business-world equivalent of the "neighboring nation of undead legions" is.

Given how many characters are defined by their trademark gear, it's suprising how often equipment is interchangeable in RPGs. Perhaps tweaking that formula a bit can give an otherwise-old concept a bit more flavor. Remember: Your gear has often been in as much trouble as you have yourself.

The Day After Ragnarok: Reality Urdha

"The will that wanted to shape an entire world according to its wish can finally attain nothing more satisfactory than . . . annihilation."
-- Richard Wagner, program note to *Götterdämmerung*

Welcome to the world at the end of the world. The skies are shrouded with burning, oily smoke, the earth groans under a poisoned corpse, and the only way out may be deeper into the belly of the beast. Like Reality [Thaumata](#) or Reality [Futura](#), worlds we've visited before, this is a world about a flavor and a feel as much as it is about extrapolation. That said, this world should have a harder edge to it -- it's a world nearly killed by the death of wonder, although not all the wonders are dead. Think of it as a cross between Richard Wagner and Tom Waits, or between Ken Russell and Ken Loach. Put the "grim" back in "grime" and see the world outside the smeared Perspex windscreen. See it smolder. See if you can save it.

"The Nazi myth which is important . . . [to] men like Hitler requires a Götterdämmerung . . ."
-- U.S. War Department counterintelligence assessment, Feb. 12, 1945

Patton's death in September didn't do it, although the wilder-eyed addicts in the Wewelsburg basement claimed that Skorzeny's "Operation Valküre" had changed things, that the American general was "the rope of the Norns," somehow tied to past and future in a way that others weren't. His breaking, they swore, signaled the new Twilight. But the Bulge ground to a halt in sight of the Mosel, and Montgomery slowly pushed the Wehrmacht back across the Ardennes. Not to worry, swore the Ahnenerbe men, sweating out the amphetamines and stinking of extinct herbs pulled from Finnish bogs. The Norns' rope was broken. Things would be different.

Montgomery swept into Lübeck, and Bradley's armor growled closer to Nuremberg, and Zhukov smashed across the Oder, and the sun of July rose over a prostrate Reich. Wagner's *Götterdämmerung* played on Berlin Radio night and day, and the smoke blotted out the stars. And then it happened; the whole world heard the howl of Garm, and the moon was eclipsed in blood. And the head of Jörmungandr, the Midgard Serpent, 600 miles across, breached the surface of the Arabian and rose up. Its first lunge destroyed three troop convoys and their escort carriers, swallowed in one bite 100 miles south of the Azores. A coil of the Serpent stretched across Africa from Mogadishu to Morocco.

"Thor shall put to death the Midgard Serpent, and shall stride away nine paces from that spot; then shall he fall dead to the earth, because of the venom which the Snake has blown at him."
-- Snorri Sturlusson, *Prose Edda*

When the head reared up again off Vigo Bay, it gulped down the U.S.S. *Essex* and TF 24, and paused to splinter a few hundred thousand tons of shipping. President Truman gave the go-ahead, and a lone B-29 took off from Iceland. Its original target had been Berlin, but Captain Joseph Westover had new orders. He, and the crew of the *Strange Cargo,* were to seek out and engage the Midgard Serpent with the Trinity Device. On July 21, 1945, spotter planes for "Operation John Henry" zeroed the *Strange Cargo* in on the Serpent, its head 20,000 feet above Oslo and moving southeast at 80 knots. Captain Westover was an ace pilot, capable of flying a plane through something much smaller than a snake's pupil twenty miles across. The Device detonated, tearing a piece of the sun down from heaven and destroying the Serpent's brain in a torrent of atomic fire. Westover and his crew died instantly. Jörmungandr took a little bit longer than that.

"The victor Perseus with the Gorgon-head,
O'er Libyan sands his airy journey sped.
The gory drops distill'd, as swift he flew,
And from each drop envenom'd serpents grew,
The mischiefs brooded on the barren plains,
And still th' unhappy fruitfulness remains . . ."
-- Ovid, *Metamorphoses,* Book IV (trans. John Dryden)

The polar vortex drove strong high easterlies that day, and a plume of radioactive venom hit the upper atmosphere and headed west. It slowly fell out of the sky into clouds and storms, twisters and waterspouts all headed west. Dark crimson rain fell from Dublin to Denver. Where it struck, the seas boiled and the earth drank poison. And things engendered, mutated horrors born of dragon's blood and broken strontium atoms. Some coiled down to the sea's depths; others clumped together and pulled apart ships. Some climbed or flopped or skittered or slunk from swamps and sewers and gutters and ponds and everywhere else rain ran in eastern North America. And some people and beasts drank from those pools and reservoirs before they knew, and some people's blood changed and they knew it not. Or at least not yet.

But it hardly mattered, not at first, because the fall of the Serpent's body back into the Atlantic sent up a wall of water a hundred miles high that smashed into the coast from Halifax to Havana. New York, Washington, Boston, Charleston, Philadelphia, Miami (and poor low-sunk New Orleans) all drowned. Montreal and Cleveland and Chicago, and Veracruz and Houston and Caracas, were merely battered. Salt water (flecked with venomous foam, right enough) lapped against the Appalachians.

"There are many seas and rivers flowing over this world, but there was not a drop of water for Nasren. There are many loudly resounding freshets cascading down these mountain valleys, but Nasren was wrapped in chains and could only thrash from side to side. Unable to get even a glassful of water he was dying of thirst. He was covered in the ice of the high mountains and his arms and legs were squeezed in the vice-like grip of the chains. Nasren would roar and moan, his cries being carried by the winds down from the summit of the Caucasus . . ."
-- John Colarusso, *Prometheus Among the Circassians*

The shock was felt all around the world, but nowhere more than in the icy depths of the Caucasus Mountains. These peaks that Hitler tried to reach in 1942 (on what advice, learned from what unknown insects' mead?) held the bound giant who had betrayed the gods. Hitler would call him Loge or Loki, the Eton-and-Oxford lads would have known he was Prometheus, but to the Ossetians of the valleys he was Nasren, greatest of the Narts, the giants at the dawn of the world. The thunder of the Serpent's fall shook him loose from his icy chains and he slid down the mountains, walking north toward Moscow, where he knew another god-hater ruled.

"Jove's bird on sounding pinions beat the skies;
A bleeding serpent of enormous size
His talons trussed; alive and curling round
She stung the bird, whose throat receiv'd the wound.
Mad with the smart he drops the fatal prey,
In airy circles wings his painful way,
Floats on the winds, and rends the heavens with cries:
Amid the hosts the fallen serpent lies;
They, pale with terror, mark its spires unroll'd,
And Jove's portent with beating hearts behold."
-- Homer, *The Iliad,* Book XII (trans. Alexander Pope)

The Serpent's head, with its skull cored out by nuclear flame, kept moving toward Nuremberg, where it had been Called, but its dead muscles overshot their mark. The head finally crashed to earth in Egypt -- or rather, on Egypt. Its body followed it down, thunderously settling across Europe in a 600-mile wide swath from Scotland to Sicily. England, the Low Countries, Germany, Austria, Italy Yugoslavia, southern Greece all smashed beneath the monster's coil. Wales was not obliterated, a stretch of western France and Savoy could see the sun, Spain survived. (Portugal was drowned in the other side of the tsunami.) Most of the armies of the Western Allies, and millions of those they had come to liberate, were dead, smashed beneath the scales. The coil across Africa had also come down hard, mostly in the Sahara, although Ethiopia had little chance to enjoy its hard-won independence. The Mediterranean and Red Seas were blocked by reptilian flesh. The earth trembled, cities around the world toppled and burned. Smoke filled the air.

"A third I see, that no sunlight reaches,
On Dead Man's Shore: the doors face northward,
Through its smoke vent venom drips,

Serpent skins enskein that hall."
-- *Voluspá,* the "Song of the Sibyl" [trans. W.H. Auden]

East of the Serpent's fall, the Red Army was mostly intact, and Eastern Europe likewise, safe in the Red Army's embrace. Russia had lost little, and the few hundred thousand dead in Hungary were nothing next to the thirty million that Stalin had killed or left to die in the last two decades. Moreover, the deadly venom fallout never touched Mother Russia; her monsters would be solely of human making. And of the giants; Molotov and Suslov declared Nasren a bogatyr, a glorious Russian giant born of Soviet Man from the scientifically nurtured soil of Soviet Georgia. Stalin's scientists (and those who had been oh-so-recently Hitler's scientists, at distant camps in Poland) pulled venom from the fallen beast and injected it into volunteers, or listened to Nasren's wisdom about the dawn time. Mysterious fires burned all across Siberia. Frozen mammoths struggled back to their feet, and resumed chewing their buttercup breakfasts. Other giants clambered out of the permafrost; Soslan of the steel body, Batyrez the invincible swordsman, Satanya the beautiful. It is a shame, Stalin tells each of them, looking at them with his wise brown eyes, it is a shame that your sons the Chechen and the Ingush were killed to the last child by the fascists and the imperialists. It is a shame, they agree, and their own icy eyes narrow.

"Now death is the portion of doomed men,
Red with blood the buildings of gods,
The sun turns black in the summer after,
Winds whine. Well, would know more?"
-- *Voluspá,* the "Song of the Sibyl" [trans. W.H. Auden]

It is the third year without a summer since the Fall of the Serpent. President Earl Warren has held onto Hawaii, turning the Japanese back toward China and their endless war there. There's no more stomach for war in the Pacific, and the Russians are welcome to the wreck of Europe. The Americans (and Texans) have their own continent to win back again, from the things that wash up now with every Atlantic tide. The last of the great monsters have been driven back down east of the Rockies. Negotiations with Texas are going well -- perhaps President Garner will consider running on a joint ticket in 1948. If the Army says it's safe to hold elections, that is. Fascist Mexico and Argentina are making noises about war; with who, nobody quite knows. Franco and the surviving French have come to their own agreement. The Welsh still swear to Queen Margaret in Sydney, as does some of India ("Congress India" is fighting two or three civil wars), and South Africa, and what's left of Canada.

It is British Petroleum who came up with drilling the Serpent for oil, and Royal Dutch Shell who set up the great cracking plants in Wales and Kenya to refine it. The Russian advisers in Arabia and Persia don't like it, but there's nothing they can do, yet. It is the Royal Navy that dives deep to salvage things from the rift where Jörmungandr rose. It is the Royal Society who have cut into the Serpent at Hereford, and (at hellish cost) brought back living samples of the things, the cultures, swarming in its cavernous belly. It is Rhodes University men who took those writhing creatures and strapped them down and drew out the sera and built the equipment that allowed Sir Edmund Hillary and his team to climb to the top of the Spine and look down at the curving world, and Vickers who hired Goddard from New Mexico to build the rocket planes to get there faster. It is Prime Minister Menzies and his government who alone seem worried about what Stalin means when he promises a "final titanic struggle." Spies, and rocketeers, and oil-men, and speleo-herpetologists gather in Sydney and Capetown and Plymouth and Nairobi, and wonder if the sun has set on the British Empire at last, or if somewhere in this smoke-stained poisoned world there is still room for a green and pleasant land.

The Deck of Many Things (for *d20 System*)

Published by Green Ronin Publishing

Layout & Design by Hal Mangold

Art by Eliane Bettocchi

Twenty-four cards (22 artifact cards & two rules cards); full color, in a tuck box; $9.95

They say any good GM can really put his performance over the top by providing a few props in play. They need to be something special, though, like treasure maps, replica weapons, or paper made to look like old parchment. However, even better than this would be something custom-made for your game, though how many groups outside the miniatures companies actually offer something useful in this respect? *The Deck of Many Things* may not be a *wand of wonder* or a *cloak of displacement* but it's a lot easier to simulate and it has actual uses for anyone sitting around the table.

If you've only been playing *Dungeons & Dragons* for, say, a week, you might not know what this deck is. It started as an insert in an issue of *Dragon* magazine and became one of the most infamous items ever: a deck of cards from which strange and wonderful occurrences might arise. Or not. A stout hero states how many cards he's willing to draw from the deck and, once committed, pulls them out one at a time.

Sometimes it's good. A dedicated follower might appear and pledge his steel to your cause, or you could gain riches, or you may be granted a certain number of *wishes.* On the other hand, you might not be so lucky. All your magic items could be drained, you could be attacked, or you might be cast into the dreaded Void. Then there are a few results that could be interpreted either way, like a sudden change of alignment. You can't go back on your agreed draw, so if you said you'd pull three cards you can't wuss out just because one of your friends was magically turned against you (though if you fall into the aforementioned Void, you're pretty much excused from additional draws).

While the article directed readers to use a regular deck of playing cards or, for that added whiff of fantastic "realism," a tarot set to duplicate the relic, Green Ronin has created the deck itself. Okay, it isn't made of plaques or vellum like the (again, quotation marks) "real" thing, but it's designed to look like the artifact proper.

The set consists of the 22 cards from the canonical deck, right down to the card names that have been twisted just a bit to reflect those you'd find in a fortuneteller's deck, like Balance, the Fates, and Skull. There are also two more that list the rules and effects of the individual cards. If you've read the original article, you've seen the text they have here as well. There isn't much added, unless you count the d20 Open Game License. Though the deck does not bear the *d20 System* logo, that's its pedigree; you can use the set with another game if you're ready to file off the serial numbers and come up with concomitant rewards. They may have taken more than just that, in fact, because part of the descriptive material still tells you to simulate the magic cards by substituting the tarot cards listed in a column that isn't actually provided. Ditto the column that tells you how to do this with ordinary playing cards. Either the text was lifted verbatim, or someone forgot to trim that section when they excised those columns.

Concentrating on what the gamer really wants, though, the cards have some good artwork. Once more, it's not the sort of thing that accurately reflects a device that's been sitting in a dungeon waiting to be claimed by adventurers; the drawings, while colorful and clean, suggest a cross between fan favorite Dan Smith and old mythological illustrations from Chinese tapestries. You get less a sense of hoary legend and more that RenFest feeling. Would that paper prices would let the cardstock quality match the fine imagery, but while these are oversized cards worthy of a tarot deck, they

aren't terribly sturdy. They're going to need some fondling, too, before the cards stop sliding so easily over one another and upsetting the deck.

Not every Dungeon Master opts to have these magic devices lying all over his game world, so maybe this isn't something that's going to see enough use to justify a sawbuck. Then again, if you had something fun to draw from, you might be able to get your players to throw caution to the wind. Who can resist playing with the cool toys? There are probably a lot of people out there who would pony up the cash for something that more closely resembled the full-blown and fanciful artifact as described, but for those who want to use *The Deck of Many Things* more than admire it, you won't bust your wallet getting this darling little prop.

Oil in Akkad

by Paul Drye

In Akkad, the 22nd century BC sees King Sargon more than a century dead and his great-grandson Shar-Kali-Sharri sitting on the throne. The Gutians threaten his empire from the north-east, and if history runs as expected the empire is close to collapse.

Meanwhile on Homeline, KMP Petroleum have recovered from the dark days after stolen fusion power technology swept away their business. They now make even greater profits than their predecessors by bringing oil from easily accessible fields on other worlds to timelines where fusion is still a fantasy.

The two meet because one Akkad, on Mesopotamia-9, is sitting on a stable nexus portal as well as the usual North Arabian oil fields. No matter what the remaining circumstances, KMP sees this as a jewel without match. In the decade since the timeline was discovered, the company has made Mesopotamia-9 home to one of its largest operations, and they've given the king important personal support. Unfortunately for them, their presence has inadvertently stirred up the peasantry, and it's becoming a race to see who'll come down on them first: Infinity, or a mob of dirt-poor Akkadians.

The Nexus

There are hundreds of pre-industrial Middle Easts for Homeline to use, so it takes something special on one for someone to set up shop. In the case of Mesopotamia-9, its distinguishing feature is a plug of volcanic material rearing up out of the swamp just west of the modern-day site of Rahhaliya, Iraq. The arrangement of basalt columns, similar in appearance to Homeline's Giant's Causeway, has no analog on any other known timeline. Once it was discovered (by a KMP petrologist who immediately noticed how out of place it was), it was examined as a potential parachronic anomaly and Infinity found its crowning nexus portal. KMP laid claim once it became clear where the portal went: to Mesopotamia in Britannica-1, a timeline where oil was worth about $40 per barrel.

On the far side of the portal, KMP bought up a near-bankrupt petroleum company with stakes in that timeline's Iraqi oil fields. They then built an "oil refinery" in Rahhaliya that apparently processed crude oil pumped from their stakes; of course, it was just a cover for the nexus portal's terminus, and the crude was coming from Mesopotamia-9, hoisted up the side of the basalt columns through several large cargo elevators.

Natural portals are never as reliable as artificial ones, though. The Akkadian nexus doesn't always connect to Britannica-1. Every now and then, there's a slow build-up of parachronic energy over the course of an hour or so, then the portal "flips" to another destination. A few minutes later it flips back to pointing at Britannica-1. Fortunately, the first time this happened the new end point was an unoccupied timeline; Infinity was able to cover up the resulting oil spill and put detectors into place that warn when the next event is about to occur. Even so, no one has ever been able to

figure out when the nexus is going to flip until the buildup begins, or why it flips at all. They can't even explain why it never connects to the same destination twice. Since the nexus was commercialized, it's hooked up to no less than 19 different alternative destinations.

KMP Petroleum

Based out of New York and backed with Kuwaiti and Venezuelan oil money, KMP's business is preponderantly out-time. After the Gulf War, the Kuwaiti government received claims on Iraqi oilfields on other timelines as partial compensation for the damage their country had suffered. Teaming up with a large American oil company to get access to the parachronic technology they needed, the new conglomerate has been exploiting their stakes to the hilt, and ship hundreds of thousands of barrels of oil from empty or pre-industrial timelines to worlds where petroleum is getting scarce.

Akkad

Even before the portal was discovered, Mesopotamia-9 drew some interest as one of the few timelines where the city of Akkad was available for study. In many universes, Akkad was the capital city of one of the first empires in human history. There are several timelines where the point of divergence from Homeline is firmly rooted in Akkadian events. Despite being historically important, and numerous attempts being launched to find it both pre- and post-parachronics, early Akkad remained thoroughly lost on most timelines. When Mesopotamia-9 was discovered and its first surveyors proved that it wasn't a historical echo (and so was safe to visit extensively), Akkad became a nexus of archeological exploration; one of these visitors was on retainer for KMP and discovered the nexus portal.

Akkad itself remains a minor focus of Homeline interest, with the academics becoming progressively more annoyed at KMP Petroleum for the way the company is warping the society they're trying to study.

The city is on the west bank of the Euphrates River, about 30 miles southwest of Homeline Baghdad's location. Southern Iraq in the 22nd-century BC is not quite as dry and used-up as it is four thousand-plus years later. While the land away from the river is arid, erratic seasonal floods leave swampy, rush-ridden areas in old oxbows of the river and in other low-lying areas.

The city is walled, like all other settlements in Mesopotamia, though as an imperial capital its fortifications are impressive by ancient standards. Fired clay bricks line the outside and inside of a 10-foot-thick wall, with clay filling the interior. This wall runs in an arc from the north to the southeast, enclosing a loop of land with the river on the other sides. From the river, a 15-foot-wide canal runs east to west, passing through the wall near the main gate. Other small gates dot the walls at roughly equal distances, while the canal carries on into the farmland that surrounds the city.

Within the walls, Akkad is different from what travelers used to other time periods might expect. The city is more a ceremonial center than a place for masses of people to live; everyone within the walls is either a priest, a servant, or a member of the king's extended family. Economic productivity in the 22nd century is quite low (there are no horses or donkeys to use as draft animals, money is more than a millennium in the future, and the list of domesticated plants is short), so the middle class is non-existent. Trade over any kind of distance is chancy, and tends to be limited to things that can't be produced locally no matter what the cost (e.g., tin from Cyprus, or cedar wood from the Empire's outlying province in Lebanon).

The main areas are a temple complex to Shin (the moon god) and another to Ishtar making up the "wings" of the town to the north and southeast; a temple to Anu and Adad (the linked sky/bull gods associated with divination) between them; and a palace complex where king Shar-Kali-Sharri lives. A joint "dwelling area of the gods" is on a flat, two-tiered ziggurat in the center of all these buildings. Previously this was a private area where the divine connected to the Earth, but the previous king Naram-Sin started the practice of Akkadian rulers claiming to be gods, and the periphery of the ziggurat is open for anyone to see the new "god" engage in the rituals that keep the world and the heavens in order.

In contrast to the well-kept temples and palace, the remainder of the area inside the walls is given over to a warren of mud houses for servants and a small contingent of fighting men. Many of the servants work in official capacities, fanning out into the countryside to collect taxes of grain and oversee the construction of roads and canals. Almost all are slaves, with the palace servants being drawn from the local population and the officials from elsewhere in an attempt to combat corruption and favoritism.

Life for almost all people in Akkad is nasty, brutish, and short. Peasants live about 50 years (if they clear childhood), and poor nutrition dwarfs them: men are about 5'3" on average, and women shorter still. Their material lives are basic as well, with most people wearing one loincloth until it falls apart, and what little food they have being bland: wheat, beans and lentils, onions and garlic for taste, and the odd bit of mutton or goat. Water is often deadly to drink, so the peasantry get by with foul wheat alcohols. The main reason the priesthood and nobility exist is to get some relief from the monotony; for example, cotton fabric and chickens are a recent introduction to the region and are reserved for the powerful. Grape wines are not much older, and are similarly hoarded.

The Gutians

Akkad is threatened to the north and east by the Gutians, a semi-nomadic people who raid the flatlands east of the Tigris from their home in the Zagros Mountains. They rely on mobility, attacking villages and livestock then escaping before the Akkadians can counter-attack. To modern eyes, the most remarkable thing about the Gutians is that they do this without help from horses; the invention of the chariot is a few hundred years in the future, and the horses of the 22nd century BC are too small to ride. Instead, they're kept as meat animals and objects of veneration, while the Gutian warriors move on foot. A lifetime of practice has given them astonishing stamina, the equivalent of top long-distance runners.

As well as stealing property, the Gutians have another motive: expansion. They've realized that the Akkadians are dependent on their irrigation canals, and try to destroy them when they can. Clogging channels with debris and fouling the water with corpses can ruin a crop, and one crop failure causes a famine. Without intervention by the king, the land will often revert to waste, which makes a perfect home for their lifestyle. In the next few hundred years, they'll be co-opted by the surpluses and luxuries of civilization, but for now they're diametrically opposed to it.

The Highway Worshippers

KMP uses the same cover story as any overt Homeline organization does on a primitive timeline: they are wizards from far away, interested in specific, non-threatening things in the area and quite willing to trade valuable magical services for permission to dwell here.

On that basis, Infinity has allowed KMP to import industrial technology, particularly since both the nexus portal and the Kifl oil field are small and can be secured from the eyes of the locals without much difficulty. Unfortunately, the two are separated by 40 miles and any reasonable route between them runs through inhabited land. A regular pipeline would have to be underground to protect from Gutian attacks, and that would have cost a lot more than KMP was hoping to spend. The petroleum company instead obtained permission to build a two-lane asphalt highway, and runs a fleet of 20 tanker trucks back and forth carrying 20,000 barrels of oil per day.

The Homeliners expected there would be some disruption in the lives of the Akkadian peasants near the highway, but assumed it would be small enough that they could justify it to Infinity. In the event, though, they've just proven how hard it is to think along with a human who's 6,000 years of cultural evolution away from modern people.

Since the trucks began running, a grassroots religious schism has developed centered around the gods Anu and Adad. Those divinities' symbol is the bull, and many peasants have been taken with the idea that the swift trucks are enormous, mystical bulls of some sort. Their shape is vaguely right; the headlights are eyes; the sound of the air horns that the warns the impious off the gods' most-unusual road is clearly the bellowing of the great animals. And don't they rumble with thunder and cause a great wind as they pass, as befits the gods of the sky?

From KMP's perspective, the new belief is a problem because of the consternation it causes in Akkad's powerful. Highway-worshipping peasants are much less likely to listen to the established priesthood of any Akkadian god; after all, the gods are out in the fields, not in the holy cities of Nippur and Ur. Taxes are harder to collect as the king himself is supposed to be a god, and his ziggurat seems less important for the proper appeasement of the spirit world if one can appeal directly to the gods as they whiz by on their mysterious business. In all, the highway is threatening to become a bizarre echo of the Protestant Reformation for the Sumerian pantheon, divorcing religious authority from the priesthood and bringing it back to the believers.

The established religious authorities and the king have replied in the usual fashion, engaging in violent reprisals against the heretics. The heretics in turn are digging in their heels and fighting back, with the whole situation threatening to turn into a widespread rebellion. The one thing most likely to end the situation is to stop running the trucks, but if that happens KMP's profits go out the window. Failing that, there's a plan afoot to drive the trucks into local villages, priests riding on them to establish their dominance, and spend a day at each locale letting the locals play "petting zoo" with the Homeline tech. Unfortunately it's foundering on priestly fear of actually sitting on the trucks while they move around at the unearthly speeds of, say, 20 to 30 miles per hour.

Characters

Leonardo Nodals: A survivor from the bad old days when Petróleos de Venezuela was falling apart, Nodals has moved into the new era with KMP. He's too conservative and frightened of failure to get to the uppermost echelons, but his experience and skill have landed him at the head of KMP's crown jewel in the field.

Apart from the traumas of the fusion era, Nodals' life is shaped by a terrorist attack eight years past that cost him his legs and one arm. Since then the director has lived his life as a cyborg, but without the positive side that might imply; Homeline can make cybernetic arms and legs but they're inferior replacements to the originals. Nodals limps along on his artificial legs, adaptive programs keeping him upright if jerky. Maintenance is a problem too, especially around the joints when Mesopotamia's sand and heat attack them.

Mawiyah al-Sanousi: A distaff relative of the royal al-Sabah family in Kuwait, Mawiyah is the liaison for KMP in Mesopotamia-9 with all outside parties: the press, investors, and (most importantly) Infinity. She's an unusual figure, one of the leading lights in the current Sheik's program to involve more women in the Kuwaiti government and other positions of power. As the program isn't entirely popular in Kuwait, she's a black sheep to many people; her strength is that she doesn't mind.

Educated in the UK, her background is in communications; as a favor to the Kuwaiti government, she has also had some Infinity agent training so she can better operate on another timeline and understand the concerns active agents bring to her. Her loyalty is to KMP and the interests of her family first, but she has sympathy for the agents she works with. Unfortunately, she also has a taste for going out in the field with them, and sometimes wonders aloud if there's an alternative version of herself on some timeline where she carried on with Infinity rather than going back to the family business.

Shar-Kali-Sharri: Literally "The King of Kings" -- it's lese majesté to speak his birth name aloud -- Shar-Kali-Sharri is the fourth king of the Akkadian Empire and the first one who looks as if he'll leave his country in worse shape than it was when he ascended to the throne. He was a decent, if uninspired ruler for most of his reign, but now that's he's passed three score years he's become increasingly obsessed with his own mortality. KMP's power rests on their ability to relieve him of some of his ailments, like arthritis and dental cavities.

While this gives the outtimers considerable control over him, the king is not happy with his dependence. His entire life he's been supreme in everything, excepting his relationship with the previous king. When Naram-Sin died, it was a profound psychological relief to him. Now that KMP can subvert his actions, he's disquieted again. He may not understand it in those terms, but he would welcome another option and put the oil-men in their place if he could.

If he's unlucky, though, he might become even more hen-pecked. The crowning achievement of Naram-Sin's reign was stabilizing his family's relationship with the priesthood by appointing his three daughters as high priestesses of Sin,

Shamash, and Enlil. All three live in different cities to the south, but "the crones" (as their brother calls them) are in a position to make his life very difficult if they feel the need.

Adventures in Akkad

Get in the Car: The Asiatic Lion is nearly extinct on Homeline, and one of the first varieties of it to disappear was the one that lived in the swamps and scrub of southern Mesopotamia. There are still some around in 2200 BC, though, and the GDREP (see "Infinite Crossroads-3: GDREP") wants them. Agents are assigned to trudge through the muck and sedge to "bring 'em back alive." Those who take the time to interrogate the locals before heading out will hear of Shir, a leonine demigod who supposedly rules over all the prides. Is he just an oversized cat, or is there more to the tale?

Through the Looking Glass: Both KMP and Infinity would like to better understand the nexus portal's alternative destinations. KMP wants to smooth their exports, Infinity wants to continue their mission to explore the multiverse. Unfortunately, since the connections only last a few minutes, and never seem to repeat, Infinity's usual cautious approach to investigating a new timeline isn't good enough, Some brave agents could be assigned to go through the nexus each time it connects to someplace other than Britannica-1.

Red Star in the Sky: One of Infinity's continuing problems is its relationship with the ornery Russian government on Homeline; one of KMP's main competitors is the Russian-owned Gazprom. Neither is averse to dirty tricks if they feel the need, and they decide to make a combined play aimed at disrupting KMP's operations on Mesopotamia-9. Adventurers can become involved at an early stage when the identity of the fifth column is unknown, or later once the Russians have safely ingratiated themselves with the local power structure.

A Little Help Here?: A radio call comes in from one of the tanker trucks hauling oil along the Rahhaliya Highway. He's broken down and the natives are restless. Someone needs to get there and retrieve the situation before the "mechanical bull god" is reduced to matchbox-sized pieces by its overenthusiastic worshippers.

I Thought You Said "No Magic": Mesopotamia-9 is intended as a no-mana timeline, but there are possibilities for GMs looking to lull their players with an apparently normal timeline then pull a switch. The Old Kingdom of Egypt fell about 80 years before the timeline's present day, with one of H.P. Lovecraft's favorite Egyptians -- the probably apocryphal femal Pharoah Nitocris -- in on the kill. Her revenge on her brother/husband's murderers (Herodotus anachronistically calls them Persians) traditionally took quite a lot out of her and led to her death. Creative types are justified in giving her a recovery period and then a return across the Sinai as an undead queen looking to finish the job against the people of the Tigris and Euphrates.

GameMastery Critical Hit Deck

Published by Paizo Publishing, LLC

Concept & design by Jason Bulmahn

Developed by Mike McArtor & Jeremy Walker

Art by Sean Glenn & Eric Deschamps

55 cards (52 critical hit cards, one OGL cards, one instruction card, one advertisement card); full color, in a tuck box; $9.99

Critical hits -- those much-beloved and so-seldom achieved results in the thick of combat -- are among the fondest memories some *Dungeons & Dragons* players have. Just when the team needed that extra push to put them over the top, or the one roll that would turn the tide of battle back in their favor, there it is: a natural 20 on the die. This simple mechanic has undergone changes and been offered variant rules throughout the game's lifetime, and some maintain that it is, along with days of the month, the only reason to keep a 30-sided die around.

On the other hand, just rolling a 20 and getting a little something extra is kind of boring.

At least, the crew at Paizo thinks so, so they've come up with their own method of codifying and expanding the flurry of joy that comes from getting the right roll, and that's the *GameMastery Critical Hit Deck.*

The 52 cards form a draw deck. A player still has to roll a natural 20, and he must still confirm his hit with another die roll. If he passes this muster, however (that is, if he's on the heroes' side . . . more about the bad guys later), instead of settling for simple double damage he can enjoy other crazy effects designed to add a little spice to the brouhaha. He might damage more than the hit point total, for example, crippling an enemy's wisdom with a skull shot or reducing the dexterity with blows to the arms, hand, fingers, or muscles. It gets colorful sometimes, with piercing attacks that may pin a foe in place.

There are four types of damage offered: bludgeoning, piercing, slashing, and magic. Most of the results seem to be in keeping with the individual styles -- for example, if you pierce someone, that's the best way to get results like deep, festering wounds or organ damage. Some things come up more than others; for example, "Spun Around" shows itself on more than a couple of cards. Magic is portrayed here as an exceedingly fickle beast. Some of the cards give you benefits like not expending the spell you just cast, while others take utterly baffling shapes. Sending your opponent into a planar rift? Losing him for a few seconds to a time vortex? Heck, in some cases you yourself may become invisible, though the card that turns the villain briefly incorporeal seems like it could hurt your cause.

Not that the bad guys always get to play with the set. The DM is asked to decide just who gets the cards and how. Variants put forth include letting anyone with a crit use a card or forcing enemies to possess this "power" as their feat, but mostly they figure it's restricted to the heavies in your game and perhaps their henchmen.

Graphically, the cards do what they're meant to. The only real art to speak of is the severed orc head on the back of each card (and as severed orc heads go, it's pretty good). From a design standpoint, the fronts could use work. The labels for the different damage types is small, painful to read, and an unsatisfying red-on-black combination. There's a corresponding symbol to go with each type, but these look like a graduating teddy bear, a Christmas tree, and a spatula

(the lightning bolt is pretty clearly a lightning bolt). Fortunately, the types and order never change so all it takes is a taste of familiarity to spare you some squinting. Better is the design work, with a parchment-like motif that's strategically spattered with blood. The cards are thin and slide around a bit unless you have a really level tabletop or you limber them up with some shuffling to relieve them of their pristine nature. Oh, and the Ps in the title look almost like Fs.

These complaints make the cards sound much worse than they really are. When you look past the graphic presentation, what you've got are some interesting and usually straightforward (though still creative) rewards for your troubles. The actual effect text is plain and concise, the titles are evocative and give you a clear idea what the special effects are before you even read the rest of the box, and most cards don't even make you go to the book for a rule. Sure, you get the occasional slip (is that -5 on the free attack applied to your roll to hit, or to the enemy's defenses?), but there's not much here to second-guess (though the text of "Decapitation" causes an amusing double-take).

The ***GameMastery Critical Hit Deck,*** just like dice, is another lovable toy for the players and the GM to make use of. It may not be as giddily humorous as the infamous ***RoleMaster*** charts, but players love to tell war stories, and these may become even more exaggerated with this pile of inexpensive, deadly results.

Cannibal Sector 1: The Kingdom of Death in the World of Progress (for SLA Industries)

Published by [Cubicle 7 Entertainment Ltd](#)

Written by John Dodd & James Desborough

Illustrated by Dave Allsop, Clint Langley, & Derek Dow

164-page b&w softcover; $29.99

Just when you thought a game line dead, up pops a supplement to prove you wrong . . . but then, **SLA Industries** has always been like that. Originally published in 1994 by Nightfall Games, its history has seen it in the hands of Wizards of the Coast and Hogshead Publishing before finding a home with Cubicle 7 Entertainment. Not only will this English publisher be supporting the definitive Scottish RPG with a second edition, but will also be releasing a second edition of *[Victoriana.](#)* Its first release, though, is **Cannibal Sector 1: The Kingdom of Death in the World of Progress** for SLA Industries.

For an RPG with just four supplements along with the core book, **SLA Industries** has maintained a very loyal online following that has kept the game alive during its leaner times. What kept the fans loyal was the setting and background, a combination of science fiction, dark corporate horror, deep secrets, and structured play set-up, all taking place in the World of Progress. This is dominated by one company, SLA Industries, run by one being, Mr. Slayer, and headquartered on Mort, a world with one single feature. This is Mort City: vast, labyrinthine, and home to billions cowed by television and rampant commercialism. The players take the roles of Operatives, troubleshooters working for SLA Industries to gain income, media exposure, and security clearance. Yet not everyone in the World of Progress believes in Mr. Slayer's message, and even a corporation like **SLA Industries** has its failures. This is the focus for this new supplement.

Cannibal Sector 1 is the first of four regions abutting Mort City, and the most notorious. It is a fecund, fetid, parasitic boil that is poisoned by the City as much as it feeds on its effluence . . . not just its waste, but also the City's failed experiments, contraceptive hormones, mutagens, radio actives, and other chemicals. Once part of Mort City, Cannibal Sector 1 sits under a layer of ash from the constant fires, is strewn with tower blocks (both fallen or ready to fall), and home to diseases so virulent and deadly that they will kill someone in two hours. Other denizens include Cannibal Clans (descendants of the sector's original inhabitants), tribes of the doglike Carrien, insect swarms so thick they can bring down vehicles, sociopathic leftovers from the "Chrome Warrior" fad a decade before, soft companies rival to SLA Industries, and guerilla forces individually more capable than anything SLA can field. At its heart stands Salvation Tower, the kilometer-tall beacon to the Fall, the catastrophe that marked SLA Industries' first failure.

Between Mort City and Cannibal Sector 1 is the Wall. Standing 20 meters high, 10 meters thick, and 7,200 km long, it is manned by almost 2,000,000 defense forces or Shivers, plus hundreds of penal troops and vehicles. The Wall is a sign of SLA Industries' failure as much as it is the company's desire to protect its citizens. It is cheaper to protect them against Cannibal Sector 1 than it is to deal with it, and it has become a huge source of media revenue. Reality TV shows are shot on and beyond the Wall, and the number of BPN files or missions for the Sector has grown. Given the lethality of the Sector, this presents the perfect opportunity for up-and-coming (though not necessarily experienced) Operative teams to make a name for themselves where others have failed.

In response to the dangers of Cannibal Sector 1, SLA Industries has publicized one secret and kept another. The former

secret is the existence of the Sector Rangers, dedicated to patrolling the sector and equipped with an advanced SMG/bolt thrower combination and a modular armor system that can integrate other armor pieces. The other secret is the existence of the Grit Stormer variant. Stormers are SLA Industries' ultra-loyal clone warriors that come in several variants. The standard model is tough, has claws, and can regenerate. The Grit Stormer does that and more, but comes with one extra, media-unfriendly feature: the consumption of freshly killed brains to extract tactical information.

Cannibal Sector 1 presents all of these dangers, diseases, and denizens in detail. What it does not do is get down to geographical specifics, nor is there a map. This is intentional. Cannibal Sector 1 is too large to map and is not really geographically diverse enough to warrant one. Instead from the broad details given, the GM is expected to design BPNs and threats for his players to face.

To help, the GM is given several sample BPNs, ranging from easy escort duty in the sewers below the Wall right up to a virtually suicidal apocalyptic mission into the Sector's heart. Other campaign types are also discussed, including all-Shiver, all-ganger, and all-civilian campaigns. The book is also one big catalog of threats and dangers to throw at the Operatives. The advice on running and staging a game in Cannibal Sector 1 is excellent, focusing upon its empty, silent nature compared to the claustrophobic hustle and bustle of inside the Wall.

The supplement also lifts the lid on a couple of SLA Industries' secrets. Not the *big* secrets, but still sizeable nonetheless. These expose who Digger -- the Manchine operating in Salvation Tower -- is and what he is up to, and who the highly capable Scavs are. Discovering these secrets could land the characters in really big trouble.

Physically, *Cannibal Sector 1* is a clean looking book. True, it needs another proofread, but all the same, it is an enjoyable, informative read. However, it does lack an index. This inexcusable absence is made all the worse given that there is space for it. The highlight, though, is the artwork, always one of the game's most notable features. Dark, disturbing, and unsettling, every piece is evocative of the nastiness that is Cannibal Sector 1.

If you are a fan of *SLA Industries,* then you will be buying *Cannibal Sector 1.* After all, it increases the number of supplements published by a quarter. Of course, you will really be buying it for the exposé upon a region of Mort discussed in hushed tones, for its revealed secrets and dangers, and its new playing options. But if you are not a fan of the game, what is in *Cannibal Sector 1* for you? As a whole, probably not a lot, though its contents could easily describe a hell hole of a world to visit in any sci-fi or cross-parallel-world RPG or campaign. Individual details can be mined to add something nasty to any of those games. Either way, *Cannibal Sector 1: The Kingdom of Death in the World of Progress* is informative, interesting, and makes for a well-written expansion to Scotland's (and one of the United Kingdom's) best RPGs.

Future Boy

by Eric Funk

This young man is a well-meaning, but slightly misguided individual. He is loyal and dedicated to the point of neurosis, but he has not seen much of the real world, learning most of his geography and history from the tales of heroes, whether shown on TV, described in newspapers, or recorded in books.

Future Boy (a.k.a. Arthur "Arty" Hammond) never had a stellar education. Standard federal testing put him in the middle of most curves. He chose well, but his grades never put him on the lists for extra achievement exams. Despite this, he was randomly chosen to represent his schools in various tours and celebrity meetings. It was on one of these trips that he first witnessed some heroes in action. (If one or more of the PCs have been active heroes for a few years, then they could be the ones he saw!) Perhaps he was even rescued from a villain's plot or indiscriminate use of power such as a giant robot knocking over a building or throwing a school bus. After that day, his life changed; he dedicated it to Saving The World. Taking the bits of his dreams that he could recall, coupled with impossible luck, he was convinced that he had some sort of precognitive powers. Despite failing ESP and clairvoyance tests, the lad is no less determined in his efforts. He believes that his powers are either too subtle, or too powerful to be tested in that way. Having studied thousands of comic books and listened to many tales, he now has chosen the group of heroes to apprentice himself to -- the PCs. At this, he will dog them in any way he can until they accept him as their ward.

Encountered

Future Boy is almost terminally optimistic. He firmly believes that the heroes will succeed in the end, even if it costs them their lives. He is cheerful, and will seek to befriend the heroes at every opportunity and do the things they do. He sees any failure on his part as a chance to learn. The scenario presented here is best implemented in a situation where the heroes already know Future Boy's parents through their "mild-mannered" identities. Arthur's alias will vary depending on the style of the campaign and apparent power levels. In a secret magic campaign, perhaps he will use the call-sign "Librum," or in a cyberpunk campaign, "Dex."

Probable PC Reactions

Option 1: Avoidance

Attempting to avoid him can result in his unconscious use of his Serendipity, and thus it cannot be used to help the team when he does catch up to them. Can they convince him that the eldritch horrors they fight are not worth the risk for someone of his age, or will his parents pay the PCs a visit to ask awkward questions as to why their son is upset? If the heroes spurn the boy's aid, will he return embittered after a few years of solitude, bent on the destruction of those who would destroy a child's dreams?

Option 2: Compliance

When he joins, weird stuff starts happening, reducing the ability of the team to remain covert. The boy's parents will want to meet the people he has been spending so much time with, and thus can begin a new role-playing situation involving the heroes' mundane alter-egos. If some of the heroes had a mundane background, perhaps they can identify with Arthur's attempts to try to keep such a lifestyle.

In the end, even if the PCs do not "buy" him as a Dependent, he should still be rolled as one, with a value of "6" (see page 131 of the *Basic Set*). Even if his number does not come up, there will likely be some sort of unusual event happening with Future Boy involved (which the heroes might not hear about until later). Such will be memorable, inconvenient, and may switch one certainly bad situation for another equally bad situation that can be dealt with. For

example, if the PCs are stuck in a pit with walls closing, an abandoned aquarium truck with multiple tanks could crash in sideways, jamming the closing walls. After an appropriately dramatic amount of time, the tanks break, half-filling the pit with water containing angry sharks and octopi.

And Then . . .

Adventure Seeds

Sensei: Future Boy has the will to learn, he just needs to grow. If trained vigorously, be could gain as much as two points of attributes per year! The players, and perhaps their characters, might find some enjoyment in planning his training and tests. Perhaps they can devise tests to remove the limitations on his Wild Talent. Finally, as his IQ rises, the Reliability enhancement on his advantages should be reduced.

One way to get Future Boy out of the heroes' hair, at least on a part-time basis, will be to find a local teacher for him, so he can learn the secret moves and lore required by the setting. A hope may be that as he learns of the real world, he will realize that there are other groups he could seek to join. There remain several obstacles: finding a teacher or two, convincing them to consider teaching the boy, getting the boy there regularly, his passing an entrance exam, and his accepting the idea!

There are some places that a child can explore inconspicuously that adults cannot, such as school yards, play grounds, amusement parks, and malls. If caught in a place they shouldn't be in, they can feign ignorance and innocence. On the other hand, if the cadre must investigate a bar or racetrack, such a minor would be left out.

Example 1: Future Boy comes to the heroes, and claims to have found one of the items they seek, be it a wall sconce emblazoned with a jade dragon, a book on necromancy, or an autographed Babe Ruth bat. It was during a school tour of a local private museum owned by a suspicious local wealthy individual. Can the heroes pass as "parents" in the next tour?

Example 2: Future Boy has spotted a villain making a getaway from the scene of a crime. Being a minor, he is not allows into many bars and nightclubs, but only he can identify the individual. Choices must be made quickly!

Super Size Me: Future Boy has awakening powers! While on a mission, or any time they are hanging out, these uncontrollable effects can lash out. If the heroes have the faith and patience to see this through, they will be rewarded with a potentially useful ally! Until then, and even then, his youth will be an object of ridicule by villains, allies, and patrons. The end of the journey toward his manhood will mark the beginning of yet another adventure . . .

Love In the Air: The character may have a romantic crush on a female protagonist, and will try to court her. He will not be able to tell her directly, nor approach her, but he will try to fulfill her expressed wishes (such as her mentioning that she wants a newspaper or likes roses). This opens the question of a variant: Future *Girl,* enamored with a male PC . . .

Quotes

*"It's not luck, it's **Destiny!**"*
"Neato! That's exactly how Thinoman would have done it!"
"Wow, cooler than Paragirl's teleport effect!"

While this character is an archetype of superhero settings, there are examples available from almost any genre of an idealistic, unprepared individual -- often a youth -- ready to jump up to the front lines, even if he must stand on a box to do so. Some pass the trial by fire, and some do not. A few examples include Brody from *Indiana Jones and the Last Crusade,* Luke Skywalker in *A New Hope,* Gozlyn from *Darkwing Duck,* and Elliot from *E.T..* Others include the sidekick wanna-be "Incredi-Boy" from *The Incredibles,* Chaz from *Constantine,* and the raving fan the "Flaming Carrot," the founder of the *Mystery Men.*

What Exactly Are We Selling Here, Anyway?

For those who have no interest in game-business-related columns, this one is sure to disappoint. So, before this veers off entirely to trade discussion, I guess I can offer the following for such folks: Ummm . . . Gamers, talk to each other. Don't be a jerk to your fellow gamers. Eat your veggies.

Okay; time for industry navel-gazing.

Every so often I'll let my mind wander to the great questions of the universe. Most recently, having sorted to my satisfaction whether or not essence precedes existence, I've been considering the market value of a gaming line, such as **Dungeons & Dragons.** Sadly, since I probably have about seven decimal places too few in my checkbook to even entertain an offer (not that I know of any plans whatsoever to find the industry stalwart a new home), I'm forced to devote the bulk of my mental CPU cycles to tackling this question obliquely. Namely, "What, exactly, is a gaming company selling to its customers?"

To most, this answer is painfully obvious: games. But I'm not too sure it's that simple. After all, the value of a product isn't necessarily in the value of the actual "product" it's selling. The most obvious example is the world of soft drinks. For the most part, there are few sodas that don't have a corresponding "generic" version, and this knock-off brand is often close enough to the real thing (at worst), at substantial savings. But since consumers aren't generally paying for the product itself, so much as the ephemeral aspects of that product, this discrepancy in cost is gladly paid by the soda-drinker.

But let's look at our "game" assertion. Are folks who buy into a game buying it for the rules? For some games this seems unlikely, especially in the RPG world; after all, one of the first things many groups do is tweak the rules for a new game to its own liking. (And, of course, the halls of online fandom are rife with folks complaining about various aspects of popular RPGs.) It seems that, with all this wit and wisdom available, it should be possible to make the "ultimate" version of some games' rules . . . especially, with **Dungeons & Dragons** in this particular era, when the game's core rules are easily available for commercial tweaking via the **d20 System.**

Does a gaming property get its value for the setting, then? Or the characters? It's possible; various licensed novels set in gaming universes sell enough copies to be worth a bunch of shelf space in most bookstores, and I suspect that many of those readers are folks who only have a passing interest (at best) in the setting as a game. But even so, it's hard to envision a character like Count Strahd having quite the same appeal as Dracula, or even Lestat.

Is a game popular because of community? In this theory, people buy games because other people are buying the same game, and folks want to be a part of a group to play the game with. This seems likely with some games (such as **Magic: The Gathering**); while it seems likely that CCGs have come along that have had better rules or more interesting subjects, the most popular games tend to be part of a cycle of popularity that acquires and keeps players because folks looking to get involved want to maximize their chances of playing the game. As I understand it, the notion of community was also one of the ideas behind the opening of the *d20 System* license in the first place; the idea was that, by enabling others to create product for the *game,* the *community* was being broadened at no additional cost to the game's owners . . . and that's where the money (supposedly) is/was. (Were this a Wikipedia article, the previous sentence would almost certainly be tagged with a "citation needed" stamp.)

Is a game popular because of availability? (This one is closely related to community.) I believe this is the case with some games, such as *Monopoly* . . . a game I find inconceivable that people would choose to play for fun, yet routinely is one of the most popular games in the country. Why? Well, when you go to buy a game at a store, if **Apples to Apples** isn't available -- indeed, if you've never even *heard* of **Apples to Apples** -- then you buy what is available. (Of course, some games are also available because they're good; *Scrabble,* for example, is a great game that has, in my mind, stood the test of time.)

The idea of what brings value to a game is interesting because it can greatly affect the fiber of the game itself. For example, the original **Torg** suffered somewhat from the idea of "character bloat" . . . there were *lots* and lots of

characters to keep track of -- mostly bad guys -- each with their own stories, goals, and motivations. Now, this isn't a bad thing if the game is selling as a "game," since RPGs need lots of adversaries, and "faceless huge dragon" isn't a possible adversary in a game devoted to individual named villains. But having lots of characters a bad thing if *Torg* is selling because it's a "setting"; too many characters means too many folks for readers to keep track of. (Consider how many major villains there are to keep straight in the mind's eye in the original *Star Wars* trilogy. Six, maybe? Of which only two are onscreen and/or alive at any given time?)

In all, I find it amazing how the concept of "game" can be broadened so greatly. Consider the notion of "football." (American rules, for the sake of our discussion.) If you were really into "football," what exactly would that mean? Do you like to play the game? If so, do you play it "live," on the computer/video game console, via board/card games, or some other way? Do you watch the game live? (With professionals or college players?) Do you keep up with your favorite players? Do you buy trading cards or action figures of certain players? Do you keep up with a favorite *team?* Do you buy clothes with a team's logo on it, or shirts that celebrate a particular game? Do you watch movies and TV shows based on the game?

As the most extreme example that I can think of, one of the most-watched television programs every year in America is the Super Bowl . . . and a non-trivial percentage of people watching are doing so because they want to watch the expensive commercials of the event. In other words, *all* other aspects of the game -- the rules, the teams, the players -- don't matter to such viewers. In this case, those consumers wouldn't care one iota about any changes or improvements made to the "rules" of the game, except for the value it continues to add to the event that is the Super Bowl for advertisers.

As the third *Pirates of the Caribbean* movie comes barreling to theaters this weekend, I note that the movie is based on a ride set in an attraction park meant to bolster the community of those interested in animated features based on a set of characters. And it's a direct line from a black-and-white "Steamboat Willie" cartoon to Jack Sparrow action figures.

Which is a roundabout way of saying that I have no idea of where the value of a game lies or how much its worth. But if a *Queen of the Demonweb Pits* movie was released, or a *Ravenloft* amusement park opened, or if *Spelljammer* action figures came out, my interest would be piqued . . . in much the same way as if a new edition of the parent **Dungeons & Dragons** game came out.

If I Were An Herbalist, Would I Be Rich? Or Useful?

Herb lore, both mundane and magical, is a fantasy staple. In the real world, what could a patient expect of the historical pharmacopoeia? How reliable was it, and what variety of effects were known? What kind of economy surrounded this information (was "being an herbalist" ever a full-time job, or just a sideline at best)?
--William Keith

"The herb is good for something, because God made nothing in vain."
-- Nicholas Culpeper, 1616-1654

It is clear that there has been herbal knowledge for at least as long as there have been written records of any kind, and that herbal remedies -- whether because of spontaneous recovery, the placebo effect, or actual beneficial properties -- have been widely believed to be effective.

An herbalist is not a doctor, physician, apothecary, nor surgeon; such gentlemen (and they all seem to have been male before the late 19th century) had and have an interest in more general theory and remedies rather than confining their treatments to the strictly herbal. Some of the more interesting medical theories -- such as those involving the position of the stars and planets at the time a remedy was administered or a plant's relationship to the humours or to classical gods and goddesses as causing it to work better at particular times of day or lunar month, the suggestion that carrying a dried frog in a bag round one's neck would ease rheumatism, and that writing charms on paper, dissolving the ink in water and drinking the water would turn aside the plague -- were unlikely to be lethal but were unlikely to be particularly helpful either. They might be combined with herbalism proper, particularly by people who made a living from the practice of medicine in one way or another, but such people were not properly speaking herbalists and will not be considered here.

Medical practice in general, between classical times and the advent of modern medicine in the 19th century, relied heavily on the Hippocratic theory of the four humours. This system became over time too complicated to explain fully in few words, but holds essentially that the four elements of the human body -- blood (hot and moist), phlegm (cold and moist), yellow bile (hot and dry) and black bile (cold and dry) -- must be balanced for the body to be healthy. If for whatever reason the balance of the humours was disturbed, it could be restored by the administration of herbs corresponding to the humour that was deficient; thus someone whose humours had become unbalanced in favor of the hot and moist could be brought back to the proper balance by a treatment concentrated on herbs related to the cold and dry. The theory was holistic, and treatment would include advice on diet, exercise, and care of the body in general: one was treating not the illness but the body, and once the balance of the humours was restored, the body would be able to restore itself.

Ordinary village herbwives, on the other hand, would accept that an herbal remedy was ideal for the treatment of a particular ailment, and that it helped the body to fight the disease, without having anything more than a very rudimentary acquaintance with the theory of the humours; they were pragmatic rather than theoretical in their treatments. This led to considerable confusion when an old-wives' remedy worked, and a plant had to be hastily re-classified by a theoretician as to its properties of cold, hot, dry, or moist in order to explain its success.

Regarding professional medical practitioners of any kind, it might be reasonable to assume that someone with an interest in treating all manner of ills in all manner of patients in return for cash payment might be likely to be less impartial than someone whose interest was in helping a relation, friend, or acquaintance to recover from an illness. The reliability of those making their living by treating diseases may be judged to some extent by the fact that the richer the patient, the more costly the treatment for what ailed him was likely to be: exotic plants, dried in Cathay and imported at great expense, were a remedy for the rich where the poor made do with local plants picked in the hedgerow -- and

the latter were as likely to be effective. Black pepper and ginger were claimed as cures for an extraordinary range of conditions and diseases at one period and another, and the more either cost at any given time, the more it was likely to be prescribed to the rich by people who were in a position to sell it to their patients. Such people were also inclined to assert that they could cure diseases about which anyone who had to live in the same village as the victim's relations would have hesitated to do anything except ease the pain with syrup of poppy. The claims made by professional physicians were often a great deal more far-reaching, and also far-fetched, than any a wise woman would have dared to make. It is remarkable how many expensive and completely ineffective "cures" for venereal diseases were peddled before the discovery of penicillin: a clear case of the triumph of hope over experience.

Actual herbs and their demonstrable medical properties have not on the whole changed very much in the past couple of thousand years, and observation of them was as acute in previous ages as now: more so, perhaps, since in those times the only remedies available to most people were herbal, and more people lived in places where plants grew rather than in towns where they did not. Mint is still a mild and somewhat unreliable abortifacient; willow-bark tea still helps to stop a headache; blackberry or cherry syrup still reduces a dry cough and still has the advantage of tasting pleasant; chamomile tea will still ease a child's stomach-ache in many cases; ginger in any form is still recommended by some midwives as a specific against morning-sickness and by some doctors as a remedy for nausea; raspberry-leaf tea (and indeed the raspberry fruit, much more palatable) is still a good tonic for pregnant women and for people who are anemic. Such things were known, and such remedies were used, and on the whole even if they did not affect a "miracle cure" did not harm the patient. It is difficult to take a fatal overdose of willowbark tea: quite apart from its needing prolonged preparation, it tastes revolting, and one will almost certainly be sick long before one has managed to consume a lethal amount.

Much of the "old wives' herbal lore" of previous generations became lore simply because it worked, and had been observed to work over many generations and even hundreds of years, just as clichs tend to become clichs because they are frequently observed to be accurate. Today tips about infant health are shared by members of a mother-and-toddler group; in previous times when a child was ill its mother would consult older women who had successfully reared children (those "old wives"), in the hope that her child too would survive if the right remedies were applied. In most settlements there would thus accumulate a pool of information about remedies for infantile disorders. In the year 1000, if little Johnny had diarrhea somebody might very well advise his mother to grate a sweet apple very fine and give it to him to eat, and when he was cured by this, that remedy would be remembered and passed on; during the 1940s one of my aunts, in training as a nurse in Canada, was instructed by her matron to use it as a first resort when a child in her ward had an upset stomach. Remedies for adult disorders too would be shared, tested, and passed on.

Herbal remedies in common use would therefore rely on two things: first, they had demonstrably done at least some good for a previous patient and done no harm, and second, that they were available in the vicinity. A plant that grew nowhere within a 50-mile radius of a village could not be used in that village, however marvelous its properties might be rumored to be, unless it had been harvested elsewhere and imported, which would be costly. A woman living on the Mediterranean Sea might know that cloths saturated in lemon-juice and wrapped round a baby's legs would reduce a fever, but a woman in Northumberland would not, since she would not have ready access to lemons. In the same way, although the classical herbals list umpteen plants as remedies against the bites of venomous serpents, this particular information would have been of little use in Ireland or Northern England where venomous serpents are few and far between.

While detail varies from place to place and time to time, as a general rule the people living in any given area would accumulate information about the herbal remedies that were available and worked for them where and when they were.

The patient's expectations would in general be lower: where we now expect or at least hope for a quick-fix cure (and become annoyed and start to talk about legal action if it is not forthcoming or is unsuccessful), earlier ages merely hoped for any relief at all. In general, the objective was to alleviate the symptoms. A cold would take between three days and three weeks to clear up, just as it does today, but nobody expected it to be prevented from running its course by a herbal tea; what they *would* expect was that the various symptoms might be made less severe or painful. An herbal syrop good for coughs, wheezing, and difficult breathing would not reduce the duration of a cold, but might make it more tolerable while it lasted. Similarly, herbal remedies would not cure the patient of measles, but might reduce its severity, duration, or long-term effects; an infusion of a febrifugal herb might make convulsions less likely

to occur by reducing the fever, and thus mean the difference between a fatal attack and survival, and the application of a specific herbal ointment to the eyes might lessen the risk that the patient would be left blind.

The aim of early herbal practice, as of all medicine at the time, was not so much to heal or cure the body as to help the body to heal or cure itself. For instance, there is no instant cure for a broken bone, which is going to be painful for some time, but it need not necessarily be fatal or leave the victim incapacitated. The bone must be set, after which the herbalist's business was to provide herbal preparations that would reduce any fever, herbs that were believed to help knit the bones, and herbs to relieve the pain. This is not so very different from the treatment given in a hospital nowadays, if a broken bone is not to be pinned.

If the body proved unable to heal, the business of the herbalist, having given what help he could, was to administer herbs to ease the pain of the body and assist the passing of the spirit.

The more exotic diseases and serious, continuing conditions were unlikely to be cured by herbal remedies, though their severity might be lessened and their most unpleasant effects reduced. Some illnesses, such as the various plagues, could not be reliably cured prior to the discovery of antibiotics; smallpox, tuberculosis and diphtheria can be prevented by vaccination but were unlikely to be cured by herbal remedies; cancer was as intractable then as it is now. (Unfortunately the herbal preparation that is presently being tested as being helpful in the treatment of cancer is poisonous if ingested; although a paste of the same herb was applied to skin cancers, reportedly with beneficial effect, it could not easily be applied to internal organs before the invention of the hypodermic needle.) Bronchitis and pneumonia could be eased but not cured by herbal treatment, as could rheumatism and arthritis. Tetanus and rabies were not curable.

Wounds treated with the application of herbs would generally tend to heal more readily than those treated in any other way. This was because it was usual to "seethe" (boil) the herbs either in water or in wine, which would then be used to cleanse the wound before binding the herbs over it. Water clean enough even to drink safely was not universally available, and washing a wound with unboiled water would be as likely to cause as to prevent infection. If a wound became infected, a hot bread-poultice or barley-meal poultice made with honey and herbs boiled in water, wine, or vinegar would help to draw out the poison: the herbs might not themselves make very much difference one way or the other, but the sterilizing effect of their boiling would certainly do no harm even though the application of the very hot poultice might be agonizing.

The reliability of herbal treatment would depend to a very large extent on the person administering it. Some preparations have a beneficial effect in small doses or applied externally, but would have severe or fatal side-effects in too great a quantity or applied internally. A knowledgeable practitioner would have a good idea how much one might expect to be able to do in the case of a particular disease or condition, and how much one might safely use of any given remedy, where someone with less knowledge (and patience) might make matters worse by over-enthusiastic or inappropriate treatments.

For this reason one would want if possible to choose with care and by personal recommendation which herbalist to consult and whose advice to trust; but then one would prefer to exercise care today when choosing one's doctor, and might demand a second opinion.

Those who dealt exclusively in herbal remedies were at least as likely to be female as male; herbs were considered to be part and parcel with cookery and brewing, which were the business of women. Many different herbs have been used, and still may be, to flavor ale; beer is in any case made from "herbs" in its widest definition, which includes barley as well as hops, and wines are also made from herbs in a similarly wide definition.

While a busy woman of a village would be unlikely to spend her whole time studying the effects of herbal preparations even if she had enough patients with a wide variety of malaises available for experiment, she would learn about remedies as the need for them arose, and would then pass her knowledge on freely for the benefit of her community. An older woman who had gathered information over a lifetime might harvest, prepare, and store plants at times when others were too busy to do so; she might become the accepted authority on their use, and be offered payment in kind for her help, but cases of illness serious enough for her services to be essential would not be frequent enough for this to provide her with a living.

The lady of a manor would have the treatment of illness and injury as part of her duties, and would gather information about herbal remedies to help her fulfill her obligation as well as possible. She would almost certainly cultivate plants that were not common in the area but which had been found to be useful and imported for that reason, and would harvest and dry them for use at times when the plants were not growing; she would also keep herbal preparations ready made-up in her stores for immediate use. Recipes for remedies would be compared and exchanged among the women of her family, and among the ladies of other, nearby manors; in this way a woman might accumulate considerable information about herbal remedies and share particularly useful recipes widely. (Such women were frequently as literate as or even more literate than their husbands, and had a wide-spread network of correspondents.) She would also consult local villagers she had reason to think knowledgeable and reliable. This medical practice would not be either her livelihood or her sole occupation, and her remedies would be distributed to her dependents, and also to guests and visitors, free of charge.

Another source of herbal lore, and of free medical treatment for the poor and for those who were on the road away from their homes for whatever reason, was the Church. Every monastery had an infirmarer as a matter of course for the benefit of the monastic and the wider community, and the monastery gardens would include plots devoted to medicinal plants of all sorts. As with the network of manor ladies, those members of an order of monks whose business was the care of the sick exchanged information and herbal recipes, and pooled their knowledge about what was and was not effective in the treatment of every disease and condition they had to deal with. They also had access to classical herbals and to more modern treatises in which they could search for treatments with which to try to ameliorate conditions that had proved intractable to their usual remedies. Furthermore, they sent seeds, roots, bulbs, and whole plants from place to place as gifts from one House to another, so that their gardens might all have as complete as possible a range of plants that had been found to be useful in the treatment of the sick.

The main difficulties facing a modern person when considering particular elements of traditional herbalism are:

- establishing which of the herbal remedies now known to be valid would be likely to have been known in the chosen period,
- establishing which of the beliefs current in that period would have been completely ineffectual or even dangerous and which were of some value, and
- identifying the actual plants.

When wishing to investigate any question about herbal lore in a particular century and area, there is difficulty in finding a written "herbal" or such text in which the commonly-held beliefs of that time are set out, particularly in a modern translation. Many of the more widely-known texts were available both in the original and in translation into the local language all over Europe and were given credence for many centuries after they were first written, but they are difficult to locate, and even a later text which repeated matter from the "masters of old" (Galen, Dioscorides, Pliny the Elder and other classical sources) is likely to be in a language that requires either expert knowledge or a translation into modern English to be comprehensible.

I tend to use a late-20th-century edition of *Culpeper's Complete Herbal,* in modern English and with an index of diseases and conditions as well as of the plant-names, to locate generally-accepted herbal remedies both during the mid-17th century when Nicholas Culpeper was writing and from earlier times; he copied much of what he wrote from earlier sources. Most plants to be found in England between 500 and 1500 appear in Culpeper, as well as many from other countries. For the modern cross-check I consult Mrs. M. Grieve, *A Modern Herbal.* This choice of reference works was made mostly because these books were available at the time I needed them, and subsequently retained because I found Mrs. Grieve's work one of the most comprehensive modern herbals I have read. She has the advantage that she sometimes marks as poisonous those plants to be treated with care, and she sometimes gives the earliest dates from which plants were found growing wild in England as opposed to having to be cultivated.

Having identified in the old text a plant to suit the ailment, one can then refer to the modern herbal in order to find out whether the plant is still considered useful as a remedy and if so whether it is a specific for the particular ailment or condition. The modern herbal will also give warning of side-effects and contra-indications. Mrs. Grieve frequently makes life even easier by quoting Culpeper so that one can be sure that she is writing about the same plant, and

commenting (or pointedly refraining from comment) on his recommendations. For example, Culpeper says of *Alkanna tinctoria* (Alkanet, Dyer's Bugloss, Spanish Bugloss, Orchanet) that it is "as gallant a remedy to drive out the smallpox and measles as any is"; this is true, in that it is not known to have any more or less effect on either disease than any other plant. It does make an excellent colorant for both pale marble and inferior port wine and is reported by Mrs. Grieve as being "perfectly harmless" when used for the latter purpose. She does not mention smallpox or measles in her entry on *Alkanna tinctoria.*

Once the plant has been selected, one may be at liberty to exaggerate its efficacy if desired or necessary, or simply to assume that the claims made for it by an herbalist writing at the time were accurate rather than hyperbolic -- which amounts to much the same thing.

A febrifugal herb such as *Potentilla reptans* (Five-leaf Grass, Cinquefoil, Five Fingers, Five-finger Blossom, Sunkfield, Synkefoyle) may reduce a fever; Culpeper says that in various different forms it will also cure an ague, be it what ague soever, cure quinsey and yellow jaundice, cure the falling sickness (epilepsy), relieve palsy (shaking or stroke), cure the shingles, running and foul scabs, sores, and the itch, cure gout and sciatica, reduce ruptures, heal bruises and stay the bleeding of wounds in any part, inward or outward. Mrs. Grieve more moderately describes it has having "Medicinal Action and Uses: Astringent, febrifuge." *Lamium album* (White Archangel, White Dead-nettle, Blind Nettle, Dumb Nettle, Deaf Nettle, Bee Nettle) and *Lamium purpureum* (Purple Archangel) according to Culpeper should be "bruised, with some salt and vinegar and hog's grease" (purified lard), and would then be "very effectual to heal green wounds and old ulcers; also to stay their fretting, gnawing, and spreading; it draweth forth splinters, and such like things gotten into the flesh, and is very good against bruises and burnings"; Mrs. Grieve reports that "the whole plant is of an astringent nature, and in herbal medicine is considered of use for arresting haemorrhages ... it has the reputation of being effectual in the healing of green wounds, bruises and burns." The more strongly smelling *Lamium galeobdolon* (Yellow Dead-nettle, Yellow Archangel, Weazel Snout, Dummy Nettle) is regarded by Culpeper as being superior to either of the other colors; Mrs. Grieve reports his view, but does not go so far as to endorse it.

At this point the third potential problem, identifying or describing the actual plants, must be noted.

The Swedish naturalist Linnaeus imposed a universal system on the nomenclature of plants in the 18th century. Before then, one plant might have had several different names varying from region to region even of the same country: to take an example completely at random rather than because of any medicinal properties, in England *Galium aparine,* which I was brought up to call Goosegrass, is also known as Bedstraw, Clivers, Cleavers, Barweed, Hedgeheriff, Hayriffe, Eriffe, Grip Grass, Hayruff, Catchweed, Scratweed, Mutton Chops, Robin-run-in-the-grass, Love-man, Goosebill, Tonguebleed, and Everlasting Friendship; it may have had other names that have not happened to come to my attention. In addition the same name may have been given to two or more quite different plants: *Prunella vulgaris, Valeriana officinalis,* and *Stachys palustris* have all been called All-heal. This sort of confusion really only needs to concern someone who is unable to find some other, less ambiguous plant for which the required medicinal properties were claimed at a chosen period, or who is planning actually to prepare a decoction or a tincture and administer it.

Further difficulty may arise when reading herbals from one country that are translations of something written in another: the translator may simply not have been sure which plant is intended in the original, either because it did not grow in the country in which he lived or because the original plant was not supposed in the translator's country to have the properties ascribed to it by the original writer, whereas another similar plant was. In such cases the translator may substitute his own information or plant, and is quite likely not to bother to mention that he has done so. Again, this need not bother a non-practitioner too much.

In many cases a common name for a plant gives a decided clue as to its use. Culpeper writes: "It is not to be supposed that Goutwort hath its name for nothing, but upon experiment to heal the gout and sciatica," in other words that it does precisely what it advertises, and Mrs. Grieve agrees: "Diuretic and sedative. Can be successfully employed internally for aches in the joints, gouty and sciatic pains, and externally as a fomentation for inflamed parts. The roots and leaves boiled together, applied to the hip, and occasionally renewed, have a wonderful effect in some cases of sciatica." Its other names are not quite so obviously informative: *Aegopodium podagraria* is also called Herb Gerard, Jack-jump-about, Goatweed, Ashweed, Achweed, English Masterwort, Wild Masterwort, Pigweed, Eltroot, Ground Ash, Ground

Elder, Bishop's Elder, Weyl Ash, White Ash, Bishopsweed, and Bishopswort, and although it would be pleasing to think it might cure one of a nasty attack of bishops, this does not seem entirely likely. (Mrs. Grieve points out that Culpeper gives a different entry to "Bishop-weed" in his herbal, calling it additionally Aethiopian Cummin-seed, Cummin-royal, Herb William and Bull-wort, which is a good example of a thorough confusion of plants and nomenclature.) Eyebright is the common name for *Euphrasia officinalis,* and although it is not mentioned in classical texts as having this particular property, nor as far as I know does it in fact have it, was widely believed by the time of Culpeper to be able to "help all diseases of the eye." *Symphytum officinale* was known as both "Knitbone" and "Boneset," as well as "Bruisewort," and it isn't exactly surprising to learn that in the middle ages it was believed to be a good herb for assisting bones to knit; its most common name, Comfrey, is a corruption of *con firma,* a reference to the belief both then and now that it will help unite bones that have been broken. It is also unsurprising that *Artemesia cina,* which is poisonous to roundworms and threadworms ("anthelmintic" or "vermifuge"), should be known as Levant Wormseed.

This last plant does bring us back to the drawback of herbal remedies in the hands of the unskilled, which is the same as that of modern drugs in unskilled hands. The active constituent of Wormseed, Santonin, kills roundworms in a small dose; in too large a dose it kills people. Mrs. Grieve notes that its side-effects may include a yellowing of the vision, headaches, nausea, vomiting, and, if a non-fatal but over-large dose is administered, epileptiform convulsions. Interestingly, she does not list "Wormseed, Levant" as poisonous.

As a final step in authentication the plant's habitat and the areas in which it might be expected to be found should be confirmed in a botanical text if possible, because it would be silly to expect anybody to be able in Scotland to pick a plant that is a native of Devon and Cornwall but has never been observed growing further north than Gloucester, or to put onto a granite mountainside a plant that is only found growing in marshy peat soil. In the same way, if it is possible to establish that a plant grew wild in England at a particular date, this is ideal, but it is extremely difficult to do so. It is known that Hyssop was introduced at some time around 1200, and Rosemary in about 1338, but in most cases there is no way of knowing whether a plant noted by Mrs. Grieve as being "Southern European" was introduced by the Romans, by the Normans, or at a later date for cultivation in monasteries because of its useful medicinal properties.

It is easy to understand why herbalists in fantasy tend to be secretive about precisely what plants they are using to cure their patients: if one is too explicit, somebody may pipe up and say "But Viper's Bugloss grows on chalk, she wouldn't find it in a pine forest" or "When you say Bishopswort, do you mean Betony or Herb Gerard?" (*Betonica officinalis* or *Aegopodium podagraria*) or even "He can't use that, it wasn't introduced into England until 1500."

Anyone working in a world other than our own is clearly free to invent any herbal remedy and herb-name required. It is worth considering, however, that infallible and instant cures for all manner of ills would alter the social structure in ways that need to be thoroughly worked out. That standard Fantasyland wish-fulfilment, the reliably contraceptive herbal tea, would have altered our own world out of all recognition by changing the balance of power between the sexes. Suppose that there were a berry that instantly removed all traces of a headache, or an herbal ointment that eliminated arthritis, or a plant whose leaves steeped in wine dissolved gall- and kidney-stones, or a plant whose juice prevented cataracts from forming; what would the consequences be, and how wide-spread?

No such wonder-herb exists in our present world. Even moly, the plant that will change you back from porcine form, has never been identified, though many suggestions as to what it may have been have been put forward; of course the problem is that in order to test them one would need also to be able to turn someone into a pig, which does present some difficulty to the researcher. Herbs have had some remarkable claims made about their properties, generally by doctors who were trying to sell themselves and their expertise to the desperate and the credulous, but the actual benefits of herbal remedies were then much as they are now: they help, and in some cases they heal, but they are not and never were instant and infallible cures for everything.

- Hippocrates of Cos (c.460BC-c.370BC), called "the father of medicine" and frequently quoted or referred to as an ultimate authority.
- Pedanius Dioscorides of Anazarbos (fl. 40-65 AD) founded the tradition of Western herbals. His *De materia medica* composed c.64 AD deals with about 500 plants and was constantly copied, revised and appropriated for 1500 years in many languages and by many herbalists.

- Galen of Pergamum (129-200 AD), was widely known and quoted.
- Isadore of Seville (c.560-636) wrote an encyclopedia entitled *Etymologaie,* of which Book 17, chapters 6-11, deals with botany. Information taken from earlier books, including Dioscorides, not including Pliny. His work contains a lot of errors, but was influential.
- *Macer* (authorship uncertain, possibly Odo of Meung-sur-Loire) is the name usually given to an 11th century poem of 2269 Latin hexameters entitled *De virtutibus herbarum* which deals with over 70 herbs, drawing on previous authors.
- *Circa Instans,* properly *De simplicibus medicinis,* is a list of 229 plants and their properties, compiled around the year 1150 by one of the celebrated Salernitan medical family Platearius.
- Hildegard of Bingen (1098-1179) covered 138 herbs in her *Liber subtilitatum diversarum naturarum creaturarum* written between 1151 and 1158.
- John Gerard (1545-1611/12) published a list of the plants cultivated in his garden in 1596 in his famous "Herball" *The General Historie of Plants,* which was enlarged and edited in 1633 after his death. Derivative but elegant and authoritative.

The Writer's Block Column

More owing to a lack of time than anything else -- our household's 2.0 model has discovered crawltech, and no object remains vertical and/or assembled for long -- I'm trotting out my "writer's block" column (first alluded to years ago. Curiously, I do have ideas for other columns, but none that I can whip out at the full rate of my 80+ words per minute. Not like writer's block.

Anyway, back in my college days -- circa the McKinley administration -- I worked on my creative writing degree via the proscribed means as laid out in the academic guidebook: hanging out in smoky coffee shops with other writers and thinking about writing. (In hindsight, perhaps spending much of that time actually *writing* might have yielded more fruitful results.) Anyway, in our writing workshops, we would all pass out copies of our masterpieces to our professors and peers, and we'd critique them.

One of the surest signs in creation that someone had absolutely no idea what to write about was when the writer chose to write about the act of writing . . . or, worse, write about how they have nothing to write about. These are usually poems that begin along the lines of, "As I stare at the keyboard, ashtray full of the remains of my lack of inspiration, my screen remains blank." And then they wander on about how they have nothing to write about, or how they've discarded ideas, or -- if they want to mix it up in a hoary clichéd "twist" -- they might reveal that their lack of anything to write has resulted in *[SPOILER!]* the very poem you're reading. In a fiction course, the main character would be a writer who struggled with the act of writing, or was confronted by a great idea that he tried to cope with, or some such. In our dramatic course, the protagonist was a playwright who . . . I think you get the point. So common was this in my writing workshops that a common comment toward the end of class would go along the lines of, "Of all the 'sitting in front of a computer trying to come up with an idea' poems we did this week, yours was the funniest."

Although sympathetic at first, as the courses ran on (and I recognized the folly of signing up for a half-dozen writing courses at once was not in creating the output, but in reading reams of my peers' efforts), I grew steadily less tolerant of this motif. It's not that the act of writing about writing is inherently bad, *per se;* many fine writers have dabbled in that as a plot device. But one, it's common; and two, it's difficult to do well (or, at least, "well enough to elevate above all the others"). And, perhaps worse, on some level it's an act of pure navel-gazing; it's tough for an audience to admire your cleverness if you keep pointing out how taxing it was for you to do it. (In much the same way that having the chef come out at a fancy restaurants and say how difficult it was to make *your* steak, and here's another funny anecdote about the slab of meat you're about to cram down your gullet . . .)

Tying it into gaming, I note that I've been a part of at least a half-dozen gaming adventures -- which, percentage-wise, is a small but significant number -- that have revolved around the idea of roleplaying. Thus in a **Werewolf** game the PCs might get entangled in a plot involving a game called **Wolfman** that encourages kids to take the role of werewolves and kill people. Or a sci-fi game might have people enter a holographic construct where they are forced to play a scenario where they are nothing more than characters in a game. Or in a modern-set game, the heroes need to make up characters for themselves in *another system* within the game world for . . . aw, heck, whatever contrived reason.

If you're a GM, I recommend you resist the urge to succumb to the temptation of gaming about gaming. While it makes sense in some settings (such as **Dream Park** and *Star Trek: The Next Generation* campaigns), for the most part it's very difficult to pull off . . . *especially* if the session is about how the PCs need to play a roleplaying game to advance the plot. I believe there was a section in the **Holodeck Adventures** book for Last Unicorn's iteration of the **Star Trek: The Next Generation** rules that points out the pitfalls of doing something unreal (like puttering around a holodeck) in a game that is, inherently, built around doing something unreal.

Fortunately, in an RPG, there's an easy answer. In a long-running campaign, it's perfectly possible for *nothing* to happen . . . at least, nothing directed by the GM. It's called downtime, and it's up to the players to direct what they want to try to accomplish in those sessions. (And, in general, it's pretty popular among players.)

So that's my "writer's block" column: Resist the urge to roleplay about RPGs. If you're that tapped for ideas, break out

a card game for that week and detox as a group of gamers playing a game . . . in the *real* world.

Icosahedron Adventures

Campaign Composition Concerns

by Owen K.C. Stephens

Most **d20 System** games have massive, odd, largely unstated underlying premises: They assume a group of about four people (with radically different skills unlikely to have been gained from similar backgrounds) band together to face a never-ending line of threats which constantly ratchet up in difficulty (always just dangerous enough to be interesting without ever massively overwhelming the heroes). The reasons for this assumption are obvious, and the games are popular enough to suggest there's good reason for it. But an ongoing campaign that doesn't explain why that's how things work can get bogged down with lack of suspension of disbelief from players or (in severe cases) the characters themselves.

However, it is possible to set up the background of a campaign so that unspoken assumption becomes spoken (or at least whispered in dark corners). Below are a few examples of core campaign ideas that easily lend themselves (or even overtly enforce) the stepped-threat format the **d20 System** does best. While some of the campaign suggestions are offbeat, they have the advantage of tying strongly to what the **d20 System** rules tend toward anyway, giving them the option of turning a potential drawback into a genre-confirming rule paradigm.

Back Order to the Future

It turns a limited form of out time travel is possible. While physical objects can't be moved backwards through time easily, information can. People and groups from the far-flung future use this ability to arrange for minions in the past to do their bidding. The primary form this bidding takes is to arrange for goods and commodities to be moved around so they are at a given location at a given time. Many of the strange economic events of the past few centuries, and not a few famous discoveries of ore and archeological valuables, are actually the result of futureling machinations through "current" agents. By changing the past (or trying to resist changes made by others) a few powerful groups in the far future have become time moguls, able to send messages back to any period of time to secure their own future.

The problem is, paradox is a constant threat to those who manipulate the past. Time turns out to be resilient, but only up to a point. You can't make changes big enough to ensure you change the past (and thus your present). Time itself only allows you to alter things so your desired outcome is possible. Generally, the best you can arrange for is a 50% chance. After that, time rejects your manipulations and annuls your effort to affect how things turn out. As a result, future time-moguls must employ many different teams of agents native to different timelines, each at a different level of competence. When a time mogul wants to change the past, he must find a group of agents just competent enough to have a decent chance of succeeding.

The PCs are special agents for Western Union's "unusual requests" division. It's their job to make sure letters from the 1800s are at a given crossroads in the 1980s, vaults of hoarded canned food are moved out of impending floods, patents reach the patent office on exactly the stated day and hour (and not a minute later *or* earlier), building blueprints are exactly accurate to how buildings are actually constructed, and items hidden for future "sleeper" bequests (not needed until the 2050s or later) aren't tampered with.

Of course, the heroes are acting as agents of future moguls. As a result, they are only assigned to missions where they have a good chance of success, rarely encountering problems that are either a cakewalk or a party slaughter. They are drawn from radically different backgrounds because the future moguls hiring the company that pays them prefer a few flexible teams to dozens of groups of specialists (sending requests back in time may be reliable, but it isn't cheap). Of course the heroes keep running into similarly-powered and broadly-skilled groups working for *other* time moguls, as well as the normal day-to-day risks of adventuring around the globe.

In This Hex There Be Dragons

In many ways this is a "default" campaign set-up that many fantasy **d20 System** games are built around, in at least a hand-waving kind of way. It's also very similar to how many MMORGs handle the same questions of carefully graduated threats.

In essence, there are zones of different danger levels, with the lowest levels of threat closest to the PCs home. Once the heroes are experienced enough that local threats aren't a challenge (or have all been defeated), they move further out to areas known to be more dangerous. In a typical campaign questions soon arise (why *do* the hill giants of the Ironswack Hills stay near their wasteland of a home, instead of invading the lands of the orcs of the Fertile Forests?), requiring the PCs to either move fast enough to ignore such issues or eventually look behind the curtain.

With a "In This Hex There Be Dragons" campaign, however, there is an outside force keeping most everyone in their own region (with thanks to everything from *Riverworld* to *Midnight at the Well of Souls*). It may be gods who divided up the world for their own worshipers long ago (and have the divine power to enforce it) or an ancient curse long since forgotten (the Last Dragon King decided it was easier to gather taxes that way) or even an "alien" experiment (everyone is actually reincarnations of races from a thousand fantasy worlds, and the otherworldly Transplanters have set it up so they don't get into fights).

Different homelands are set at different levels of danger ecology. The heroes' homeland is safe and peaceful, but those around them are slightly more dangerous, and the ones accessed from that ring are even *more* dangerous, in an ever-expanding selection of increasingly deadly lands filled with opportunity, villains, or just mysteries that need to be delved to satisfy curiosity. The level of technology, magic, and psionics available in each homeland may vary (letting groups experiment with rules from splatbooks without committing to them long-term).

For whatever reason, however, the heroes are able to move from homeland to homeland, but only when they're together. They may be agents of the Transplanters (or gods, or whatever) doing systems maintenance, or they might be unplanned heroes who happen to be an exception through prophecy and destiny. There may even be a universal way for anyone to earn the right to travel from homeland to homeland, involving gathering a band of individuals to pass through a deathtrap (restricting the ability to those willing to risk their lives to earn it). Once they can move more freely, the PCs can either have an overarching plot to follow (from fixing minor problems to finding a criminal who is fleeing one world a head of them or even a quest to find who is responsible for this set up and demand changes), or they can adventure purely for the experience and wealth.

They may even be forced to undertake their homeland-hopping to counter a more powerful force that has also learned to move from zone to zone, and set out to conquer (or just eliminate) all other homelands.

Saturday Night Dungeons

If all you really need is a thin excuse to set adventurers up on life-threatening missions in exotic places without anyone asking too many questions, why not just admit it to the characters themselves? The Saturday Night Dungeon borrows from **X Crawl, Dream Park,** John Varley's Gaea Trilogy, as well as professional wrestling, reality television, and every movie that showed gods using heroes as chess pieces.

It doesn't matter if magic and technology are mixed, or if magic is simply advanced enough to duplicate the effects of mass media. Reality programming is the top of the heap, be it satellite pay-per-view or CBN (crystal ball network), and creatures powerful enough they might as well be gods are the main client. You can spin this with dragons running megacorporations or angels who have the unenviable task of keeping young deities amused so they don't start cross-reality battles, but someone needs to create entertainment based on small bands of heroes facing difficult odds in unlikely situations.

The player characters are transported, willingly or not, to ancient underground cities overrun by humanoids from cultures with distasteful personal codes and easily liquidated trade goods, dungeons filled with professional damsels in

need of rescue from endangered specifies of psychic lizards, and lost jungle temples were teams from competing networks see who can summon the biggest demon. In more upbeat games the characters are sent to deal with actual villainy and oppression. In darker settings they're as likely to destroy peaceful but ugly humanoids, as long as it looks good on screen.

Since the heroes are teleported into and out of their core adventure zones, downtime can be pure training, carousing, and equipment upgrading with no need for long rides to major cities. That doesn't mean there's no place for non-combat roleplaying. Contract disputes, corporate executives "re-imagining" the heroes, fan mail, stalkers, and general behind-the-scenes drama can be just as driving as wooing the local baroness and building a tavern for retirement. And of course, if the system sending the heroes hither and yon is itself a major evil it may form a meta-plot, where the heroes must work within the system in the hopes of eventually brining it down.

The Men From MERLIN

If the tropes your game call for don't make sense in most settings, it may be easier to change the setting than the things both game system and players count on to cut through the "boring" parts of the game and get to the action.

The Magical Emergency Response League Intervention Network realized long ago that heroes are most effective when controlled from a central headquarters. There are hundreds of major threats to arcane stability and peace, and it makes no sense to have archmages and warlords stopping minor goblin wars while apprentices and squires find themselves facing titans and evil eyes. By using a whole branch of mystic seers looking for potential threats and crunching their prophecies through omen-golems run by dwarven data-smiths, MERLIN manages to match dangers with team of agents most suited to dealing with them.

Of course there's always high demand for the most accomplished agents, so threats are prioritized based on who has the minimum talents needed to overcome them. That's a harsh reality, and MERLIN controllers try to protect their own teams as much as possible, but there's just no way to spare younger agents from being thrown in over their head now and again. The best MERLIN's upper-level commanders can do is try to prepare every team with proper training and equipment, and assure them that if something really is way beyond them, bigger guns will get called into play.

MERLIN works best when villains are unaware of it, so its field houses are generally disguised as large inns and taverns with extensive private meeting rooms and a tradition of mysterious figures hiring roving mercenaries to find lost treasures. The truth -- that this is the cover MERLIN uses to get its field teams mission briefings -- should be obvious but is somehow overlooked by most commoners. Indeed, the idea that big taverns, in many cases too large for local merchant traffic to justify, are hotbeds of adventure is one way MERLIN enlists new agents. If a band of young hopefuls turns up looking for someone to sell them an old treasure map, MERLIN recruiters are more than happy to run them through the basic level training testbed. If they survive that a few minor but real missions might be offered to the heroes, before a recruiter approaches them with the truth of the secret mystic wars.

Out of Sight, Out of Mind

Just because the adventures the players actually play through are carefully balanced for them doesn't mean that's all their doing. In a world where experience comes from threats that stretch your abilities and being dead is more an inconvenience than an end, it may be the heroes run through four or five adventures for every one you play out. They may also get together with lots of other characters, often more in keeping with their individual backgrounds, for the adventures you don't play through.

For example, a new game session might begin by telling the fighter he's been on caravan duty, and easily swept away the attacks of goblins and kobolds. The cleric put down an outbreak of skeletons at a country chapel with other members of her order. The rogue tried to steal from a traveling merchant who turned out to be a dragon in disguise, and the money made just exactly paid for a *raise dead* and *restoration* to undo the damage from that effort. The sorcerer was part of an arcane army that faced inhuman threats on the ethereal plane, and while that fight went well the sorcerer just got changed back from spending three weeks as a newt.

Oh, and the sorcerer spotted a small contingent of ethereal foes go to ground at an old temple not far from here. Since the arcane army is still healing from wounds sustained, the sorcerer needs to get together at least a few allies to go deal with the temple. The cleric is obvious, since she's of a rival sect to that of the temple. The fighter has guarded sorcerous caravans in the past, and a dragon ally suggest keeping an eye on the rogue.

In this campaign, only the highlights of each character's career is actually played out. The day-to-day stuff -- incluing spectacular successes and disastrous failures -- is all off-screen. The main benefit is the GM can introduce concepts without dealing with the PCs direct responses: maybe a lich that kills the cleric in every other off-screen adventure is a major foe for the PCs in eight levels. It also gives ample opportunity to pass time and allows heroes to have lives outside the in-sessions adventures.

The major drawbacks are a need to come up with down-time for every player (though a GM might allow the players do so much of that work themselves), and the establishing of few penalties for failure. If the players are told they get beaten periodically and always manage to overcome their loss, they can reasonably expect the same to be true if they fail miserably during play-time. On the other hand, since that allows everyone to get back to "the fun part" quickly, it may not be such a bad thing.

Pyramid Review

Terror (for [Call of Cthulhu](#))

Published by [Chaosium, Inc.](#)

Written by Troy C. Wilhelmson

Illustrated by Todd C. Wilhelmson

Cartography by David Conyers & Carolyn Schulz

32-page b&w tapebound softcover; $10

When a scenario opens with their characters under interrogation by the NKVD, it should be clear to the players that they are in a very bad situation indeed. Since they also know that they are playing a scenario for *[Call of Cthulhu,](#)* they are equally justified in knowing that their situation is undoubtedly going to get worse.

This is the opening set-up in *Terror,* a monograph from Chaosium that marks a return visit to the Soviet Russia of the 1930s last seen in the atmospheric one-shot, *[Machine Tractor Station Kharkov-37.](#)* As a monograph, *Terror* is available only direct from Chaosium, but it marks it as something that the publisher believes to be of interest to the *Call of Cthulhu* devotee, but for which it does not have the resources to fully publish and make available through the normal distribution channels. This means that the publisher has given it the minimum of attention prior to limited publication, leaving the editorial and layout chores to the author. In the past this has meant that some monographs have been a little rough around the edges, but with *Terror,* the production values are surprisingly reasonable. The writing is overall error free, and the illustrations -- if not of the best quality -- are dark, murky, and interesting.

Where *Machine Tractor Station Kharkov-37* was set deep in the wilds of Russia, *Terror* takes place in Moscow, in the winter of 1932. Stalin rules as the "man of steel," maintaining a tight terror and paranoia-fueled grip over all the Soviet Union in order to remain in power. Designed for six characters (though it can be played with as few as four), the PCs -- engineers, chemists, bureaucrats, lawyers, doctors, and even criminals -- have fallen victim to one of the purges that have helped keep Stalin in power. They find themselves under arrest for disloyalty to the Party and for crimes against the State.

With their lives at stake, the characters are thrown a lifeline. Already dead as far as the State is concerned, their interrogator offers them the chance to begin anew by investigating a threat to the very heart of the State. Given false papers as "Special Agents" of the NKVD, the now-investigators have little choice but to look into a strange death at Moscow's huge railway yard.

What the newly appointed investigators discover is a boxcar dripping with frozen blood and containing a score of bodies, all dead from various means. From this starting point, their task is to track down all those connected to the train and what it was transporting. In carrying it out, the Muscovites have two factors at their command beyond their mere wits and intelligence. One is a sense of desperation, knowing that their lives are on the line. The other is the false papers in their possession that enable them to play upon the same sense of paranoia that they have been living in under Stalin. Of course, the investigators do need to be careful here, as the papers will not withstand any thorough examination.

[SPOILER ALERT!]

At the heart of *Terror* is yet another take upon the Tunguska incident of 1908. Previously used in the recently re-published *Spawn of Azathoth,* the object that fell to Earth was in fact a larval outer god that has varying effects upon those exposed to it. At best the exposed is simply melted, at worst the exposed either goes insane or is mutagenically transformed into a "thing" capable of metamorphing into other creatures or people, able to sprout wicked teeth and tentacles, and possessing thick armor. This last effect and Stalin's interest in the object do not bear contemplation, but then how did he acquire the "man of steel" sobriquet?

From that, it is obvious that the author has built the scenario around placing the creature from John Carpenter's Thing From Another World in Stalinist Russia. This is not as awful an idea as it might sound, since the transformative aspects of the Thing nicely suit the sense of paranoia that should instill the scenario. More so given the fact that the player characters have the chance of being transformed themselves. Of course, such a transformation might not be enough to save the investigators in the end . . .

[END SPOILER ALERT]

Terror was originally a tournament scenario run at GenCon run in 1997, but it has been clearly revised for publication as a monograph. Yet the revision has not been carried far enough, because as a one-off scenario the author could have made it easier to run. There should have been some background on Moscow and the Soviet Union of the period to help both the Keeper and his players gain a feel for the setting; a map of Moscow would have helped; and general advice to the Keeper would not have gone amiss. A nice addition would have been to Sovietize the handouts, as they are very plain. And since this is a one-off scenario, why not include a full set of ready-to-play characters, or at least give some advice on creating suitable characters for the period? Yes, the author does include the new skills Bureaucracy and Party Knowledge, but it is not enough. Certainly some information on weapons of the time and their availability should have been included, thus covering something that the players are certainly going to ask about.

Despite leaving more preparation and research up to the Keeper to conduct than it really should have done, *Terror* is a nastily effective exercise in paranoia . . . at least, it deserves to be in the hands of a good Keeper, or any GM who wants to adapt it to the modern day rule set of his choice. As it is, *Terror* is nevertheless playable, but it should have been allowed to deliver more and then it would have lived up to the aim of the monograph series, being fully worthy of a *Call of Cthulhu* Keeper's attention.

A Mélange of Magical Creatures VII

for *GURPS*

by Eric Funk

In the real world, nature seems subdued only by a lack of time and the laws of physics. But in a fantasy world, where magic and mana can be channeled to do the impossible, it's quite likely that nature would be even *more* creative. Here, then, are seven more entities that run the range from the useful to the dangerous to the just plain weird.

Nest Mimic

"The lookout climbed the tree and moved to take a position at an upper branch. As he stepped out onto it, he noticed a nest midway out on the branch. It looked empty. Nudging the nest with his foot, it nudged back. He tapped it with his climbing hook, and it scooted off to a side branch, only for it to return to its previous position. By then, his counterpart across the way had already spotted him."
-- Private Enmok, 1st Cavalry

This gray-brown arachnid is a form of trapdoor spider that carries a nest to trap unwary birds and nest thieves. Covering its back with sticks, it sits in wait snaring small birds and egg-stealing predators. Some larger predators, such as cats, have learned that they can tackle them from below.

Encountered

Usually found in trees, these nest mimics can be annoyances for people who would reach into a nest. They rarely stay in dead wood, prefering leaves to help camouflage themselves. In winter, nest mimics hibernate in the nook of a tree, looking like a bundle of twigs.

Industrial Uses

"There it was, we had just felled the last tree of the day. We were all tired, and Larry, here, backs toward the trunk to sit down. Wouldn't you know it that it was at that moment, a nest falls out of the branches beside him. So, he sits down on the trunk and puts his hands out like this to lean back, see? Next thing we know, he's panicking 'I can't move me arm! I can't move me arm!' The little blighter managed to scuttle away while we were laughing . . ."
-- Overheard in the tavern *The Prancing Gorilla*

Some orchards use these insects to clean out trees of small predators and invading birds as a form of biological pesticide. Their hibernation instinct allows for easy storage. Enchanters have found use in the construction of items that remove scents, imitate scents, and aid in jumping.

Adventure

The heroes must dress up and deliver a giant nest mimic for a wizard. They must feed it a chicken every week and make sure that special sticks are available for it to build into the nest. The former might call for a Fright Check at +2 if unused to such an event.

Nest Mimic

Ghost Gum

"I know it sounds strange, but with a ghost behind us, we ran for the graveyard. As we crossed the seal, we heard a loud 'thump' as it the spirit hit a barrier. Looking back, we could see the stone walls glowing in a luminescent goo while the angry specter pounded at the invisible barrier. Cracks seemed to form in the lichen. The three of us then took the moments we knew we had left to try a last-ditch effort." -- Ghost-breaker Ivon Estevey, *The Ill-Fated Mission*

What is commonly known as "ghost gum" is actually a putty suspension of a derivative from a form of lichen. This gray fungus can feed off necromantic energy in the place of sunlight. When receiving light to moderate amounts of energy (in addition to nutrients from rainwater), it grows stronger. As a part of its symbiosis, it also generates a barrier that is resistant to extraplanar creatures. In particular, the weaker-willed ghosts tend to have the most difficulty with "gum lines." This natural barrier can also help ghosts in their Will rolls to stay (see page 35 of *Spirits*). Those who recognize its potential seed this lichen around cemeteries, mausoleums, and mansions.

Encountered

The mold extract is a common component in hedge medicine when dealing with hostile spirits. Suspended in a clay, it can be stuck to walls and floors to form barriers. The down side is that simple distilled essence naturally decays; preserved, it can last much longer. Some say indefinitely.

Industrial Uses

"It has also been prescribed to those who are holding to life tenuously, to keep them here. They say it has had some disastrous consequences. There are tales told of a gang of murderous thieves who made a suicide pact, and each drank a large vial of ghost gum. They all returned at midnight as undead, and nearly wiped out the whole town."
-- Autobiography of Judge Traigman.

Some patented "ghost barriers" are merely canvas painted in ghost gum. The cheapest are sold by con men, and deteriorate quickly. Certified alchemical workshops find no end to contracts to produce ghost gum. Ghost gum is used as part of some Pentagram enchantments, although it is not powerful enough to keep back strong-willed beings on its own. It can also create a barrier to restrict astral projectionists.

Adventure

The adventurers are hired to pick up a shipment of valuable high-quality ghost gum and erect a barrier around a sensitive outpost. Complications can include missing paperwork, stolen goods, hostile spirits, and restless natives who seek to use it for their own ends.

Ghost Gum

Appearance: Naturally, it is a green-blue or green-gray lichen. Refined, it becomes a similarly colored paste. Commonly, it is sold suspended in a soft clay putty (of varying purity).
Category: Plant.
Diet: Photovore.
HT 12.

Variants: Gengineered ghost gum, which captures necromantic energy more effectively, has a reduced growth rate and emits the excess energy as light or electricity. It could be used as nearly eternal light or power source. For those not concerned with ethics, just capture a spirit into small enough container covered by the substance . . .

Shadow Hand

"The origins of this unusual creature are uncertain, but the most credible sources point to an adjudicator who wished to answer the question as to whether or not creatures of shadow were inherently evil or not. To answer it, she carefully asked questions of different extraplanar beings, and eventually she was pointed to this creature. As her work was under much scrutiny, her triumphant summoning of one of these creatures was cut short when an earthquake severed the pentagram, and three Ancient spirits broke free. The surviving Elders declared a state of emergency, and these shadow hands were loosed into the world, forgotten."
-- History of the Hiltine Elders, *The Fall*

This two-dimensional starfish-like creature is made of shadow. Tales fly about it, but its species is not evil (in general), but tame. Children are most often the ones to discover these living shadows. Adults are too often caught up in their lives to notice such things. These strange creatures can manipulate objects through their shadows. They live in total silence, being completely mute and silent. They respond well to shadow puppets and signs. They have their own language, but can be taught human sign languages.

Encountered

Sometimes seen dancing around candles and camp fires, these creatures normally appear in groups of one to six. The fewer, the more likely that they are going to want to play games with a person. Labeled a nuisance in many urban areas, they are considered a form of benevolent spirit in many rural communities. They can be easily trained.

Industrial Uses

"As the bard played his lute, he caused the candle and harp strings to dance. The shadows on the wall moved in harmony. Just then, some extra shadows began to dance in time with them. A child bounced a ball in that direction. Then, it seemed to be caught in mid-air, ant it bobbed with the music, caught by the shadow hands . . . "
-- The Bardic text *Rhythm*, *Shadows on the Wall*

Research continues to try to find large-scale uses for this creature. Tentative uses include using them to clean behind things, inside intricate parts as well as posting as guard dogs and sentries . . . Enchantment opportunities include telekinesis, air golem, and illusion independence.

Adventure

A wizard wishes to lead an expedition to the land or world of the shadow hands' origin. He and some of his coworkers seek to create a way to return them all there. The adventurers need to gather at least a hundred of these creatures to help open the gateway. Whether they agree to join the second half of the project is another matter . . .

Shadow Hand

Appearance: A black blob with five appendages, somewhere between a hand and a starfish.
Category: Plant/insect hybrid.

Sky Whale

"Then I was running through the dark along the small path cut by the shallow creek. A few of the Baron's men were behind me -- I hadn't done anything yet -- and they spotted me first. Cursing my rotten luck, I instinctively threw myself to the ground to avoid a huge shape. It passed over me in a second, and I was up and running. A glance behind me told me that it was a sky whale! The splashes that followed a few moments later told me of the guards' dexterity. I kept running anyway."
-- Overheard at *The Waltzing Badger* tavern

Although the appearance can be surprising, these gentle giants have been known to help travelers. Their sky blue skin makes them hard to see from below, although the red spike ridge on their back makes them visible from above. The hazard they create for air navigation is lessened slightly by the trumpeting that is part of their form of communication. They filter the air for insects. Pigeons and birds of prey try to use them as perches. Whales in a pod look out for each other, trying to scare or crush the offending birds . . .

Encountered

These giants are most often seen on open plains, over rivers, flying low to scoop up insects with its baleen. Some can be found over swamps and dells, and must be chased away from the space over garbage dumps.

Industrial Uses

"Records indicate that the first appearances of sky whales are from the kingdom of Tria-Rikel. The wizard-king Yuzik moved his family from the coast to the plains. At this time, his young daughter pined for whales. Thus, he designed these creatures to fill the void. To answer the most common question, Yuzik himself commented that the red spine ridge was an unintended side effect."
-- *Flying Creatures Made Easy*, Chapter II

Research has been very slow as it was discovered that sky whales are immune to "animal" magic, and instead respond to "people" enchantments. A few armies have recruited sky whales as steeds for flying chariots, as well as scouts. Some cultures use them as muscle for mill wheels. Although it is opposed by well-meaning "civilized" nations, many tribal cultures find that the thick hide is useful for armor. While most will not look a gift from the gods in the mouth, only morbid cultures will seek them out to kill them. Enchantment of flight and levitation items is made much easier by recycling the large masses of these creatures as is sound sense.

Adventure

Must find two to recruit to serve a local mercenary unit. They require the adventures to mediate with them. The nearest pod agrees to send volunteers, if the heroes can organize prayer at the nearest temple to the insect god. This will cause some consternation, and the kind of human that would serve such a temple might not be the most savory of characters.

Intelliworms

"Immediately after we entered the office, Marius' frog sensed something was amiss. Bringing it around the room, it focused on a chair covered in cat hair. It took two searches, but we eventually found an inchworm. After examining its markings, master Lu let the frog eat it. This certainly explains why toad familiars are so useful."
-- Adept Zuric, Memoirs

These gray-brown inchworms were engineered to record sound. Most are programmed to begin listening at a cue, and then to record the next human voices until cued to stop or its memory is full. When waiting to record, they seem to dance around. They are perfectly rigid when recording sound. Spaces in conversations are removed. Some are also trained to emit a sound cue when their memory becomes full, so that another unit can continue from that point.

Encountered

The PCs could encounter this creature as targets, or agents to plant it. Most likely, they will be discovered as media, carrying messages such as "Your mission, should you choose to accept it . . ." One-shot uses of these creatures will make useful disposable message devices.

Industrial Uses

"While one can commonly find white papers documenting the earliest use of these creatures, none describe the modern, reusable intelliworm. They all describe the time-honored tradition of how one can use it once, dessicate it, and break it to play the message."
-- Sargent Vickers, 3rd Precinct

Modern techniques are closely guarded from the public, and many organizations punish civilians for possessing the tools to operate worms capable of learning multiple messages. Single use "voice mail" could become common place. The providing companies like the idea of such one-shot message devices. Unfortunately, each message takes a toll on the creature, and its storage capacity reduces by 1% of its original maximum each time its memory is cleared. Thus, many low-capacity, public surveillance worms are *rented* to the civilian population for message recording after seeing 30 to 50 uses in the government's service. Enchantment can include perfecting the memory as well as spells that record sound.

Adventure

The heroes are instructed to find an intelliworm, reprogram it, and bring it to their patron. He will record something on it while the PCs go for lunch. When they return, they must mummify it for transport. Complications early on can take the form of a dead ninja with an open capsule in hand. Inside is an intelliworm that looks identical to that which is carried by the PCs . . .

Sticker Plant

"After the ambush, we set out on the road right away. It started to rain lightly, and we discovered the extent that the enemy aerated the canvas roof of the wagon. Sargath tried to glue patches on, with little success. Alita then moved to the front and -- spotting something -- hopped off the wagon. She soon returned bearing a plant with thick leaves. Crushing a leaf between the tarp and a patch, it quickly solidified into a sticky waterproof adhesive. These patches would hold until the wagon was carried away a year later . . ."
-- Tirgin the Sage, *Adventuring Years*

This deciduous plant has a brown stalk and unusually thick leaves. It is so because it actually has two separate circulatory systems. Both carry nutrients and help cool the plant. Experiments show that it can operate with only one operational. The first benefit that this brings is the coolant, and the second is that when the enzymes mix, they bond to form an adhesive that is so powerful that it can kill insects and small animals by gumming their mouths shut. It is a serious inconvenience for larger creatures.

Encountered

Some angry homesteaders plant sticker plants as an angry response to "free range" laws. It is a health hazard for children and pets, thus it should be kept at a height. Youths have been known to "plant" these leaves where they will be broken inconveniently: in books, underfoot, and in door jambs.

Industrial Uses

"The royal mint jelly was frosted with icing sugar, and the red wine fire blossoms. Unfortunately for Lord Joachim, he chose to fire his taste tester in the middle of the meal. Fortunately for the kingdom, he was dining alone at the royal table that evening, his family headed out early while he finished business. The aforementioned foods each contained copious amounts of halves of the glue. They solidified in his gut in the night, and he died of hemorrhaging in the night."
-- *Cooking with Death*, Volume II, Chapter IV

Obviously useful as an adhesive, it can aid in the manufacturing of everything from wooden chairs to aircraft decals. Its prevalence is limited only by the fact that it is immediately dangerous to children and small animals. The enchantment industry benefits in the way of any item that makes the use stickier, such as Climbing items, glue, and wall walking.

Adventure

The heroes are sent after a snake-oil salesman that has sold some local craftsmen poor glue. He claims that it is the fault of the supplier who he is heading to see. His sample glue works just fine. Is he telling the whole truth, or did he know it all along? The truth is that he did suspect something, and received an unusually low price on that shipment of glue to which he thought was his haggling skill.

Pigment Fish

"Their water and corrosion resistant coating is a sort of enamel from refined sand that can clog pores, making these fish very lonely. Navigation in some reefs is done by color, following the migration of different schools."
-- Captain Ihgioft of the ship *Fenris*

These pickerel-like fish come in a variety of colors. As a defense, they seem to drop pigment ambiantly on areas they go to to make it harder for predators to locate them. In infant fish, the coloring power lays dormant. When they reach maturity, their color is decided by their population density. In a sparsely occupied pond, they join the majority. In a densely populated area, they tend to take on random colors, and migrate away. These fish are hard to keep in aquariums; the glass keeps getting painted over, even the outside. Thus ponds are popular corrals. These creatures are considered a great nuisance when they escape to the wild. Fortunately, the do not tolerate cold well, and head toward warmer climates as soon as possible.

Encountered

Found in all sorts of colors, they can be hard on fabrics, and are normally stored on a table in the center of a room. The aquariums and table often have slots to store items to be painted. Pigment fish that get loose are obnoxious and hard to catch.

"A trick that apprentices like to play on each other is to swap fish. When it is known the victim is about to put an important project 'under the fish,' someone will then swap the fish inside the aquarium when he leaves. The next morning, both the project and the aquarium will have the new colors."
-- Marvus the Smith, in his autobiography

Industrial Uses

Items next to the tanks are painted as well. It can be good for coating metals. Assembly lines can place many bowls with a small variety of colors along them, and the item can be coated with virtually any color. Enchantment of aura, measurement, and scribe spells are simplified.

Adventure

Escaped pigment fish are leaving stripes on boats in the harbor. As it is not even the middle of the summer, and a VIP is coming next month. The harbor must be clean by then. Make it happen.

Beyond Fantasy

This article describes seven creatures, most of which could appear to physically exist in a hard-science world, even if the more wondrous aspects could not. A Nest Mimic is a trapdoor spider. Ghost Gum is a lichen said to have mystical properties against forces that normal people cannot see. Sky Whales are not impossible, if they utilize lift gas. Intelliworms are in the realm of possibility in their ability to record sounds, but playback would require technology of some sort. Sticker Plants are very feasible, considering the many varieties of plants out there. Pigment Fish simply refine sand in a way similar to most fish eating sand . . . it merely suspends it in a hydrocarbon and disperses it in the water.

So Why Do We All Meet In a Tavern?

"You all meet in a tavern . . ." until the owner throws you out for being roughneck deadbeats who do nothing but feel up the help and start fights. Yet bars are everywhere in fantasy and sci-fi, from "The Prancing Pony" to "The White Hart" to the Cantina at Mos Eisley. Why do watering holes exercise such influence in our storytelling?
   --Bob Portnell

The watering-hole is a common trope of modern fiction primarily because it has been used successfully in earlier works. When the protagonists descend on an inn, a pub, or a spaceport bar, the readers or players know roughly what they can expect. How it got to be that way is another matter.

It has been suggested that alcohol was one of the principal motivators for the shift from hunter-gatherer to agrarian societies. Whatever the truth of that, sitting around in a group and drinking is one of the oldest and most pervasive human activities, just as much as sitting around in a group and telling stories; it was perhaps inevitable that these should come together.

Historically, presenting fiction as such is a recent development; older fictional works tend to have some sort of framing story such that the author can claim that he is personally telling the truth, that he is not the originator of this blatantly untrue narrative. The nature of framing stories varies: Victorian adventure stories tended to start with the author describing papers found in a dispatch-case or a message in a bottle, while Sir Thomas Malory claimed he was copying from an "old French book." However, a much earlier technique and a way of binding together a portmanteau of disparate works was to give an account of (fictional) people telling stories to each other, at a dinner-party (the *Satyricon*), a drinking-party (the *Symposium*) -- or in a tavern (*The Canterbury Tales*).

As it became more acceptable to present fiction as fiction, the framing story largely fell into desuetude, though Dickens resurrected it to some extent with *The Posthumous Papers of the Pickwick Club* and *The Old Curiosity Shop.* The frame came into its modern form with Count Jan Potocki's *The Manuscript Found at Saragossa* and Robert Louis Stevenson's *New Arabian Nights,* the latter of which was widely copied by other Victorian writers. However, the greatest single influence on the modern science-fictional or fantastic bar story is probably Lord Dunsany, with his tales of Joseph Jorkens and the Billiards Club: a combination of realistic and fantastic elements with characters and a setting that continue between stories.

Dunsany was (and is) read by many authors of science fiction and fantasy, and must be considered a primary influence particularly on Arthur C. Clarke, whose *Tales from the White Hart* were also in part inspired by post-war meetings of the London SF Group at the White Horse; Isaac Asimov wrote several series of stories set in clubs. These in turn are likely to have influenced Larry Niven (the Draco Tavern stories), Spider Robinson (Callahan's), and so forth; during the cyberpunk boom of the 1990s, the newsgroup alt.cyberpunk.chatsubo used a bar as the jumping-off point for a wide range of stories written by its participants, a shared world only in the loosest sense.

In a recent or contemporary setting or in a relatively pure framing story, the pub or bar (or, until as late as the 1930s, the club) is less likely to be an isolated travelers' rest and more often simply a gathering-place of friends; the clientele is fairly homogeneous, as people tend to meet in a place that caters for others like them. Patrons are likely to be local (at least in terms of travel time) and habitual rather than passing through. The modern as well as the classical bar-story tends to be about story-telling, the recounting of tall tales; if action is called for, it is likely to happen within the sub-narratives, just as in Petronius. The narrative convenience is that one may be among friends but still meet strangers, thus giving an excuse to tell one's tales and hear what they have to say - mediated as always by alcohol, so that even the least reasonable tall tale may gain a veneer of plausibility. Many mediaeval romances begin with the familiar

setting of a feast (*Sir Gawan and the Green Knight, Arthur and Gorlagon, Yvain*); the drinking-house is a similarly familiar jumping-off point for a tale that may become quite fantastic.

A more medieval type of tavern (still with story-telling involved, but with rather more risk of violence than the framing-story offers) got its boost following the unexpected popularity of *The Lord of the Rings* and the consequent boom in fantasy literature. Many of the new generation of writers imitated Tolkien perhaps rather too closely, and along with hordes of faceless enemies, ancient magic swords, and Mysterious Cloaked Figures felt the need to insert into their fantasy trilogies a scene in an inn. This medieval tavern on the Tolkien model (which shows up only thinly disguised as the spaceport bar, as exemplified by the Mos Eisley cantina) breaks out of the frame and becomes in itself a location significant in the narrative; it is one setting of many, both a site of action and a springboard for further development.

Tolkien was also of course a significant influence on **Dungeons and Dragons.** As roleplaying developed from its wargaming origins, players felt the need for a reason for their disparate pawns -- who had never met each other before the first adventure -- to choose to risk life and limb together . . . and, indeed simply to have an excuse to run in to each other in the first place. Why would a noble knight, a studious magician, a pious priest, and a disreputable thief ever find themselves in the same place? With the inn at Bree surely in mind, as well as the shadow of millennia of storytelling, some nameless DM must first have come up with the phrase now so well-worn that it has become a cliché of roleplaying: "You all meet in a tavern."

In the real medieval world, very few people traveled in the first place; before the Black Death, most were tied to the land. Those who did tended to be very important (and could thus foist themselves on local notables), monks (who would travel from one religious house to another), pilgrims, or itinerant tradesmen. In theory, that last class would include anyone whose trade could not be supported by a single village -- such as masons traveling to work on castles and cathedrals -- but in practice it tended also to include an array of faintly disreputable people who might find it advantageous to be elsewhere in a hurry.

Long-distance travel on foot is tiring, and undertaken with a goal in mind; one has little time to speak with people one might meet on the road, unless one happens to be going in the same direction at the same speed. The only time one might have to meet and converse with other people would be at the end of the day's journey. From telling stories in an inn, it is only a short step to telling stories that are set in an inn.

The Tolkien model of inn was a place where people who did not live in the village or town would be able to find (or find out about) somewhere to sleep for the night, and get a meal, once the monasteries no longer existed. (Some of the oldest pubs in England -- for example, the George at Norton St Philip in Somerset -- claim to have been part of a monastic establishment in the first place.) The inn is neutral ground in a way that someone's house is not. It is a place where anyone can go, with no more reason than wanting to get out of the weather. It is a place to meet people, starting with other travelers, who might share news of the roads ahead, or indeed wish to band together for protection on the following day's journey. (*The Canterbury Tales* is perhaps the canonical example of strangers meeting in an inn and moving off as a group)

There would also of course be some locals, who might know news and rumors interesting to someone looking for a place to ply his trade, and would certainly want to hear news from far-off places such as the next village but one, to say nothing of who the King was . . . which might have changed since the last time a traveler passed through in the previous year. In a small village where everyone knew everyone else's business, even the most prosaic stranger was a breath of fresh air, and the tallest of his tales were at least new and entertaining.

Almost anyone might arrive at an inn, stay there for a while, and talk with

> ## Real Hostelries
>
> In England at least, in the real early medieval world neither "tavern" nor "inn" was the term for a place for travelers to stay. That was the role of "victualling houses" (and later coaching inns), which were to be found only in towns or on major routes between large settlements; a village would simply not see enough travelers to justify keeping rooms aside for them. Generally the victualling house would cater only to travelers; locals would tend to have their own pub elsewhere, or in earlier times drink at the house of whoever had recently made some beer.

others. It is also a place where thieves might gather -- both local and traveling -- aiming to prey on people who would not have time to stop and try to get their property back. (In reality, though, any place that got a bad reputation would simply have been burned down by the retainers of the local lord, so the idea of an innkeeper in league with thieves is primarily a modern development.) If there is going to be a free-for-all fight in a village or town, it will probably happen where people are drinking alcohol and not in their homes. In a larger town, an inn may well be where people gather to take a coach that leaves at a set time, and a tavern or coffee-house in a mercantile area is likely to be a significant place of business (the origin of the Inns of Court in London).

All of these functions provide hooks for incidents that can advance the plot of a story or add background detail. It must be remembered, however, that The Prancing Pony and its imitators are based on an idealized vision of the country pub, not on a real one (which still survived in places even in the 1930s, and with which Tolkien, Lewis and their colleagues were certainly familiar). The Shire itself, in spite of its medieval trappings, is really more of a never-never land in which villainous saltpeter was never digged out of the harmless earth.

The "Tippling Acts" of the early 17th century (James I and Charles I) were an attempt at a sort of limited prohibition, and offer a suggestion as to what the victualling house was meant to do (and what in practice it may have been doing): it was not intended as a place for drinking, but rather "for the receit, relief and lodging of wayfaring people traveling from place to place, and for such supply of the wants of such people as are not able by greater quantities to make their provision of victuals and not meant for entertaining and harbouring of lewd and idle people to spend and consume their money and time in lewd and idle manner."

Lord of the Rings: Battlefields Expansion (for the *Lord of the Rings Boardgame*)

Published by [Fantasy Flight Games](#)

Designed by Reiner Knizia

Illustrated by John Howe

Three double-sided color boards, one sheet of double-sided color illustrated tokens (20 trigger tiles, 30 enemies, 5 fellowship members), 27 cards (6 feature cards and 3 Gandalf cards, each in an English, French, and German version), and a 20-page color trilingual rule book; $29.95

After a five-year delay, Fantasy Flight Games has finally released the third (and supposedly final) expansion for Knizia's award-winning **Lord of the Rings** boardgame. Was it worth the wait?

For those readers unfamiliar with it, **Lord of the Rings** is a co-operative boardgame in which two to five players take the part of hobbits trying to survive the journey to Mt. Doom to destroy the One Ring. The game itself fights against you in the form of events and die rolls which gradually corrupt your hobbit, strengthen Sauron, or otherwise bring you closer to losing your way. The first expansion, **Friends & Foes,** added two new scenarios, several cards, and enemies that you had to fight along your way. The second expansion, **[Sauron,](#)** allowed another person to play as the dark lord himself, for those who preferred more competitive play. (**Battlefields** is compatible with both of these expansions, primarily because it doesn't really interact with the new rules from either.)

This brings us to a question frequently voiced by new players: "So, what about the *rest* of the fellowship?"

Battlefields answers that, by adding five tokens for the other fellowship members and a "battlefield board" for each scenario, representing an important fight tied to that location. The boards cover the battles in Weathertop (for Bree), the Chamber of Mazarbul (in Moria), Amon Hen (near Isengard), the fortress of the Hornburg (in Helm's Deep), Pelennor Fields (with Shelob's Lair), and the Black Gate (of Mordor). There are five different enemies for every battlefield board, each printed on a different color token.

The expansion also includes 20 "trigger tiles" which each show 0-5 colored swords and a number from 1-4. These tiles are placed by every space on the main track of the scenario board, and also next to each "sundial" event, with the leftovers (four to six tiles) all dumped on the last event. As each player advances down the track (or draws a sundial), he collects these trigger tiles from the board. After his turn, he starts flipping them over. Every colored sword activates the appropriately colored enemy; if he isn't on the board yet, the first sword puts him there (the number on the tile tells you which of the four spawn points to use), with further swords moving the enemy piece. The board itself tells you where to move each enemy as you flip over trigger tiles, with arrows showing which way the enemy will move next and an alternate path (if both are blocked, he doesn't move). Most of the spaces have negative effects, like corruption, moving backwards on the main track, or losing all your shields.

To counter this, the active player can discard Fighting cards to place fellowship members on the board. Boromir (1 card) prevents an enemy from doing damage. Legolas and Gimli (2 cards each) do the same but can block most enemies, while Aragorn (3 cards) can block anyone. Gandalf requires 2 Joker cards, but kills the enemy instead of blocking them. Some boards also have special squares in which any enemy can be killed by discarding 2 Joker cards. If you kill an enemy, you get the reward shown on its token, which can be healing, drawing cards or shields, defeating

Foes, or even moving Sauron one space back.

Thematically, **Battlefields** is a qualified success. Overall, the concept makes sense and it works. The battles were chosen wisely, and each board is set up in a way that *tends* to reflect the specific fight in question; at Weathertop, the Nazgul spiral in at you from the outskirts, while at Pelennor Fields, Sauron's armies come in a straight-on charge. A few things detract from the theme, though, such as the inability to move a fellowship member once you've placed him, and the oddity of the complete fellowship fighting at Weathertop.

Battlefields' strength is in its game play. The trigger tiles and board layout work as a basic AI (in the video game sense), allowing the game itself to control the enemies, as they attempt to flank the fellowship and slow the hobbits' quest. This further reinforces the cooperative, "it's us against the game" feeling. Despite the occasional rewards obtained for defeating a foe, the expansion adds a significant challenge to the game, making it that much more rewarding to finally make it to the top of Mt. Doom. Fighting and Joker cards become much more important, as does card management -- which indirectly makes this expansion somewhat more difficult for larger groups than for smaller ones.

The quality of the components is top-notch. The tokens are printed on thick, durable cardboard with a linen finish which emphasizes their "painted" quality. Howe's artwork is absolutely gorgeous, bringing the tokens to life despite their small size. The battlefield boards are attractive, but due to the necessarily built-in functionality, they look like a cross between a flowchart and a choreography aid. This may turn off some gamers who were drawn to the beautiful and evocative artwork which covers the other boards. On both the tokens and boards, the icons and arrows are clear and easy to use in-game without having to consult the rules.

Battlefields is similar to **Friends & Foes** in that it adds another layer of game play; with both expansions, you'll be simultaneously shepherding hobbits across Middle Earth, fighting foes along the way, and guiding the rest of the fellowship in their own battles. **Battlefields** is not nearly as seamless, though, playing like an expansion rather than a natural extension of the game. *If* you already have **Friends & Foes** and would like to add further depth to your **Lord of the Rings** games, **Battlefields** is definitely recommend. It's a solid expansion worth adding when you're ready for a greater challenge.

The Terrifying Plot of Dr. Z!

Episode Episode 3: Tomb of the Lost Pharaoh

by Matt Riggsby

When we last left our heroes, they were chained to Dr. Z's deathtrap. The shaft descends slowly, so characters with Escape skill have significant time to get free. Also, any PCs who escaped Dr. Z's thugs have a good chance to explore Dr. Z's lair -- now largely free of guards -- and rescue their friends. However, Dr. Z is gone, and most of the guards with him. If heroes who evaded capture were keeping an eye on Occident-Orient, they saw several crowded cars leave.

With a dearth of guards, the investigators can search the underground complex if they're quiet about it (make a Stealth roll every 15 minutes). Dr. Z has left behind lots of scientific gear, mostly in the deathtrap room. Further investigation nearby uncovers a few lavish apartments. One, probably used by Dr. Z when he was in town, has several scientific and technical journals on the shelves. Other finds of interest include:

- notebooks containing calculations identical to some of those copied into Mathers' notebooks
- an empty, opened envelope addressed to Lee at the address of Seven Happiness; the return address is the German consulate in Washington
- an apartment which was probably used by Miss Papillon, still smelling of her perfume
- a room converted into a combined electronics lab and operating theater
- stray copies of itineraries for steamship tickets to Cairo, indicating a fast run of 12 days (add a three-day train trip if Anytown is on the West Coast) with departure not long after Dr. Z left the PCs to their fate
- enough physical evidence of smuggling to put Lee away, if the PCs could get the cops to listen to them.

At this point, the PCs should have two priorities: following Dr. Z to Cairo and figuring out what he's up to. If the PCs are determined to have it out with Lee, they've got a chance, but they'll be wasting time (see sidebar).

Places to Go, Tombs to Thieve

The heroes might deduce that Dr. Z's plan has something to do with the Mathers concentrator. They'd be right, but what's the connection to Cairo and "the tomb of Khuthmet"? Clearly, there's a need for an Egyptologist. Scholars can work in Anytown, but superior libraries can be found in Egypt, if they care to wait. The name Khuthmet belongs to several figures in Egyptian history, most notably a possibly legendary pharaoh whose tomb has never been found. Although a minor historical figure, Khuthmet is said to have been a great mystic, practicing magic and dealing with the gods of death and the underworld. He was overthrown by terrified subjects after a very brief reign. His tomb was lavishly provided with riches for the afterlife, but protected with powerful curses. Sharp-eyed researchers may (on a Vision roll) take note of a photo of a painting of Khuthmet carrying a staff surmounted by a large blue gem. In case someone studying Mathers' papers asks, a sapphire would make the concentrator fire an amplified electrical pulse, like directed lightning.

The PCs must hurry if they want to catch up with Dr. Z. If they go for relatively affordable transportation (at least $600 per person in steerage on a cargo ship), they'll reach Cairo a week or more after him. If they wrangle a fast liner ($900/person and up), they'll end up two days behind, but they'll likely be sold out that close to sailing. If they take a

liner to Gibraltar, then a plane (at least another $120), they might catch up, or even beat him by a few hours. Well-connected PCs might talk their way on to an experimental mail flight between New York and London and beat Dr. Z to Cairo by a week, though there will be limited room, splitting the group. Whatever they choose, the faster the route the PCs try, the more expensive and difficult to arrange it will be. This may involve weather delays, transfers to the wrong vehicle, running to make connections, bribing customs officials not to open that violin case, and stowing away if berths on the fastest ship available are sold out.

But eventually: Cairo. Like many colonial capitals, the city is divided into a new section, largely built by and for Europeans, with hotels, restaurants, tidier and more familiar (and expensive) shopping districts, broader and cleaner avenues, and the like, and an old section, with less deferential natives, dusty, twisting streets and countless dark alleys, and hardly anybody who speaks English. Cairo is a major tourist destination, and Westerners will be besieged by beggars, souvenir-sellers, and eager guides until they hire one.

When Dr. Z arrives, he'll go to a fine hotel and send for Francois Gaudet, a disgraced French Egyptologist who spends his days drinking. Gaudet believes he has found Khuthmet's tomb in the [Valley of the Kings](#) near Luxor, about 250 miles or two days by boat south of Cairo, and is trying to sell the information for as much as possible. Once Dr. Z has that information, he will take a party south via chartered riverboat to recover the blue gem.

Characters researching Khuthmet in Egypt may hear about Gaudet themselves; he's known in the expat community mostly for selling forged artifacts, but also for an obsession with a pharaoh who many people don't believe existed. A little Streetwise can help track him down. If they can't or simply don't hear about him, they might shadow Dr. Z when he arrives and see what he's up to. After all, they've got his itinerary, or can easily find where he's staying by checking out the limited number of good hotels. Shadowing Dr. Z is fairly safe. He believes the PCs dead, so while his men will be on their guard (Cairo can be dangerous), they won't be looking specifically for the PCs. On the other hand, western PCs are conspicuous. If the heroes are discovered (some of the thugs can recognize them), Dr. Z will try to have one captured and interrogated to find out what they know; he'll suspect they're part of a larger group.

Gaudet will talk to anyone buying drinks, but won't reveal his secret without letting Dr. Z make a counteroffer. However, a persuasive character may be able to get the general region of the tomb (winning a contest of a Will of 11 and Carousing-1) and the cryptic statement that Khuthmet was buried "at the doorway to autumn" (contest against Carousing-3). Kidnapping or killing Gaudet would alert Dr. Z to the heroes' survival, and if need be Gaudet could have hidden secret notebooks which would keep Dr. Z on the right track.

The weak link in Dr. Z's group is Miss Papillon. If she spots her contact among the PCs (which would be entertaining, so you may want to engineer such an encounter), she'll give him a chance to seduce or bribe her into not spilling the beans. A persuasive character could get her to tell what she knows: Dr. Z is looking for a blue gem with the aid of a greedy drunk, and after they find it, they're heading to Ulan Bator with "some boring German." A *very* persuasive character might convince her to talk to Gaudet for him, in return for a promise of a cut of the loot if the heroes come out ahead. She won't directly betray Dr. Z, but she will hedge her bets.

Though available clues are sparse, the PCs may want to get to Luxor as quickly as possible. If they get a head start, they can begin searching before Dr. Z gets there, but even if they figure out Gaudet's hints, it'd be a long shot for them to find the tomb. Dr. Z, on the other hand, can find out exactly where he should go from Gaudet. Khuthmet's well-hidden tomb lies at the end of a side canyon near the Valley of Kings facing west; specifically, it faces the point of sunset of the last day of summer. The tomb is small: a narrow hallway with lavish inscriptions leading to a treasure room. From there, another short hallway leads into a larger room containing a sarcophagus. There is the mummy of Khuthmet, carrying a staff topped with a large blue crystal.

Fun in Cairo

If the pace in Cairo, which is probably heavy on research and shadowing, starts to flag, local color can be used to perk things up. Adventurers might have to deal with:

- Thieves in dark alleys
- Runaway donkeys in a marketplace
- Angry crowds inflamed by unexpected etiquette violations (getting too familiar with a lady, stepping on someone, etc.)
- Inadvertently running into one of Dr. Z's thugs

Regardless of who gets there first, it's likely that the heroes will get to Khuthmet's tomb just before Dr. Z appears, or -- if the PCs simply follow Dr. Z south -- he and his thugs will open the tomb before the protagonists can get to it (given the genre, you should make sure of it). Worse yet, Dr. Z will have a number of thugs roving around to make sure that nobody comes close to his operation. Sooner or later, there's going to be a confrontation.

If the heroes beat Dr. Z to the tomb, his objective will be the tomb and the blue crystal. He'll personally inspect the tomb to make sure the PCs have what he's looking for, and he may negotiate, but for a limited time and not in particularly good faith. If it's the other way around, his thugs will fight a defensive action and make their way away from the tomb, but not back towards the river and their transportation. Rather, they head towards the desert. In either case, Dr. Z's thugs take a prisoner if it's feasible.

Sooner or later, somebody has a surprising revelation. It will be clear to anyone with relevant knowledge (roll against Geology, Jeweler, Archaeology, or an appropriate Expert Skill at +5) who sees the crystal close up that it *isn't* a sapphire. It's a prism of blue glass, now patinaed with age. Dr. Z will be surprised when he finds out, but ultimately appreciates the irony and continues the retreat into the desert.

Topping a hill, the PCs will understand why he's heading that way. Sitting on the plain beyond is a large gray airship with a swastika on the tail fins. If the heroes are determined to follow, the airship crew will lay down covering fire with machine guns, which have *much* better range than whatever the PCs might carry. But Dr. Z won't depart without a final speech (from a safe distance): "You are quite remarkable, my young friends, to have escaped your fate, but you must remain with the dead this time." With that, he takes a small box from his pocket, presses a button, and strides up the gangway onto the zeppelin, followed by his thugs. The zeppelin crew casts off and heads away into the sky. Could a daredevil character sprint close enough to grab a mooring line and climb up to the zeppelin? Only one way to tell . . .

And what could Dr. Z have meant about remaining with the dead? Anyone who looks back towards the Valley of Kings will find out: shambling towards them out of the shadows is the hulking figure of a mummy.

An alliance with Nazis! An ancient curse comes to life in a crumbling tomb! How will our heroes escape? Come back next time for another episode of The Terrifying Plot of Dr. Z!: The Hordes of Mongolia!

Adventurous Occupations: Computer Expert

for *GURPS*

by Paul Stefko

Since the creation of telecommunications networks, a secret war has been raging across phone lines, broadband cables, and now the ether of wireless communication. The soldiers on this new battlefield are experts at manipulating the security of computer systems, whether for good or ill.

This conflict has entered the public consciousness through movies like *WarGames* and *Hackers*. Even the otherwise over-the-top *Matrix* series included elements of real-life cyber-intrusion. Today's computer experts form the basis for the entire cyberpunk genre, with its glittering neon realms of virtual crime.

Below, we present several templates for creating characters that are at home in the glow of a display. These characters provide critical service to an adventuring group, stealing (or protecting) valuable data. At 75-100 points, these templates leave room for a great deal of personalization when creating PCs and NPCs.

New Talent

The following talent is useful for computer experts on both sides of the line.

Computer Genius: Computer Hacking (if allowed in the campaign), Computer Operation, Computer Programming, Electronics Operations, Electronics Repair (Computers), Expert Skill (Computer Security).
Reaction bonus: computer professionals, hackers. *5 points/level.*

Lenses

The following lens may be added to any of the templates below, but it is only appropriate in highly weird and highly conspiratorial campaigns.

Seen Too Much (+15 points): Your exposure to so much data has opened your mind to elements of reality beyond the experience of most. You are now privy to the world's secrets, and powerful forces want to see you silenced for this knowledge. Add Enemy (Illuminati; 6 or less) [-20], Illuminated [10], Racial Memory (Passive) [15], and Reawakened [10].

Security Expert   *75 points*

A security expert is a professional skilled in analyzing a system or network of systems for possible exploits and shoring up its defenses against them. He may have a permanent position with an organization (with appropriate Patron and/or Duty) or work freelance.

Allies and Contacts: The security expert often maintains contacts in corporatations and law enforcement, allowing him to call on a wide network of resources and information. Rarely will any of these associates rate as Allies, however. They'll answer the expert's questions, but they won't fight his battles.

Equipment: Typically, a security expert will be provided appropriate equipment by his client or employer. Often, and especially among freelance troubleshooters, the expert also will have his own hardware, typically portable, which he uses to test systems and diagnose problems. At TL8, this is usually a high-end laptop computer (Complexity 3, p.

B288) running standard operating and programming software (no bonus to skill). At TL9+, design a Small computer using the rules in Chapter 2 of *GURPS Ultra-Tech.*

Attributes: **ST** 10 [0]; **DX** 10 [0]; **IQ** 12 [40]; **HT** 10 [0].

Secondary Characteristics: Dmg 1d-2/1d; BL 20 lbs.; HP 10 [0]; Will 12 [0]; Per 12 [0]; FP 10 [0].

Advantages: 25 points chosen from IQ+1 [20], Computer Genius [5/level], Contact (Business or Police) [varies], Favor [varies], Patron [varies], Security Clearance [5 or 10], or Wealth (Comfortable) [10].

Disadvantages: -15 points chosen from Addiction (Stimulants) [-10], Code of Honor (Professional) [-5], Duty (Nonhazardous) [varies], Honesty [-10*], Insomniac [-10 or -15], or Workaholic [-5].

Primary Skills: Computer Operation-14 (E) IQ+2 [4]; Computer Programming-12 (H) IQ [4]; Expert Skill (Computer Security)-12 (H) IQ [4].

Secondary Skills: Pick *three* of Cryptography-11 (H) IQ-1 [2], Electronics Operations (Communications)-12 (A) IQ [2], Electronics Operations (Security)-12 (A) IQ [2], Electronics Operations (Surveillance)-12 (A) IQ [2], or Mathematics (Computer Science)-11 (H) IQ-1 [2].

Background Skills: 7 points chosen from Current Affairs (Science and Technology) and Games (Computer Games), both IQ/E; Administration and Electronics Repair (Computers)†, both IQ/A; or Intelligence Analysis, IQ/H.

* Multiplied for self-control number; see page 120 of the *Basic Set.*
† Raised from Computer Operation default.

Lenses

Underground Ties (-15 points): You work for a criminal organization. You may be an in-house security expert for organized crime, or you may have a legitimate job as cover, utilizing your employer's resources in criminal activities. You may be forced into this position through blackmail or threats. Add Duty (12 or less) or Duty (Involuntary; 9 or less) [-10], Patron (Fairly powerful organization; 9 or less; Provides equipment up to starting wealth, +50%) [15] and Secret (criminal) [-20].

Hacker   *75 points*

The hacker is a modern rogue. Instead of picking locks, grifting, or counterfeiting, he breaks encryption, steals passwords, and fools unsuspecting sysops.

Allies and Contacts: Most hackers maintain a network of like-minded peers for the purposes of trading tools and information. Some hackers organize into "guilds" that support each other on particular difficult tasks. A few hackers may have contacts in law enforcement that can tip them off if investigators get too close.

Equipment: The hacker will usually be operating from a high-end desktop computer (Complexity 4) running home-brewed software and tools collected from various underground sites. A more mobile and adventurous hacker may use a laptop like the security expert's above combined with a wireless modem, stealing access from various open networks in public spaces.

Attributes: **ST** 10 [0]; **DX** 10 [0]; **IQ** 13 [60]; **HT** 10 [0].

Secondary Characteristics: Dmg 1d-2/1d; BL 20 lbs.; HP 10 [0]; Will 11 [-10]; Per 13 [0]; FP 10 [0].

Advantages: 25 points chosen from IQ+1 [20], Ally (hacker) [varies], Alternate Identity [5 or 15/identity], Computer

Genius [5/level], Contact (Police or Street) [varies], Favor [varies], or Single-Minded [5].

Disadvantages: -25 points chosen from Addiction (Stimulants) [-10], Enemy [varies], Insomniac [-10 or -15], Loner [-5*], Odious Personal Habit [-5/level], Overweight *or* Skinny [-1 or -5], Unfit *or* Very Unfit [-5 or -15], or Wealth (Struggling or Poor) [-10 or -15].

Primary Skills: Computer Operation-14 (E) IQ+1 [2]; Computer Programming-14 (H) IQ+1 [8].

Secondary Skills: Pick *four* of Cryptography-12 (H) IQ-1 [2], -13 (A) IQ [2], Electronics Operations (Communications)-13 (A) IQ [2], Electronics Operations (Surveillance)-13 (A) IQ [2], Fast-Talk-13 (A) IQ [2], Mathematics (Computer Science)-12 (H) IQ-1 [2] or Scrounging-14 (E) Per+1 [2].

Background Skills: 7 points chosen from secondary skills or Current Affairs (Science and Technology), Games (Computer Games), and Savoir-Faire (Net), all IQ/E; Electronics Operations (Media), Electronics Operations (Security), Electronics Repair (Computers)†, Research, and Streetwise, all IQ/A; or Psychology (Human), IQ/H.

* Multiplied for self-control number; see p. B120.
† Raised from Computer Operation default.

Lenses

Got Caught (-28 points): You have been convicted of cyber-crime and are currently serving probation. You are prohibited from using any electronic communication device and are monitored semi-regularly by a probation officer. This lens assumes that you have broken the terms of your probation. If the government learns of this, you will be sent to prison. Add Enemy (Probation officer; 6 or less) [-3], Secret (hacker) [-20], and Social Stigma (Criminal Record) [-5].

White Hat (+7 points): You have reformed and joined the "good side." You now work for a corporation or government agency as a security expert (see above). Add Patron (Fairly powerful organization; 9 or less) [10], Duty (Nonhazardous; 12 or less) [-5], and Expert Skill (Computer Security)-12 (H) IQ-1 [2].

Decker   *100 points*

The decker is a cinematic cyberpunk hacker. Armed with a neural interface jack, a high-end computer ("deck"), and a whole lot of attitude, the decker is the king of cyberspace.

On the downside, deckers are often embroiled in the depths of the criminal underworld, associated with the lowest of lowlifes. It is easy for a decker to break the wrong promises to the wrong people and find himself in serious trouble faster than he can boot up his OS.

This template assumes a cinematic TL9 cyberpunk-style campaign.

Allies and Contacts: For an Ally, the decker might choose an AI that runs off his deck, useful for covering his back on intrusion runs. The computer below could run a dedicated IQ 8 AI or a non-volitional IQ 6 AI simultaneously with his hacking suite and a dedicated suite for the AI.

Equipment: At TL9, his Signature Gear gives him a fast, high-capacity Small computer (Complexity 5, 10 TB, 0.5 lbs., 2B/20 hrs.) and a suite of Good-quality hacking software (+1 to Computer Hacking, not included in the template), and he still has plenty room for weapons, electronic lockpicks, or what have you.

Attributes: **ST** 10 [0]; **DX** 10 [0]; **IQ** 13 [60]; **HT** 10 [0].

Secondary Characteristics: Dmg 1d-2/1d; BL 20 lbs.; HP 10 [0]; Will 13 [0]; Per 13 [0]; FP 10 [0].

Advantages: Cable Jack (Sensie, +80%) [9]; Computer Genius 1 [5]; Signature Gear 1 [1]; and 35 points chosen from IQ+1 [20], Ally (AI or human) [varies], Alternate Identity [5 or 15/identity], Chip Slots (4) [17/slot], Contact (Business, Police, or Street) [varies], Gadgeteer (Software only, -20%) [20], more Signature Gear [1/level], Single-Minded [5], or Zeroed [10].

Disadvantages: -35 points chosen from Addiction (Sensies) [-15], Addiction (Stimulants) [-10], Duty (Involuntary) [varies], Enemy [varies], Loner [-5*], Social Stigma (Criminal Record or Second-Class Citizen) [-5], or Wealth (Struggling or Poor) [-10 or -15].

Primary Skills: Computer Hacking-13† (VH) IQ [4]; Computer Operation-15† (E) IQ+2 [2]; Computer Programming-14† (H) IQ+1 [4].

Secondary Skills: Pick *four* of Cryptography-12 (H) IQ-1 [2], Electronics Operations (Media)-14† (A) IQ+1 [2], Electronics Operations (Security)-14† (A) IQ+1 [2], Electronics Operations (Surveillance)-14† (A) IQ+1 [2], or Mathematics (Computer Science)-12 (H) IQ-1 [2].

Background Skills: 7 points chosen from Current Affairs (Science and Technology), IQ/E; Scrounging, Per/E; Electronics Repair (Computers)†, Research, and Streetwise, all IQ/A; or Computer Programming (AI)† and Psychology (AI), both IQ/H.

* Multiplied for self-control number; see page 120.
† Includes +1 from Computer Genius
‡ Raised from Computer Operation default.

Lenses

Under Your Skin (+4 points): Instead of using a portable computer, you've had your deck (a genius Tiny computer) implanted inside your own body. You can deck wirelessly with a radio implant. Software tools may be purchased with starting wealth. Replace Signature Gear with Computer Implant [7] and Cable Jack with Implant Radio [7] (both found in Chapter 8 of *Ultra-Tech*).

Here, There, and Everywhere

Last night the missus and I took young Sam to the [Children's Museum of Indianapolis](#) for a free open house targeting new and expectant moms; the cake, fruit, drinks, and goodies made us wonder why we'd bothered with dinner beforehand.

Anyway, among other fascinating displays and exhibits -- including Sam's interaction with the water table -- was the "Fireworks of Glass." This glass sculpture by Dale Chihuly is "the largest permanent installation of blown glass ever." This thing was huge, so I'm willing to bet their assertion is right. (Check out pictures at http://www.childrensmuseum.org/themuseum/fireworks_ofglass/index.htm)

Anyway, as long as you're clicking on random links, take a gander at the floor plan: http://www.childrensmuseum.org/generalinfo/floorplan.htm . See the blue shaded area? The 43-foot-tall glass sculpture is in the center of that region (with the square delineating an ascending walkway that can be used to go all the way to the top floor), visible from all central points.

On our way out of the building to go home, we . . . err, we got lost. We went to the bottom floor the (Lower Level of elevator fame), when we really wanted to go to the first floor. As we were wandering around said level, looking for a nonexistent exit, my wife noticed something amazing. "Look up!" she exclaimed. Upon doing so, I noticed that the "ceiling" was in fact clear glass, and we were able to see the underside of the 43-foot-tall brightly colored glass sculpture. For some reason, the realization that I was under umpteen zillion pounds of glass made me very uncomfortable. (Despite the fact that I'm frequently under umpteen zillion pounds of concrete and steel, glass just somehow seems less . . . fluffy.)

In the gaming world, there's often a tendency to compartmentalize locations. Rooms seldom spill over into others and -- especially in classic dungeon crawls -- there's not much interaction between denizens or their locale. But in the real world, events happen all the time that impact others. If someone opens a window in the bedroom, the resultant cross breeze can cause the door to the office to slam shut, sending someone in the kitchen to scurry to see what happened. If my upstairs neighbors decide to practice the guitar at 4:00 a.m. (not a hypothetical), my son awakens with a banshee's howl while my wife assumes the half-wolf form, fangs slathering to rend the flesh of musicians.

Computer games tend to do a better job of simulating changes in environment, probably because it's one thing that's easier to keep track of or -- if need be -- make up (unlike realistic NPC reactions, which are the realm of human GMs). As a minor example, in the classic computer text-adventure game *Zork,* one room is too loud with an echoing roar to do anything in other than leave. (In fact, in a neat bit of meta-gaming, any commands you try to do merely echo back the last word; typing in "EXAMINE PLATINUM BAR," for example, produces the response of "Bar . . . bar . . .") The reason this room is so loud, you discover, is because a huge dam is pouring water over the top of the room; closing the dam results in the room becoming eerily quiet, and you can then get the treasure in that room as well as leave it for other environs. As another example, in the game *Planetfall* you learn that the water level of the planet is rising; as the game progresses, some rooms become inaccessible as they become submerged.

But areas in RPGs are usually compartmentalized; this is especially true in published adventures, where that route is usually taken to preserve the keyed encounter feel. But this tends to compartmentalize the adventure, turning it into a series of episodic scenes with little relation to each other. (After all, does it really matter in the grand scheme of things if the heroes faced the skeletons *before* the mad mage instead of after?)

But by having the environment -- either the actual place or the interactions of other beings -- as something that exists outside of a self-contained room, you open up all kinds of possibilities. For example, how much spookier would the classic adventure **Ravenloft** (called **Expedition to Castle Ravenloft** nowadays) be if the GM kept track of monsters that the heroes were likely to hear, and moved them according to some kind of predetermined pattern . . . giving the players aural information as appropriate? ("The sound of bone scraping against metal starts getting louder again below you, but soon trails off to the north.")

Or what if the adventure takes place in a mad scientist's laboratory where there's a Big Boom about midway through the adventure; suddenly the entire landscape of the once-familiar complex becomes alien. Alternate routes need to be found, difficulties need to be navigated, and decisions may have lasting repercussions on the location . . . including future points of the adventure. ("There's an access tunnel we can get to behind this vat of liquid nitrogen . . . but to get to it, we need to tip the vat over!")

Or take your standard "trapped in a haunted house" riff. Part of the standard appeal is that no one knows exactly what's in the next room. But what if we turn it on its ear (in a reversal): The heroes wake up in a strange room in an unusual house. Oh, and the entire house is transparent, as if it were made of clear acrylic. They can see their adversaries, they can see the strange horrors as they navigate the environment that they're familiar with while the heroes struggle -- it's tricky finding a clear doorknob on a clear door! -- and, as the horrifying but still-distant creatures shamble from floors above and below, the heroes need to come up with a plan. Fast.

(This "transparent" idea can be used to rejuvinate any classic adventure; what would the **Tomb of Horrors** or **Ravenloft** be like if the tomb or castle were transparent? Of course, in a sword-and-sorcery campaign the notion of "line of sight" would need to be sorted out ahead of time as well . . .)

Most locations are interconneted with others, in ways that may not be obvious. Keeping this in mind can help the GM spruce up an otherwise bland adventure. After all, no matter how many foes the heroes dispatch, they're always surrounded . . by someplace.

Elvish Checkers

Published by [Three Sages Games](#)

Designed by David Wainio

16 stones (seven each of two colors & two Stone Men), cloth map, string, rules sheet, and storage instructions, stored in a clear plastic mail tube; $12.95

Every time someone wants to do a game about elves, or has elves show up in their stories or their game world, they always start the same way: "Not much is known about the elves." *Elvish Checkers,* -- a new board game from Three Sages Games -- is no different, but it doesn't attempt to take us on a tour of the entire elven culture. Rather, it limits itself to this one facet of their lives.

The rules start by telling us not much is known about what this game means to elves. Is it a leisure activity? A way to train potential recruits should war break out? A metaphor for their civilization and its customs? Maybe. You're paying for it, so you decide if it has deeper meaning.

Regardless of what you decide, the object is to be the first to get all your elves into the opposing player's village.

Two village spaces sit on opposite sides of the board, and between these extremes are several leafy glades, the sort elves seem keen to inhabit. Both players occupy the spaces nearest to their home towns, and the village itself contains a large and imposing Stone Man, a summoned creature who -- like a golem of legend -- has a limited ability to discern what the summoner really wants. Lines from one village or glade to the next indicate where units can move (mostly it's a crisscross pattern).

An elf can move into a glade so long as there's room. Two elves (from either side -- you and your opponent can occupy the same space) fill up a glade, as does a single Stone Man. You must move one unit one space per turn (backing up and moving laterally are no-nos), and if you have no moves, you forfeit. Stone Men cannot move onto each other, and if one enters the opposing village, it crumbles and reforms in its home town (only the elves leave the board). If these titanic elemental creatures move onto a glade with elves, the smaller units scatter to their respective villages and begin their journey anew.

Forced to move and unable to go backward, eventually one team or the other gets all its elves into the opposing village. From there, they discover the fabled Elvenhome and win the game.

It's a simple game from a component standpoint. Everyone is represented by stones, with larger pieces used for the Stone Men. It's hard to be more descriptive; if you've ever seen polished rocks in any form in the genre industries, you know the sort of thing to expect here. The color may vary between sets, and the light plays funny tricks, but if one copy is any benchmark, it seems easy enough to tell the colors apart, and they fit onto the spaces.

The board is worth mentioning for two reasons. First, it's a cloth with the play area printed on it, rather like the sort of rubbery imprinting you find on some sweatshirts, but the cloth is a stiffer material. Second, the company includes a length of string. The stones can be placed in the cloth and the whole thing gets tied into a small bag for that Renaissance-fair feel. Whatever the cord is (twine? yarn?), it's rough enough that even a single cinch seems to keep the bag closed. What effect this has long-term (on the string or the rubbery map printing) is unknown, but it's clever. It comes in a plastic tube, so unless you're going for a look as you carry this about with you at the convention, there's not much keeping you from using it . . . it's every bit as secure.

As for actual play: It's hard to convince some people you can't just throw counters into a box, add a board whose parameters are themselves a decorative design (even if it isn't made of cloth), and call it a leisure pastime, but Three Sages knows what they're doing. Perhaps with practice, the game becomes one of those annoying exercises where going first gives you an edge mathematically speaking, but that doesn't always play out. It's a simple idea, an even simpler execution, and a wonderful challenge.

The strategy changes as the game goes; certainly the Stone Men start out as big, stompin' behemoths, but as you near the end, they're closer to goalies in a soccer game. Do you try to block your opponent's pieces, or do you race up the sides where a megalith might get hung up? Do you try to intercept your enemy out in the middle of the board, or reach for the other village so you can cycle back home and protect it from intruders? And is your rival willing to stomp his own elves if you pair yours with his? It's quick; it's fun; it's portable: What's not to like?

The game has a copyright date of 2004, but local game store shelves say it's new. This could just be one of those hiccups where the game was created before funds were available for production, but regardless of the reasons, it's heartwarming to see a small company make good and live up to its hype with a small and unassuming winner like **Elvish Checkers.**

Pirates of the Spanish Main: Swashbuckling Roleplaying in the Age of Sail

Here is a curious thing: Just when you thought a genre was utterly passé, up pops a game to prove you wrong. Pirates were all the rage back in 2003, riding the wake left by the film *Pirates of the Caribbean: Curse of the Black Pearl,* so it is surely no coincidence that the latest entry in the genre, the ***Pirates of the Spanish Main: Swashbuckling Roleplaying in the Age of Sail*** RPG, has been released just before the debut of *Pirates of the Caribbean: At World's End.* The game is based upon the WizKids CSG of the same name, which itself got a new expansion prior to the opening of the film and also happens to be the only game that survived the 2003 trend.

The ***Pirates of the Spanish Main RPG*** uses [Shane Lacy Hensley's *Savage Worlds*](#), also from Pinnacle Entertainment, but it is a complete, standalone RPG and does not need the core rules. Although the genre is not new to ***Savage Worlds*** -- Pinnacle having visited it before with [*50 Fathoms*](#), a more fantastical take upon the genre set in a drowning world -- ***Pirates of the Spanish Main RPG*** is not a Plot Point campaign. This latest pirate book is an ahistorical take upon the Spanish Main, set in the late 17th and early 18th centuries, but blending three centuries of history to get an idealized version of the Spanish Main. Furthermore, because this RPG is based on the core setup for ***Pirates of the Spanish Main CSG*** and its first expansion, ***Pirates of the Crimson Coast,*** it involves the Dutch, English, French, Pirate, and Spanish factions only. Although the game touches upon some supernatural elements -- enough to model the events of a certain 2003 film by adhering to just the first two sets -- this RPG forgoes the American, Barbary Coast, Viking, and even the Chinese factions, as well as the monstrous sea beasts of recent expansions from the CSG.

The ***Pirates of the Spanish Main RPG*** is an opportunity to swashbuckle your way around the Spanish Main, all against a background of the major European maritime nations jockeying for power and prestige. They war for dynastic, economic, and religious reasons, primarily through sanctioned privateers, even as pirates sail in search of the next big prize -- perhaps even a Spanish treasure ship. Slavery is on the wane, and although the position of women might not be equal, the Spanish Main is the place where a woman can make a name for herself. This is a setting in which player character pirates are more rogues than vicious, bloodthirsty raiders -- that is left to the villainous NPCs. Gaming possibilities include intrigue, subterfuge, rapier wit, and high swashbuckling action.

Character generation in the ***Pirates of the Spanish Main RPG*** follows that for ***Savage Worlds.*** A player buys dice for his character's attributes and skills, chooses Edges, Hindrances, and equipment. Edges and Hindrances certainly help enforce the game's piratical theme. These include Hindrances such as Branded (facially as a pirate) and Seasick; while

Bilge Rat lets a pirate fight in the cramped below-decks without penalty, and Wall of Steel enables a pirate to face multiple foes unpunished. In addition, Professional Edges such as Explorer, Helmsman, and Rope Monkey define a character's role aboard ship or ashore, while Fencing Academy grants fencing school membership where a character can learn a secret fighting maneuver. Although not all schools teach fencing styles, there is one taught by a peg-leg pirate for other amputees. The character generation rules offer plenty of choice, but curiously this section lacks any full example. Considering that this is a complete RPG aimed at players of the CSG as a crossover product, this is an unhelpful omission.

Mechanically, *Pirates of the Spanish Main RPG* relies on the reasonably easy and pulp-action-orientated *Savage Worlds* system, the simple rules encouraging characters to use the kind of tricks so beloved of the genre. The system not only handles brawling, musketry, and dueling on a personal level, it executes mass combat with the same ease. It is also can support miniatures combat, although it abstracts this slightly for land engagements, understandably focusing on ship-to-ship engagements. And if the *Pirates of the Spanish Main CSG* is one thing, it is a ready source of inexpensive, attractive ship miniatures and seaborne scenery.

The obvious choice for handling the RPG's naval combat would be to the CSG's rules. Yet those rules lack the detail necessary for the RPG, and thus it provides its own. Much like the CSG, these rules begin by defining a ship by the number of her masts, but adds color and flavor with various nautical Edges and Hindrances. Templates are provided for use with these rules, which emphasize the role of the crew aboard and whatever position the player characters take. The damage rules are also more detailed than in the CSG, which only measures damage taken by masts lost.

The GM's section includes a guide to the Caribbean full of details that can be brought into play, from towns and forts to people of note and even ancient Mayan ruins. An additional set of tables helps the GM create his own islands and adventure hooks. Actual GM advice begins with the basics -- getting a group together before going on to discuss the expected but is nevertheless sound advice. It includes a starting adventure, "The Lady's Favor," which starts off with an increasingly tired cliché -- somebody in peril in the street -- and winds up including treachery, treasure, cannibals, and the opportunity for derring-do.

Rounding out the book is an extensive bestiary and encounter list that offers fully detailed versions of several legendary figures from the CSG. More importantly, it also provides the game's only coverage of the supernatural. The write-ups of ghost ships, kraken, mermaids, and sea serpents all point to the CSG's inspiration as much as the CSG itself, as does the inclusion of a trained monkey.

Physically, this is a nice-looking hardback. The artwork -- drawn from the CSG -- is decent, as is the writing, and what looks like oddly colored text is actually a series of clues in a treasure-hunt competition.

Personally, the *Pirates of the Spanish Main RPG* is not the best pirate-themed RPG available. That is still Green Ronin's *[Skull & Bones: Swashbuckling Horror in the Golden Age of Piracy,](#)* which is more interesting and more detailed, but this new release is certainly not a poor entry in the genre. It is not quite the introductory RPG it wants to be, but as a crossover RPG from the CSG, it does a passable job. Being ahistorical and cinematic in both style and source, the *Pirates of the Spanish Main RPG* is very accessible. Considering the lack of piratical RPGs currently on the gaming shelf, it fills that niche rather well. Mechanically and thematically easy to pick up and play, *Pirates of the Spanish Main: Swashbuckling Roleplaying in the Age of Sail* lets players swash their buckles and commit acts of daring with élan.

A Thanatopsis Of Basilisks

"ANNE. Out of my sight! Thou dost infect my eyes.
RICH. Thine eyes, sweet lady, have infected mine.
ANNE. Would they were basilisks, to strike thee dead!
RICH. I would they were, that I might die at once;
For now they kill me with a living death."
-- William Shakespeare, *Richard III,* I:ii:144-152

In that bit of byplay, Shakespeare says it all. That a gaze can infect, and that seeing the danger may only -- or also -- create it. Thus perception makes reality, and reality's only defense is to kill you. Or to blur your perception so much that you don't even know what you've seen. All those answers, mirror-wise and backward, infect the eyes of the basilisk. Or is it the cockatrice? Do they exist if we can't see them? Or must they exist if we can't see them? Well, that, as the Bard says elsewhere, is the question . . .

". . . All who see its eyes expire immediately. The basilisk serpent also has the same power. It is a native of the province of Cyrenaica, not more than 12 inches long, and adorned with a bright white marking on the head like a sort of diadem. It routs all snakes with its hiss, and does not move its body forward in manifold coils like the other snakes but advancing with its middle raised high. It kills bushes not only by its touch but also by its breath, scorches up grass and bursts rocks. Its effect on other animals is disastrous: it is believed that once one was killed with a spear by a man on horseback and the infection rising through the spear killed not only the rider but also the horse. Yet to a creature so marvelous as this -- indeed kings have often wished to see a specimen when safely dead -- the venom of weasels is fatal: so fixed is the decree of nature that nothing shall be without its match."
-- Pliny the Elder, *Natural History,* VIII:33

Good old Pliny isn't quite our earliest source for the basilisk. That honor goes, if my murky data are to be relied upon, to Democritus of Abdera, most famous for developing the atomic theory of matter in the 4th century B.C. But Pliny is by far our most complete résumé of classical intelligence on the beast, leaving almost nothing for later writers like Aelian to do except add that the basilisk fears cock-crow, which is fatal to it. But as befits its regal state ("basilisk" comes from the Greek *basileos,* or "king"), the basilisk is far more fatal to its surroundings. Pliny covers every possible base: the "basilisk serpent" kills with its gaze (or at least kills those "who see its eyes"), its hiss, its touch, its breath (which may be fiery, as it "scorches up" vegetation), and last but not least its supremely venomous blood. As the poet Lucan says, it creates a desert wherever it dwells, rather like Agricola's Roman legions.

"They hatch cockatrice eggs, and weave the spider's web: he that eateth of their eggs dieth, and that which is crushed breaketh out into a viper."
-- Isaiah 59:5

About 350 years or so later, Cassianus informs us that the basilisk is born "from the eggs of birds which in Egypt are called ibises," probably based on a misunderstanding of Ammianus' report of the ibis' propensity for eating baby snakes and laying eggs, though not snake eggs, through its beak. Things got even more snarled up when Isidore of Seville tried to combine Ammianus, Cassianus, and the passage from Isaiah above with an entirely different story from Pliny, one about the bird (or snake) that lives inside the crocodile's jaws. Isidore wound up saying nothing clearly at all, but later commentators doped out that a weasel somehow lived in the crocodile's jaws and killed it. Just like weasels kill basilisks. With the kind of thoroughgoing malapropism of which only the medievals were truly capable, Isidore's conflated texts from Pliny got intermixed with Cassianus' garbled Ammianus to produce the word "cockatrice," probably derived from *crocodilis* via *cocodrilis* and many similar scribal hiccups. The (crowned) snake, possibly born of an ibis egg, who fears the crow of the (crested) rooster became, by the time of Alexander of Neckham's bestiary (ca. 1180), a snake born from a rooster's egg.

The illustrations in 12th-century bestiaries already show the basilisk with a rooster head, and two generations later Pierre de Beauvais explains that the rooster's egg, laid on a dung-heap and hatched by a toad, produces a half-snake half-rooster that fears only cock-crow, weasels, or mirrors. (Around this time a few classical-minded scholars,

remembering that Lucan had said the basilisk grew from the blood of the Gorgons -- about whom more in another Transmission -- decided that its gaze might petrify people in addition to just plain killing them.) The end result of all this tomfoolery was to replace the simple snake (or lizard) of Pliny with a kind of chimerical half-snake half-rooster (the "basilicoc" of Chaucer), which eventually became the default version of the creature. To get back to the snake version, some authorities had to postulate that the cockatrice's egg, in turn hatched out by a toad, produced Pliny's supremely venomous serpents, occasionally with two heads, one on each end, for more efficient death-vision.

"But the Basilisk of elder times was a proper kind of Serpent, not above three palms long, as some account; and differenced from other Serpents by advancing his head, and some white marks or coronary spots upon the crown, as all authentick Writers have delivered. Nor is this Cockatrice only unlike the Basilisk, but of no real shape in Nature; and rather an Hieroglyphical fansie, to express different intentions, set forth in different fashions."
-- Sir Thomas Browne, *Pseudodoxia Epidemica*

So now that we've got at least two versions of the myth, what could the basilisk have been in dull old reality? (There's a real-life "basilisk" in Mexico, but it's a lizard named for the legendary beast, and needn't detain us further.) I think it's fairly obvious that the beast Pliny refers to began as the king cobra, which combines the "royal diadem" on the head with the erect posture he noted. Its cousin the spitting cobra can even blind or kill foes -- including birds -- at a distance. The Egyptians venerated the cobra, and it's not impossible to imagine them buying all kinds of snakes from dealers in Arabia, India, and wherever else they could find them, explaining how the various types of cobra could have joined in one "uber-cobra" legend. The slam dunk is Pliny's reference to the basilisk's mortal enemy, the weasel, which just screams "mongoose" to anyone paying attention. Some cobras eat eggs, which would explain their seeming emeregence from ibis (or chicken) nests. The cock-crow stuff might just be a standard folklore trope -- cock-crow drives away demons and ghosts, after all -- or a garbled reference to cobras' legendary (and fictional) susceptibility to sound. On a somewhat wilder note, we could postulate a now-extinct cobra species spitting a resinous, incidentally herbicidal venom that killed plants all around it and hardened over its prey.

"They shall be burnt with hunger, and devoured with burning heat, and with bitter destruction: I will also send the teeth of beasts upon them, with the poison of serpents of the dust."
-- Deuteronomy 32:24

Since apparently nobody could decide what the things looked like -- and since seeing them would almost invariably kill you -- it's not surprising that there is a dearth of basilisk sightings over the years. Pope Leo IV killed one with prayers in Rome in the ninth century, but not everyone can bring that kind of clout. Pierre de Beauvais reports on a basilisk hunt (with a mirror) in 1202; there exists a similar report from Vienna in 1212. In 1350 the knight Frettard de Claunay killed a cockatrice at cock-crow (though it returned every ten years), while in 1356, an earthquake nearly destroyed the city of Basel, and the town fathers apparently blamed the homophonous basilisk for the deed, making it the civic emblem thereafter. A man named Green killed a cockatrice in Wherwell, Hampshire, in 1538, also with a mirror, earning a patch of forest called Green's Acres to this day, where (eerily) very little vegetation grows. In the early seventeenth century, Father Eugene Roger saw a dead one in Syria, and a Kansas City preacher named Bob Jones (no relation to the university) had apocalyptic visions of the Basilisk Antichrist on July 23 of both 1996 and 1997.

I haven't seen any direct theorizing to this effect, but it strikes me that the drawings of the rooster-snake cockatrice look a whole lot like -- and may have come from -- similar depictions of Abraxas, the rooster-headed, snake-legged Demiurge postulated by a Gnostic heresiarch named (intriguingly enough) Basilides. We know Abraxas (or Abrasax, or Abarasx) from his appearance on amulets protecting against, among other things, the evil eye starting in the 2nd century A.D., but he remained very popular throughout the East. I offer up the likewise unsupported connection between the Jewish-Gnostic Abraxas and the Jewish demons known as the shedim, who were reported to have the feet of cocks and be the children of serpents. The best known of the shedim is Ketev Meriri, the "bitter destruction" linked in the Deuteronomy verse above with "the poison of serpents of the dust." In other words, with the poisoned desert of the basilisk. Ketev Meriri is covered with scales and (in one rabbinic report) resembles a turning ladle -- which is to say, an upright snake. And what was Ketev Meriri's power? Among other things, he killed with a glance.

"Another isle is there toward the north, in the sea Ocean, where that be full cruel and full evil women of nature. And they have precious stones in their eyen. And they be of that kind, that if they behold any man with wrath, they slay him

anon with the beholding, as doth the basilisk."
-- Sir John Mandeville, *Travels*

The combination of eyes, snakes, poison, and killing brings us around to our old friend the Lamia, who as it happens came from Libya, just like the basilisk. (And just like the Amazons, who perhaps provide the necessary feminine danger adduced by Sir John Mandeville, above.) What else happens in Libya Ultraterrestria? Why, St. George kills a dragon -- at "Silene," perhaps another Isidorean misprint for "Cyrene" -- with a spear, no less, just as Pliny urges us not to kill a basilisk. The death of George's dragon relieves a famine and nourishes a desert; again this very serpentine dragon seems rather basilisk-ish. And once more around the coil, as if distorted in the cockatrice-thwarting mirror, we have the tale of the Argonaut Mopsus, who knew the Language of the Birds, killed by snake-bite in Libya. Bird and serpent, cock and basilisk, the secret of the Sirens (Cyrenes?) traded for death in a serpent's hiss.

"But when they would represent Eternity differently, they delineate a Serpent with its tail covered by the rest of its body: the Egyptians call this Uraeus, which in the Greek language signifies Basilisk . . . The Egyptians say that Eternity is represented by this animal; because of the three existing species of serpents, the others are mortal, but this alone is immortal; and because it destroys any other animal by merely breathing upon it even without biting. And hence, inasmuch as it thus appears to have power over life and death, they place it upon the head of the Gods."
-- Horapollo, *Hieroglyphica*

But our path takes yet another snaky turn when we confront the 4th-century A.D. Greek adept Horapollo, whose interpretations of the hieroglyphs transcended petty linguistics to shape medieval magic for a millennium. To him, the basilisk is a symbol of immortality, and it becomes a divine halo, the Uraeus. Some versions of Horapollo depict the basilisk as a ouroboros, the serpent biting its own tail -- which, for a basilisk, might well be a suicidal act. This leads me ineluctably toward the conjunction of the basilisk with the phoenix, which also symbolizes immortality through death. The phoenix, remember, begins as a "worm" inside an egg -- just as the basilisk begins as a "wyrm" inside an egg. Both basilisk and phoenix are identified with fire, with Egypt, and with the "dog days" of the heliacal rising of Sirius. During these hot weeks, the phoenix returns to Heliopolis, and the cockatrice eggs are laid. The dog days also roughly correspond with Bob Jones' basilisk visions, and with the *bein hametztarim* or "perilous straits" -- the 21 days between 17 Tammuz and 9 Av, during which the Ketev Meriri is abroad.

Pliny describes the basilisk's blood as "brighter red than cinnabar," implying a connection between basilisk blood and mercury. This leads us to the perhaps not surprising by now revelation that the alchemists considered the basilisk a mighty symbol. The cockatrice, especially, conveys the Conjunctio, the Alchemical Marriage of opposites. (Like basilisk and phoenix, perhaps?) Albertus Magnus quotes Hermes Trismegistus (incorrectly) as saying that the basilisk skin gives silver the appearance of gold; by the 15th century Sir George Ripley, court alchemist to King Edward IV of England, was quoting Ramon Llull (also incorrectly) as saying that as the basilisk fixes its prey by eye, so operates the Azoth on matter. The basiliks fixes, kills, what it sees -- the Azoth fixes, distills, mercury into silver. And since Hermes tells us that the basilisk skin turns silver to gold, what could the basilisk be but the Philosopher's Stone itself, the True Red Elixir? Ripley lets the cat out of the bag himself, writing: "Our Baselysk, otherwyse our Cokatryce, our great Elixir most of pryse." It's probably just a coincidence that a nuclear fusion reaction would transmute minerals, just like the Stone -- and petrify (or mummify?) a target and blast the land far around into desert, like the basilisk. (Browne describes the basilisk's poison as "pestilential Atoms." Democritus invented atomic theory and first describes the basilisk. Coincidence, yep.) Could the basilisk's "hiss" and "glare" be sonoluminescent fusion, emitted by whatever negative space, whatever Hawking chimera, whatever ineffably twisted superstring the cockatrice truly represents?

"If he who saw you is alive,
Then your history is entirely lies,
If he died not, he can be ignored,
If dead, he could not have told a word."
-- Francisco de Quevedo, "The Basilisk"

Having chased the basilisk this far, where have we got to? Risking death, we see that something about this beast does not want to be seen, does not want to be known or apprehended. Pliny warned that it was not to be approached, despite the curiosity of kings. Indeed, attempting to pin it down results in a comic-opera etymology in which the basilisk is the

enemy of the crocodile which is the name of the cockatrice which is hatched from the cock which terrifies the basilisk which is the prey of the weasel and so on around in an ouroboros spiral. No wonder the thing can only be killed with -- seen in -- a mirror. If the Lamia is the quantum options of perspective as epistemology, and the Phoenix is the eye of destruction flickering from world to world, perhaps the Basilisk is the necessary indeterminacy between them and the warning of its necessity. Seeing is believing, and believing -- picking just one option, collapsing the wave front, focusing in and perceiving the twisted shape in the desert -- can kill you when you see it. So now you don't.

Pyramid Interviews

Free RPG Day Extravaganza
Aldo Ghiozzi of Impressions Advertising
Joseph Goodman of Goodman Games

Interview by Steven Marsh

A few months ago, a buzz began building in the RPG world about an event sure to pique the interest of tabletop gamers . . . especially for those seeking something new or for folks on a budget. Free RPG Day is coming on Saturday, June 23, with over a dozen publishers offering up a free adventure, quickstart rule book, or RPG supplement (while supplies last) for those who visit participating retailers. And the plan is to ensure that these items are brand new, so you've never seen these items before.

But how did Free RPG Day come about, and what does it hope to accomplish? For answers, *Pyramid* first went to the man with the plan: Aldo Ghiozzi -- owner of Impressions Advertising & Marketing -- who is the mastermind and ringleader behind Free RPG Day, sat down for a few moments with us to give us the inside scoop.

* * *

Pyramid: **Okay . . . Free RPG Day: What's the 100-word-or-less pitch?**

Aldo Ghiozzi: We hope retailers use the giveaways to create an event and experience in their store to help spur interest in RPGs.

Pyramid: **Who is Free RPG Day targeted at? Is it intended for hardcore gamers that publishers are hoping to woo with something new, folks familiar with RPGs, people who have no clue what this RPG-thing is all about, or some combination?**

Aldo: I have said straight from the beginning that I have no intention to try and make this event something to attract people who have never heard of RPGs before. My goal is to either get the hardcore RPG players to play more or get the players who have gone away over the years.

Pyramid: **How big do you see the "fallen away" audience being? Is that a vast untapped reserve, and -- if so -- how hard do you think it's going to be to get them back?**

Aldo: Wow . . . I don't think I have the knowledge or ability to answer this. Again, I just believe some consumers got so sick of *d20 System* this and *d20 System* that, that they just walked away.

Pyramid: **I'm presuming this is based on the success of the Free Comic Book Day, right?**

Aldo: Correct. I wish I could say I was being creative, but it is taken directly from FCD.

Pyramid: **Free Comic Book Day has generally been timed to coinside with a super-hero-themed blockbuster movie. Is there a reason June 23 was picked?**

Aldo: Most consumers will not see the significance of the date, but I picked it because it was after two industry trade shows (GamesExpo and GTS) so I could pitch publishers and retailers. And, it was before Origins and Gen Con so we could see if it helped spur some sales for some publishers at those shows.

Pyramid: **Aldo, you're the contact person for this. Was this event your idea? How long has it been "in the**

works"?

Aldo: Ironically, no, this was not my idea. The spark came from Joseph Goodman from Goodman Games while we were having lunch last December. He wanted the event for his own *Dungeon Crawl Classics* series, but then I said we should just open it up and get a few publisher friends and retailers on-board. Well, 300 stores and 14 publishers later . . . .

Pyramid: **Yeah, getting over a dozen publishers to do *anything* coordinated is a real accomplishment! <grin> How enthusiastic of a response did you get from them? Was it something where you had folks jumping all over this opportunity, or were they wary?**

Aldo: I wish I could say it was that easy, but in the hobby game market, it is always hard to get publishers to spend money. Many wanted in, but they had to determine if printing 1,000-3,000 copies of something was worth it.

Pyramid: **Well, even assuming that you can get those numbers down to $0.50-$1.00 a copy, that's still a big chunk of change. On the other hand, it *is* a chance to get to target 1,000-3,000 would-be-customers directly . . .**

Aldo: Yes, and that is the key: hitting 300 stores and hopefully thousands of consumers that are completely and utterly interested in RPGs is very valuable to the publishers.

Pyramid: **And how has the response from retailers been? Have they been excited, or did they need convincing?**

Aldo: The retailers have been the ones with the overwhelming desire to make this work. I was floored to get 300 stores; my goal was 100. On top of all of this, I had to cut off stores from signing up three weeks ago because we barely have enough product to satisfy the existing stores. *And* . . . these are only stores in the U.S. I had a lot of Canadian and European stores getting mad at me because I told them that Year One is a test and only available to U.S. stores! (Don't worry, though . . . worldwide next year!)

Pyramid: **Was the decision to limit this to the United States because of logistics, economics, something legal . . .?**

Aldo: Total logistics. I did not want to go out there and promise the sun, moon, and sky on year one; I wanted to make sure to get it right the first time, and if something did go wrong, I had the small group of U.S. stores to deal with. Year two will be worldwide, so no worries after this year!

Pyramid: **There's been at least one other "bring attention to games" program that I'm aware of: National Games Week. In your opinion, how does this program differ from that one (in outlook, participation, philosophy, or anything else)?**

Aldo: NGW's goal was to brings games to the mass market. As I said above, my goal is to only inspire existing gamers are past RPG players. On top of that, NGW was just about playing games and selling games to consumers; FRD is all about giving away the freebies so folks have something instantly new to play as each product freebie has to be a never-before-seen RPG product.

Pyramid: **It seems like you've been adamant that Free RPG Day contain that "new product" element, insisting that publishers not use this as, for example, an opportunity to dump existing stock. How important is this to you, and why?**

Aldo: Adamant is a strong word. This is just another copied element from Free Comic Book Day; they only give away never-before-seen comics, so I just figured it was par for the course.

Pyramid: **In looking over the fact sheet, it looks like publishers are publishing 1,000 items, to be distributed among "100 stores." Now, according to the website, 300 stores have signed up. How does this work out? Are those 1,000 items being distributed to all 300 stores, are only some stores getting the 1,000 items, are publishers printing more than the 1,000, or something else creative?**

Aldo: Yeah . . . that was the original goal [to divide each publisher's 1,000 freebies among the participating retailers]. Since then, publishers like White Wolf, Goodman, Flying Buffalo, and others agreed to send more than the 1,000 required to cover the extra stores.

Pyramid: **Okay; so some of the publishers are going to be coming up with extra stock, and there's at least 1,000 copies floating around for some stores. Does this mean that if I'm really looking forward to, say, the Quickstart rules for** *Castles & Crusades* **or** *Changeling: The Lost,* **what is my best bet? Are my odds pretty good if I show up at store opening on that Saturday, or should I call ahead to my shop and sort it out with them? Or should I not get my hopes up for any particular offering and instead go in with the idea of seeing what** *is* **available?**

Aldo: That's a tough question; I think it depends on the store and what they are doing to create excitement. If you see a store with flyers, posters and a calendar talking about free food, free prizes and gaming all day, then chances are you will be fighting for the key freebies. On the flip side, some folks may be lucky to find the stores that are just putting the freebies on a table for folks to grab with no challenge from other consumers.

Pyramid: **Have you reached any kind of agreement with publishers about this being "exclusive" product, or are these freebies all things that could find a home elsewhere (perhaps as free or for-pay PDFs from the publishers after the event)?**

Aldo: This is actually a requirement. The product *must* be new and cannot be given away until *after* June 23; the whole point is to get consumers to have a reason to go into their local retailer. If they were available online, then why go in?

Pyramid: **Sorry; I phrased that poorly. After this year's Free RPG Day, the publishers can do what they want with any extra copies or electronic versions of their giveaways, right?**

Aldo: Correct. Some publishers are even printing them with alternate covers to sell later on through distribution.

Pyramid: **You've got 300 stores signed up; do you have any idea what percentage that is of all RPG retailers?**

Aldo: All of them! <laughs> There is actually a joke in RPG publisher circles that there are only 200-300 stores in the U.S. that carry RPGs in any capacity beyond Wizards of the Coast and White Wolf. I wish I had stats, but I don't.

Pyramid: **It's obvious that this has been a program designed with the retailer in mind from the beginning, since the freebies are only available at participating stores. This says to me that you view brick-and-mortar shops as being a vital part of the effort to get new gamers since -- for example -- you could have done the entire promotion as an "online only" event, with the books being offered free for one day. Can you expand a bit on this philosophy here (assuming my assessment of it was correct)? Additionally, is this a case where the scarcity of these books makes for a more effective promotion?**

Aldo: Yes, definitely made for the brick-and-mortar retailer. These are the people that are in the trenches everyday trying to evangelize games, and I believe a retail store location is the only way consumers can get excited about games (except maybe at local cons). Free RPG Day is all about the experience, and I hope stores do everything they can to get people excited to play RPGs more . . . or once again.

Pyramid: **What are your thoughts on the current state of the RPG industry? Do you see Free RPG Day more as being a means of revitalizing a suffering industry, or an effort to help grow a healthy one?**

Aldo: I actually don't see RPGs as suffering anymore. I continue to see RPG sales for *d20 System* and non-*d20 System* products increasing. In my opinion, things have settled from the glut and people are back on track to play more . . . and my hopes are that Free RPG Day will help get those people to play new RPGs from publishers they have never heard of before.

Pyramid: **How do you define "success" for this program? Do you have any concrete goals or ideas, or is it more a case of "I'll know we've done well when I see it"?**

Aldo: That is a funny question to me because I always said that my goal for the event is to financially break even! Each charge to the retailers and the sponsorships to the publishers have gone straight into a pot to pay for every expense to make the event as big as possible. Any profit was put into marketing the event: posters for stores, an ad in *Dungeon,* flyers, postcards, exhibit booths, etc.

Pyramid: **Assuming Free RPG Day is successful, do you have any ideas for how you'll tweak it next year?**

Aldo: I did mention this above, but the big change for next year is that it will be available worldwide.

Pyramid: **It looks like no one's signed up for the Gold-level sponsorship. Any theories as to why that is?**

Aldo: Yeah, that was interesting, but it was part of the learning experience. Actually, Wizards of the Coast was going to do it, but we only gave them five months advance notice for the event and they need 10 months to create new product. They wanted to just pay the sponsorship and put in a catalog, but after a lengthy conference call we all thought that it might make consumers and retailers believe there was a Wizards freebie . . . and we didn't want that. They have verbally committed to 2008 and told me to call in July to work it out. I still believe though that the Gold Level sponsorship is very much worth it considering it was based off of only 100 stores and we got 300 . . . but I am sure that since this is a first year event, publishers want to sit back and see how it goes.

Pyramid: **Again, assuming it's successful, do you plan on tweaking those levels next time?**

Aldo: Tweaking in price? Yup. Tweaking in a package sense? No. <grin>

Pyramid: **So any last thoughts before we get in line at our local game shops?**

Aldo: In the end, I just want people to know that I have no goals or hope that this event will "save" the RPG industry or bring in vats of new players. Many people think that is my goal and I always stress that the goal is to just get people excited to play more or bring in players who happened to stop playing over the years.

And with that our interview with Aldo Ghiozzi ended. But *Pyramid* had a question or two about the origins of Free RPG Day, so we tracked down the previously mentioned Joseph Goodman of Goodman Games. While we had his ear, we asked a bit about a publisher's point of view for this promotion.

* * *

Pyramid: **Joseph, do you have any anecdotes or insight as to how you originally envisioned this promotion? How does the promotion as it shaped up compare to what was in your mind's eye?**

Joseph Goodman: A lot of my promotional ideas are based around how to get fans excited about game stores. That's why I sponsor my 20% off sale every May, why I provide free *Dungeon Crawl Classics* spinner racks to retail stores, why I created the Click-to-Brick Conversion Project to send online gamers back into stores, and why I started producing $2 modules. My idea behind "Free Adventure Module Day" (the original concept) was to give fans a reason to physically step into a game store and see what's new, giving brick-and-mortar stores a little something that nobody else had. Aldo suggested broadening the concept to "Free RPG Day," and the final result is better than I'd ever hoped; we have a broad publisher base and a huge number of stores signed up.

Pyramid: **How do you see the current state of the gaming biz?**

Joseph: I think things are good. This is a fad-based industry, and things are always best when lightning strikes. It's been several years since the last lightning bolt, but that's not always a bad thing! Millions of people are still gaming, and game stores everywhere are still selling a lot of pen-and-paper games. It's the job of everybody in the industry to give fans a reason to walk into a store to buy a game. Publishers who are being proactive with events like Free RPG Day are seeing the rewards. Fans everywhere are excited about the event, and it's shown me there's a lot of energy out there . . . all you need is a lightning rod to tap it.

Pyramid: **You've mentioned a couple of times that one of your goals is to get fans and would-be fans into brick-and-mortar game shops. Why do you feel that's important?**

Joseph: I think stores are the best place to expose fans to new games, build the social network surrounding game play, and introduce new fans to games. The Internet allows existing customers to pursue their hobby, but doesn't expand the fan base. Conventions operate on a similar principle. But stores . . . stores are in the public space, and every day they show new people what our hobby is all about.

Pyramid: **How will Goodman Games measure the success of this promotion?**

Joseph: By more people gaming with our products. The retail-level promotions I've done in the past have always resulted in significant, retail-level sales increases. The first $2 module I released resulted in a huge spike in backstock sales, and the first 20% off sale I sponsored more than tripled my usual sales. Every sale means another fan playing one of my games. If Free RPG Day works as well as previous promotions, I expect to have several thousand new fans after June 23.

Pyramid: **Goodman Games obviously has a lot of fans who would no doubt clamor for new adventures (especially free ones!), but Free RPG Day seems to be targeting folks who aren't already fans of the various promoted lines. Are you afraid that the die-hard fans will scoop up the goodies . . . or is it okay so long as they find a good home?**

Joseph: I'll share a funny anecdote. On one of the RPG collecting web sites, a fan lamented that he couldn't get a copy of my Free RPG Day modules because no local store signed up for Free RPG Day. His response was that he would stop collecting my products because I was making them too hard to acquire. I laughed at that. I'm literally spending thousands of dollars to give away thousands upon thousands of free adventure modules on June 23. These aren't cheap-o products; they have the same production values as the modules I normally charge $8 to $10 for. Some of the die-hard existing fans will definitely see this as an opportunity to scoop up a rare collectible, and I do expect to see some folks standing in line at 6:00 a.m. to make sure they get a copy. That will only add interest to the casual fans, who will wonder what all the excitement is about. One guy on a forum complaining that he can't get something only makes the rest of the fans want it more!

Pyramid: **Did the minds behind the giveaways approach these items any differently than your regular adventures (in terms of ideas, execution, philosophy, etc.)?**

Joseph: Goodman Games has been doing promotional modules like this for years. *Dungeon Crawl Classics #11* and *#31* are both priced at $2. *Etherscope: Just a Delivery* is $3. *Xcrawl: Dungeonbattle Brooklyn* was already in production as a $2 module before I designated it for Free RPG Day. So we've got a lot of familiarity with the concept. Promotional modules are designed to introduce fans to a larger concept, so they have to be archetypal and good examples of the larger brand. Aside from that, they're just like the rest of the product line.

Pyramid: **For fans who can't make it out to the event (especially those outside the United States), are there any plans for to make Goodman Games' Free RPG Day offerings available after June 23?**

Joseph: The basic concept behind Free RPG Day is to get fans into game stores. I am not entirely altruistic in this endeavor. I believe that game stores are the future of this industry. If a fan wants a free RPG product, I'm willing to give it to them, but the fan's part of the deal is they have to patronize their local store. I've already had a number of stories from fans who used www.freeRPGday.com to find a store nearby that they hadn't patronized before. That's great!

Overseas stores will be eligible to participate next year, and were only excluded this year because Aldo and I had to work out the logistics entirely on our own without support from the every tier of the industry. At this point it's obvious that the June 23 proof-of-concept should warrant support from all tiers.

* * *

Will there be riots outside game shops in two weeks? Will thousands of gamers find a new game line or publisher they didn't know they loved? Only time will tell.

Until then, however, we noted that information on the official sponsors' page about the actual products being offered was a little scanty (consisting of nothing more than a title or cover image). Seeking to fill this void, our agents tracked down a few more details about some of the products being offered.

The Temple On Terilek Prime (*Amarillo Design Bureau, Inc.*): Written for both **d20 System** and **GURPS** *Fourth Edition,* this 16-page booklet includes a follow-the-numbers adventure exploring an ancient temple on a distant planet. It includes sample characters with full data for both systems, along with rules for phasers, tricorders, and communicators. Players take the role of a small Star Fleet team that has been left to explore the temple while their starship goes to solve some crisis. They quickly discover that a Klingon military intelligence officer and a swashbuckling gang of Orion Pirates are already inside the temple, copying its ancient weapons technology. This adventure is designed to showcase the **Prime Directive RPG Universe.**

Imperial Town Of Tell Qa: Northern Bastion Of The Falling Empire (*Adventure Games Publishing*): This 16-page campaign setting sourcebook for **Castles & Crusades** includes an entire town set in the Empire of Viridistan in the **Wilderlands of High Adventure.** Tell Qa is a town on the border between civilization and savagery, on the frontier of a crumbling, decadent empire with monsters and barbarians peeking over the walls. A bastion of law and order amidst howling chaos, Tell Qa provides countless opportunities for urban, wilderness, and dungeon adventures, as well as a complete home base for an adventuring party. (Preview available online at http://jamesmishler.blogspot.com.)

Check It Out If You Like: Obviously, the **Wilderlands of High Fantasy** campaign setting, home of the classic **City State of the Invincible Overlord;** the classic **The Village of Hommlet** adventure; and other classic urban "swords & sorcery" and fantasy settings.

Dungeon Crawl Classics #51.5: The Sinister Secret Of Whiterock (*Goodman Games*): A 16-page 1st-level adventure for the **d20 System** that can be run on its own or as preparation for the blockbuster 500-page **Castle Whiterock** dungeon crawl coming out later this year. This adventure is a great introduction to the **Dungeon Crawl Classics** line, which has more than 50 adventures available to support campaigns from 1st to 20th level.

Check It Out If You Like: Old-school classic dungeon crawling, epic campaign adventures.

Wicked Fantasy Factory #0: The Temple Of Blood (*Goodman Games*): This 16-page 1st-level adventure for the **d20 System** is a great introduction to the Wicked Fantasy Factory and its high-energy approach to gaming.

Check It Out If You Like: Hack-and-slash dungeon crawling, the **God of War** video games.

Xcrawl: Dungeonbattle Brooklyn (*Goodman Games*): If you love dungeon crawls, you'll love **Xcrawl.** This special alternate-cover edition of the introductory 24-page 1st-level adventure sends the heroes into their first professional crawl! **Xcrawl** is like **Dungeons & Dragons** meets the WWE meets a modern game show: The players are superstar athletes taking their chances in a live-on-pay-per-view dungeon death sport. It's a modern-day world with a fantasy twist. Citizens of the North American Empire tune in every week to watch their favorite celebrities get eaten, paralyzed, turned to stone, and ripped apart. The nations hunger for blood and mayhem grows with every contest. How will you fare?

Zombies!!! 6: Six Feet Under

Published by [Twilight Creations, Inc.](#)

Written by Kerry Breitenstein and Todd A. Breitenstein

Illustrated by Dave Aikins and Kurt Miller

16 map tiles, 32 event cards, 10 sewer tokens, one-page rules sheet; $14.99

Zombies!!! 6: Six Feet Under is another expansion set for *[Zombies!!!](#),* the board game of tile-laying, shotgun-shucking, dead-body-blasting mayhem in which the players must escape "Anytown America" by using its resources and coping with the endless hordes of the corpse cortege between them and the Helipad. Of course, the players have an advantage in the benefits that the game's Event Cards grant, all superbly illustrated to ghoulish effect by Dave Aikins. And while the players might end up in the grave if a game goes badly, that is not what *Zombies!!! 6: Six Feet Under* is about. No, this expansion focuses on going below ground to get around, specifically via the sewers and the underground.

Since its publication in 2001, *Zombies!!!* has received four expansions and one complete add-on game. Not all have been that successful, too often just increasing the game's sprawling nature or providing a fiddly new mechanic. Fortunately, *Zombies!!! 6: Six Feet Under* is a whole lot better than that in three simple ways. First, it does not add another area to explore -- and find space on your table for. Second, it is designed to be mixed in with the basic *Zombies!!!* game, rather than being played from a separate pile. Third, its new Event Cards and mechanics are a better fit for its "get around underground" theme.

Of course, *Zombies!!! 6: Six Feet Under* does come with several new standard tiles, mostly road sections, but also some new buildings, including the Bank, the Record Store, and the Liquor Store. The latter has one card associated with it: "Inflated Self Esteem!" This depicts a drunken man gesticulating rudely at zombies looking on through the windows, and when played in the Liquor Store, allows a player to raise his health to a maximum of 5 by missing a turn. It is a great card and also my favorite card in this expansion, but it highlights the lack of associated Event Cards for the other two buildings. As but one example, the Record Store card could have provided an opportunity for some disc-throwing mayhem as in *Shaun of the Dead.* Its associated card could have enabled a player to take out any three zombies in the building or outside it, and be called (say) "Spin This!!!," "My Favorite 45s," or "These Are from My Record Collection!!!"

The other new building tile is the Subway Station. A player can enter this just like any other building, but by missing a turn, he can travel to any other Subway Station currently in play. This means that he cannot remain aboard a train and shuttle between Stations, and of course, there has to be more than one Subway Station in play and he must still deal with any zombies immediately threatening him in the Station before he boards the train.

The new rules for sewer movement require the use of the Sewer Tokens. Every player begins the game with two. To enter a sewer, a token is played on a street space and a player lays his pawn on its back to indicate his current subterranean status. For each turn spent moving in the sewer, a player loses one Health token (or Guts token if playing with *Zombies!!! 5*). A player staying underground too long will run out of Health and die. Entering the sewers, though, allows him to move unhindered by the cadaver cavalcade, which dislike the sewers. To exit, the second sewer token is placed down and the player's pawn is stood up to indicate he has returned above ground.

Many of this expansion's Event Cards are tied into this new form of movement. For example, "Flood" forces a player

to leave the sewers, while "Oh . . . That's New" blocks a sewer exit or entrance, by (as the card shows) making the road closed for sewer construction for a turn. The underground-specific card is "Missed Stop," which forces a player to exit by a Subway Station other than the intended one.

Some of the new less-conditional or location-specific event cards are really vicious. For example, "Are You Scared Yet?" cancels out the effect of all weapon or item cards in play for a turn, while "Zombies!!! Come Out and Play" adds a zombie to every possible space adjacent to every player. Then there is "It WAS Here!?!" This is a game-busting card because it moves the Helipad tile, the destination and escape route for the game, to any legal spot on the board. Used at the right time, this can deny a rival player the game or bring it a lot closer to someone. Either way, it is one way to lose friends.

This is one of the best expansions for *Zombies!!!* to date, primarily because it alters how the game is played. Normally, movement is sedate, a few squares at a time, hampered of course by whatever zombies are in front of the players. Now a player has additional movement options (other than those already provided by Event Cards), both of which let him avoid the walking dead. Sewer movement is best used to avoid pockets of zombies because a player has more control over it, while Subway movement is dependent upon the placement of stations but enables a player to travel a far greater distance. The danger, of course, is that Subway Stations become focal points for the game, a player battling to enter and leave them to gain the movement bonus as his rivals seed the streets around the Station with zombies. This is part of the game anyway, and the new rules just give the setting of zombies on the other players a potential geographical foci.

The *Zombies!!!* game line gives you plenty of choice in terms of expansions and options, but for whatever reason, it is rare that all of the expansions are played at once. Certainly this is so for my regular gaming group, so we pick and choose the expansions we want to include in our game. Indeed, we even pick the bits out of the expansions that we like and ignore the rest. *Zombies!!! 6: Six Feet Under* is not like that, for despite a missed opportunity or two, we liked this expansion as a whole, and it is one that we have happily mixed into our game. *Zombies!!! 6: Six Feet Under* feels the most tightly focused expansion in some time and benefits by doing its theme fair justice.

Big Mouths and the Monsters that Have Them

by Nick Grant

We have too many monsters today. We all know what monsters are: Those distorted, horrific things that hang out with villains. Usually not masterminds in and of themselves, they still present some threat and need to be overcome. Between the fourth installation of the *Monster Manual* series, the *Encyclopedia Cthulhiana* and the who-knows-how-many **GURPS** supplements with extensive bestiaries -- not to mention the mythological literature which inspired all that content -- we have hundreds on hundreds of unique, fascinating, and imaginative monsters. But do we really need that many?

There was a time in my childhood when the word "monster" meant something specifically ambiguous. Back when Bill Watterson painted those terrifying red eyes hovering over teeth that somehow caught the only light in the room and Berkeley Breathed drew a carrot-topped kid in pink pajamas screaming at a horned horror from his closet, I didn't care if the creature had 10D8 or 10D4 hit points. They were there, they were hungry, and they could gobble up a tiny little kid like me with two bites . . . maybe three. This was back before fear was quantifiable.

Now, of course, inundated as we are with yugoloths and yuan-ti it's hard to differentiate between monsters without numbers. Mountain Giants have STR 20, scary. Hill Giants have STR 8, not scary. Somehow, now that we know the difference between a ghoul and a ghast, neither are frightening. They've lost that fundamental mystery that the slobbering beasties under the bed had, and that Sunday morning comic strip writers seemed uncannily able to evoke. What was it that their monsters had that our crypt-haunting dungeon-stalking bundles of walking XP lack?

I came up with a few keys that I think can be used to generate solid, scary monsters. I can't promise that your player's 20th-level fighter will be quaking in his stylish-yet-not-so-affordable boots, but using these guidelines to make, modify, or present the monsters in your campaign will keep them fresh and interesting. And who knows . . . maybe they'll stop tallying how many hit points they've knocked off the thing and start treating it like the big broiling obstacle it ought to be.

Monsters are Grotesque

The word "grotesque" gets thrown around a lot these days, especially in gaming circles. In my group, it's usually used to mean something along the lines of "super-gross" (i.e. "wasn't it grotesque, what we did to that village?" or "I can't believe you're wearing his stomach as a hat; that's just grotesque.") The facts that the word sounds so silly and that it's meaning is so dark makes it popular. Regardless of its common use though, it has a more specific meaning which I'm using here today: something is grotesque if some aspect of it is changed beyond acceptable limits. Let me explain.

There are basically two kinds of grotesquery, both rooted in the forced identification with something horrible. Physical grotesquery has to do with weird manipulations of human body, and social grotesquery with perversions of human (you guessed it!) social interactions and drives. One of these is bound to pop up in any monster you employ: monsters completely tangential to human experience generally have little effect on us. The Color Out of Space wasn't scary until it drove humans insane, and ghouls weren't chilling until we saw their distorted, exploded hunger.

Physical grotesquery doesn't get as much pure play in the West as it does in the East. Here, the physical break from human form tends to be absolutely minimal or totally complete: there are fewer of those disturbing grays which pervade Eastern (and particularly Japanese) mythology. Take White Wolf, for example, who are arguably the industry leaders on deep, complex looks at monsters. Of their current *World of Darkness* games, only one -- *Promethean* -- explores physical grotesquery extensively, while three *(Vampire, Mage, Werewolf)* are overwhelmingly social. Though both *Vampire* and *Werewolf* do dabble in the physical side of things (in the Nosferatu and Gauru, respectively), both games achieve that unity of empathy and repulsion because of social deviations. Also, although *Promethean's* horror depends on physical grotesquery, it does so in service of a more nuanced social aspect: the line between automation and sentience.

By contrast, Asian mythologies have a glut of weird physical deformities. Such bizarre creatures as *huta kuchi onna* (the two-mouthed woman), *rukuro kubi* (long-necked woman) or the *noppera bou* (faceless man) are iconic Japanese monsters. The West has a few of these -- Medusa comes to mind, as do giants and the ambiguous horned, tailed, pitchfork-wielding demon -- but they aren't nearly as prominent or frequent.

The key to powerful physical deformity is the human body. From this base (a commonality for all players) you can multiply, divide, increase, transpose, invert, and redefine any of the constituent parts. The most effective monsters push the bounds of this body a little too far. A beautiful woman may have long, flowing hair . . . animate it and you have Medusa.

Some parts of the body are iconic because of how they are used, and magnifying that property makes them scary. Hands are a good example, because they are so versatile. Harden them, add some rending claws and you have Grendel: horrific partially because he can only use his hands for destruction. Lengthen the fingers to super-dexterous lengths and you have ***Buffy the Vampire Slayer's*** The Gentlemen: frightening projections of upper-class elites who manipulate and master manual minutia with their extended digits. Psychic monsters might have huge heads that their necks have trouble supporting, while under-the-bed monsters might have uncomfortably big teeth. The important part of physical grotesquery is that the body is being manipulated in unnatural ways, so push the deformities to awkward extremes for the most effective results.

Social grotesquery is subtler, and more difficult to convey in a dungeon setting. It comes in a few different brands. The distortion of drives is the easiest to show, because it can be done with solitary monsters. This is what drives Vampire and Satyr mythology. White Wolf crystallizes the vampire situation well: they are in a constant struggle between their humanity and a perverse desire for human blood. You could hardly ask for a more clear-cut example of social grotesquery. Satyrs, while not necessarily horrific figures, are known for their grotesque sexual appetites. This magnification makes them compelling nemeses in certain settings (Paul Czege's ***Bacchanal*** comes to mind), and makes them interesting monsters regardless. There are any number of different drives to riff on for new monsters: hunger, thirst, friendship, dogma, sex, self-destruction, and novelty are all fine choices.

Permutations of social conventions are rarer and harder to model, but can be rewarding if you work them in right. The unholy feasts of Lovecraftian ghouls, the brutal hierarchy of Burning Wheel orcs, and the terrifying normalcy of the pod people all exemplify conventional grotesquery. These all take some pattern of social behavior and modify some part of it. The ghoul's feast takes an iconic human celebration -- the feast -- and makes two minor changes: the greediness of the participants is magnified and the normal food is replaced with corpses. By changing these elements, a normal celebration becomes a repulsive sacrilege, and the participants become monsters. The power here comes from the familiarity and the disgust. Players identify with the feast, but despise the cannibalism. That dissonance is the stuff that fleshes out a monster in the imagination.

Monsters are Dangerous

There's a paradox in gaming. We want danger, but we don't want to risk anything. We want excitement, but we dislike jeopardy. We spend hours looking up rules, auxiliary rules, and counter-rules to minimize the threat to our characters, and then complain that the adventure was boring. In order to make adventures fun, there has to be a real danger, but we also (theoretically) want to avoid character-death as much as possible. This puzzle of how to make monsters dangerous-but-not-too-dangerous has yielded some interesting answers, some angry answers, and some downright dumb answers.

The worst answer, to me, is that players should be able to kill everything they run across. The overwhelming fear at seeing a dead skeleton spontaneously animate and advance with menace in its burning eye sockets is lacking after having already bashed 30 of them to death with the good old club of clobbering. These fights are the useless, unstimulating tripe that should be reserved for video game systems. They belong nowhere near the vibrant, creative world that pen-and-paper RPGs have the potential to create. Ingenuity and a grasp of human emotion and drama is one of the things that humans still have machines unconditionally beaten on, and should be employed mercilessly in whatever game you're running.

Dangerous monsters are fun. The resolution to the paradox lies in distinguishing between dangerous and deadly. There are threats that have nothing to do with a character's vitality, but which are nevertheless undesirable. This is easy in games with complex goals and thoroughly developed characters: the antagonist presents a threat to the PC's family or friends, or starts a political revolution in his lands, or destroys his great cathedral. It is a little more difficult in games with one-dimensional characters, but is still possible: think along the lines of curses (gold becomes tin at the touch, anti-magic fields, conditional damage) and complications (if this little dinosaur gets away, he might be able to find a big dinosaur mother). Vary how the monsters imperil your adventurers, but make sure the threat is always palpable and serious.

Another bad answer to the paradox stems from absolute literalism. My first GM employed this philosophy: the world is a tough place. If your character dies, you were dabbling in the wrong places. He designed a massive world. There were cultures, histories, laws, maps, and charts. There was so much world in that game that there was hardly any room for our characters. We nevertheless pushed heroically forward, throwing caution to the wind with a pioneering spirit. As one might expect, it wasn't long before we died, made new characters, died again, and elected a new GM. The problem with this approach isn't that it is too dangerous (although it is), nor that this particular setting was un-fun (although it was), but rather that there is no sense of dramatic danger. The world wasn't against us; it was indifferent.

Monsters, to be effective, not only have to be dangerous, but have to be personally threatening in some way. A cliff may be dangerous, but is so impersonal that it's completely lame as a monster. The best monsters always apply to the characters' stories somehow. Sometimes the application is abstract and symbolic, sometimes it's direct and obvious, but it needs to be there for the characters to actually be engaged with the monster as a villain. The Boogey Man is a shadowy, shifty specter because he manifests children's fear of the dark. The brute power and grotesque size of the giant of the beanstalk is exciting because Jack is a young boy -- weak and small in a land of normally giant adults. By being significant in their daily lives, these monsters bring with them an emotional weight which will cause your players to invest more in the adventure.

Monsters are Alien

At home, whether it be a castle, an apartment, or a spaceship, the characters are comfortable. If it weren't for that dastardly prince who defamed their families, those ugly Reavers who cannibalized their ships, or that pernicious singing landlord who must have the rent, the characters could all stay at home and watch VH1 until their brains drizzled out their noses. But that's not the case, and now they are on an adventure. Monsters are there to add a touch of excitement and exoticism to the new world the characters venture into. They are manifestations of precisely what is dangerous and scary about their new setting. In some situations this is really easy to take advantage of, while in others it's a bit trickier. In either case, dealing with the alien nature of your monsters will contextualize them and make them more interesting to your players.

The simplest cases involve actual new worlds that characters venture into. In *The Wizard of Oz,* the fascistic flying monkeys reflect the dangerous aspect of Oz's randomness. The new world for Dorothy is typified by creative chaos, but that very creativity is dangerous in so far as it can be controlled by evil witches. So, by highlighting the difference between Dorothy's everyday world (sepia, anti-epic, logical) and the Wonderful Land of Oz (bright, mythological, creative), the monkeys do more than raise the stakes: they show just how different this world is from the old one. The monkeys are monsters because they represent an alien threat, rather than a normal one. Miss Gulch may be dangerous (and her nose bordering on grotesque), but she's not quite a monster. The same logic that created the monkeys can be applied to any game where the players venture to a fundamentally different dimension, planet, or even country.

The more complicated cases involve local problems. Whenever you don't technically have a new location to contrast with your adventurers, it's harder to forge monstrous creatures. The known isn't scary. However, the archetypical monster under the bed has continued to inspire fear in generations of children who have performed exhaustive searches of the crannies beneath their mattresses in daylight hours, so there must be something to the familiar.

In adventures that take place on the characters' turf, there is inevitably some upset to the normal balance. A new company came into town, the stars aligned in new ways, or the room suddenly became dark. By upsetting the status

quo, the home territory becomes the foreign territory. The idea of "home turf" no longer means the two acres in Kansas where the Dorothy grew up, but rather the social order of those acres, with Auntie Em making lemonade, Toto running around the yard and Ms. Gulch antagonizing -- but not actually changing -- the lot of them.

So how can monsters be made out of this unheimlich feeling? The movie *The Descent* comes to mind. In it, a spelunker suffers an accident after exploring a cave. Her daughter dies and she's hospitalized. After she has recovered, she and her friends go spelunking again, in a supposedly small cave. She soon discovers though, that the cave is actually a massive system, akin to what she and her friends would explore before the accident. At this point the impact of the upset status quo -- caves are now a source of fear, rather than adventure -- sets in and the movie becomes horrific. Blind, cannibalistic humanoids appear and start to terrorize the women. The reason we accept these weird monsters is because they are directly applicable to what psychologically distinguishes the caves now from the caves then. They are dangerous, random, and hateful, rather than being adventurous and fun. In the same way, whatever makes the world different now from how it was in more idyllic times in your campaign should be the motivation for the monsters you make, and should underpin your descriptions of the monsters you borrow.

Monsters have lost a lot of their impact over the years, but there's no reason they can't make a bloody resurgence. They don't have to be rarefied, they just need to become significant again. My hope is that like the misshapen, hungry creature-of-the-dark under Calvin's bed, the monsters of modern gaming can snap their teeth and hear a response other than "can we move into flanking position?"

Murphy's Rules

Disguised and Endangered

A few days ago we returned to the [Children's Museum](#) in Indianapolis, this time for a proper visit (instead of the new-parents open house we attended the first time). Although we had planned to make a full day of the event, in order to fully see everything, we need not have worried; there was more than enough to do that we almost certainly didn't see half of what the museum offered. We're already making plans to go back in a week or two, to upgrade to an annual membership; really, this column is on the cusp of becoming the gaming essay equivalent of *Waiting for Godot,* with the audience as Vladimir and Estragon, and columns not about the Children's Museum filling the role of Godot.

Anyway, one of the exhibits I found most interesting was called "Spymaker," a temporary exhibit on loan from the [London Science Museum](#). In this exhibit -- one that's about 90% of the way to a full-blown roleplaying session -- participants take the role of new spies, going through training and engaging in activities that reveal clues and information about OSTECK, an evil corporation engaged in a typical nonsensical Bondian plot involving global domination via cell-phone-transmitted viruses. I'm more fully realizing that "activities targeted at kids" is also a reasonable subset of "activities that gamers would find interesting." For example, one of the spy games was attempting to discern a secret message in a seemingly mundane communication by taking a board with holes and putting it atop the message, revealing certain letters or words that form a sentence. (Of course, this breaks down if any modicum of thought is applied to the process; why *would* a high-tech company use a simple letter-shift cypher to encode their tippy-top-secret messages?)

One of the most interesting aspects of the entire exhibit for me, however, was the part when your "training" ends and you're expected to infiltrate OSTECK by pretending to be an OSTECK employee. Stepping through the vinyl flaps, one enters a separate display area (accessible only after passing through a "body scan"). This part of the exhibit is designed to look just like an evil office/research facility (in smaller scale); there are signs warning about spies (i.e. "you"), call buttons to alert security if one *does* see a spy, information to uncover in research stations, security cameras (including amusing signs such as "This camera is to make sure you work harder"), and so on. It's amazing how on edge I felt at this part of the exhibit, even though I was in no danger and -- in fact -- there wasn't anyone who would stop me . . . everyone present was a fellow museum attendee.

In a gaming world with sufficiently interesting adversaries (which is to say, "hopefully almost any game world"), there's something thrilling about infiltrating the Other Side: trying to get behind enemy lines, maintain a cover, and achieve some goal. This adventure type also turns standard tropes on their ears. In many adventures (such as the typical dungeon crawl), the heroes push their way further into bad situations. In this structure, there's often an implicit understanding that the heroes are controlling the pace of the proceedings; if things get bad, there's a good chance that they can retreat to safer havens to recoup and recover. But if they're deep in enemy territory, that option is greatly lessened. And if they're clandestinely in enemy territory (especially in disguise as the enemy), their options are even more reduced.

In addition, this style of adventure gives some character concepts and skill sets a chance to shine. For example, most out-and-out warrior-types are not as useful in these type of adventures; when you're surrounded by bad guys, going berserk isn't usually the way to survive (especially if the bad guys' base of operations is a long way from home).

Finally, these types of adventures are a good way to bring out interesting background information on characters the heroes might not otherwise be privy to, as well as forcing them to consider the opposing point of view. For example, an adventure in the classic *Star Trek* universe which had Federation spies donning prosthetic ears and goatees and going behind enemy lines into Klingon territory would make them try to understand a philosophy that combines honor and pugilism in equal parts. (It's also a good way to justify those "enemy culture" sourcebooks that never seem to get as much play as the "gadgets and powers" books.)

Even more interestingly, the heroes might be forced to come to grips with information that the enemy has that the good guys don't. This can be made even more problematic if that information is difficult to act upon. For example, consider an Empire-era *Star Wars* campaign. What if the Rebel heroes have managed to worm their way deep into Empire territory through forged credentials, only to discover some dire threat that could endanger both Empire and rebels alike

(say, an alien invasion that has its sensory organs fixated on targeting Yavin and Coruscant)? The Empire is keeping this information private (no doubt in an effort to turn the situation to their advantage), but the investigating Rebels discover internal communiques that admit the Empire doesn't know if it can handle the threat itself. Do the Rebels risk their spies' identities to broach the subject with the Empire? Or did the Empire plant this evidence in an effort to suss out suspected spies?

Or what if the heroes encounter some piece of information that forces them to concede that the bad guys may not be monsters, and/or that they know more about the heroes' situation than the heroes do? Going back to our *Star Wars* example, what if the spies learn that Admiral Ackbar is dying . . . a fact that the Admiral hasn't revealed to anyone in the Rebellion? Or what if the rebels uncover a file of war crimes the Rebellion has supposedly committed on remote worlds . . . crimes which sound pretty serious? (And, again, the same caveats involving misinformation apply.)

Sneaking behind enemy lines is a great hook for all sorts of adventures. Whether it's to gather information, strike the baddies in their heart of darkness, or acquire some item or person of interest, leaving the comfortable world behind to become surrounded by threats is a true mark of a hero. Unless they discover your identity . . . then it's probably the true mark of a corpse.

Schermo Argento

by Paul Drye

Resources and scientific knowledge are not the only important crosstime imports. For example, culture and history have benefited from parachronics now that lost or alternative works by Aristotle, Rembrandt, and others are available to Homeline. Even so, this isn't where the man in the street puts his heart. If you want to make money out of art, the movies are the place to be.

There are now so many options for viewing, it being so easy to pirate out-time films, that the days of the blockbuster are done. Audiences are fractured into dozens of interests, and there's not enough money concentrated in one place to produce big films on Homeline anymore. Big commercial properties like Homeline superheroes and fantasy icons remain tied up by expensive copyrights, so "studios" tend to be small, nimble operations that either snap up franchises that don't exist at home, or else focus tightly on a particular genre.

There are dozens of small operations devoted to importing movies, spread across every timeline where "talkies" have been invented, especially color films (though old black-and-white and even silent films have their constituencies back home).

Cinecittà

One typical example of out-time movie entrepreneurship is *il Palazzo,* a theater-house in Palermo, Italy on Bonaparte-6 (see page 114 of *Infinite Worlds* for an overview of the timeline). The year there is 1971, and entertainment technology is quite similar to Homeline in the same year; films there have been big business since the teens.

Palermo is the preeminent city for movie-making on this timeline, as the Roman Republic is a leading country in the world; the industry moved to Sicily en masse in the 1920s after Turin and Milan priced themselves out of the rapidly growing business.

When Homeline first made contact with Bonaparte-6 in the early 2000s, its movie industry had sprung from that move into a golden age of historical romances. This was fortunate, as the 1950s on that timeline were like the 1970s back home: a world of hideous fashions. This is a common problem for people looking to pirate modern culture from other worlds, as actors can look distractingly odd to Homeline audiences. Languages can be dubbed, soundtracks replaced, and even plot points driven by unusual mores can be accepted, but if the leading man has a foot-wide afro or purple pants the movie becomes an inadvertent comedy. If a movie has a historical setting no more than a few decades after the divergence point (less, if the branch is in the 20th century), the issue fades away.

With a promising timeline at hand, a group of producers and actors -- still rich from pre-parachronics movies, but hurting as their industry imploded in the face of nearly cost-free competition -- set up *il Palazzo.* The front was a

major, but otherwise unremarkable, theater in Palermo which had access to prints of all Bonaparte-6's new releases. Behind a secret door in a maintenance corridor, though, a set of stairs led down to a photography lab with all the necessary technology for working with film and transferring a copy to Homeline.

Fontana della Vergogna

The theater that houses *il Palazzo's* Bonaparte-6 operations has supplied its name to the whole corporation -- they also own a small office building in Los Angeles on Homeline. It's near the center of Palermo, right next to the small Quatro Canti crossroads defined by the city's two main streets. In most cities such a prestigious location would be expensive and a little too noteworthy for Infinity to approve a corporate partner's headquarters, but *il Palazzo* depends on two coincidences. First, the Piazza Pretoria dominates the street in front of the theater, and that includes the Pretoria Fountain; Homeline art aficionados will recognize the enormous fountain as a masterwork, but Bonaparte-6's citizens consider it an eyesore. It drags down the property values of everything in its line of sight.

Second, one of the buildings directly facing the piazza on Homeline is Palermo's city hall, a refurbished old palazzo. The same building exists on Bonaparte-6, and so negotiations to set up parachronic equipment in the basement of the municipal hall on Homeline were relatively easy. The out-time version of the palazzo was bought, gutted, and turned into a theater.

At the time it was quite an opulent establishment, but its Homeline owners have subjected it to benign neglect in the two decades since then and *il Palazzo* is starting to go to seed.

Visitors pull up to near the theater in cabs (visitors might walk from nearby hotels) on the via Maqueda, one of the two main streets mentioned earlier, and stroll through the piazza to reach the entrance. The building itself is made of pinkish-orange stone, faced with false pillars in yellow. There are three floors at the front, subdivided into offices and storage space, but the entire back part of the building is opened up to form a lobby and the movie hall itself. The dome on top of the building has been given a floor, and is used as an attic.

Movie-going is still a relatively formal event in the Roman Republic, though with allowances made for the largely middle-class audience that takes them in. Men dress in their best plus-fours and tailed coats, while women wear voluminous dresses and paint their faces white overlaid with a colorful pattern (a butterfly, perhaps, or a coiling vine). The timeline's movies are considerably longer on average as well, so there is invariably an intermission at the one-hour mark for the audience to retire to the foyer for a drink, smoke, and discussion. If the show is more than two hours long (as is often the case), there is usually another anywhere from 45 to 60 minutes after the film begins again.

Whenever a new film is being shown, the print will be run once more during the day not long after it's acquired. This time it's through a cantankerous, 50-year-old Fernseh telecine machine, which copies the movie to video for shipping back to Homeline. Use of the aged device (which looks for all the world like the 1960s-era conception of a computer, down to the cabinets and the spinning reels on front) is dictated by Infinity, which wants *il Palazzo* to have equipment that would pass cursory inspection in lower-tech Bonaparte-6. Advanced digital equipment is strictly forbidden to civilians.

Botteghino Grosso

The movies parasitized from Bonaparte-6 have had better days. When the timeline was discovered (the last of a slew of Napoleon-centered worlds discovered in the early days of parachronics), it was one of the first that was advanced enough to have movies to import. *Il Palazzo* made over $100 million dollars on several movies into the 2010s, but their offerings needed to be dubbed into English and came from a relatively alien culture. By the second decade of the 21st century, much of their business had been taken away by movies stolen from timelines that diverged post-WWII.

Il Palazzo's most profitable current venture is the Castelli series. In these. Antonio Castelli -- a young officer in Napoleon's intelligence service during the wars of unification -- battles mystical foes determined to thwart the Enlightenment republic he serves. While a middling success on Bonaparte-6, the movies have caught the attention of

Homeline's public. The second movie was one of the few to clear $50 million in box office in 2022, good enough to crack the Top 20 that year, and is making money in the home entertainment market to boot. Though the third and fourth movies started the series' decline, *il Palazzo* is still very interested in seeing more in the same vein, and were glad to announce to their backers that filming had begun on a fifth installment earlier in the year.

The latest epic is *Sabbia nera* ("Black Sands"), wherein Napoleon's invasion of Egypt is threatened by the shadowy forces of an undead wizard, and it's up to Castelli to save the Italian army. Unfortunately, the movie itself is what needs to be saved. Shot in Tunis as a cheaper substitute for Egypt (with the Medjerda River impersonating the Nile), the set has fallen afoul of that region's recently resurgent Islam-fuelled unrest. Meanwhile, the Sicilian mafia has reached across the straits to put the squeeze on for protection money. The actors are upset about living in relatively primitive conditions, and even the special effects robot playing Castelli's alchemically driven companion RD-22 is plagued by sand in its gears. In a few weeks the production will be out of money, and will shut down.

Il Palazzo's backers have made the unprecedented decision to put some of their own money into the pot. This poses some problems, not least that the tax authorities are going to be awfully suspicious if a non-descript Palermitani movie house supplies a boatload of cash; Palermo is, after all, a center of Mafia activity in this timeline too. Even if their suspicions of criminal involvement are wrong, Infinity considers any attention too much, and insists on a finance company as a front. Essentially, anyone in this project will be engaged in money laundering.

The second difficulty is liquidity. Homeline takes money out of Bonaparte-6, it doesn't put it in, and it's not like one can convert Homeline dollars into Republican lira. Entrepreneurial spirits are going to be reduced to barter or counterfeiting, as their skills dictate.

There is one other problem the would-be financiers will likely not see at first. The manager of the theater is Lorenzo Basso, and he doesn't want to return to Homeline. He's been in Bonaparte-6 for the last five years avoiding his wife and his relentlessly dull existence back home. He likes this timeline, and in particular he likes his mistress here. He's got his eye on a house in Cyprus where he holidayed last year, and he thinks the sum passing through his theater during this scheme (nearly five million lira, equivalent to about two million Homeline US dollars) is the answer. If possible, he's going to embezzle it, marry his paramour, and then skip the country with her.

Leone Vecchio

Rudolph Petersen is the star of the Castelli series, and is a popular-if-fading actor. Born in Vienna to a German father and an Italian mother, his dark good looks and intense acting made him an idol when he was younger, an out-time counterpart to James Dean. Unfortunately, middle age and a bad car accident have ensued since those days; Scogliera is less marketable now and addicted to pain killers, though he still has enough ability and cachet to help drive the Castelli movies to success.

So far, Petersen has been bringing off some of the best acting of his late career during the filming of this latest installment. He's also miserable, and for the same reason he's been resurgent: in Tunisia, he's somewhat cut off from the compliant doctors who supply his drugs. As time goes by, however, he's getting plugged more and more into the local scene, and is going to need baby-sitting if the production is to continue. Not only does everyone want to keep him clean for performance reasons, getting in touch with Tunisia's underworld is not the safest thing in the world. It's a turbulent region beyond even organized crime.

Tunisia

One of the most politically important parts of the Roman Republic, Tunisia was only annexed in the 1880s after the local government defaulted on loans from several Italian banks. Since then, the Republic has suffered periodic crises over the role of Italian settlers in the region, as Tunisia is the country's last remaining frontier -- Egypt and Greece already being exploited to the hilt. The republican government is considering making it an autonomous region, but have been stymied by frightened Italian colonists who've experienced various local uprisings and want more Roman control, not less.

The latest attempt by native Tunisians to throw off their overlords has been going on since last November. It's quite confused, as the previous set of malcontents was thoroughly crushed back in 1962. New organizations have sprung up but there are serious fractures in their solidarity. Some use a military approach, making the Aurès Mountains of the northwest quite unsafe and the cities are targets of bombings and shootings. Opposing them as well as the Italians is a group devoted to civil disobedience. This has further consequences for the shooting of films in the country, as sometimes local workers don't show up for weeks on end.

Appasionato Numero Uno

The Bonaparte (or rather, in this timeline, Buonaparte) family has been a political dynasty in the Republic since Napoleon reunified Italy and conquered Greece and Egypt. Besides Napoleon himself, his son was commander-in-chief of the Army in the 1840s and 1850s, a nephew was First Consul of the Republic, and in the present day (after the reforms of the 1920s), his great-great-grand-nephew is one of the triumvirate that makes up the executive of the Roman government.

The latter is Carlo Buonaparte, who owes his position to his name more than his natural talents. A dissolute man just 31 years old, he spends most of his time spending the money built up by his ancestors. One of his particular obsessions is cinema, and he's come to the conclusion that he wants a theater in Palermo, the epicenter of the movies in his world. He's set his heart on purchasing the grand old *il Palazzo,* where he saw the premiere of a favorite movie of his as a child. He was enormously surprised, then irritated, when his generous offer was turned down and is now turning to less-aboveboard methods to get what he wants.

It's within Carlo's power to exercise eminent domain in pursuit of various laws passed by the Senate. One morning, the theater's employees arrive to discover that soldiers (the army being under triumvir control) have been posted around the building. A decree from Bonaparte will be handed to the manager, indicating that the building is to be demolished in order to widen the via Maqueda.

The triumvir doesn't intend to tear the theater down, of course, but is going to keep the shows closed to pressure for the sale he wants. On the other hand, out-timers know that just because he's blocked all the doors and windows, it doesn't mean he's cut off every means of access. There's another Infinity station in Rome, and they just have to get to it while giving the slip to the private detectives Bonaparte has hired to keep an eye on them.

Other Adventures in Bonaparte-6

I soliti sospetti: A series of spectacular murders has been taking place of Spanish citizens living in Palermo. Each has been killed, decapitated, and their heads thrown into the Pretoria Fountain in front of the theater. Fortunately, *il Palazzo's* employees have been cleared by means of iron-clad alibis and the police are not examining their facilities too closely. The upset to business is annoying however, and Infinity can't yet rule out that the Centrum isn't behind it for obscure reasons. Certainly the police are baffled. Their main theory is that it has something to do with the fountain itself, which was built during the years the Spanish ruled Sicily and was considered a shameful reminder of that time. The Spanish origin of all the victims dovetails with this nicely, but doesn't really explain why they murders are occurring at all; being upset by the former Spanish control of Sicily is a bit like being angry about the Battle of Hastings -- it was all a very long time ago.

Vero christiano: The building next to the theater is an old church, the Chiesa di San Giuseppe dei Teatini. It's not a site of any great note, but it's got a new priest and he's looking to make a name for himself. Palermo itself is quite deeply sunk in moral relativism, rather like Hollywood on Homeline. Also like its Homeline counterpart, it's often viewed as a symbol of anti-Christianity. This problem is exacerbated by the rural parts of Sicily still being quite conservative. The town picks up many immigrants from the countryside each year, and these people are often shocked by the things that are accepted in Palermo. They're correspondingly willing to listen to a person who wants to work against "immorality."

The priest is a relatively enlightened person, and won't condone violence or illegality, but on the other hand there's a very good example of civil disobedience going on across the water in Tunisia. If he's allowed a free hand, the theater is going to have to suffer sit-ins, shunning, and picketing until it starts showing more wholesome fare. Unfortunately, these movies are absolute dogs on Homeline; to make their real profit, *il Palazzo* needs more nuanced shows to copy.

Innocente: The island of Pantelleria, just to the south of Sicily, is the isolated, expensive resort to which movie types retreat whenever public scrutiny gets to be too much. A cloud of lower-level figures covets the occasional invitation to hold court with stars and moguls, and negotiate secret deals with the latter while indulging in a 24/7 party.

The hapless Lorenzo Basso has traveled there for the first time, and his typical cloud of bad luck has followed him. Actress Marietta Appennini has fallen from a high balcony in suspicious circumstances, and is in a coma. She may have fallen while stupefied on alcohol, or it might have been a murder attempt. Not only is she a huge star, rumor has it that she is involved with Carlo Buonaparte (a married man) and that he was on Pantelleria to visit her when she fell. A blast of publicity and pressure to solve the case is about to ensue, and needless to say, *il Palazzo's* boss was in the same small hotel as Marietta was when she had her accident.

Using Il Schermo Argento in Other Settings

When *il Palazzo* is used with Infinite Worlds, adventurers have two things to hide: a secret and The Secret. Only the former of these is necessary, that they're engaged in naughty (if not illegal) activity with the movies they legitimately show. This set-up is surprisingly robust, since it relies on only one basic principle: if A wants to prevent B from copying his intellectual property while also giving C access to it, he's in an impossible situation if B and C are the same party. The only question remaining is what motivates B to do what he does.

In modern-day settings, the answer is already known to any person paying attention to tech news. There's money in the piracy of movies, if one has access to markets like East Asia or the former Soviet Union.

Near-future and SF settings likely have the same motivation available, but there might be others. What if someone has access to a newly discovered original copy of, say, *The Magnificent Ambersons* or the oeuvre of Theda Bara? There will be some people who want to open such a cultural treasure to the world, and the law can go hang.

In the past, there's the question of censorship. Under the Hays Code (in the United States, but similar set-ups existed throughout the world) after the 1920s, the morally upright viewed films and cut out sections they considered objectionable no matter how much commercial tastes may have disagreed. Suppose that a cabal in the screening room is working counter to their employer, passing on unedited, racy prints to the Mob in Chicago or Vegas and you have the seeds of an adventure.

Even pre-20th-century settings can work with this idea. Helpful clerks working for the Vatican's *Index Librorum Prohibitorum* can get their hands on unexpurgated works by the likes of Galileo for a rich Italian natural philosopher, or Rabelais for a French libertine with more coin than virtue. Any number of printing houses might want to make copies of books on the sly for sale on the black market. There are immense commercial possibilities throughout the more-strictly Catholic countries in Europe.

This in turn leads to fantasy settings. There are ancient librams and folios, redolent of brimstone and worse, banned throughout the gods-fearing world. Someone with access to them, possibly as adherents of some god of knowledge, might not like his clientele, but their gold is untarnished even if their souls aren't. Just don't mind the chthonic tentacles that start showing up in the basement once you get a little too involved.

The Omniscient Eye

How Heavy Is Dense Reading?

GURPS Technomancer indicates that storing the average spell takes 20,000 words. I heard that the average GURPS Third Edition softcover book is about 100,000 words.

Classically, how big would a book be to hold 20,000 words? Written the other way, what dimensions/mass of encumbrance would the average book be and most importantly, what is its capacity, in snapshots across history? What is the average density for "feature" civilizations such as the Greeks, Egyptians, Norse, Romans, Dark Ages, and Renaissance (and any others the Omniscient Eye would care to mention)?

Does this severely "bust" the archetype of a wizard's spellbook with hundreds of spells?
--Eric Funk

How big is an average book and how much does it hold? Here, as with most things in history, an "average" isn't a particularly useful or meaningful quantity. What we'll be exploring here is information density, how much information various societies can or appear inclined to pack into a given space. Information density depends on several factors: materials, script, style, and purpose of the text. There are some trends across periods and societies, but all of these show a great deal of variability *within* any given period as well, to the point that a value somewhere in the middle of the range of variation doesn't necessarily represent a typical or even particularly common example. Details? That's what the Eye is here for . . .

Book Technology

We'll start with the physical constraints of writing media. The very earliest writing comes to us from Mesopotamia, using a medium the vast alluvial plain had in quantity: mud. Scribes produced smooth-surfaced slabs of wet clay and used triangular sticks to impress characters into them. In hot, dry Iraq, this proved to be a pretty good medium for writing. The stiff mud took impressions well and would soon dry into a fairly durable form. Moreover, if they should happen to be exposed to fire, they would simply bake into an even more durable ceramic.

The drawbacks of cuneiform tablets are that they're extremely heavy and can chip or shatter if mistreated. The density of dried clay isn't actually far off from that of paper or parchment, but a cuneiform tablet is far thicker than a paper or parchment page. Even the smallest tablet is likely to be at least a half-centimeter thick, and larger ones could easily be two or three centimeters, thick enough for a scribe to write on the side as well as on the primary writing surfaces; some tablets have been found with dates or other identifying information on the side, as on the spine of a modern book.

This also made it difficult to create books in any recognizable form. There was no practical way of binding them together, or at least no means practiced by the various Mesopotamian civilizations; linking together more than two or three tablets would make the whole arrangement unwieldy. Someone might have a shelf full of tablets (archaeologists have found any number of "libraries" of tablets) which would constitute something we'd recognize as the contents of a book or other long text, but they were collections of unconnected slabs, not a single physical unit.

The next development in book writing came with the invention of much thinner writing surfaces. The best known in the west is papyrus, made from strips of the pith of a reed growing along the Nile, pressed together and dried. The Chinese, it happens, developed similar pith-based writing materials, generally called rice paper but almost never having anything to do with rice.

A single piece of papyrus was limited to no more than 50 centimeters by 20 to 30 centimeters, with a thickness between a third and a half of a millimeter. For longer texts, papyrus sheets were glued or otherwise fastened together to form scrolls. The end pieces of the scroll were typically made from heavier, stronger bits of papyrus; since one end or the other would be the outside of the scroll, it needed to stand up to a bit more punishment. A scroll might come with one or two spindles to assist rolling and unrolling, but those were far from standard. It might also come with a protective case and a tag displaying the work's name and author, so that the scroll could be identified without having to unroll it. Scrolls could be huge. One monumental scroll which has come down to us is nearly 17 meters long. But practical concerns typically made them much smaller, rarely going over ten meters and often no more than three.

The great advantages of papyrus and similar "papers" over clay tablets are, of course, their extremely light weight and the ability to compose longer works with them. With papyrus, a single scroll could contain a long philosophical treatise, a complete story, or a lengthy legal commentary which could be read without stopping to move to a different text every few minutes; it is at this point that we can start talking meaningfully about "books." Nevertheless, the constant rolling and unrolling put considerable strain on the relatively brittle papyrus, and with a practical maximum size of between one and three square meters, it was still hard to write really long works. Papyrus's durability was particularly problematic in more humid areas than arid Egypt. Papyri could last hundreds of years in the right climate, but crumbled relatively quickly elsewhere.

Europe came up with two reactions to the limitations of papyrus scrolls. The first was the adoption of parchment, animal skins dried and scraped smooth for writing. Parchment could be made from the skin of sheep, goats, calves, and very occasionally other animals, making it far easier to cultivate away from Egypt, and it was more durable in the more humid climate. The size of a piece of parchment obviously can't easily be standardized, since the animals from which it is produced don't come standardized either. A full sheet could easily be anywhere between three quarters and a full square meter. The thickness could vary considerably; anything from .1 mm to .5 mm is entirely reasonable.

Figure 1

The second is a fundamental change in the form of the book. The scroll started to give way around the first century AD, when the Romans started to fold their scrolls accordion-wise, making it easier move through the text and to keep one's place. There was also a quick realization that, unlike scrolls which typically only had writing on one side, the scribe could write on both sides of a leaf without worrying about damage to the back while it was being rolled up, thus effectively doubling the writing surface of a single piece of material. This new form of book was called the codex, and in its broad outlines is essentially the same as many modern hardcover books. The pages of the book, once stacked, are stitched together, possibly with a strip of cloth backing to guide and aid the process. The bound pages are then put between stiff covers connected by a flexible spine. Unlike a modern book, which uses cardboard covers, older book covers were thin wooden boards (typically a bit under a centimeter thick) wrapped in thin leather. A skillful book-maker could produce codices containing over five hundred leaves, providing a writing area that could rise to over 200 square meters. Most books, though, were much shorter. Works which would run over two to three hundred pages were, more often than not, broken up into two or more volumes.

A side-effect of the invention of the codex was the rise of terms to describe, in general terms, about how big a book was. They arose when book-makers realized that they could fold a single piece of parchment or, later, paper multiple times and cut off the edges, producing stacks of pages of sizes convenient to various purposes. Most books are made from a number of these

Other Writing Surfaces

A variety of societies have uses writing materials other than the paper, parchment, and clay discussed here. Cloth was an occasional writing medium, particularly in Asia before paper came into widespread use. However, it's also expensive and usually somewhat thicker and therefore heavier relative to paper and its cousins. Large dried leaves were used as writing material in some areas; leaf pages are likely to have a density similar to paper, but they do tend to be a bit thicker and share papyrus's storage problems. Some early Chinese books were made from thin slats of bamboo. They were, not surprisingly, heavier than paper books, but not so heavy as clay tablets.

One particularly exotic writing surface is shown in Figure 1. This "page," which comes from a Buddhist text from Southeast Asia, has a strip of cloth at its core, stiffened with lacquer, and coated with gold leaf.

stacks, now called signatures, piled up in order and stitched together. These folding schemes, mostly named according to powers of two, would produce more, smaller pages with each fold: the folio (folded once) produced two leaves in the finished book for each original sheet. The quarto (folded twice) produced four leaves, the octavo produced eight, and so on. There are a few "odd men out" which break the power of two rule; the most common is the duodecimo which is essentially a quarto folded into thirds for twelve leaves per sheet. Books smaller than sextodecimos (made from sheets folded four times for 16 leaves; this is the modern standard, which is why most books you buy have a page count divisible by 16, even if some pages are left blank) are rare, but occasionally books made with sheets folded five or even six times were occasionally, if inefficiently, produced.

Stacks of them would be held together with a rope (there's a small hole for it near the center of the right side) to form a book.

Paper-making, introduced into Europe in the 12th century, had less impact than one might expect. It did provide another writing medium, but the process of producing a book was sufficiently difficult and expensive for several centuries that it didn't have a massive impact on writing. Paper was cheaper than parchment, certainly, but not astronomically so. Besides, the more important price factor was the immense amount of labor needed to write the book's text. There was no more standardization in paper sizes than there was in parchment sizes, though most paper sizes remained in the general range of the parchments they supplemented, perhaps because anything larger becomes unwieldy and difficult to produce. Paper is also usually somewhat thinner than parchment (though, certainly, thicknesses vary for paper as much as for parchment) and less dense, so paper books were lighter and slightly thinner than parchment books.

The next major innovations in book-making was the invention of printing. Printing didn't change the size of books at all, and the demand for paper only slowly ramped up as reduced publishing costs pushed the cost of books down. The major effect, so far as information density, was that it made it easier to produce some kinds of content than others. Instead of creating each page from scratch, pages could be more efficiently composed from a set of pre-built elements (which is to say, the letters and punctuation marks of sets of moveable type). What this means is that, instead of it being not much more time-consuming to produce a richly illuminated page than to produce a page of carefully written text, it became relatively inexpensive to concentrate on what could be done with type and dispense with ornamentation. In time, this led to books which were much heavier on text than on decoration, and therefore denser on information.

Running Some Numbers

Let's get down to cases to demonstrate both historical trends and the range of variability. As our yardstick, we'll take advantage of the historical continuity of Christianity. The Bible is probably the most widely reproduced book in history, which allows us to make some comparisons over space and time (the Qur'an would be another useful text for this exercise, since it's almost always found in Arabic regardless of time and place even into the modern period, but the data for historical bibles and biblical texts is somewhat more accessible). The Bible is, to be certain, very large, with just about every version coming in at something over 700,000 words. Subsets of the Bible were also produced in large numbers. Indeed, given the size and expense of an entire Bible, subsets were more common than the complete work. The two most common were psalters (collections of the psalms which were often used in worship) and the gospels. These three books can be regarded as close as one comes to "typical" books during the Middle Ages and Renaissance, and though there's greater diversity in publishing these days, we can still compare modern versions with their predecessors.

For the most part, we'll be looking at Latin bibles and subsets of the bible, since Latin was a constant across most of western Europe. Though there are small variations, psalters are about 37,800 words, gospels 58,900 words, and a full Latin vulgate bible, the version most widely used in the regions in question here, 712,000 words (for anyone wanting to extend comparisons to modern storage media, the Latin vulgate is about 4.15mb as a text file). The Medieval and Renaissance manuscripts listed below are selected from illuminated texts curated by the British Museum. More modern books include the Gutenberg Bible, which is an edition of the vulgate but printed rather than manuscript; a modern copy of the King James Bible (at about 750,000 words, a bit longer than the Latin bible); and our notional 100,000 word *GURPS* book.

There's a wide range of information density here. The Medieval and Renaissance books range from just over 800 to nearly 34,000 words per square meter, with something in the 3,000-4,000/sq. m range appearing reasonably common. However, we don't see any consistent changes in information density across the period of manuscripts encompassing the whole of the Middle Ages and the early years of the Renaissance.

The invention of printing doesn't initially make a lot of difference. The Gutenberg Bible has a slightly *lower* information density than contemporary manuscript bibles. The 100,000 word **GURPS** book falls on the upper end of the words-per-area scale, but there are several much earlier books with a greater information density. The final bible on our list of texts is a modern Gideons' KJV bible, available in any hotel room in the United States. With its small print, narrow margins, and thin paper, it packs a lot of text into not very much space and appears to push the practical limits of information density with an alphabetic script . . .

. . . except for one of the earliest texts on our list, a copy of the Gospels from 750 AD, the tail end of the Dark Ages. This particular item was composed with portability in mind. It's small and light enough to slip into a pouch one might wear on a belt or around the neck. This tiny, densely written volume has even smaller text and thinner margins than the Bible printed more than a thousand years later.

Figure 2

Figure 2

The differences in information density probably lie mostly in the purpose of the individual books. The modern bible and the gospels from 750 (and, to a lesser extent, the **GURPS** book) share a particular characteristic: to put information into as compact a form as possible. Most of the other texts were intended as art or visual spiritual inspiration as much as mere information. A great deal of space is taken up by ornamentation, such as illuminated illustrations and giant decorative capitals. Even so, there are some aspects which might be chalked up to cultural preferences. There's a general tendency for ancient texts to have what we would regard as very large

How Long?

Since we're considering other attributes of books, we can provide a ballpark figure for how long they took to write. Canonically, it took about a year to produce a bible, which translates into something just shy of 2,000 words a day. A scribe working for utility rather

Figure 3

than artistic merit could probably skip the illuminations and double that figure. An early printing press could crank out something like 200 bible-sized books a year.

margins (for example, see some examples here). Our ancestors probably regarded smaller margins as crowded. They also operated in a literary tradition where writing one's own notes and comments in a book was regular practice, so the extra space was downright utilitarian. Scribes at least as far back as the Dark Ages could produce books as densely written as we can today, but they rarely did. There's a curious cross-cultural tendency for that preference. Figure 2, a 17th-century Coptic text with a parallel Arabic translation, reserves a good deal of room for capitals but otherwise leaves a lot of blank space, while figure 3, from an 18th-century Persian Qur'an, has about half of the page taken up with neatly written main text. The curving lines of text around the central box are a reader's commentary. Big margins aren't just a Medieval European thing; they show up in the separate textual traditions of Iran and northeast Africa as well.

Artistic standards aren't the only reason for most texts leaning towards the low end of the spectrum; cultural practices play a role as well. In many times and places, perhaps because of low general literacy rates, reading appears to have been a public act. One was read to more often than one read alone. Entire law codes were inscribed on huge plaques and put in public places rather than tucked away in books so that the whole community could see them, and books were written in large print so that someone could stand at a lectern and read them aloud. A few really big books which have survived the Middle Ages, weighing tens of kilograms and measuring over a meter on a side with writing of proportionate size, were meant to stand on a lectern in front of a choir so that large groups of singers could all sing from the same text. We've excluded books which are clearly built for that scale, but even so, there's a leaning towards public rather than private reading throughout.

Of course, that's just how much information was packed into a given area of writing space. When considering encumbrance, we might also want to consider weight and volume. For the weight and volume calculations above, we've assumed that the parchment on which the books were written is an average of 0.3mm (though, as we've said, it could vary considerably) and that the parchment has the same density as leather, about 0.945 grams/cc. In addition, each book has a wooden cover (a total thickness of 1.6 cm at 0.45 grams/cc). For anyone who cares to extend the calculations to paper books, the average thickness of a paper leaf of this period is closer to 0.25 mm (though with a similar range of variation to parchment), with a mass of about 0.7 grams/cc. A paper book is likely to weigh about 62% as much as a parchment book of the same height, width, and page count.

Other Periods

So much for the Middle Ages, the Renaissance, and some of modernity. How does this compare with some other periods? Greek and Roman papyri appear to have had a similar information density per square meter, fitting 25 to 45 lines of text in columns typically from a quarter to a third of a meter high, about what one would find in a larger Medieval book or the Gutenberg bible. Margins were somewhat less generous, but columns of text were narrower, so the amount of white space on the side of the scroll that was used wasn't too different from a codex page.

Cuneiform texts are a different matter. They start at nearly 10,000 words per square meter and go up from there, with some texts having an information density in excess of 50,000 words per square meter. Part of the reason, of course, is the issue of margins and ornamentation. Many cuneiform tablets are utterly utilitarian records, the equivalent of accounting ledgers and sales receipts, with little or no attempt to make the text attractive. For example, on this tablet, the text is not just tightly packed, it even starts to slide over the edges. Another reason is that the script used in the cuneiform texts is a syllabary, not an alphabet. Each character represents a group of sounds (for example, nam, ni, ha, mas, ab) rather than a single sound (n, h, m, a); syllabaries naturally result in more compact text, because fewer characters are needed to represent the same words.

On the other hand, while a cuneiform text could hold several times as much information as a similar area of an alphabetic text, its *volume* would be vastly higher. The thinner cuneiform tablets we have are tiny sales receipts and

similar records, about the size and shape of a thin charcoal briquette and at least fifteen to twenty times thicker than a sheet of paper or parchment. Longer texts are frequently on thicker slabs of clay, the equivalent of a hundred or more pages of paper.

It might be worth noting that many of the cuneiform texts which have come to us contain incantations and alchemical formulae which are mere hundreds of words, not tens of thousands. However, their brevity may be explained by the fact that they don't work.

Conclusions

Clearly, then, this means that at 20,000 words per spell, a magician in a pseudo-Medieval or pseudo-ancient world isn't going to be carting around a spellbook with hundreds of spells. Even something Bible-sized (which would hold no more than 40 spells) would be large, heavy, and difficult to use in the field. At five volumes, the 1430 bible comes in at nearly 85 kilograms, probably heavier than anyone who attempted to read it. The 750 AD gospels, though pocket-sized and only a third of a kilogram, would have held the equivalent of a mere three spells. A single very densely written papyrus scroll three to four meters long might contain a single spell, which might be convenient for filing (and is pleasingly agreeable with the typical gaming assumption that one scroll equals one spell), but spells would most likely go on longer scrolls or be split across multiple scrolls. At the most common information densities, whether papyrus scroll or paper or parchment book, a single spell comes in at between half and a full kilogram. A few hundred spells, while not enough to fill a "typical" half-ton oxcart, would certainly be more than anyone would consider portable. In a more modern setting, such a collection would fit comfortably on a CD, or have plenty of room left over on a DVD or a good flash memory card. Looking at it from another direction, with typical manuscript information densities the storage capacity of an oxcart is about 67mb, though it could be more than eight times higher for unornamented, closely written texts; it'd take nearly 200 oxcarts or a medium-sized cargo vessel to transport a manuscript version of Debian Linux 4.0, enough capacity to feed a typical Medieval city for half a week. If a historical magician has a library of spells, it's a library, not a notebook.

On the other hand, the script used and writing for utility rather than pleasing presentation are significant factors. For one thing, a "typical" book may not be an appropriate model for a wizard's spellbook. A wizard, scribbling notes for himself, might pack information more densely on the page than a scribe working for beauty and ease of reading. Writing on the order of the 750 gospels or the Gideons' bible makes lugging a library around difficult but at least thinkable. We've also been limiting ourselves to major languages in Europe and the Near East, which may not be appropriate for fantasy campaigns. The west has long rejected syllabic and logographic (where symbols represent entire words) scripts, such as Egyptian hieroglyphics, cuneiform, and early Greek syllabaries. However, syllabic and partly logographic scripts are alive and well in Asia. Such scripts, though, are clearly more space-efficient than easier-to-learn alphabetic scripts. If the fantasy world in question uses a pseudo-Chinese or pseudo-Mesopotamian writing system and the wizards or the scribes on whom they depend treat the material they're writing on as though they're paying for it themselves, a magician might actually be capable of carting his spellbooks around with him.

The Usual Escape Clause

Since we're talking about spell books, we can't forget that magic throws regular concerns out the window. The literature has a number of examples of magical spellbooks which are not constrained by the limits of their physical media. The witch sisters of *Charmed,* for example, used a book whose contents changed from time to time. Likewise, in an episode of *Angel,* the more-evil-than-average law firm of Wolfram and Hart had a magic book which could be used to view the contents of any other book in their library. Maybe a wizard *can* use a single book for all of his spells, as long as he knows the right spell for it.

Shogun

English translation by Christine Biancheria

One two-sided board, 110 cards (53 province cards, 25 war chest cards, five special cards, five daimyo cards, 10 action cards, 12 event cards), five individual player boards, 330 wooden army cubes (62 each in five player colors, 20 green farmer units), 55 wooden war chests (35 one-point, 20 five-point), five wooden victory point markers, five wooden rice markers, 80 cardboard building tiles (28 castles, 26 temples, 26 theaters), 42 cardboard revolt markers, battle tower, storage tray, rules, rules supplement; full-color boxed set; $64.95

It is the 16th century, you are a daimyo, and Japan is in need of the stabilizing influence of a shogun. Much more setup than that and there won't be any room left to talk about the game.

Dirk Henn has transplanted his mechanics from the Thirty Years War in *Wallenstein* to feudal Japan. The object of *Shogun* is to have the most victory points at the end of two years of infighting.

Three to five warlords take control of various provinces across the island nation, filling them with their armies. Each location comes with a small reference card and is rated for the money, rice, and civic improvements it can produce or hold. Money funds troops and building projects while rice staves off famine during the long winter. Other appetites have players expanding into adjoining territories.

Three things moderate your actions. First, you have to bid for turn order and the special card that comes with it. If you go first, you get the card in that position. If you'd rather do a different action than the one in the first position, you're stuck with the turn position on which that card sits. Second, the "seasons" of play are accompanied by event cards. The top half gives a benefit or drawback: money is scarce, or deployment requires more of it, or an overtaxed populace may be assuaged by the creation of new buildings. The bottom half is only used in winter, telling you how much rice is lost. Players know what four event cards are coming in a given year, but not their order. Finally, play runs according to the 10 action cards along the side of each board.

The first five action cards are face up, and players can plan with that much certainty. The other five action cards are only revealed as play proceeds, an unknown quantity for everyone. Your individual board shows all 10 actions (and its chart provides information about all the provinces so you don't have to ask coyly, "Say, Sam, apropos of nothing . . . how much money does your Settsu province produce?"). You must choose a war chest card (rated zero to four) to bid for turn position, and the rest of the province and war chest cards are assigned to the various actions.

For example, if you want rice, place a province card on the rice symbol on your individual board. When the *Confiscate Rice* action comes up, flip that card and collect the rice that area lists. To assault a neighbor, put the attacking province on a *Battle* space. The order means everything: If *Collect Taxes* comes up fifth, expenditures before that -- say, *Build a Temple* -- aren't possible unless you've saved money from last round.

Armies are small wooden cubes, and battles are fought by dumping the participants blindly into the battle tower. This

hopper has a series of ledges and other irregular features that can catch some pieces and release others (perhaps some from previous battles), then spill them into a tray. Opposing units pair up and kill each other, and the winner puts his survivors back in the disputed territory. If everyone dies, the location is left neutral until someone moves armies in anew to confront the farmers. Fighting also breaks out if the people tire of having too much rice and money taken from them; then the daimyo has to contend with revolts by the green farmer armies.

Come winter, the rice is used to sustain the people. If you haven't squirreled enough away for everyone, there may be more farmer uprisings.

You score points for controlling provinces and buildings, with bonuses awarded for having the most of certain building types. After two years (eight seasons), the point leader wins.

The components are beautiful; and the graphic design, which is just as important here, is a mark in the win column as well. There's a lot of information, and it's repeated anywhere you may need it with extensive cross-referencing. Wooden pieces abound, the board is solid, and there's room for everything (paramount for all those itty-bitty armies). It can be a nightmare trying to find the province listed on the cards, but you get as much help with diagrams as the creators can give you. Getting used to the layout is taxing, and as soon as you get it down you realize on the other side of the playing surface is *a whole other map,* just in case familiarity breeds contempt and too many wins for the same person.

Game play is involved, no way around it. Planning for your turn can be slow as you try to balance what happens when (and what only might happen when), and "program" the actions to your best advantage. It's not an impossible task and, while daunting, it all comes together splendidly. When you see it, it's hard not to admire it. A strategy game that allows you to plan attacks, and yet does not depend on endless warfare to carry it, is one to be congratulated. You're as much up against your own planning skills as you are the other players, but without feeling it's just overcomplicated victimization.

Shogun is like a graceful host, offering something to everyone, keeping everybody occupied, never lingering too long on one subject, and thinking ahead to all your needs. Whatever you require is close to hand as soon as you think of it. The game's creator has thought of everything, leaving you nothing to do but play. And you will.

Magic Item Compendium (for *Dungeons & Dragons*)

Published by [Wizards of the Coast](#)

Designered by Andy Collins (Lead), Eytan Bernstein, Frank Brunner, Owen K. C. Stephens, & John Snead

Cover by Francis Tsai

Edited by Chris Thomasson, Logan Bonner, & Jennifer Clarke Wilkes

224-page full-color hardcover; $39.95

If you are the type of gamer who likes to trick-out your character with the best equipment, or the type of GM who likes to give your players lots of quests items and reward the PC's efforts with goodies and gear then you will likely find this book both interesting and useful. The designers of this book have pulled together a vast number of items and introduced new rules to make implementing magic items more systematic, and made it perhaps more fun for players who may have learned their first fantasy gaming from computer rather than table-top experiences.

The book contains more than a thousand magic items along with their price and description. The items are organized by their usage. The book is sectioned into Armor, Weapons, Clothing, Tools, and Magic Item Sets. Each section contains alphabetized entries for the items that make up the category. Some of these categories are pretty obvious, but two bear further description.

The Tools section includes items that aren't covered in the main categories of Armor, Weapons or Clothing. Magical things like bridles, elixirs, bandages, rods, spheres and a variety of other items can be found in this section. The Magic Item Sets provide a group of items that is composed of various magic pieces which each have their own effects, but which provide additional powers when more portions of the set are equipped and/or worn together. If you have ever played the video game *Diablo II* (or similar computer RPGs) this will be a very familiar concept. By using these rules, a GM may be able to make it so that relatively mundane magic items a player character is already carrying can turn out to be part of such a set. These item sets are all adventures waiting to happen.

The Weapons section of the book introduces a new way to augment existing items. Augment Crystals are magical gems that can be inserted into weapons to add extra magical features. The gems are not permanently bonded to the weapon so that they can be switched out as a move action, allowing a mundane weapon to become capable of a variety of magical effects (ranged attack defense, mental attack defense, improved stamina, and so on). These are a novel and potentially inexpensive way to improve the efficacy of your party without the difficulty of reforging weapons, or having runes inscribed by some expensive NPC craftsman. The crystals come in three grades (least, lesser, and greater) with the power of the effect improved proportionally with the quality of the gem.

Relics represent a new class of item. They are powerful magic items which become even more powerful if wielded by users aligned to the divinity of the entity powering the magic. These are something like mini-artifact level items, and there is usually a price for gaining the extra abilities of these items, such as sacrificing a spell slot each day to allow the divine power to go into the item.

The Armor section includes many novel pieces of defensive, and also provides beautiful illustrations. Like the best weapons, named armor is usually powerful and appealing. Most of the effects of the armor involves simple stat

bonuses and could probably be made up by a GM with a little effort, but the fantasy names, prices and descriptions are all listed here for your convenience.

Continuing on the subject of pricing, the book contains lots of new items, but also includes items from various **Dungeons & Dragons** books that Wizards of the Coast has put out in the past few years. The prices listed in the book vary wildly from the original items, and the designers explain in one of their "Behind the Screen" entries that the pricing listed in this book is intended to be based on the relative usefulness of the item rather than its exact GP value as calculated by the original value rules in the **Dungeon Master's Guide.**

This cross-reference with other non-core **Dungeons & Dragons** books leads to the first of two complaints about the **Magic Item Compendium.** The book reprints the vast majority of the needed detail to make each of these items useful . . . but items that aren't in the core **Dungeons & Dragons** books, such as those from "Libris Mortis," merely reference you to get the particular spell properties from the book from which they are derived. That's a nice way to sell a few extra copies of these other books, but if this book were truly the reference compendium it is trying to be then that detail should be included. The second complaint is that, like many new gaming books, there is no index. Sure, the items are ordered alphabetically by section . . . but why leave out the index? A compendium with this many items should have tools to facilitate ease of use.

Those complaints aside, the book does include some very useful charts. The items in the book are arranged in detailed tables organized by the type of item and then sorted by price. Also tables are included for rolling up some random treasure out of the book. Items are sorted by level so that you can provide proper random goods for encounter the PCs have survived.

In addition to all the items, rules are included for how to craft new magic items as well as several suggestions on how to handle buying and selling items in a fantasy market economy. Care is also taken to advise GMs on how to handle the price changes encountered in this book.

The art in this volume is superb and abundant. More than 28 artists are credited on the book, yet the work in the book has a common feel and doesn't seem discordant. Though the majority of the art merely shows the items described in the text, they are colorful and crisply rendered illustrations, making it simple to imagine the various uses of the depicted entries.

At times the whole book seems like a holiday catalog for the discerning adventurer, a veritable seer's wish-book. Whether the magic items in the **Magic Item Compendium** will make it into actual game play is an entirely different question, but it couldn't hurt to buy your GM a copy of this book to find out.

Son of Stupervillians!

More Costumed Nuisances for Supers Games

by J. Edward Tremlett

In our last episode of "Stupervillains!" we explored the world of inept, loser supervillains. These humorous "special guest stars" for your Supers campaign were possessed of power, but either shockingly inept or mind-bogglingly disorganized, and . . .

Wait, you didn't get that issue? Well, never fear, true believers; this time we shall up the ante by presenting even more Stupervillians than ever before! The following Garrulous Groups and Terrible Team-Ups present *gangs* of miscreants for your Supers campaign.

As before, they have notes on powers, strengths, and weaknesses, and are listed in increasing order of power. Stat guidelines go: Poor, Average, Medium, Impressive, Powerful, Way-Powerful. Almost-ready-made comedy relief is yours with the addition of game mechanics and your own setting. (Batteries not included)

The Disco People (Has-Been Musicians Going After Solid Gold)

Put your hands up, now, baby! Do a hot dance, now, baby! Gimmie the dough, now, baby! Watch us go, now, baby!

The '70s were an era when talented but homely people in loud clothing could make beautiful disco together, and actually be paid for their efforts. But then came punk, new wave, and hair metal, which left noble, beautiful Disco in the dust.

One of those left behind was Leif Wonderland Bohannon, lead musician for the Band Called Midnight Wonderland (not to be mistaken for the Wonderland Band, Midnight Rhythm, or Midnight Rhythms Wonderland Band). In his prime, he'd been a funky trombonist and passable singer admired for the length and style of his mustache. And he and his 16-piece ensemble rode to temporary stardom on the back of their one single, "Midnight Wonderland," from their one LP, cleverly entitled Midnight Wonderland.

Stardom was fine, but fickle and fleeting. BCMW might have gotten a few more singles out, but arguments over pay, petty jealousies, and in-fighting among the horn section ensured that they didn't even make it onto Soul Train before imploding. And by the time Leif got to thinking about rounding up more musicians for another try, Disco was on the outs, leaving him to fall back on his largely-unlauded talents in sound engineering to pay for mustache wax.

What finally pushed him from behind-the-scenes hitmaker to disco-style lawbreaker? No one knows. All that is certain is that, after years quiet research, Leif discovered that certain combinations of pulsed sound and light could make the audience open to suggestion. After a few low-key experiments in frequency modulation and stage lighting, he gathered four refugees from BCMW since relegated to session musicians and talked them into joining a new kind of band.

The first appearance of the Disco People was almost their last. The five '70s relics in hypnotic sequined jumpsuits and musical belts attacked a shopping mall, using their personal music and light shows to hypnotize onlookers and get them to dance while they robbed them blind. Unfortunately, the blind, deaf, and mute Swashbuckler -- who fights crime by sense of smell -- appeared from nowhere, and slashed the miscreants' belt buckles with his silvery blade, dispelling the effect.

Somehow they managed to get away but did not learn their lesson. Since then, they've pulled off decreasingly lucrative heists, the most recent being the Oogy-Boogie Bowling Alley ($123.50 and a hot dog). Leif is unhappy with the way things are going, but he's leading this enterprise like he led the band, with no regard for others ideas or concerns. So

it's only a matter of time before he either hits the right step, or lands them all in jail.

Powers: Their flashy clothes, flashing lights, and hot hypnotic music put everyone within 50 feet into a Medium mesmeric trance. It's powerful enough to let the Disco People compel simple, non-harmful instructions, such as "Gimmie your money," "open the safe," and "dance to the *muuuuu*-sic"! but nothing more complex than that.

The only problem is that they are just as susceptible to their own gimmick! They have to wear special earplugs and sunglasses, which means they can't effectively communicate with one another during a job. So any serious change to the plan -- hero, rival supervillain, people resisting the hypnosis, etc. -- puts the gig in serious jeopardy.

D

Leif Wonderland Bohannon; 49; American citizen with no criminal record (yet)

Stats: Average Body; Medium Mental; Average Spirit

Appearance: 510, 250 lb, long brown hair in wavy curls, blue-blue eyes, and the longest, waxiest mustache you've ever seen. Still wears leisure suits open to his nipples and gold chains with groovy love medallions.

I

Marvin Fly Eye Freeman; 47; American citizen with a criminal record

Stats: Average Body; Average Mental; Average Spirit

Appearance: 55, 190 lb, shaved bald with a full soul beard. Wears blue jeans, denim jackets, and a gold strip tiara he stole from one of Earth, Wind and Fire's roadies, back in the day.

S

Samuel Soul Man Caruthers; 50; American citizen with no criminal record

Stats: Poor Body; Average Mental; Average Spirit

Appearance: 57, 300 lb, with a six-inch-high afro that's balding badly from the front. Wears huge pants held up with suspenders, a collection of ratty T-shirts and thick orthopedic shoes. His girth is such that he has to wrap himself in a girdle to fit into the group's special costume.

C

Charlie Blower Bilbokowski; 46; American citizen with a criminal record

Stats: Average Body; Average Mental; Poor Spirit

Appearance: 511, 204 lb, long straight red hair weighed down with beads. Still wears the gold and silver pants and jacket he wore on stage with BCMW, even though they've been repaired -- badly -- close to a hundred times apiece.

O

Orenthal Oh-Oh Orangestein; 47; American citizen with a criminal record

Stats: Average Body; Poor Mental; Average Spirit

Appearance: 55, 150 lb, black hair cut short and scraggly with an unkempt Fu-Manchu mustache. Wears tight pants

and wife-beaters. He also wears big black cowboy boots, which is where he keeps his stash of mind-melting medicine.

Costume: Everyone wears more or less the same costume: suggestively cut red, white, and blue jumpsuits covered with spangles and pulsing lights. Each one has platform shoes and a special belt buckle in the shape of their codename (D, I, S, C, and O, respectively) that pipes music from the master player in the Disco Van (also painted red, white, and blue, and fitted with lights and sound blasters to effect an entrancing getaway).

The Curse, and Company (Worlds Unluckiest Would-Be Conqueror)

"Now, allies seven of The Curse, into the breach! The City will see the full price of defying . . . The . . . wait, no! You fools! You're driving your earth-shakers into the same location! You'll be . . . oh, oh no. Call off the attack! Retreat before we're seen! The Curse cannot withstand another such embarrassment!"

Baron Gunter von Groleichenschlo (Gunter von Gross to his enemies) is the hereditary ruler of Leichenland, son of one of the great criminal geniuses of our age, and horribly doomed to fail in anything grandly evil. Every plot falls apart, every henchman dies a horrid death, and every attempt to redeem his evil standing collapses . . . leaving him to crawl back to the ancestral home of the Groleichenschlo, all alone.

Many years ago, Gunter was a callow, privileged youth living under the shadow of his father, the criminal arch-genius known as Baron Cadavre. Befitting his name, his father was a cold tyrant who preferred his offspring to be neither seen nor heard in his presence. Gunter, his only child, was barred from being within so much as shouting distance of his father, which eventually led him to take up a profligate lifestyle outside the castle.

So it was that one fateful day young Gunter became terribly drunk, weaved his fancy Daimler through the villages, and collided head-on with a donkey. The beast survived, but the car did not, and yet Gunter woke up a short time later in the wreckage, miraculously unharmed. And the first thing he saw was the donkey's owner tut-tuting him, telling him that the donkey -- the oldest and most powerful in all Leichesland -- had cursed him to a long life of rotten luck for his foolish ways.

Gunter laughed it off, at first, but after that he *did* have rotten luck. His house burned down, his servants developed leprosy, and every car he owned thereafter wound up crashed and burned by the side of the road. And yet Gunter survived all . . . including his now-more-insane-than-ever-before father's attempt to turn Leichenland itself into the center of the world. The über-insane plan failed without outside interference, turning the green and lovely country into a black, rocky, and unpopulated wasteland.

The plan also killed Baron Cadavre, leaving Gunter with a cracked and crooked castle filled with wonky android copies of his father, two corpse-servants named Hubert and Jurgen, and decades of notes, plans, and strange, untested devices. It would have been the perfect fixer-upper for a budding supervillian, except that Gunter knew next to nothing about science, invention, or conquering the world. He also had a hard time reading his father's strange supervillian vernacular, in which he'd penned his notes and plans, as well as the instructions on the devices, themselves.

A chance meeting with his father's colleague Barronet Zero, the Fine Red Menace (who stopped by to claim Baron Cadavre's artifacts for himself), proved useful, as Zero spoke fluent supervillian. Together, they formed The Two, and sought to dominate the world from Leichenland. And Gunter took the name The Curse, vowing to redeem the power and majesty of the line Groleichenschlo before claiming the mantle of Baron Cadavre.

Unfortunately, he also took one of his father's as-yet-untested armor variants for himself. The suit went haywire in a fight with the Liberty League, and he was rocketed into the middle of the Atlantic. Meanwhile, Barronet Zero got one of the weird knob-things on his helmet-crown caught in untested war machinery, and was turned into a fine red mist.

Undaunted, The Curse assembled the Mad Tinker and the Master of Puppets to his side to form The Three. Their attempt to march the population and resources of The City across a skybridge to Leichenland failed due to the Liberty League, atmospheric disturbances, and the push of the wrong big button. The plan failed, two of The Three died in the resulting conflagration, and The Curse was left a laughing-stock, once more, just as he was after the subsequent loss of

The Four and The Five.

The Curse is currently assembling The Nine, but is having a hard time making a proper go of it. It's not that he's short of volunteers, mind, but after seeing off 28 worthy criminal super-geniuses and world-conquerors, the cream of the crop has been replaced by the dregs.

Powers: His suit provides Impressive strength, armor, and flight. The armor has numerous techno-wonder weapons hidden within it, but chances are good they will fail at a bad moment.

Plus, Gunters lineage provides him with near-limitless finances and resources, decades of scientific equipment and weaponry, manufacturing facilities . . . and a reputation (however undeserved) as a dangerous criminal genius, just like dad, whose notes are now his own. He has vault upon vault of impressive war machines, exotic weapons, and deadly doomsday devices, none of which work exactly as advertised. He also has a near-endless, if wonky, army of android duplicates of his father, and the ability to make loyal, if fragrant, servants from specially-pickled corpses.

The problem is that pesky curse. So long as he lives, any attempt to do anything evil or selfish will fail . . . badly. Any who seek to do it with him will die -- horribly -- unless they're already dead or robots. And he alone will escape . . . unharmed, but embarrassed. The only way to be rid of this fate would be to seek the donkey's forgiveness, but unbeknownst to Gunter, it died in the same cataclysm that leveled Leichenland.

The Curse: Gunter von Groleichenschlo; 40; Ruler of Leichenland (pop. 1)

Stats: Average Body; Average Mental; Average Spirit

Appearance: 62, 180 lb, long blonde hair down to his belt and a somewhat pale and cadaverous yet pretty face (the pretty comes from his long-vanished mother). He wears his costume at all times, but leaves the helmet off unless he's in battle, a meeting, at work, or on his throne.

Costume: His father's armor variant is a bronze-colored, baroque suit of armor with a horned, skull-like helmet that seems to be lit from within by baleful, orange fire. He also wears a heavy, red cape lined with black fur.

Hell And Damnation (The Devil's Children, Improperly Reared)

"So, how'd you like to enjoy unlimited power and wealth on Earth in exchange for you know, this really is a crappy deal . . ."
"ON YOUR KNEES BEFORE THE CHILDREN OF YOUR MASTER, WORM!!!"
"For crying out tears, will you stop with the fire-breathing already?"
"I WILL RAIN BLOOD FROM THE SKYYYYYYYYY!!!!"
"Oy . . ."

Yes, it's true what they say: the Devil *does* have human children. Back during the '70s he took advantage of the goings-on at certain religious institutions to plant some seeds, planning to tend to them later. But the greed and cynicism of the '80s and '90s were such a playground for him that he completely forgot about his kids, leaving their rearing to their mortal carriers.

But then the '00s hit, and with them came a certain ennui. So he decided to correct his mistake . . . but a little too late, it seems. Most of his whelps turned out to be little angels with no head for cutthroat business, which meant he had no use for them. But there were two who suited his needs, sort of.

Glenn Warner was a 30-something stoner who lived in his mom's basement, sang in terrible heavy metal garage bands under the stage name Hell, and secretly lived for Satan . . . at least as he'd been presented to him, thus far. The one thing his wayward mortal father had left before taking off was his collection of '70s and '80s heavy metal, on vinyl, which Glenn listened to rather . . . errr, religiously. So when the Devil appeared and revealed himself to be Glenn's real father, come to bestow him with his rightful title and powers, the deal was as good as sealed.

Helen Applebaum was a different story. Raised a good girl in a good, reform Jewish household, her first reaction on hearing of her true parentage was to laugh and ask if she should be impressed, or something. But after a few demonstrations of his power, she wasn't so sure that this was the Satan she'd been told about. At any rate, blood knows its own, and she soon realized that the fellow *was* her real father, and -- loath as she was to admit it -- the air-guitaring weirdo calling himself Hell was her half-brother, too.

The plan, their father said, was for the two of them to be his agents in the world: bring him souls and infernal bargains. He would reveal to them the powers needed to accomplish this task, and in return they would rule by his side at the end of days.

Helen was utterly appalled by her father's plans, but decided to pretend to go along with it. She'd learned enough about business from her father, who made his money credit-counseling others out of debt, to know how *not* to run a business. So she figured she could engineer any number of good-sounding, but doomed, ideas to keep daddy occupied until he got tired, or something.

So Hell frolics in their mansion outside The City, puts out truly awful CDs, sees a harem of supermodels, and drives Italian sports cars he can't pronounce. Meanwhile Damnation -- as Helen calls herself -- creates convincing-looking schemes that go nowhere and/or self-destruct, and keeps her half-brother from doing anything really explosive and stupid.

It's a full time job saving the world from her extended family, but Helen's nothing if not stubborn. At least she comes by that honestly . . .

Powers: Hell and Damnation share the same powers, which are magical in nature and Powerful in level (their father's are Way-Powerful, of course). They do not age, sicken, hunger, or thirst, and can live forever -- and die and come back -- at their father's sufferance. They can generate fire in any form they care to, including turning their own bodies and/or clothes into living flame, and can fly while fully aflame. They can change their appearances and voices, so as to look and sound like anyone they can imagine, including real people. They *cannot* force anyone to do anything, but they can make various alternatives -- such as signing a certain contract -- look either very enticing or very bad. And they are capable of masking their true intentions from *anyone,* which is why Hell and the Devil have no idea that Damnation is pulling a scam on them.

Hell

Glenn Warner; 35; American citizen with a criminal record

Stats: Poor Body; Poor Mental; Poor Spirit (defends and attacks as though Powerful)

Appearance: 59, 237 lb, long greasy black hair. Usually wears greasy, holey and unwashed heavy metal t-shirts, black jeans and sneakers gone green when no ones looking.

Damnation

Helen Applebaum; 34; American citizen with no criminal record

Stats: Average Body; Medium Mental; Medium Spirit (defends and attacks as though Powerful)

Appearance: 52, 160 lb, short curly black hair. She tends to wear black glasses and mostly-modest business suits that show off some cleavage.

Costumes: None to speak of, but Hell thinks it's really cool to have a body of fire, generate fiery wings, horns, and a tail and wear skin-tight black leather from head to toe, so he does whenever he can. Damnation prefers to keep it low-key, except for the cleavage.

Variation: If you'd rather leave the real-life occult out of your game, then the father of Hell and Damnation isn't *the* Devil, but just another spirit in a long, long list claiming to be him. Alternatively, he's some other supervillian who can bestow or awaken powers in others, and is either seriously deluded or enjoys this kind of prank.

Unspeakable Words

Art by Tony Steele

full-color boxed set with 96 Letter Cards, 30 Cthulhu Pawns, one 20-sided die, & rulebook (in English, Spanish, French, & German); $20.00

It's never too early to start teaching your children: warning them not to talk to strangers, telling them to look both ways before crossing the street, alerting them to the hazards of congress with eldritch beings whose sole goal is the perversion of mankind. *Unspeakable Words* isn't just an educational game about spelling, it's a public service.

The object of the game is to be the first player to make it to 100 points without going insane.

Two to six players can join in, and each gets a hand of seven cards and a set of five Cthulhus. All the cards in the game have a letter on them and a helpful pointer that uses H.P. Lovecraft's mythology: A is for Azathoth, B is for Byakhee, C is for . . . well, that's probably obvious. On your turn, you must play a word of at least three letters. If you cannot, or don't want to, you must trade in your hand for seven new cards. Letters are worth as many points as they have angles in them. An E is worth four points, for example, while an O or U is worth nothing. Having points is a mixed bag, because the hounds of Tindalos enter this reality through angles in the architecture. The more one dallies with unknown forces, the closer one comes to having the Abyss look back into you.

Don't worry, you'll get your points. But at what cost? After every word you play you must roll the 20-sided die; if the result is equal to or greater than the points you scored, you've cheated fate. If it's less, your mind becomes just a little bit more unhinged as secrets make themselves known unto you, and you must give up one of your Cthulhu Pawns. If you give up your last piece, you go completely mad and must retire from the game. Whoever gets to 100 points first, or remains when every else has fallen to the predations of insanity, wins.

There are two material issues with the Letter Cards, neither of them encouraging. They're awfully thin, and shuffling them is surprisingly difficult. The texture is the same on both sides. They slip together beautifully as you fan the two halves of the deck together, but then tamping them all together is like scraping paint (and you have to shuffle them at least two or three times in a six-player game). The art is a different matter. The illustrations, recalling more savory children's resources, show the various beings in delightful storybook situations. Some of it is awkward and gangly, but then given the subject matter that may not be the criticism it comes off as. There's a sly sense of humor in every card that adds to the fun.

The creators could have asked for, would have gotten, and may yet want, 20 bucks for a bag of Cthulhu Pawns alone. These are unbearably adorable little figures of a miniature, squatting Cthulhu (showing a bit much at the back, and if Cthulhu tush-crack isn't enough to warrant a sanity check, there is no balm in Gilead). With their beautiful green color and tiny, painted eyes, you'll have to be careful no one swipes them.

This game is half word construction and half playing the odds. The closer you get to your goal, the more cautious you are . . . no one wants to score so big they lose their last pawn, so slow and steady may win the race. Then again, if someone is ahead of you in points, you may be tempted into learning more Things Man Was Not Meant To Know. It doesn't help that some of the most common letters in the English language are worth more points than you'd care to

win in one go. You never wanted a U this much in **Scrabble** (though to be fair getting stuck with the Q isn't as bad, either).

Once you get past the arguments about the angles (B is worth five points, and I is worth four), there's not much fault to find. There are a number of alternate rules that deftly cover what players want to know most ("Can I get my pawns back?"), and Playroom again provides the rules in multiple languages. If you're wondering how they're going to get a new generation of gamers in this age of console and computer play, the answer is with games like **Unspeakable Words.** Assuming they're not of gentle constitution, even the kids are going to love learning with this clever pastime, and they may get a taste for the source material while they're at it.

Dork Tower!

Dork Tower!

Projection Racket

At some level, most RPGs are about wish fulfillment. Certainly the most successful ones have been about giving the players the chance to run wild on an interesting playground where their abilities set them apart from common folks.

But one aspect of wish fulfillment that doesn't get as much attention is the ability to play "what if?" with various tropes. After all, when watching a horror movie the viewer can do little more than yell at the screen: "Don't split up! Don't in that room alone! Look how many improvised weapons there are in that kitchen; *grab one!*" But when playing an RPG, gamers can engage with classic situations on their own terms, with their own sensibilities. Thus a player in a horror campaign based on our example movie can make whatever decisions he'd like to ensure his PC's survival, knowing that character isn't a victim of a sadistic scriptwriter (or, at least, the sadistic scriptwriter allows a lot more choice).

But are injecting one's own sensibilities something that should be downplayed, or encouraged?

On the one hand, part of the fun of an RPG is the ability to project one's own feelings onto other times or genres. Probably the most common example of this is the glossing over of the past's various discriminations; realistic sexism and racism -- outside of the occasional plot point and window dressing -- aren't most gamers' ideas of fun. In addition, it allows the gaming group to do a certain amount of "this is how it *should* be" versus how things actually went; this is the same mindset that permits one to play in a fantasy/medieval campaign and believe feudalism doesn't seem like that bad a governmental style.

It also lets players act in ways that wouldn't be acceptable for the genre. For example, a devil-may-care wisecracking atheist would find himself excommunicated and run out of town (or worse) throughout the Middle Ages, but it's a perfectly viable character concept for most fantasy/historical campaigns. *Army of Darkness* is basically a projection of a modern tough-cool guy onto a fantasy/horror plot, in the same way that *Jack of All Trades* was a modern tough-cool guy projected back to the early 1800s. (Aw, heck; everything Bruce Campell touches is a genre projection of . . . well, Bruce Campbell.)

On the other hand, some genres require so much handwaving that the mere act of participating requires leaving some modern sensibilities at the door. For example, participating in a four-colors supers campaign usually means that PCs need to refrain from killing, even though both sides know that the crazed world-threatening villain will just escape at some point and run amok again.

Likewise in a **Call of Cthulhu** campaign (or many other horror settings), one of the best things the heroes can probably do once they learn the extent of the baddies' ambitions and powers is stay home. Sure, you may die along with the rest of the planet when the unimaginable evil plot comes to fruition, but at least you'll do so with your mind mostly intact and your couch cushions suitably indented. (This doesn't even include that seemingly endless group of adventures that has the heroes serve as unwitting instruments of the adversary: "Fools! You have been accumulating the Rod of 3.14 Parts because you believed it alone would have the power to stop me, when all along I was manipulating you into gathering them for *me!* Bwahahahahahaaaa! . . . Sorry; it's an inside joke. Anyway, your destruction.")

As with most things gaming, I believe that it's up to each group to sort out its own feelings in terms of projecting modern ideas and ideals to the past. Personally, I tend to approach such projections with abandon; the only restriction -- one which seems likely to be shared by many groups -- is one against any projections that actually hinder the ability of the campaign to exist, like our "let's just stay home" **Call of Cthulhu** example. (Besides, if I want to gun down golden-age villains, what the heck am I doing in a golden-age campaign in the first place?)

Of course, that doesn't mean that projections that question the status quo of the campaign are against my beliefs. For example, I'd be fine with a character in a golden-age supers campaign having a more self-centered "What's in it for me?" attitude, even though I'm not aware of any characters like that back in the era. But that's probably because such a character would be well-suited to be played by Bruce Campbell . . . and, really, Bruce Campbell works in any genre,

any time, anywhere.

Crimefighters Of New York!

for *GURPS*

by Mark Gellis

Introduction

Bringing new players to *GURPS* involves certain challenges. One of these is the complexity of the character design system. Although the enormous range of options is a distinct advantage for GMs designing campaign worlds and players interested in unique characters, the learning curve can be daunting to some people. For this reason, having a stock of "Characters, Ready to Use" and pre-made campaign settings are helpful tools for GMs who are planning demo games for conventions or trying to introduce *GURPS* to new players.

This article contains six 350-point superheroes, suitable for any modern setting (although the default world is a Cliffhangers setting centered on New York City in which masked crimefighters battle spies, cult leaders, and criminal masterminds; this is why all wealth is calculated for TL6). The six characters were designed to cover a spectrum of player interests. Bricks, nature spirits, psychics, and master detectives are all provided, and have enough overlap in skills and abilities that no one character is essential for making a campaign (or one-shot) successful. The 350-point level was chosen because it allows for significant paranormal abilities without overwhelming new GMs and players with too many options. In addition, more experienced players may find it an interesting challenge to play superheroes who are merely legendary rather than godlike. For settings other than New York in the 1920s or 1930s, some aspects of the character histories and certain skills (Area Knowledge, Typing, etc.) might have to modified, but this should not be very difficult.

If players come up with their own characters, GMs may find these characters useful as rivals, allies, contacts, or patrons. With a little tweaking (e.g., replacing Code of Honor and Pacifism with disadvantages like Greed and Megalomania), they would even make good villains! River Girl could easily become a vicious, uncontrolled avenger of nature. Iron John could be a thug or a dangerous religious fanatic. Seven could be a thief or an assassin. And so on . . .

The origin of mutant powers has been left to the GM. For modern settings, latent radiation from atomic tests is the usual suspect. For earlier settings, having the Earth exposed to strange radiation when it passed through the tail of a comet -- which happened in 1861 and 1910 -- should work well enough, if anyone asks.

All six characters have been designed with Unkillable 1. This is probably the easiest way to simulate how superheroes can soak up incredible amounts of damage, and often get knocked out, but somehow never seem to get hurt badly enough to bet killed.

Certain aspects of these characters have been deliberately left open-ended. Reputations have not been defined for them; it is assumed that different people view masked heroes as everything from vigilantes little better than criminals to virtual saviors (assuming they have even heard of a particular hero . . . most people do not know River Girl even exists), so there is no general reaction modifier for them. It is also left to the GM to determine how masked crimefighters are viewed by the police and other authorities. It is assumed by your humble author that, as long the heroes do not break any laws themselves, the police are not interested in arresting them (and, again, opinions probably vary between those who dislike amateurs sticking their noses into police business and those who are grateful for their help).

Roleplaying games being what they are, it is also assumed that the authorities generally treat the use of force in apprehending criminals or in self-defense with some leniency; if the bad guys start shooting at the heroes, the heroes should be allowed to shoot back.

Finally, it is left to the GM to determine whether and how these particular heroes know each other before the start of the campaign. It is possible that the adventure begins with them all arriving on the scene of a crime, meeting for the first time, and deciding (or declining) to work together. It is also possible that they have known each other and worked together as a team for years. (Tommy Nickels has a big enough place that a team of adventurers could use it as a headquarters; he usually has coffee and sandwiches on hand, too)

Iron John

John Washington worked in a chemical factory in New Jersey from the time he had graduated from high school. He was 22 when a chemical leak and an explosion changed his life forever. The strange combination of chemicals and the sudden shock of the blast triggered the manifestation of his latent abilities. It saved his life, but when he woke up in the hospital three days later, he found it had changed his life, too.

The most visible change was that his skin was now a dark metallic red. It was also hard, like armor. Knives would not cut him; fire would not burn him. In fact, he was safe from almost any attack less powerful than a machine gun. And he was much stronger than he had been. A little experimenting revealed that he could lift about five times what a normal person could manage.

It was a miracle. John had always been a very religious young man, but now he had proof that the Divine was at work in the daily lives of men and women. He was alive when he should have been killed; it still bothers him that five other men died in the explosion -- good men, men with families -- and he was spared. And he had been given the gifts of strength and protection from harm. It had to be a miracle. And John knew what he had to do. He had to dedicate his life to protecting others from danger and crime.

New York was already the home to a number of crimefighting mystery men. John was able to gain introductions to some of them and learned from these heroes the business of crimefighting. Soon, he was a respected member of the New York superhero community. Unfortunately, being a crimefighter usually does not pay the bills. However, early in his career as a crimefighter, John had the good fortune to rescue a garage owner who needed a new worker. John is actually a very capable mechanic and electrician, and his boss understands that there are times when John may have to miss a couple of days of work every once in a while to fight crime or rest up from a big battle, so the two men have a good working relationship. John does not even try to keep his identity secret, but he never boasts about his crimefighting activities, and aside from his odd appearance lives a very normal life, so he is about as much of a celebrity as a minor league baseball player.

Using John in a campaign is fairly straightforward. He is good in a brawl, able to soak up a lot of damage and then deliver his own powerful blows to subdue foes. In addition, he is a good-natured, easy-going fellow (he is devout, not intolerant) who mixes well with people and can gather information in informal settings. (It does not hurt that he has an excellent singing voice -- John is a valued member of his church choir -- which can sometimes be a good way to break the ice at a party or in a country roadhouse bar.)

River Girl

As long as there have been people in the Valley, there have been spirits in the River. One day, one of the spirits came out of the River to defend it and the people who lived by its shores from evil.

Her name is Muhheakantuckikwemanitou, which means "Woman spirit from the river that flows both ways," but she tells people to simply call her River Girl.

River Girl has no idea how old she is, but she remembers when the first humans came to the River, and that was at least 8,000 thousand years ago. She has no idea why the River has chosen this point in history to tell her to come up out of the waters and help people. She only knows that is what she is supposed to do.

River Girl understood that the world had changed in the centuries since the White Men came to the River, and so she did not simply walk out of the water one day and ask to be introduced to the Chiefs of the City. That, she knew, was likely to get her locked up as a madwoman. Instead, she watched from the shadows for several weeks and, when the time was right, introduced herself to local crimefighters.

She appears to be a strikingly beautiful Native American woman barely out of her teens. Despite her appearance, she is very strong and a ferocious fighter; in fact, she is a little on the bloodthirsty side. More than once, her fellow crimefighters have had to remind her that she must abide by the law of the land, not the law of the River, and that she is not allowed to simply mete out punishment as she sees fit, no matter how foul her adversary. Sometimes it is difficult for her to accept this.

In addition to her formidable fighting skills, River Girl is an excellent scout, and she can go places no human scout can go. She is perfectly at home 50 feet below the surface of the water and can stay there indefinitely. And she can ask animals and even plants what they know about an area or the people who live there (sometimes the answers are a little cryptic, as fish and honeybees and oaks have different interests than crimefighters, but River Girl can usually find something useful in them; GMs should note that this is a good opportunity for both puzzles and humor).

River Girl understands the concept of money, but has none, and desires none, as she is perfectly capable of finding, catching, or making anything she needs. (She does not have negative Status because she is utterly outside human society, in terms of wealth; she has no cost of living and therefore cannot be living below it. This is a 0-point feature of her unique form of existence and it would be completely inappropriate for most characters. However, as she has no money, she is unable to buy anything she cannot find, catch, or make herself. She does not mind this, but it is sometimes a disadvantage.)

A water spirit, River Girl must return to her River once every day for at least an hour or she will begin to die. In addition, as an innately magical creature, if she was ever forced to enter an area or dimension without mana, she would

immediately begin to take damage and would die in a matter of minutes. (Technically, in a no mana zone, a number of her abilities should no longer function, either, but as she cannot survive in such zones, the issue a moot point pretty quickly.) One interesting aspect of her being a magical creature is that she always looks clean and well-groomed. (This does not mean she will not get her hair mussed in combat, but she does not appear to experience any cosmetic ill-effects from sleeping underwater or the like.)

An interesting aspect of her relationship with other New York crimefighters is that Iron John, a devout Christian, finds her a little unsettling. She is, after all, a pagan spirit, and one who politely dismisses Christianity with remarks like, "Every tribe has its own name for the Great Spirit. I do not need to learn a new one." But he refuses to give up on her (he assumes that she has a soul -- or rather, that she *is* a soul that for some reason was never born into a normal human body). It is one of the things she likes about him.

Grease Monkey

Tommy Nickels was born ugly. As far back as he can remember, the other kids called him Monkey. In fact, he looked like a monkey: short, squat, and hairy, with a sloping skull and bulging eyes. It did not help that Tommy wore his heart on his sleeve; when he was hurt or angry, people knew it, and the neighborhood kids who teased him knew they were getting to him. Tommy finally figured out that the only thing he could do was fight. He got good at it, and so most of the kids stopped teasing him because they knew he could beat them.

As Tommy grew older, he realized that he was more like a monkey than he had thought. He could climb almost anything, moving in darkness with ease. And he was clever, too. He had an uncommon affinity for machines and he could fix or modify almost anything.

Tommy came from a poor family, but he put himself through college by working nights. He is not a particularly erudite or well-mannered individual, so he never quite fit in with the wealthier students from socially connected families, but he easily made friends with other students who, like him, who were from working class families and who were interested in science and engineering.

While at university, Tommy developed a number of small, useful inventions, most of them manufacturing components that increased the efficiency of certain machines, and he now lives very comfortably off the royalties from his patents.

Tommy is not the kind of fellow to hold a grudge. But he gave in to one temptation. When he finally had enough money to do so, he bought a new house on Long Island for his parents and used his industry connections to get his father a job that paid nearly twice as much as his old one. And he made certain that the people from his old neighborhood, -- people who had tortured him when they were kids but who were now mostly stuck in poverty and dead end jobs, some of them already old and tired even though they were only their 20s and 30s -- knew that he had made good. He never said a word to them, kind or cruel, but he wanted them to see what a Monkey could do.

And now what? Tommy was set for life. He owned his own small lab and had enough money that he did not have to work, although he often took temporary jobs as a technical consultant to keep his skills fresh. But he felt as if there was something else he could be doing.

He had seen what crime did to people growing up in his old neighborhood. Maybe he could do something about it, make a difference. He met with local crimefighters, learned new sciences, and honed his physical skills. Now, he goes by the name Grease Monkey. He is a quite versatile as a crimefighter. He can scout by climbing across the rooftops, make sneak attacks with a crossbow loaded with drugged darts, provide technical support to a team as a driver or a mechanic, use and defuse explosives, and even operate heavy weapons should the need arise. And he always has one of his small inventions handy to help things along.

Seven

Alan Severen was just getting started on his career as an archeologist when he chanced upon some mysterious caverns in Mexico. He and his team went into the caves.

Something happened, something he will not talk about. Severen was the only one who came out of the caves and he was Changed. He could move and think with superhuman speed. What happened to him is a mystery. Aliens? Ancient artifacts? Magic? He will not say. He claims he does not remember, and it is possible that he is telling the truth.

However, for some reason, he has decided to be a crimefighter. Is he trying to assuage the guilt he feels over the disappearance of his comrades? Did he make some kind of pact -- his powers in return for the promise to defend the innocent? Is he simply bored? Again, he will not say.

He calls himself "Seven," because his abilities make him roughly seven times as fast as a normal person. He actually has a costume, a form-fitting black outfit with the number seven emblazoned in scarlet on his chest. Naturally, his incredible speed makes him an asset to any team of crimefighters. He can outrun and outmaneuver most foes; in fact, he can actually outrun most automobiles. He is rarely surprised in combat and can strike his opponents at least three times as quickly as a normal person; his speed also allows him to strike with the precision of a prizefighter. In addition, being a trained scholar, he is skilled at doing the sort of library research that is often necessary when tracking down certain kinds of information.

He makes a good living as a professor of Archeology at a local college, keeping his adventures as a superhuman crimefighter secret to avoid unnecessary and possibly embarrassing publicity for his employer. (This is sometimes a bit of a strain because his powers have left him with one physical disadvantage: He does not feel fatigued when he uses his abilities, but he does need a little more sleep than most people to restore himself. For Severen, who has a full-time teaching job, moonlighting as a masked crimefighter and taking care of himself by getting enough sleep leaves him with very little time for a social life.)

The secret of his abilities is actually simple. Something in the caverns -- and he truly does not know what it was --

killed his fellow explorers, literally vaporizing them, but for some reason did not kill him; instead, he absorbed some of the energies of the other men, and this is the source of his powers. (In fact, certain forms of energy seem to be able to short out his powers on a temporary basis.) Severen would very much like to know exactly what happened to him and he spends much of his free time researching strange and mysterious events and groups around the world. The true source of his powers is left to the GM, who should feel free to use Severen's obsession to learn the truth behind his abilities as a way to get the player characters involved in adventures.

As for his motivation, it is not really guilt (he does not blame himself for the death of his fellow explorers because he knows he could not have foreseen what was going to happen . . . at least, that is what he tells himself every time he has nightmares about the incident) but he does feel he survived for a reason and he should put his powers to good use.

Scarlet Sparrow

Wren Williams was always interested in being a detective. It was so exciting, so daring. Solving mysteries, bringing criminals to justice . . . it all sounded so romantic. As a young girl, she devoured mystery stories such as those about Sherlock Holmes. She followed news stories about crimes. When her brother joined the police force, it was the

proudest day of her life.

Her brother quickly let her in on the secret that being a police officer was often dull, dirty, and dangerous. There was little romance to breaking up a bar brawl and hauling the drunks down to jail. And there was nothing romantic about real murders, which were usually sordid, ugly things. But he also told her that it was a very satisfying job. Helping people in trouble and bringing actual criminals to justice was a lot more interesting than just reading about it. It was hard work, no doubt about it, but it was good work, work that was worth doing.

Wren and her brother were very close. Her parents had been killed in an automobile accident when she was three and she did not even remember them. They had been raised by their grandparents and, after their grandparents passed away when Wren was in High School, her brother, in his early 20, became her legal guardian.

But even her brother did not know about her secret.

Wren could fly. Her powers had manifested when she was 14. At first, she simply felt strangely light on her feet. Eventually, she could levitate a few inches off the ground, which terrified her the first time it happened. She told no one. Gradually, over the years, she taught herself how to control her abilities. By the time she had graduated from high school, she could literally fly like a bird. Her top speed was around one hundred miles per hour.

Wren had always been the smart one in the family. Her brother recognized her potential and helped her go to college. She studied chemistry. She had always been good at math and science. (In high school, she had been drawn to science partly because detectives in the mysteries she read often relied on it to solve crimes, but she quickly learned that she found the subject interesting in and of itself.) She also took every course she could in subjects like criminology. After graduation, she got a job at a chemical laboratory.

She was 23 when her brother, who had been promoted to the rank of detective only three months earlier, was killed in a shoot-out with gangsters.

Wren swore revenge. She knew she had the skills to be a great detective. And she knew her special ability gave her an edge that would be hard to overcome. She got a job with a detective agency and learned everything she could, including how to fight and how to shoot. Five years later, she was a licensed private detective, and decided to run her own one-woman agency; it made it easier to pursue criminals her own way, as the Scarlet Sparrow. The Scarlet Sparrow is an asset to any team of crimefighters because she can both scout and attack from above (and being hit by a 100-pound woman moving at 50 or 60 miles an hour, when she is controlling the blow, is enough to put a serious dent into most people). She is also a very capable detective with scientific training who can spot, collect, and analyze clues. Finally, she is an actress whose skills will let her pose as a maid or a secretary, allowing her to infiltrate the homes or businesses of a suspect.

Doctor Nightcraft

James R. Chapel II, the handsome and intelligent son of a wealthy and prominent New York surgeon, started hearing voices when he was a teenager. He thought he was going crazy. Fortunately, the psychologists his parents sent him to realized very quickly that he was not insane, but was somehow having sporadic telepathic episodes. They taught him some mental exercises and meditation techniques that allowed him to control his abilities. In addition, as he got older, his abilities became more stable (they also became more powerful, but this was something he kept to himself). He later learned from his own studies that strange abilities often manifested in puberty, as a result of hormonal changes in the body, but once hormonal balance was achieved in adulthood, the powers usually stabilized, too (and sometimes simply vanished).

Not surprisingly, James became fascinated by how the brain worked. And, with his special gift, he knew he could help others. He studied medicine and psychiatry, and for a few years established a very successful practice. He married. He bought a house. He thought life was perfect.

He was betrayed. James was careful not to read minds unless he thought someone needed help. And so he never knew about the affair between his wife and a prominent attorney until she tried to shoot him. She missed. And then tried to shoot again. In the moment of crisis, a new ability manifested, and he was able to stun her with a telepathic blow.

Then he read her mind and learned everything.

James divorced his wife; he achieved some satisfaction by being able to prove the attempt on his life, sending her and her lover to prison. Although no one would have accepted what he learned from reading her mind as evidence, he now knew all the details of the plot, some of which were easy enough to prove through simple police work once he put the police on the right trail. But the wound was not healed. He closed his practice (to his surprise, he found the hardest thing about the process was leaving his patients). He began to travel. He studied at monasteries in the Far East, honing his talents. When he returned to America after five years, he was ready to return to his psychiatric practice, but somehow, he wanted to do more. His abilities were now truly impressive. He decided to moonlight as a crimefighter.

Chapel has been unusually successful as a crimefighter, or perhaps just unusually lucky; he has been instrumental in

the arrest of two organized crime kingpins. In addition, the fact that he can read minds makes him particularly unnerving to criminals. As a result, even more so than with most masked crimefighters, the mob is hunting for him, trying to find some way to find him and destroy him.

His wealthy family knows nothing about his "other job." He suspects they would be embarrassed and troubled by it, so he keeps it a secret, using the alias Doctor Nightcraft when he patrols the streets or confronts evildoers. It is not too hard to keep his secret; most people who know Chapel view him as a dedicated professional, a pleasant and charming man who spends a lot on his clothes (it is one of the few luxuries on which he refuses to skimp) and who probably takes the suffering of his patients too much to heart for his own good, but not as someone obsessed with fighting crime.

Free RPG Day Report: Indianapolis Area

June 23, 2007

by Steven Marsh, Nikola Vrtis, & Sam Vrtismarsh

Since Free RPG Day seemed like one of the biggest cross-publisher cross-retail events since . . . well, *ever,* we thought it would be appropriate if *Pyramid* went on its first investigative road trip to nearby Friendly Local Game Stores to see how the event turned out for them. Unfortunately, the definition of "nearby" proved to be somewhat problematic; there was only one store within half an hour of where we lived. Expanding that definition to "those within an hour's drive" opened up many more possibilities; it also meant that there might be as much as a two-hour drive between stores. Nevertheless, we persevered and picked a plan that took us to five stores over the course of 10 hours . . . and a couple of the stores we visited more than once.

The weather was decidedly uncooperative throughout the day, and we had overcast periods intermingled with torrential downpours that made driving along state roads even more exciting. We had envisioned our journey as beginning at around 9:00 a.m. Saturday morning, so naturally we headed out the door at 10. This didn't prove to be a problem, as we discovered that the first store we arrived at didn't open until 11:00; faced with our first dilemma, we decided to skip that store and continue onward.

And thus we arrived shortly after 11:00 at our first stop of the day, Reader Copies.

Reader Copies
2976 N. Scatterfield Road Ste 131
Anderson, IN 46012
765-642-4028
www.readercopies.com

Reader Copies opened at 9:00 a.m., and there were some customers playing a card game, as well as a few milling around holding Free RPG Day material. Reader Copies is owned by an affable gentleman named Rembert Parker, who -- among other talents -- has also written for the gaming industry (including *Airwaves* for *Over the Edge*).

Reader Copies is a traditionally appointed comic and game shop, with separate rooms of what seemed to be a former office building converted into various sections. Reader Copies had plenty of space for in-store gaming, including a separate back room where trusted customers could lock up at the end of the night after the store had closed.

By the time we arrived at the establishment, a couple of the items were already low or out, despite the one-item-per-customer limit the store had placed on the Free RPG Day material.

We spoke with Keilah Clay and Tim Ward, gamers who drove from

Richmond, IN (about a 75-minute drive), and who were deliberating over which items they wanted to pick out. Keilah, a fan of *d20 Modern* and *Dungeons & Dragons,* hoped that the event would serve to bring more gamers into the hobby; it seemed to her that there weren't as many players as there were when she started gaming four years ago. Both Keilah and Tim had heard about Free RPG Day on Free Comic Book Day, when the store handed out promotional material about the gaming event; Keilah wasn't sure if she would have heard about it otherwise.

As we were talking, another customer arrived asking about Free RPG Day, and Rembert directed him to the various offerings on the table, pointing out each item by name and giving a brief description.

After we finished talking with Keilah and Tim, the store quieted down for the first time since we'd arrived, and we chatted with Rembert a bit about the state of the gaming world. He also saw the lack of players as a potential problem: "It's very difficult to get game groups together anymore; we get four to six people for an event, we're happy." Reader Copies' biggest problem is finding people to run games, especially GMs for roleplaying events.

Rembert was pleased with the way the event had transpired up to that point, and he seemed most affirmative about whether he would participate in the future, especially if the cost remained reasonable. He would have liked to see more variety in the material, especially from bigger-name publishers (most notably Wizards of the Coast); he compared the level of publisher involvement with its counterpart in the comic world: "With Free Comic Book Day, every major comic book publisher is involved."

Reader Copies specializes in diversity, with no one game or product line dominating sales; as such, maintaining or expanding on diverse offerings was crucial for Rembert in making future Free RPG Days more successful to him. As such, Rembert would have also liked to see other companies ancillary to the gaming world participate, in particular miniatures and dice manufacturers. One of the items in the retailer kit was a set of four dice with the store's name on them; Rembert would have liked the option to purchase a hundred of those dice to use for promotional purposes.

We thanked Rembert for his time and moved on.

The Danger Room
2213 S. Scatterfield Road, #6
Anderson, IN 46016
(765) 646-634
www.danger-room.com

The second store we visited was the Danger Room, located in the same town as our first stop. While the previous store felt more like a traditional comics-and-games spot, the Danger Room seemed more like a media retailer that included games as part of its mix (along with DVDs and CDs, comics, pinball and arcade gameplay, and other merchandise). Although relatively small, the location made excellent use of its limited space, while still providing an on-site gaming area in the back. We arrived shortly after their noontime opening, and the

store was still setting up their Free RPG Day event.

The Danger Room's plans centered around running RPG demos all day and offering the Free RPG Day publications as prizes for those who participate; it sounded like each participant would receive one product. The demos were run by Jason Korthuis, who also viewed the lack of players as a problem facing the industry, and hoped that Free RPG Day would prove useful in efforts to recruit new or lapsed players. "I think a strong community push would really do wonders, because everyone knows what *Dungeons & Dragons* is. Everybody's heard about it, but not that many people have played *Dungeons & Dragons,* or had the experience of sitting around a table with four other guys or girls and playing a game." The event was still warming up in our time there, and only one player was seated who was interested in participating in a demo when we arrived. It looked like Jason was going to be running *The Sinister Secret of Whiterock,* one of the Free RPG Day offerings from Goodman Games.

Although it was still too early in their day to judge the success of the event, General Manager Tony Lakas was happy with how the products were presented by the publishers. Since Tony was utilizing the event as an extension of their demo program, he would have liked to see some more demo-ready product, with pre-prepared character sheets and the like. (In another odd bit of industry synchronicity, it turns out that Tony is also a member of the GAMA Retail Division.)

Carrying on a theme established with the visit to our first store, Jason took a break from setup to purchase a card-game booster pack along with a few sodas to have on hand for the day's demos. "Diversification works!" quipped Tony, commenting on the two disparate items purchased.

After that, we headed out again.

It was around 3:00 p.m. when we stopped at Krypton Comics; although the door was open, business at the store didn't officially get underway until 4:00, so the owner wasn't on hand for comments. We pressed on, vowing to return.

The Game Preserve
101 W. Kirkwood Ave.
Bloomington, IN 47404
www.gamepreserve.com

Our third full stop was the Game Preserve, which we arrived at shortly before 4:00 p.m. We were actually familiar with the Game Preserve

name, since another of their shops does business in a mall about five minutes from our house. It turns out that there are four locations total, of which the [Bloomington branch](#) is the third. Bloomington is a [college town](#), so the clientele and atmosphere was very different from other shops we'd visited that day.

Located in a storefront situated along a main street, the Game Preserve is a deceptively deep store, with a large selection of games: board, card, miniatures, and RPG. We spoke with Assistant Manager Jessica Leach as she was learning how to demo a new game that was expected to arrive next week.

Apparently the relative quietness of the store when we were there belied a bustling business in the hours before our arrival. According to Jessica, there were eight tables running eight demos earlier in day; they would have run more if they had room, and they were turning folks away from events. Demos included the new *Changeling: The Lost;* the *Warehammer Fantasy Roleplay* adventure *The Pig, the Witch and her Lover;* and *Castles & Crusades.* Interestingly, they also ran demos of the new *Star Wars Saga Edition RPG* as well as *Dungeons & Dragons.* According to Jessica, the Game Preserve has a good relationship with their Wizards of the Coast delegate, so it wasn't hard to arrange demos and prize support through them. We found this development interesting; where other stores had lamented the lack of Wizards of the Coast's official involvement, the Game Preserve took matters into their own hands.

By the time we got there, the Free RPG Day offerings had been fairly well picked over, despite the store's strict one-item-per-customer limit. "I wish they would have sent us a few more of certain ones," Jessica admitted, "It would've been nice to have more so people could get more than one." This was especially true of the high-demand items (primarily the Goodman Games books, which were "gone immediately").

Jessica had been promoting the event heavily in the weeks leading up to Free RPG Day, telling regular customers as well as those who browsed the RPG section about their plans. Besides updating the in-store signage and online message boards with information, she notes that news about the event "spread around by word of mouth, and the fact that people are excited to see something like the new *Changeling* RPG or *Warhammer.*"

When asked how she felt the event went, Jessica replied, "I'm impressed!" She believed the event served them well as retailers, "because for some of the games that are question marks it will help us generate pre-orders and will allow us to be more informed about our ordering." One game she sited as an example was the new *Changeling;* the old version of the game has a large following in town, and she wasn't sure how much interest there was in the new version.

Jessica disagreed with the need for a larger demonstration program, stating her belief that it was the store's job to find demoers: "I roped people in," she said.

We thanked her for her time and left her to continue learning new games.

Krypton Comics
152 N Main St
Martinsville, IN 46151
(765) 346-7169
groups.myspace.com/KryptonComics

We retraced our steps back to Krypton Comics, which was now fully open when we arrived at 4:30. This was a smaller shop that had a mixture of comic and game product on its walls, plus a demo table in the front and a separate gameplay area in the back. Despite being only half an hour away from the previous store, the clientele for Krypton Comics was decidedly different, as we learned in our discussion with store owner Eric Singer. They weren't expecting a large turnout among their customers, and -- in comparison to reports of folks arriving at or before store opening at other retailers -- it didn't seem that many items had been taken yet from their display.

Eric is a believer in developing gamer interest at the local level, and one of the signs incorporated into the Free RPG Day display was a sign about the "Fun & Games at the Library" program he participates in that targets grades 6 to 12. He was disappointed that the promotional items only arrived a few days before the event, because he would have liked to be able to read the material and prepare demos of some of the products. "They really should have gotten this merchandise to us a month ago . . . at least two weeks," he said. We were again reminded of regional differences in store locations when we learned that there was little buzz among his customers about Free RPG Day; similarly, they never got a large turnout for Free Comic Book Day. Because of this lack of a regional push, Eric wasn't expecting to restrict the number of items customers could take. We learned that Eric had limited the display area for Free RPG Day to include only those items with color covers that he could display attractively (thus leaving the *Prime Directive, Dark Alley,* and *Runequest* items behind the counter). Said Eric, "They're not attractive; with any kind of thing like this, it's got to be attractive; if it's not attractive, the customer doesn't look at it." Likewise he didn't believe it was worthwhile to put out items he received too few copies of (such as the *Septimus Quickstart* and the *Little Ork Wars,* both of which he only received one or two).

Like the other stores we went to that day, Eric sited diversity as a strength of both his store and the game market: "There's so many different games out there besides *[Dungeons & Dragons],* besides *Magic.*"

We continued our journey, returning to the store we had first attempted to check out . . . ironically, a store that has ties to the first store we visited.

Reader Copies TWO
2325 Conner Street
Noblesville, IN 46060

(317) 774-8220
readercopiestwo.com

It was late in the day by the time we arrived at Reader Copies TWO, a partner store to the location in Andersonville. It wasn't wildly busy in the store when we got there, although a group of folks were sitting down to a game of *Settlers of Catan,* including owner Matt Phillips. Taking a break from his Catan-settling, Matt willingly answered our questions about how the event went. "This is the quietest it's been all day," he said; the store had seen a lot of foot traffic, and the state of the Free RPG Day display table bore out this observation.

Matt viewed this event as a unique opportunity to get the word out about his location. Said Matt, "The biggest problem we've had is the same as everybody else: letting people know we're here." This was especially true for Reader Copies TWO, which moved to its new location a month ago from the other side of town. "It's actually brought in a lot of new faces," said Matt. "There have been a lot of roleplaying game people coming in and out all day long, and I've been really impressed, because I didn't think it would work." The store wasn't limiting what people could take from the Free RPG Day offerings; they only they had was "don't take the last of something." They were hoping to run demos of some of the titles later and could only do so if they had the product.

Reader Copies TWO used the occasion to tie in the event with material of local interest; *Rifts* is a huge seller for the store, so the regional Megaversal Ambassador from Palladium arrived early in the day with a box of *Rifters,* which were made freely available on the same display as the other Free RPG Day offerings.

Continuing a theme we'd encountered many times throughout the day, Matt volunteered his impressions on the Free RPG Day publications, noting the "good mix of *d20 [System]* and non-*d20 [System]*" material. Obviously any store that has a huge *Rifts* following must believe in market diversity to some extent.

And with that, we drove home, having added five stores (1.66% of participating locations) to our belt and 232 miles to our car. Despite the similarities one might expect from having five stores in the same general region, each approached the event in its own way; in much the same way that each store was different, so too was their utilization of Free RPG Day.

While diversity is usually something to be frowned upon in the business world -- most Wal-Marts are alike, and they're more similar than dissimilar to Targets -- in the gaming world, it seems to be a hallmark of the industry: diverse interests, diverse products, diverse stores, diverse customers. Hopefully in this sea of diversity some gamers have some new ideas of what they're going to be doing next Friday night, just as some store owners have some new ideas about what they're going to be doing for next year's Free RPG Day.
